  This was formerly allowed but trying to do it had various unpleasant consequences, notably that the originating backend could not exit as long as an UNLISTEN remained uncommitted.
- Disallow dropping a temporary table within a prepared transaction (Heikki)
  This was correctly disallowed by 8.1, but the check was inadvertently broken in 8.2 and 8.3.
- Fix rare crash when an error occurs during a query using a hash index (Heikki)
- Fix incorrect comparison of tsquery values (Teodor)
- Fix incorrect behavior of LIKE with non-ASCII characters in single-byte encodings (Rolf Jentsch)
- Disable xmlvalidate (Tom)
  This function should have been removed before 8.3 release, but was inadvertently left in the source code. It poses a small security risk since unprivileged users could use it to read the first few characters of any file accessible to the server.
- Fix memory leaks in certain usages of set-returning functions (Neil)
- Make encode(bytea, 'escape') convert all high-bit-set byte values into \nnn octal escape sequences (Tom)
  This is necessary to avoid encoding problems when the database encoding is multi-byte. This change could pose compatibility issues for applications that are expecting specific results from encode.
- Fix input of datetime values for February 29 in years BC (Tom)
  The former coding was mistaken about which years were leap years.
- Fix “unrecognized node type” error in some variants of ALTER OWNER (Tom)
- Avoid tablespace permissions errors in CREATE TABLE LIKE INCLUDING INDEXES (Tom)
- Ensure pg_stat_activity.waiting flag is cleared when a lock wait is aborted (Tom)
• Fix handling of process permissions on Windows Vista (Dave, Magnus)
  In particular, this fix allows starting the server as the Administrator user.

• Update time zone data files to tzdata release 2008a (in particular, recent Chile changes); adjust timezone abbreviation VET (Venezuela) to mean UTC-4:30, not UTC-4:00 (Tom)

• Fix ecpg problems with arrays (Michael)

• Fix pg_ctl to correctly extract the postmaster’s port number from command-line options (Itagaki Takahiro, Tom)
  Previously, `pg_ctl start -w` could try to contact the postmaster on the wrong port, leading to bogus reports of startup failure.

• Use `-fwrapv` to defend against possible misoptimization in recent gcc versions (Tom)
  This is known to be necessary when building PostgreSQL with gcc 4.3 or later.

• Enable building `contrib/uuid-ossp` with MSVC (Hiroshi Saito)

E.168. Release 8.3

Release date: 2008-02-04

E.168.1. Overview

With significant new functionality and performance enhancements, this release represents a major leap forward for PostgreSQL. This was made possible by a growing community that has dramatically accelerated the pace of development. This release adds the following major features:

• Full text search is integrated into the core database system

• Support for the SQL/XML standard, including new operators and an XML data type

• Enumerated data types (ENUM)

• Arrays of composite types

• Universally Unique Identifier (UUID) data type

• Add control over whether NULLs sort first or last

• Updatable cursors

• Server configuration parameters can now be set on a per-function basis

• User-defined types can now have type modifiers

• Automatically re-plan cached queries when table definitions change or statistics are updated

• Numerous improvements in logging and statistics collection

• Support Security Service Provider Interface (SSPI) for authentication on Windows

• Support multiple concurrent autovacuum processes, and other autovacuum improvements

• Allow the whole PostgreSQL distribution to be compiled with Microsoft Visual C++
Major performance improvements are listed below. Most of these enhancements are automatic and do not require user changes or tuning:

- Asynchronous commit delays writes to WAL during transaction commit
- Checkpoint writes can be spread over a longer time period to smooth the I/O spike during each check-point
- Heap-Only Tuples (HOT) accelerate space reuse for most UPDATEs and DELETEs
- Just-in-time background writer strategy improves disk write efficiency
- Using non-persistent transaction IDs for read-only transactions reduces overhead and VACUUM requirements
- Per-field and per-row storage overhead has been reduced
- Large sequential scans no longer force out frequently used cached pages
- Concurrent large sequential scans can now share disk reads
- ORDER BY ... LIMIT can be done without sorting

The above items are explained in more detail in the sections below.

**E.168.2. Migration to Version 8.3**

A dump/restore using pg_dump is required for those wishing to migrate data from any previous release. Observe the following incompatibilities:

**E.168.2.1. General**

- Non-character data types are no longer automatically cast to TEXT (Peter, Tom)

  Previously, if a non-character value was supplied to an operator or function that requires text input, it was automatically cast to text, for most (though not all) built-in data types. This no longer happens: an explicit cast to text is now required for all non-character-string types. For example, these expressions formerly worked:

```
substr(current_date, 1, 4)
23 LIKE '2%
```

but will now draw “function does not exist” and “operator does not exist” errors respectively. Use an explicit cast instead:

```
substr(current_date::text, 1, 4)
23::text LIKE '2%
```

(Of course, you can use the more verbose CAST() syntax too.) The reason for the change is that these automatic casts too often caused surprising behavior. An example is that in previous releases, this expression was accepted but did not do what was expected:

```
current_date < 2017-11-17
```

This is actually comparing a date to an integer, which should be (and now is) rejected — but in the presence of automatic casts both sides were cast to text and a textual comparison was done, because the text < text operator was able to match the expression when no other < operator could.
Appendix E. Release Notes

Types `char(n)` and `varchar(n)` still cast to `text` automatically. Also, automatic casting to `text` still works for inputs to the concatenation (`||`) operator, so long as at least one input is a character-string type.

- Full text search features from `contrib/tsearch2` have been moved into the core server, with some minor syntax changes.

  `contrib/tsearch2` now contains a compatibility interface.

- `ARRAY(SELECT ...)`, where the `SELECT` returns no rows, now returns an empty array, rather than `NULL` (Tom)

- The array type name for a base data type is no longer always the base type’s name with an underscore prefix.

  The old naming convention is still honored when possible, but application code should no longer depend on it. Instead use the new `pg_type.typarray` column to identify the array data type associated with a given type.

- `ORDER BY ... USING operator` must now use a less-than or greater-than `operator` that is defined in a btree operator class.

  This restriction was added to prevent inconsistent results.

- `SET LOCAL` changes now persist until the end of the outermost transaction, unless rolled back (Tom)

  Previously `SET LOCAL`’s effects were lost after subtransaction commit (`RELEASE SAVEPOINT` or exit from a PL/pgSQL exception block).

- Commands rejected in transaction blocks are now also rejected in multiple-statement query strings (Tom)

  For example, "BEGIN; DROP DATABASE; COMMIT" will now be rejected even if submitted as a single query message.

- `ROLLBACK` outside a transaction block now issues `NOTICE` instead of `WARNING` (Bruce)

- Prevent `NOTIFY/LISTEN/UNLISTEN` from accepting schema-qualified names (Bruce)

  Formerly, these commands accepted `schema.relation` but ignored the schema part, which was confusing.

- `ALTER SEQUENCE` no longer affects the sequence’s `currval()` state (Tom)

  This improves semantic consistency and helps avoid performance problems.

- Restrict object size functions to users who have reasonable permissions to view such information (Tom)

  For example, `pg_database_size()` now requires `CONNECT` permission, which is granted to everyone by default. `pg_tablespace_size()` requires `CREATE` permission in the tablespace, or is allowed if the tablespace is the default tablespace for the database.

- Remove the undocumented `!!=` (not in) operator (Tom)

  `NOT IN (SELECT ...)` is the proper way to perform this operation.

- Internal hashing functions are now more uniformly-distributed (Tom)

  If application code was computing and storing hash values using internal PostgreSQL hashing functions, the hash values must be regenerated.

- C-code conventions for handling variable-length data values have changed (Greg Stark, Tom)
The new \texttt{SET_VARSIZE()} macro \textit{must} be used to set the length of generated \texttt{varlena} values. Also, it might be necessary to expand (“de-TOAST”) input values in more cases.

- Continuous archiving no longer reports each successful archive operation to the server logs unless \texttt{DEBUG} level is used (Simon)

### E.168.2.2. Configuration Parameters

- Numerous changes in administrative server parameters
  - \texttt{bgwriter_lru_percent}, \texttt{bgwriter_all_percent}, \texttt{bgwriter_all_maxpages}, \texttt{stats_start_collector}, and \texttt{stats_reset_on_server_start} are removed. \texttt{redirect_stderr} is renamed to \texttt{logging_collector}. \texttt{stats_command_string} is renamed to \texttt{track_activities}. \texttt{stats_block_level} and \texttt{stats_row_level} are merged into \texttt{track_counts}. A new boolean configuration parameter, \texttt{archive_mode}, controls archiving. Autovacuum’s default settings have changed.
  - Remove \texttt{stats_start_collector} parameter (Tom)
    We now always start the collector process, unless UDP socket creation fails.
  - Remove \texttt{stats_reset_on_server_start} parameter (Tom)
    This was removed because \texttt{pg_stat_reset()} can be used for this purpose.
  - Commenting out a parameter in \texttt{postgresql.conf} now causes it to revert to its default value (Joachim Wieland)
    Previously, commenting out an entry left the parameter’s value unchanged until the next server restart.

### E.168.2.3. Character Encodings

- Add more checks for invalidly-encoded data (Andrew)
  This change plugs some holes that existed in literal backslash escape string processing and \texttt{COPY} escape processing. Now the de-escaped string is rechecked to see if the result created an invalid multi-byte character.
- Disallow database encodings that are inconsistent with the server’s locale setting (Tom)
  On most platforms, \texttt{C} locale is the only locale that will work with any database encoding. Other locale settings imply a specific encoding and will misbehave if the database encoding is something different. (Typical symptoms include bogus textual sort order and wrong results from \texttt{upper()} or \texttt{lower()}.)
  The server now rejects attempts to create databases that have an incompatible encoding.
- Ensure that \texttt{chr()} cannot create invalidly-encoded values (Andrew)
  In UTF8-encoded databases the argument of \texttt{chr()} is now treated as a Unicode code point. In other multi-byte encodings \texttt{chr()}’s argument must designate a 7-bit ASCII character. Zero is no longer accepted. \texttt{ascii()} has been adjusted to match.
- Adjust \texttt{convert()} behavior to ensure encoding validity (Andrew)
The two argument form of convert() has been removed. The three argument form now takes a bytea first argument and returns a bytea. To cover the loss of functionality, three new functions have been added:

- convert_from(bytea, name) returns text — converts the first argument from the named encoding to the database encoding
- convert_to(text, name) returns bytea — converts the first argument from the database encoding to the named encoding
- length(bytea, name) returns integer — gives the length of the first argument in characters in the named encoding

- Remove convert(argument USING conversion_name) (Andrew)
  Its behavior did not match the SQL standard.
- Make JOHAB encoding client-only (Tatsuo)
  JOHAB is not safe as a server-side encoding.

E.168.3. Changes

Below you will find a detailed account of the changes between PostgreSQL 8.3 and the previous major release.

E.168.3.1. Performance

- Asynchronous commit delays writes to WAL during transaction commit (Simon)
  This feature dramatically increases performance for short data-modifying transactions. The disadvantage is that because disk writes are delayed, if the database or operating system crashes before data is written to the disk, committed data will be lost. This feature is useful for applications that can accept some data loss. Unlike turning off fsync, using asynchronous commit does not put database consistency at risk; the worst case is that after a crash the last few reportedly-committed transactions might not be committed after all. This feature is enabled by turning off synchronous_commit (which can be done per-session or per-transaction, if some transactions are critical and others are not). wal_writer_delay can be adjusted to control the maximum delay before transactions actually reach disk.
- Checkpoint writes can be spread over a longer time period to smooth the I/O spike during each checkpoint (Itagaki Takahiro and Heikki Linnakangas)
  Previously all modified buffers were forced to disk as quickly as possible during a checkpoint, causing an I/O spike that decreased server performance. This new approach spreads out disk writes during checkpoints, reducing peak I/O usage. (User-requested and shutdown checkpoints are still written as quickly as possible.)
- Heap-Only Tuples (HOT) accelerate space reuse for most UPDATEs and DELETEs (Pavan Deolasee, with ideas from many others)
Appendix E. Release Notes

**UPDATE** and **DELETE** leave dead tuples behind, as do failed **INSERT**. Previously only **VACUUM** could reclaim space taken by dead tuples. With HOT dead tuple space can be automatically reclaimed at the time of **INSERT** or **UPDATE** if no changes are made to indexed columns. This allows for more consistent performance. Also, HOT avoids adding duplicate index entries.

- Just-in-time background writer strategy improves disk write efficiency (Greg Smith, Itagaki Takahiro)
  
  This greatly reduces the need for manual tuning of the background writer.

- Per-field and per-row storage overhead have been reduced (Greg Stark, Heikki Linnakangas)
  
  Variable-length data types with data values less than 128 bytes long will see a storage decrease of 3 to 6 bytes. For example, two adjacent `char(1)` fields now use 4 bytes instead of 16. Row headers are also 4 bytes shorter than before.

- Using non-persistent transaction IDs for read-only transactions reduces overhead and **VACUUM** requirements (Florian Pflug)
  
  Non-persistent transaction IDs do not increment the global transaction counter. Therefore, they reduce the load on `pg_clog` and increase the time between forced vacuums to prevent transaction ID wraparound. Other performance improvements were also made that should improve concurrency.

- Avoid incrementing the command counter after a read-only command (Tom)
  
  There was formerly a hard limit of $2^{32}$ (4 billion) commands per transaction. Now only commands that actually changed the database count, so while this limit still exists, it should be significantly less annoying.

- Create a dedicated WAL writer process to off-load work from backends (Simon)

- Skip unnecessary WAL writes for **CLUSTER** and **COPY** (Simon)

  Unless WAL archiving is enabled, the system now avoids WAL writes for **CLUSTER** and just `fsync()`s the table at the end of the command. It also does the same for **COPY** if the table was created in the same transaction.

- Large sequential scans no longer force out frequently used cached pages (Simon, Heikki, Tom)

- Concurrent large sequential scans can now share disk reads (Jeff Davis)

  This is accomplished by starting the new sequential scan in the middle of the table (where another sequential scan is already in-progress) and wrapping around to the beginning to finish. This can affect the order of returned rows in a query that does not specify **ORDER BY**. The `synchronize_seqscans` configuration parameter can be used to disable this if necessary.

- **ORDER BY ... LIMIT** can be done without sorting (Greg Stark)

  This is done by sequentially scanning the table and tracking just the “top N” candidate rows, rather than performing a full sort of the entire table. This is useful when there is no matching index and the **LIMIT** is not large.

- Put a rate limit on messages sent to the statistics collector by backends (Tom)

  This reduces overhead for short transactions, but might sometimes increase the delay before statistics are tallied.

- Improve hash join performance for cases with many NULLs (Tom)

- Speed up operator lookup for cases with non-exact datatype matches (Tom)
E.168.3.2. Server

- Autovacuum is now enabled by default (Alvaro)
  Several changes were made to eliminate disadvantages of having autovacuum enabled, thereby justifying the change in default. Several other autovacuum parameter defaults were also modified.
- Support multiple concurrent autovacuum processes (Alvaro, Itagaki Takahiro)
  This allows multiple vacuums to run concurrently. This prevents vacuuming of a large table from delaying vacuuming of smaller tables.
- Automatically re-plan cached queries when table definitions change or statistics are updated (Tom)
  Previously PL/pgSQL functions that referenced temporary tables would fail if the temporary table was dropped and recreated between function invocations, unless `EXECUTE` was used. This improvement fixes that problem and many related issues.
- Add a `temp_tablespaces` parameter to control the tablespaces for temporary tables and files (Jaime Casanova, Albert Cervera, Bernd Helmle)
  This parameter defines a list of tablespaces to be used. This enables spreading the I/O load across multiple tablespaces. A random tablespace is chosen each time a temporary object is created. Temporary files are no longer stored in per-database `pgsql_tmp/` directories but in per-tablespace directories.
- Place temporary tables’ TOAST tables in special schemas named `pg_toast_temp_nnn` (Tom)
  This allows low-level code to recognize these tables as temporary, which enables various optimizations such as not WAL-logging changes and using local rather than shared buffers for access. This also fixes a bug wherein backends unexpectedly held open file references to temporary TOAST tables.
- Fix problem that a constant flow of new connection requests could indefinitely delay the postmaster from completing a shutdown or a crash restart (Tom)
- Guard against a very-low-probability data loss scenario by preventing re-use of a deleted table’s relfilenode until after the next checkpoint (Heikki)
- Fix `CREATE CONSTRAINT TRIGGER` to convert old-style foreign key trigger definitions into regular foreign key constraints (Tom)
  This will ease porting of foreign key constraints carried forward from pre-7.3 databases, if they were never converted using `contrib/adddepend`.
- Fix `DEFAULT NULL` to override inherited defaults (Tom)
  `DEFAULT NULL` was formerly considered a noise phrase, but it should (and now does) override non-null defaults that would otherwise be inherited from a parent table or domain.
- Add new encodings `EUC_JIS_2004` and `SHIFT_JIS_2004` (Tatsuo)
  These new encodings can be converted to and from UTF-8.
- Change server startup log message from “database system is ready” to “database system is ready to accept connections”, and adjust its timing
  The message now appears only when the postmaster is really ready to accept connections.
E.168.3.3. Monitoring

- Add `log_autovacuum_min_duration` parameter to support configurable logging of autovacuum activity (Simon, Alvaro)
- Add `log_lock_waits` parameter to log lock waiting (Simon)
- Add `log_temp_files` parameter to log temporary file usage (Bill Moran)
- Add `log_checkpoints` parameter to improve logging of checkpoints (Greg Smith, Heikki)
- `log_line_prefix` now supports `%s` and `%c` escapes in all processes (Andrew)
  Previously these escapes worked only for user sessions, not for background database processes.
- Add `log_restartpoints` to control logging of point-in-time recovery restart points (Simon)
- Last transaction end time is now logged at end of recovery and at each logged restart point (Simon)
- Autovacuum now reports its activity start time in `pg_stat_activity` (Tom)
- Allow server log output in comma-separated value (CSV) format (Arul Shaji, Greg Smith, Andrew Dunstan)
  CSV-format log files can easily be loaded into a database table for subsequent analysis.
- Use PostgreSQL-supplied timezone support for formatting timestamps displayed in the server log (Tom)
  This avoids Windows-specific problems with localized time zone names that are in the wrong encoding.
  There is a new `log_timezone` parameter that controls the timezone used in log messages, independently of the client-visible timezone parameter.
- New system view `pg_stat_bgwriter` displays statistics about background writer activity (Magnus)
- Add new columns for database-wide tuple statistics to `pg_stat_database` (Magnus)
- Add an `xact_start` (transaction start time) column to `pg_stat_activity` (Neil)
  This makes it easier to identify long-running transactions.
- Add `n_live_tuples` and `n_dead_tuples` columns to `pg_stat_all_tables` and related views (Glen Parker)
- Merge `stats_block_level` and `stats_row_level` parameters into a single parameter `track_counts`, which controls all messages sent to the statistics collector process (Tom)
- Rename `stats_command_string` parameter to `track_activities` (Tom)
- Fix statistical counting of live and dead tuples to recognize that committed and aborted transactions have different effects (Tom)

E.168.3.4. Authentication

- Support Security Service Provider Interface (SSPI) for authentication on Windows (Magnus)
- Support GSSAPI authentication (Henry Hotz, Magnus)
  This should be preferred to native Kerberos authentication because GSSAPI is an industry standard.
• Support a global SSL configuration file (Victor Wagner)
• Add ssl_ciphers parameter to control accepted SSL ciphers (Victor Wagner)
• Add a Kerberos realm parameter, krb.realm (Magnus)

E.168.3.5. Write-Ahead Log (WAL) and Continuous Archiving

• Change the timestamps recorded in transaction WAL records from time_t to TimestampTz representation (Tom)
  This provides sub-second resolution in WAL, which can be useful for point-in-time recovery.
• Reduce WAL disk space needed by warm standby servers (Simon)
  This change allows a warm standby server to pass the name of the earliest still-needed WAL file to the recovery script, allowing automatic removal of no-longer-needed WAL files. This is done using $r in the restore_command parameter of recovery.conf.
• New boolean configuration parameter, archive_mode, controls archiving (Simon)
  Previously setting archive_command to an empty string turned off archiving. Now archive_mode turns archiving on and off, independently of archive_command. This is useful for stopping archiving temporarily.

E.168.3.6. Queries

• Full text search is integrated into the core database system (Teodor, Oleg)
  Text search has been improved, moved into the core code, and is now installed by default. contrib/tsearch2 now contains a compatibility interface.
• Add control over whether NULLs sort first or last (Teodor, Tom)
  The syntax is ORDER BY ... NULLS FIRST/LAST.
• Allow per-column ascending/descending (ASC/DESC) ordering options for indexes (Teodor, Tom)
  Previously a query using ORDER BY with mixed ASC/DESC specifiers could not fully use an index. Now an index can be fully used in such cases if the index was created with matching ASC/DESC specifications. NULL sort order within an index can be controlled, too.
• Allow col IS NULL to use an index (Teodor)
• Updatable cursors (Arul Shaji, Tom)
  This eliminates the need to reference a primary key to UPDATE or DELETE rows returned by a cursor. The syntax is UPDATE/DELETE WHERE CURRENT OF.
• Allow FOR UPDATE in cursors (Arul Shaji, Tom)
• Create a general mechanism that supports casts to and from the standard string types (TEXT, VARCHAR, CHAR) for every datatype, by invoking the datatype’s I/O functions (Tom)
Previously, such casts were available only for types that had specialized function(s) for the purpose. These new casts are assignment-only in the to-string direction, explicit-only in the other direction, and therefore should create no surprising behavior.

- Allow `UNION` and related constructs to return a domain type, when all inputs are of that domain type (Tom)
  Formerly, the output would be considered to be of the domain’s base type.

- Allow limited hashing when using two different data types (Tom)
  This allows hash joins, hash indexes, hashed subplans, and hash aggregation to be used in situations involving cross-data-type comparisons, if the data types have compatible hash functions. Currently, cross-data-type hashing support exists for `smallint/integer/bigint`, and for `float4/float8`.

- Improve optimizer logic for detecting when variables are equal in a `WHERE` clause (Tom)
  This allows mergejoins to work with descending sort orders, and improves recognition of redundant sort columns.

- Improve performance when planning large inheritance trees in cases where most tables are excluded by constraints (Tom)

### E.168.3.7. Object Manipulation

- Arrays of composite types (David Fetter, Andrew, Tom)
  In addition to arrays of explicitly-declared composite types, arrays of the rowtypes of regular tables and views are now supported, except for rowtypes of system catalogs, sequences, and TOAST tables.

- Server configuration parameters can now be set on a per-function basis (Tom)
  For example, functions can now set their own `search_path` to prevent unexpected behavior if a different `search_path` exists at run-time. Security definer functions should set `search_path` to avoid security loopholes.

- `CREATE/ALTER FUNCTION` now supports `COST` and `ROWS` options (Tom)
  `COST` allows specification of the cost of a function call. `ROWS` allows specification of the average number or rows returned by a set-returning function. These values are used by the optimizer in choosing the best plan.

- Implement `CREATE TABLE LIKE ... INCLUDING INDEXES` (Trevor Hardcastle, Nikhil Sontakke, Neil)

- Allow `CREATE INDEX CONCURRENTLY` to ignore transactions in other databases (Simon)

- Add `ALTER VIEW ... RENAME TO` and `ALTER SEQUENCE ... RENAME TO` (David Fetter, Neil)
  Previously this could only be done via `ALTER TABLE ... RENAME TO`.

- Make `CREATE/DROP/RENAME DATABASE` wait briefly for conflicting backends to exit before failing (Tom)
  This increases the likelihood that these commands will succeed.

- Allow triggers and rules to be deactivated in groups using a configuration parameter, for replication purposes (Jan)
This allows replication systems to disable triggers and rewrite rules as a group without modifying
the system catalogs directly. The behavior is controlled by ALTER TABLE and a new parameter
session_replication_role.

- User-defined types can now have type modifiers (Teodor, Tom)
  This allows a user-defined type to take a modifier, like ssnum(7). Previously only built-in data types
could have modifiers.

### E.168.3.8. Utility Commands

- Non-superuser database owners now are able to add trusted procedural languages to their databases by
default (Jeremy Drake)
  While this is reasonably safe, some administrators might wish to revoke the privilege. It is controlled
by pg_pltemplatetmpldbacreate.
- Allow a session’s current parameter setting to be used as the default for future sessions (Tom)
  This is done with SET ... FROM CURRENT in CREATE/ALTER FUNCTION, ALTER DATABASE, or
ALTER ROLE.
- Implement new commands DISCARD ALL, DISCARD PLANS, DISCARD TEMPORARY, CLOSE ALL,
  and DEALLOCATE ALL (Marko Kreen, Neil)
  These commands simplify resetting a database session to its initial state, and are particularly useful for
connection-pooling software.
- Make CLUSTER MVCC-safe (Heikki Linnakangas)
  Formerly, CLUSTER would discard all tuples that were committed dead, even if there were still transac-
tions that should be able to see them under MVCC visibility rules.
- Add new CLUSTER syntax: CLUSTER table USING index (Holger Schurig)
  The old CLUSTER syntax is still supported, but the new form is considered more logical.
- Fix EXPLAIN so it can show complex plans more accurately (Tom)
  References to subplan outputs are now always shown correctly, instead of using ?columnN? for com-
plicated cases.
- Limit the amount of information reported when a user is dropped (Alvaro)
  Previously, dropping (or attempting to drop) a user who owned many objects could result in large
NOTICE or ERROR messages listing all these objects; this caused problems for some client applications.
The length of the message is now limited, although a full list is still sent to the server log.

### E.168.3.9. Data Types

- Support for the SQL/XML standard, including new operators and an XML data type (Nikolay
  Samokhvalov, Pavel Stehule, Peter)
- Enumerated data types (ENUM) (Tom Dunstan)
This feature provides convenient support for fields that have a small, fixed set of allowed values. An example of creating an `ENUM` type is `CREATE TYPE mood AS ENUM ('sad', 'ok', 'happy').`

- Universally Unique Identifier (UUID) data type (Gevik Babakhani, Neil)
  This closely matches RFC 4122.
- Widen the `MONEY` data type to 64 bits (D’Arcy Cain)
  This greatly increases the range of supported `MONEY` values.
- Fix `float4`/`float8` to handle Infinity and NAN (Not A Number) consistently (Bruce)
  The code formerly was not consistent about distinguishing Infinity from overflow conditions.
- Allow leading and trailing whitespace during input of `boolean` values (Neil)
- Prevent `COPY` from using digits and lowercase letters as delimiters (Tom)

### E.168.3.10. Functions

- Add new regular expression functions `regexp_matches()`, `regexp_split_to_array()`, and `regexp_split_to_table()` (Jeremy Drake, Neil)
  These functions provide extraction of regular expression subexpressions and allow splitting a string using a POSIX regular expression.
- Add `io_truncate()` for large object truncation (Kris Jurka)
- Implement `width_bucket()` for the `float8` data type (Neil)
- Add `pg_stat_clear_snapshot()` to discard statistics snapshots collected during the current transaction (Tom)
  The first request for statistics in a transaction takes a statistics snapshot that does not change during the transaction. This function allows the snapshot to be discarded and a new snapshot loaded during the next statistics query. This is particularly useful for PL/pgSQL functions, which are confined to a single transaction.
- Add `isodow` option to `EXTRACT()` and `date_part()` (Bruce)
  This returns the day of the week, with Sunday as seven. (dow returns Sunday as zero.)
- Add `ID` (ISO day of week) and `IDDD` (ISO day of year) format codes for `to_char()`, `to_date()`, and `to_timestamp()` (Brendan Jurd)
- Make `to_timestamp()` and `to_date()` assume `TM` (trim) option for potentially variable-width fields (Bruce)
  This matches Oracle’s behavior.
- Fix off-by-one conversion error in `to_date()/to_timestamp()` D (non-ISO day of week) fields (Bruce)
- Make `setseed()` return void, rather than a useless integer value (Neil)
- Add a hash function for `NUMERIC` (Neil)
  This allows hash indexes and hash-based plans to be used with `NUMERIC` columns.
• Improve efficiency of \texttt{LIKE/ILIKE}, especially for multi-byte character sets like UTF-8 (Andrew, Itagaki Takahiro)

• Make \texttt{currtid()} functions require \texttt{SELECT} privileges on the target table (Tom)

• Add several \texttt{txid_*()} functions to query active transaction IDs (Jan)
  
  This is useful for various replication solutions.

\section*{E.168.3.11. PL/pgSQL Server-Side Language}

• Add scrollable cursor support, including directional control in \texttt{FETCH} (Pavel Stehule)

• Allow \texttt{IN} as an alternative to \texttt{FROM} in PL/pgSQL's \texttt{FETCH} statement, for consistency with the backend's \texttt{FETCH} command (Pavel Stehule)

• Add \texttt{MOVE} to PL/pgSQL (Magnus, Pavel Stehule, Neil)

• Implement \texttt{RETURN QUERY} (Pavel Stehule, Neil)

  This adds convenient syntax for PL/pgSQL set-returning functions that want to return the result of a query. \texttt{RETURN QUERY} is easier and more efficient than a loop around \texttt{RETURN NEXT}.

• Allow function parameter names to be qualified with the function's name (Tom)

  For example, \texttt{myfunc.myvar}. This is particularly useful for specifying variables in a query where the variable name might match a column name.

• Make qualification of variables with block labels work properly (Tom)

  Formerly, outer-level block labels could unexpectedly interfere with recognition of inner-level record or row references.

• Tighten requirements for \texttt{FOR loop STEP} values (Tom)

  Prevent non-positive \texttt{STEP} values, and handle loop overflows.

• Improve accuracy when reporting syntax error locations (Tom)

\section*{E.168.3.12. Other Server-Side Languages}

• Allow type-name arguments to PL/Perl \texttt{spi_prepare()} to be data type aliases in addition to names found in \texttt{pg_type} (Andrew)

• Allow type-name arguments to PL/Python \texttt{plpy.prepare()} to be data type aliases in addition to names found in \texttt{pg_type} (Andrew)

• Allow type-name arguments to PL/Tcl \texttt{spi_prepare} to be data type aliases in addition to names found in \texttt{pg_type} (Andrew)

• Enable PL/PythonU to compile on Python 2.5 (Marko Kreen)

• Support a true PL/Python boolean type in compatible Python versions (Python 2.3 and later) (Marko Kreen)
Appendix E. Release Notes

- Fix PL/Tcl problems with thread-enabled libtcl spawning multiple threads within the backend (Steve Marshall, Paul Bayer, Doug Knight)
  This caused all sorts of unpleasantness.

E.168.3.13. psql

- List disabled triggers separately in \d output (Brendan Jurd)
- In \d patterns, always match $ literally (Tom)
- Show aggregate return types in \da output (Greg Sabino Mullane)
- Add the function’s volatility status to the output of \df+ (Neil)
- Add \prompt capability (Chad Wagner)
- Allow \pset, \t, and \x to specify on or off, rather than just toggling (Chad Wagner)
- Add \sleep capability (Jan)
- Enable \timing output for \copy (Andrew)
- Improve \timing resolution on Windows (Itagaki Takahiro)
- Flush \o output after each backslash command (Tom)
- Correctly detect and report errors while reading a -f input file (Peter)
- Remove -u option (this option has long been deprecated) (Tom)

E.168.3.14. pg_dump

- Add --tablespaces-only and --roles-only options to pg_dumpall (Dave Page)
- Add an output file option to pg_dumpall (Dave Page)
  This is primarily useful on Windows, where output redirection of child pg_dump processes does not work.
- Allow pg_dumpall to accept an initial-connection database name rather than the default template1 (Dave Page)
- In -n and -t switches, always match $ literally (Tom)
- Improve performance when a database has thousands of objects (Tom)
- Remove -u option (this option has long been deprecated) (Tom)

E.168.3.15. Other Client Applications

- In initdb, allow the location of the pg_xlog directory to be specified (Euler Taveira de Oliveira)
- Enable server core dump generation in pg_regress on supported operating systems (Andrew)
- Add a -t (timeout) parameter to pg_ctl (Bruce)
This controls how long `pg_ctl` will wait when waiting for server startup or shutdown. Formerly the timeout was hard-wired as 60 seconds.

- Add a `pg_ctl` option to control generation of server core dumps (Andrew)
- Allow Control-C to cancel `clusterdb`, `reindexdb`, and `vacuumdb` (Itagaki Takahiro, Magnus)
- Suppress command tag output for `createdb`, `createuser`, `dropdb`, and `dropuser` (Peter)

  The `--quiet` option is ignored and will be removed in 8.4. Progress messages when acting on all databases now go to stdout instead of stderr because they are not actually errors.

### E.168.3.16. libpq

- Interpret the `dbName` parameter of `PQsetdbLogin()` as a `conninfo` string if it contains an equals sign (Andrew)

  This allows use of `conninfo` strings in client programs that still use `PQsetdbLogin()`.

- Support a global SSL configuration file (Victor Wagner)

- Add environment variable `PGSSLKEY` to control SSL hardware keys (Victor Wagner)

- Add `lo_truncate()` for large object truncation (Kris Jurka)

- Add `PQconnectionNeedsPassword()` that returns true if the server required a password but none was supplied (Joe Conway, Tom)

  If this returns true after a failed connection attempt, a client application should prompt the user for a password. In the past applications have had to check for a specific error message string to decide whether a password is needed; that approach is now deprecated.

- Add `PQconnectionUsedPassword()` that returns true if the supplied password was actually used (Joe Conway, Tom)

  This is useful in some security contexts where it is important to know whether a user-supplied password is actually valid.

### E.168.3.17. ecpg

- Use V3 frontend/backend protocol (Michael)

  This adds support for server-side prepared statements.

- Use native threads, instead of pthreads, on Windows (Magnus)

- Improve thread-safety of `ecpglib` (Itagaki Takahiro)

- Make the `ecpg` libraries export only necessary API symbols (Michael)
E.168.3.18. Windows Port

- Allow the whole PostgreSQL distribution to be compiled with Microsoft Visual C++ (Magnus and others)
  This allows Windows-based developers to use familiar development and debugging tools. Windows executables made with Visual C++ might also have better stability and performance than those made with other tool sets. The client-only Visual C++ build scripts have been removed.
- Drastically reduce postmaster’s memory usage when it has many child processes (Magnus)
- Allow regression tests to be started by an administrative user (Magnus)
- Add native shared memory implementation (Magnus)

E.168.3.19. Server Programming Interface (SPI)

- Add cursor-related functionality in SPI (Pavel Stehule)
  Allow access to the cursor-related planning options, and add \texttt{FETCH/\texttt{MOVE}} routines.
- Allow execution of cursor commands through \texttt{SPI\_execute} (Tom)
  The macro \texttt{SPI\_ERROR\_CURSOR} still exists but will never be returned.
- SPI plan pointers are now declared as \texttt{SPIPlanPtr} instead of \texttt{void *} (Tom)
  This does not break application code, but switching is recommended to help catch simple programming mistakes.

E.168.3.20. Build Options

- Add configure option \texttt{--enable-profiling} to enable code profiling (works only with gcc) (Korry Douglas and Nikhil Sontakke)
- Add configure option \texttt{--with-system-tzdata} to use the operating system’s time zone database (Peter)
- Fix PGXS so extensions can be built against PostgreSQL installations whose \texttt{pg\_config} program does not appear first in the \texttt{PATH} (Tom)
- Support \texttt{gmake draft} when building the SGML documentation (Bruce)
  Unless \texttt{draft} is used, the documentation build will now be repeated if necessary to ensure the index is up-to-date.

E.168.3.21. Source Code

- Rename macro \texttt{DLLIMPORT} to \texttt{PGDLLIMPORT} to avoid conflicting with third party includes (like Tcl) that define \texttt{DLLIMPORT} (Magnus)
Appendix E. Release Notes

- Create “operator families” to improve planning of queries involving cross-data-type comparisons (Tom)
- Update GIN extractQuery() API to allow signalling that nothing can satisfy the query (Teodor)
- Move NAMEDATALEN definition from postgres_ext.h to pg_config_manual.h (Peter)
- Provide strlcpy() and strlcat() on all platforms, and replace error-prone uses of strncpy(), strncat(), etc (Peter)
- Create hooks to let an external plugin monitor (or even replace) the planner and create plans for hypothetical situations (Gurjeet Singh, Tom)
- Create a function variable join_search_hook to let plugins override the join search order portion of the planner (Julius Stroffek)
- Add tas() support for Renesas’ M32R processor (Kazuhiro Inaoka)
- quote_identifier() and pg_dump no longer quote keywords that are unreserved according to the grammar (Tom)
- Change the on-disk representation of the NUMERIC data type so that the sign_dsacle word comes before the weight (Tom)
- Use SYSV semaphores rather than POSIX on Darwin >= 6.0, i.e., OS X 10.2 and up (Chris Marcellino)
- Add acronym and NFS documentation sections (Bruce)
- "Postgres" is now documented as an accepted alias for "PostgreSQL" (Peter)
- Add documentation about preventing database server spoofing when the server is down (Bruce)

E.168.3.22. Contrib

- Move contrib README content into the main PostgreSQL documentation (Albert Cervera i Areny)
- Add contrib/pageinspect module for low-level page inspection (Simon, Heikki)
- Add contrib/pg_standby module for controlling warm standby operation (Simon)
- Add contrib/uuid-ossp module for generating UUID values using the OSSP UUID library (Peter)
  Use configure --with-ossp-uuid to activate. This takes advantage of the new UUID builtin type.
- Add contrib/dict_int, contrib/dict_xsyn, and contrib/test_parser modules to provide sample add-on text search dictionary templates and parsers (Sergey Karpov)
- Allow contrib/pgbench to set the fillfactor (Pavan Deolasee)
- Add timestamps to contrib/pgbench -l (Greg Smith)
- Add usage count statistics to contrib/pgbuffercache (Greg Smith)
- Add GIN support for contrib/hstore (Teodor)
- Add GIN support for contrib/pg_trgm (Guillaume Smet, Teodor)
- Update OS/X startup scripts in contrib/start-scripts (Mark Cotner, David Fetter)
- Restrict pgrowlocks() and dblink_get_pkey() to users who have SELECT privilege on the target table (Tom)
- Restrict contrib/pgstattuple functions to superusers (Tom)
Appendix E. Release Notes

• contrib/xml2 is deprecated and planned for removal in 8.4 (Peter)

The new XML support in core PostgreSQL supersedes this module.

E.169. Release 8.2.23

Release date: 2011-12-05

This release contains a variety of fixes from 8.2.22. For information about new features in the 8.2 major release, see Section E.192.

This is expected to be the last PostgreSQL release in the 8.2.X series. Users are encouraged to update to a newer release branch soon.

E.169.1. Migration to Version 8.2.23

A dump/restore is not required for those running 8.2.X.

However, a longstanding error was discovered in the definition of the information_schema.referential_constraints view. If you rely on correct results from that view, you should replace its definition as explained in the first changelog item below.

Also, if you are upgrading from a version earlier than 8.2.14, see Section E.178.

E.169.2. Changes

• Fix bugs in information_schema.referential_constraints view (Tom Lane)

This view was being insufficiently careful about matching the foreign-key constraint to the depended-on primary or unique key constraint. That could result in failure to show a foreign key constraint at all, or showing it multiple times, or claiming that it depends on a different constraint than the one it really does.

Since the view definition is installed by initdb, merely upgrading will not fix the problem. If you need to fix this in an existing installation, you can (as a superuser) drop the information_schema schema then re-create it by sourcing $SHAREDIR/information_schema.sql. (Run pg_config --sharedir if you’re uncertain where $SHAREDIR is.) This must be repeated in each database to be fixed.

• Fix TOAST-related data corruption during CREATE TABLE dest AS SELECT * FROM src or INSERT INTO dest SELECT * FROM src (Tom Lane)

If a table has been modified by ALTER TABLE ADD COLUMN, attempts to copy its data verbatim to another table could produce corrupt results in certain corner cases. The problem can only manifest in this precise form in 8.4 and later, but we patched earlier versions as well in case there are other code paths that could trigger the same bug.

• Fix race condition during toast table access from stale syscache entries (Tom Lane)
The typical symptom was transient errors like “missing chunk number 0 for toast value NNNNN in pg_toast_2619”, where the cited toast table would always belong to a system catalog.

- Improve locale support in money type's input and output (Tom Lane)

Aside from not supporting all standard lc_monetary formatting options, the input and output functions were inconsistent, meaning there were locales in which dumped money values could not be re-read.

- Don’t let transform_null_equals affect CASE foo WHEN NULL ... constructs (Heikki Linnakangas)

transform_null_equals is only supposed to affect foo = NULL expressions written directly by the user, not equality checks generated internally by this form of CASE.

- Change foreign-key trigger creation order to better support self-referential foreign keys (Tom Lane)

For a cascading foreign key that references its own table, a row update will fire both the ON UPDATE trigger and the CHECK trigger as one event. The ON UPDATE trigger must execute first, else the CHECK will check a non-final state of the row and possibly throw an inappropriate error. However, the firing order of these triggers is determined by their names, which generally sort in creation order since the triggers have auto-generated names following the convention “RI_ConstraintTrigger_NNNN”. A proper fix would require modifying that convention, which we will do in 9.2, but it seems risky to change it in existing releases. So this patch just changes the creation order of the triggers. Users encountering this type of error should drop and re-create the foreign key constraint to get its triggers into the right order.

- Preserve blank lines within commands in psql’s command history (Robert Haas)

The former behavior could cause problems if an empty line was removed from within a string literal, for example.

- Use the preferred version of xsubpp to build PL/Perl, not necessarily the operating system’s main copy (David Wheeler and Alex Hunsaker)

- Honor query cancel interrupts promptly in pgstatindex() (Robert Haas)

- Ensure VPATH builds properly install all server header files (Peter Eisentraut)

- Shorten file names reported in verbose error messages (Peter Eisentraut)

Regular builds have always reported just the name of the C file containing the error message call, but VPATH builds formerly reported an absolute path name.

- Fix interpretation of Windows timezone names for Central America (Tom Lane)

Map “Central America Standard Time” to CST6, not CST6CDT, because DST is generally not observed anywhere in Central America.

- Update time zone data files to tzdata release 2011n for DST law changes in Brazil, Cuba, Fiji, Palestine, Russia, and Samoa; also historical corrections for Alaska and British East Africa.

E.170. Release 8.2.22

Release date: 2011-09-26
This release contains a variety of fixes from 8.2.21. For information about new features in the 8.2 major release, see Section E.192.

The PostgreSQL community will stop releasing updates for the 8.2.X release series in December 2011. Users are encouraged to update to a newer release branch soon.

E.170.1. Migration to Version 8.2.22

A dump/restore is not required for those running 8.2.X. However, if you are upgrading from a version earlier than 8.2.14, see Section E.178.

E.170.2. Changes

- Fix multiple bugs in GiST index page split processing (Heikki Linnakangas)
  The probability of occurrence was low, but these could lead to index corruption.
- Avoid possibly accessing off the end of memory in `ANALYZE` (Noah Misch)
  This fixes a very-low-probability server crash scenario.
- Fix race condition in relcache init file invalidation (Tom Lane)
  There was a window wherein a new backend process could read a stale init file but miss the inval messages that would tell it the data is stale. The result would be bizarre failures in catalog accesses, typically “could not read block 0 in file ...” later during startup.
- Fix memory leak at end of a GiST index scan (Tom Lane)
  Commands that perform many separate GiST index scans, such as verification of a new GiST-based exclusion constraint on a table already containing many rows, could transiently require large amounts of memory due to this leak.
- Fix performance problem when constructing a large, lossy bitmap (Tom Lane)
- Fix array- and path-creating functions to ensure padding bytes are zeroes (Tom Lane)
  This avoids some situations where the planner will think that semantically-equal constants are not equal, resulting in poor optimization.
- Work around gcc 4.6.0 bug that breaks WAL replay (Tom Lane)
  This could lead to loss of committed transactions after a server crash.
- Fix dump bug for `VALUES` in a view (Tom Lane)
- Disallow `SELECT FOR UPDATE/SHARE` on sequences (Tom Lane)
  This operation doesn’t work as expected and can lead to failures.
- Defend against integer overflow when computing size of a hash table (Tom Lane)
- Fix portability bugs in use of credentials control messages for “peer” authentication (Tom Lane)
- Fix typo in `pg_srand48` seed initialization (Andres Freund)
This led to failure to use all bits of the provided seed. This function is not used on most platforms (only those without `srandom`), and the potential security exposure from a less-random-than-expected seed seems minimal in any case.

- Avoid integer overflow when the sum of `LIMIT` and `OFFSET` values exceeds $2^{63}$ (Heikki Linnakangas)
- Add overflow checks to `int4` and `int8` versions of `generate_series()` (Robert Haas)
- Fix trailing-zero removal in `to_char()` (Marti Raudsepp)

  In a format with `FM` and no digit positions after the decimal point, zeroes to the left of the decimal point could be removed incorrectly.
- Fix `pg_size_pretty()` to avoid overflow for inputs close to $2^{63}$ (Tom Lane)
- Fix `psql`'s counting of script file line numbers during `COPY` from a different file (Tom Lane)
- Fix `pg_restore`'s direct-to-database mode for `standard_conforming_strings` (Tom Lane)

  `pg_restore` could emit incorrect commands when restoring directly to a database server from an archive file that had been made with `standard_conforming_strings` set to on.
- Fix `write-past-buffer-end` and memory leak in `libpq`'s LDAP service lookup code (Albe Laurenz)
- In `libpq`, avoid failures when using nonblocking I/O and an SSL connection (Martin Pihlak, Tom Lane)
- Improve `libpq`'s handling of failures during connection startup (Tom Lane)

  In particular, the response to a server report of `fork()` failure during SSL connection startup is now saner.
- Make `ecpglib` write `double` values with 15 digits precision (Akira Kurosawa)
- Apply upstream fix for blowfish signed-character bug (CVE-2011-2483) (Tom Lane)

  `contrib/pg_crypto`'s blowfish encryption code could give wrong results on platforms where `char` is signed (which is most), leading to encrypted passwords being weaker than they should be.
- Fix memory leak in `contrib/seg` (Heikki Linnakangas)
- Fix `pgstatindex()` to give consistent results for empty indexes (Tom Lane)
- Allow building with perl 5.14 (Alex Hunsaker)
- Update configure script's method for probing existence of system functions (Tom Lane)

  The version of `autoconf` we used in 8.3 and 8.2 could be fooled by compilers that perform link-time optimization.
- Fix assorted issues with build and install file paths containing spaces (Tom Lane)
- Update time zone data files to `tzdata` release 2011i for DST law changes in Canada, Egypt, Russia, Samoa, and South Sudan.

E.171. Release 8.2.21

**Release date:** 2011-04-18

This release contains a variety of fixes from 8.2.20. For information about new features in the 8.2 major release, see Section E.192.
E.171.1. Migration to Version 8.2.21

A dump/restore is not required for those running 8.2.X. However, if you are upgrading from a version earlier than 8.2.14, see Section E.178.

E.171.2. Changes

- Avoid potential deadlock during catalog cache initialization (Nikhil Sontakke)
  In some cases the cache loading code would acquire share lock on a system index before locking the index’s catalog. This could deadlock against processes trying to acquire exclusive locks in the other, more standard order.
- Fix dangling-pointer problem in BEFORE ROW UPDATE trigger handling when there was a concurrent update to the target tuple (Tom Lane)
  This bug has been observed to result in intermittent “cannot extract system attribute from virtual tuple” failures while trying to do UPDATE RETURNING ctid. There is a very small probability of more serious errors, such as generating incorrect index entries for the updated tuple.
- Disallow DROP TABLE when there are pending deferred trigger events for the table (Tom Lane)
  Formerly the DROP would go through, leading to “could not open relation with OID nnn” errors when the triggers were eventually fired.
- Fix PL/Python memory leak involving array slices (Daniel Popowich)
- Fix pg_restore to cope with long lines (over 1KB) in TOC files (Tom Lane)
- Put in more safeguards against crashing due to division-by-zero with overly enthusiastic compiler optimization (Aurelien Jarno)
- Support use of dlopen() in FreeBSD and OpenBSD on MIPS (Tom Lane)
  There was a hard-wired assumption that this system function was not available on MIPS hardware on these systems. Use a compile-time test instead, since more recent versions have it.
- Fix compilation failures on HP-UX (Heikki Linnakangas)
- Fix path separator used by pg_regress on Cygwin (Andrew Dunstan)
- Update time zone data files to tzdata release 2011f for DST law changes in Chile, Cuba, Falkland Islands, Morocco, Samoa, and Turkey; also historical corrections for South Australia, Alaska, and Hawaii.

E.172. Release 8.2.20

Release date: 2011-01-31

This release contains a variety of fixes from 8.2.19. For information about new features in the 8.2 major release, see Section E.192.
E.172.1. Migration to Version 8.2.20

A dump/restore is not required for those running 8.2.X. However, if you are upgrading from a version earlier than 8.2.14, see Section E.178.

E.172.2. Changes

- Avoid failures when `EXPLAIN` tries to display a simple-form `CASE` expression (Tom Lane)
  
  If the `CASE`’s test expression was a constant, the planner could simplify the `CASE` into a form that confused the expression-display code, resulting in “unexpected CASE WHEN clause” errors.

- Fix assignment to an array slice that is before the existing range of subscripts (Tom Lane)
  
  If there was a gap between the newly added subscripts and the first pre-existing subscript, the code miscalculated how many entries needed to be copied from the old array’s null bitmap, potentially leading to data corruption or crash.

- Avoid unexpected conversion overflow in planner for very distant date values (Tom Lane)
  
  The `date` type supports a wider range of dates than can be represented by the `timestamp` types, but the planner assumed it could always convert a date to timestamp with impunity.

- Fix `pg_restore`’s text output for large objects (BLOBs) when `standard_conforming_strings` is on (Tom Lane)
  
  Although restoring directly to a database worked correctly, string escaping was incorrect if `pg_restore` was asked for SQL text output and `standard_conforming_strings` had been enabled in the source database.

- Fix erroneous parsing of `tsquery` values containing `... & !(subexpression) | ...` (Tom Lane)
  
  Queries containing this combination of operators were not executed correctly. The same error existed in `contrib/intarray`’s `query_int` type and `contrib/ltrie`’s `ltxtquery` type.

- Fix buffer overrun in `contrib/intarray`’s input function for the `query_int` type (Apple)
  
  This bug is a security risk since the function’s return address could be overwritten. Thanks to Apple Inc’s security team for reporting this issue and supplying the fix. (CVE-2010-4015)

- Fix bug in `contrib/seg`’s GiST picksplit algorithm (Alexander Korotkov)
  
  This could result in considerable inefficiency, though not actually incorrect answers, in a GiST index on a `seg` column. If you have such an index, consider `REINDEX`ing it after installing this update. (This is identical to the bug that was fixed in `contrib/cube` in the previous update.)

### E.173. Release 8.2.19

**Release date:** 2010-12-16

This release contains a variety of fixes from 8.2.18. For information about new features in the 8.2 major release, see Section E.192.
E.173.1. Migration to Version 8.2.19

A dump/restore is not required for those running 8.2.X. However, if you are upgrading from a version earlier than 8.2.14, see Section E.178.

E.173.2. Changes

- **Force the default** `wal_sync_method` **to be** `fdatasync` **on Linux** (Tom Lane, Marti Raudsepp)

  The default on Linux has actually been `fdatasync` for many years, but recent kernel changes caused PostgreSQL to choose `open_datasync` instead. This choice did not result in any performance improvement, and caused outright failures on certain filesystems, notably `ext4` with the `data=journal` mount option.

- **Fix assorted bugs in WAL replay logic for GIN indexes** (Tom Lane)

  This could result in “bad buffer id: 0” failures or corruption of index contents during replication.

- **Fix recovery from base backup when the starting checkpoint WAL record is not in the same WAL segment as its redo point** (Jeff Davis)

- **Add support for detecting register-stack overrun on IA64** (Tom Lane)

  The IA64 architecture has two hardware stacks. Full prevention of stack-overrun failures requires checking both.

- **Add a check for stack overflow in `copyObject()`** (Tom Lane)

  Certain code paths could crash due to stack overflow given a sufficiently complex query.

- **Fix detection of page splits in temporary GiST indexes** (Heikki Linnakangas)

  It is possible to have a “concurrent” page split in a temporary index, if for example there is an open cursor scanning the index when an insertion is done. GiST failed to detect this case and hence could deliver wrong results when execution of the cursor continued.

- **Avoid memory leakage while `ANALYZE`ing complex index expressions** (Tom Lane)

- **Ensure an index that uses a whole-row Var still depends on its table** (Tom Lane)

  An index declared like `create index i on t (foo(t.*)` would not automatically get dropped when its table was dropped.

- **Do not “inline” a SQL function with multiple **`OUT`** parameters** (Tom Lane)

  This avoids a possible crash due to loss of information about the expected result rowtype.

- **Behave correctly if** `ORDER BY`, `LIMIT`, `FOR UPDATE`, or `WITH` **is attached to the VALUES part of `INSERT ... VALUES`** (Tom Lane)

- **Fix constant-folding of `COALESCE()` expressions** (Tom Lane)

  The planner would sometimes attempt to evaluate sub-expressions that in fact could never be reached, possibly leading to unexpected errors.

- **Add print functionality for `InhRelation` nodes** (Tom Lane)

  This avoids a failure when `debug_print_parse` is enabled and certain types of query are executed.
• Fix incorrect calculation of distance from a point to a horizontal line segment (Tom Lane)
  This bug affected several different geometric distance-measurement operators.
• Fix PL/pgSQL’s handling of “simple” expressions to not fail in recursion or error-recovery cases (Tom Lane)
• Fix PL/Python’s handling of set-returning functions (Jan Urbanski)
  Attempts to call SPI functions within the iterator generating a set result would fail.
• Fix bug in contrib/cube’s GiST picksplit algorithm (Alexander Korotkov)
  This could result in considerable inefficiency, though not actually incorrect answers, in a GiST index on a cube column. If you have such an index, consider REINDEXing it after installing this update.
• Don’t emit “identifier will be truncated” notices in contrib/dblink except when creating new connections (Itagaki Takahiro)
• Fix potential coredump on missing public key in contrib/pgcrypto (Marti Raudsepp)
• Fix memory leak in contrib/xml2’s XPath query functions (Tom Lane)
• Update time zone data files to tzdata release 2010o for DST law changes in Fiji and Samoa; also historical corrections for Hong Kong.

E.174. Release 8.2.18

Release date: 2010-10-04

This release contains a variety of fixes from 8.2.17. For information about new features in the 8.2 major release, see Section E.192.

E.174.1. Migration to Version 8.2.18

A dump/restore is not required for those running 8.2.X. However, if you are upgrading from a version earlier than 8.2.14, see Section E.178.

E.174.2. Changes

• Use a separate interpreter for each calling SQL userid in PL/Perl and PL/Tcl (Tom Lane)
  This change prevents security problems that can be caused by subverting Perl or Tcl code that will be executed later in the same session under another SQL user identity (for example, within a SECURITY DEFINER function). Most scripting languages offer numerous ways that that might be done, such as redefining standard functions or operators called by the target function. Without this change, any SQL user with Perl or Tcl language usage rights can do essentially anything with the SQL privileges of the target function’s owner.
  The cost of this change is that intentional communication among Perl and Tcl functions becomes more difficult. To provide an escape hatch, PL/PerlU and PL/TclU functions continue to use only one inter-
preter per session. This is not considered a security issue since all such functions execute at the trust level of a database superuser already.

It is likely that third-party procedural languages that claim to offer trusted execution have similar security issues. We advise contacting the authors of any PL you are depending on for security-critical purposes.

Our thanks to Tim Bunce for pointing out this issue (CVE-2010-3433).

• Prevent possible crashes in `pg_get_expr()` by disallowing it from being called with an argument that is not one of the system catalog columns it’s intended to be used with (Heikki Linnakangas, Tom Lane)

• Fix Windows shared-memory allocation code (Tsutomu Yamada, Magnus Hagander)
  This bug led to the often-reported “could not reattach to shared memory” error message. This is a back-patch of a fix that was applied to newer branches some time ago.

• Treat exit code 128 (ERROR_WAIT_NO_CHILDREN) as non-fatal on Windows (Magnus Hagander)
  Under high load, Windows processes will sometimes fail at startup with this error code. Formerly the postmaster treated this as a panic condition and restarted the whole database, but that seems to be an overreaction.

• Fix possible duplicate scans of `UNION ALL` member relations (Tom Lane)

• Fix “cannot handle unplanned sub-select” error (Tom Lane)
  This occurred when a sub-select contains a join alias reference that expands into an expression containing another sub-select.

• Reduce PANIC to ERROR in some occasionally-reported btree failure cases, and provide additional detail in the resulting error messages (Tom Lane)
  This should improve the system’s robustness with corrupted indexes.

• Prevent show_session_authorization() from crashing within autovacuum processes (Tom Lane)

• Defend against functions returning setof record where not all the returned rows are actually of the same rowtype (Tom Lane)

• Fix possible failure when hashing a pass-by-reference function result (Tao Ma, Tom Lane)

• Take care to fsync the contents of lockfiles (both `postmaster.pid` and the socket lockfile) while writing them (Tom Lane)
  This omission could result in corrupted lockfile contents if the machine crashes shortly after postmaster start. That could in turn prevent subsequent attempts to start the postmaster from succeeding, until the lockfile is manually removed.

• Avoid recursion while assigning XIDs to heavily-nested subtransactions (Andres Freund, Robert Haas)
  The original coding could result in a crash if there was limited stack space.

• Fix `log_line_prefix`’s `%i` escape, which could produce junk early in backend startup (Tom Lane)

• Fix possible data corruption in `ALTER TABLE ... SET TABLESPACE` when archiving is enabled (Jeff Davis)

• Allow `CREATE DATABASE` and `ALTER DATABASE ... SET TABLESPACE` to be interrupted by query-cancel (Guillaume Lelarge)
• In PL/Python, defend against null pointer results from PyCObject_AsVoidPtr and PyCObject_FromVoidPtr (Peter Eisentraut)

• Improve contrib/dblink's handling of tables containing dropped columns (Tom Lane)

• Fix connection leak after “duplicate connection name” errors in contrib/dblink (Itagaki Takahiro)

• Fix contrib/dblink to handle connection names longer than 62 bytes correctly (Itagaki Takahiro)

• Add hstore(text, text) function to contrib/hstore (Robert Haas)

  This function is the recommended substitute for the now-deprecated => operator. It was back-patched so that future-proofed code can be used with older server versions. Note that the patch will be effective only after contrib/hstore is installed or reinstalled in a particular database. Users might prefer to execute the CREATE FUNCTION command by hand, instead.

• Update build infrastructure and documentation to reflect the source code repository's move from CVS to Git (Magnus Hagander and others)

• Update time zone data files to tzdata release 2010l for DST law changes in Egypt and Palestine; also historical corrections for Finland.

  This change also adds new names for two Micronesian timezones: Pacific/Chuuk is now preferred over Pacific/Truk (and the preferred abbreviation is CHUT not TRUT) and Pacific/Pohnpei is preferred over Pacific/Ponape.

• Make Windows’ “N. Central Asia Standard Time” timezone map to Asia/Novosibirsk, not Asia/Almaty (Magnus Hagander)

  Microsoft changed the DST behavior of this zone in the timezone update from KB976098. Asia/Novosibirsk is a better match to its new behavior.

**E.175. Release 8.2.17**

**Release date:** 2010-05-17

This release contains a variety of fixes from 8.2.16. For information about new features in the 8.2 major release, see Section E.192.

**E.175.1. Migration to Version 8.2.17**

A dump/restore is not required for those running 8.2.X. However, if you are upgrading from a version earlier than 8.2.14, see Section E.178.

**E.175.2. Changes**

• Enforce restrictions in plperl using an opmask applied to the whole interpreter, instead of using Safe.pm (Tim Bunce, Andrew Dunstan)
Recent developments have convinced us that Safe.pm is too insecure to rely on for making plperl trustable. This change removes use of Safe.pm altogether, in favor of using a separate interpreter with an opcode mask that is always applied. Pleasant side effects of the change include that it is now possible to use Perl’s strict pragma in a natural way in plperl, and that Perl’s \$a and \$b variables work as expected in sort routines, and that function compilation is significantly faster. (CVE-2010-1169)

- Prevent PL/Tcl from executing untrustworthy code from pltcl_modules (Tom)

PL/Tcl’s feature for-autoloading Tcl code from a database table could be exploited for trojan-horse attacks, because there was no restriction on who could create or insert into that table. This change disables the feature unless pltcl_modules is owned by a superuser. (However, the permissions on the table are not checked, so installations that really need a less-than-secure modules table can still grant suitable privileges to trusted non-superusers.) Also, prevent loading code into the unrestricted “normal” Tcl interpreter unless we are really going to execute a pltclu function. (CVE-2010-1170)

- Fix possible crash if a cache reset message is received during rebuild of a relcache entry (Heikki)

This error was introduced in 8.2.16 while fixing a related failure.

- Do not allow an unprivileged user to reset superuser-only parameter settings (Alvaro)

Previously, if an unprivileged user ran ALTER USER ... RESET ALL for himself, or ALTER DATABASE ... RESET ALL for a database he owns, this would remove all special parameter settings for the user or database, even ones that are only supposed to be changeable by a superuser. Now, the ALTER will only remove the parameters that the user has permission to change.

- Avoid possible crash during backend shutdown if shutdown occurs when a CONTEXT addition would be made to log entries (Tom)

In some cases the context-printing function would fail because the current transaction had already been rolled back when it came time to print a log message.

- Update pl/perl’s ppport.h for modern Perl versions (Andrew)

- Fix assorted memory leaks in pl/python (Andreas Freund, Tom)

- Prevent infinite recursion in psql when expanding a variable that refers to itself (Tom)

- Fix psql’s \copy to not add spaces around a dot within \copy (select ...) (Tom)

Addition of spaces around the decimal point in a numeric literal would result in a syntax error.

- Ensure that contrib/pgstattuple functions respond to cancel interrupts promptly (Tatsuhito Kasa-hara)

- Make server startup deal properly with the case that shmget() returns EINVAL for an existing shared memory segment (Tom)

This behavior has been observed on BSD-derived kernels including OS X. It resulted in an entirely-misleading startup failure complaining that the shared memory request size was too large.

- Avoid possible crashes in syslogger process on Windows (Heikki)

- Deal more robustly with incomplete time zone information in the Windows registry (Magnus)

- Update the set of known Windows time zone names (Magnus)

- Update time zone data files to tzdata release 2010j for DST law changes in Argentina, Australian Antarctic, Bangladesh, Mexico, Morocco, Pakistan, Palestine, Russia, Syria, Tunisia; also historical corrections for Taiwan.
Appendix E. Release Notes

Also, add PKST (Pakistan Summer Time) to the default set of timezone abbreviations.

E.176. Release 8.2.16

Release date: 2010-03-15

This release contains a variety of fixes from 8.2.15. For information about new features in the 8.2 major release, see Section E.192.

E.176.1. Migration to Version 8.2.16

A dump/restore is not required for those running 8.2.X. However, if you are upgrading from a version earlier than 8.2.14, see Section E.178.

E.176.2. Changes

- Add new configuration parameter ssl_renegotiation_limit to control how often we do session key renegotiation for an SSL connection (Magnus)
  This can be set to zero to disable renegotiation completely, which may be required if a broken SSL library is used. In particular, some vendors are shipping stopgap patches for CVE-2009-3555 that cause renegotiation attempts to fail.
- Fix possible deadlock during backend startup (Tom)
- Fix possible crashes due to not handling errors during relcache reload cleanly (Tom)
- Fix possible crashes when trying to recover from a failure in subtransaction start (Tom)
- Fix server memory leak associated with use of savepoints and a client encoding different from server’s encoding (Tom)
- Fix incorrect WAL data emitted during end-of-recovery cleanup of a GIST index page split (Yoichi Hirai)
  This would result in index corruption, or even more likely an error during WAL replay, if we were unlucky enough to crash during end-of-recovery cleanup after having completed an incomplete GIST insertion.
- Make substring() for bit types treat any negative length as meaning “all the rest of the string” (Tom)
  The previous coding treated only -1 that way, and would produce an invalid result value for other negative values, possibly leading to a crash (CVE-2010-0442).
- Fix integer-to-bit-string conversions to handle the first fractional byte correctly when the output bit width is wider than the given integer by something other than a multiple of 8 bits (Tom)
- Fix some cases of pathologically slow regular expression matching (Tom)
• Fix the STOP WAL LOCATION entry in backup history files to report the next WAL segment’s name when the end location is exactly at a segment boundary (Itagaki Takahiro)

• Fix some more cases of temporary-file leakage (Heikki)

  This corrects a problem introduced in the previous minor release. One case that failed is when a plpgsql function returning set is called within another function’s exception handler.

• Improve constraint exclusion processing of boolean-variable cases, in particular make it possible to exclude a partition that has a “bool_column = false” constraint (Tom)

• When reading pg_hba.conf and related files, do not treat @something as a file inclusion request if the @ appears inside quote marks; also, never treat @ by itself as a file inclusion request (Tom)

  This prevents erratic behavior if a role or database name starts with @. If you need to include a file whose path name contains spaces, you can still do so, but you must write @"/path to/file" rather than putting the quotes around the whole construct.

• Prevent infinite loop on some platforms if a directory is named as an inclusion target in pg_hba.conf and related files (Tom)

• Fix possible infinite loop if SSL_read or SSL_write fails without setting errno (Tom)

  This is reportedly possible with some Windows versions of openssl.

• Fix psql’s numericlocale option to not format strings it shouldn’t in latex and troff output formats (Heikki)

• Make psql return the correct exit status (3) when ON_ERROR_STOP and --single-transaction are both specified and an error occurs during the implied COMMIT (Bruce)

• Fix plpgsql failure in one case where a composite column is set to NULL (Tom)

• Fix possible failure when calling PL/Perl functions from PL/PerlU or vice versa (Tim Bunce)

• Add volatile markings in PL/Python to avoid possible compiler-specific misbehavior (Zdenek Kotala)

• Ensure PL/Tcl initializes the Tcl interpreter fully (Tom)

  The only known symptom of this oversight is that the Tcl clock command misbehaves if using Tcl 8.5 or later.

• Prevent crash in contrib/dblink when too many key columns are specified to a dblink_build_sql_ function (Rushabh Lathia, Joe Conway)

• Fix assorted crashes in contrib/xml2 caused by sloppy memory management (Tom)

• Make building of contrib/xml2 more robust on Windows (Andrew)

• Fix race condition in Windows signal handling (Radu Ilie)

  One known symptom of this bug is that rows in pg_listener could be dropped under heavy load.

• Update time zone data files to tzdata release 2010e for DST law changes in Bangladesh, Chile, Fiji, Mexico, Paraguay, Samoa.
E.177. Release 8.2.15

Release date: 2009-12-14

This release contains a variety of fixes from 8.2.14. For information about new features in the 8.2 major release, see Section E.192.

E.177.1. Migration to Version 8.2.15

A dump/restore is not required for those running 8.2.X. However, if you are upgrading from a version earlier than 8.2.14, see Section E.178.

E.177.2. Changes

- Protect against indirect security threats caused by index functions changing session-local state (Gurjeet Singh, Tom)
  This change prevents allegedly-immutable index functions from possibly subverting a superuser’s session (CVE-2009-4136).
- Reject SSL certificates containing an embedded null byte in the common name (CN) field (Magnus)
  This prevents unintended matching of a certificate to a server or client name during SSL validation (CVE-2009-4034).
- Fix possible crash during backend-startup-time cache initialization (Tom)
- Prevent signals from interrupting VACUUM at unsafe times (Alvaro)
  This fix prevents a PANIC if a VACUUM FULL is canceled after it’s already committed its tuple movements, as well as transient errors if a plain VACUUM is interrupted after having truncated the table.
- Fix possible crash due to integer overflow in hash table size calculation (Tom)
  This could occur with extremely large planner estimates for the size of a hashjoin’s result.
- Fix very rare crash in inet/cidr comparisons (Chris Mikkelson)
- Ensure that shared tuple-level locks held by prepared transactions are not ignored (Heikki)
- Fix premature drop of temporary files used for a cursor that is accessed within a subtransaction (Heikki)
- Fix incorrect logic for GiST index page splits, when the split depends on a non-first column of the index (Paul Ramsey)
- Don’t error out if recycling or removing an old WAL file fails at the end of checkpoint (Heikki)
  It’s better to treat the problem as non-fatal and allow the checkpoint to complete. Future checkpoints will retry the removal. Such problems are not expected in normal operation, but have been seen to be caused by misdesigned Windows anti-virus and backup software.
- Ensure WAL files aren’t repeatedly archived on Windows (Heikki)
  This is another symptom that could happen if some other process interfered with deletion of a no-longer-needed file.
Appendix E. Release Notes

- Fix PAM password processing to be more robust (Tom)
  The previous code is known to fail with the combination of the Linux pam_krb5 PAM module with Microsoft Active Directory as the domain controller. It might have problems elsewhere too, since it was making unjustified assumptions about what arguments the PAM stack would pass to it.

- Fix processing of ownership dependencies during CREATE OR REPLACE FUNCTION (Tom)

- Fix bug with calling plperl from plperlu or vice versa (Tom)
  An error exit from the inner function could result in crashes due to failure to re-select the correct Perl interpreter for the outer function.

- Fix session-lifespan memory leak when a PL/Perl function is redefined (Tom)

- Ensure that Perl arrays are properly converted to PostgreSQL arrays when returned by a set-returning PL/Perl function (Andrew Dunstan, Abhijit Menon-Sen)
  This worked correctly already for non-set-returning functions.

- Fix rare crash in exception processing in PL/Python (Peter)

- Ensure psql’s flex module is compiled with the correct system header definitions (Tom)
  This fixes build failures on platforms where --enable-largefile causes incompatible changes in the generated code.

- Make the postmaster ignore any application_name parameter in connection request packets, to improve compatibility with future libpq versions (Tom)

- Update the timezone abbreviation files to match current reality (Joachim Wieland)
  This includes adding IDT and SGT to the default timezone abbreviation set.

- Update time zone data files to tzdata release 2009s for DST law changes in Antarctica, Argentina, Bangladesh, Fiji, Novokuznetsk, Pakistan, Palestine, Samoa, Syria; also historical corrections for Hong Kong.

E.178. Release 8.2.14

Release date: 2009-09-09
This release contains a variety of fixes from 8.2.13. For information about new features in the 8.2 major release, see Section E.192.

E.178.1. Migration to Version 8.2.14

A dump/restore is not required for those running 8.2.X. However, if you have any hash indexes on interval columns, you must REINDEX them after updating to 8.2.14. Also, if you are upgrading from a version earlier than 8.2.11, see Section E.181.
E.178.2. Changes

- Force WAL segment switch during `pg_start_backup()` (Heikki)
  This avoids corner cases that could render a base backup unusable.
- Disallow `RESET ROLE` and `RESET SESSION AUTHORIZATION` inside security-definer functions (Tom, Heikki)
  This covers a case that was missed in the previous patch that disallowed `SET ROLE` and `SET SESSION AUTHORIZATION` inside security-definer functions. (See CVE-2007-6600)
- Make `LOAD` of an already-loaded loadable module into a no-op (Tom)
  Formerly, `LOAD` would attempt to unload and re-load the module, but this is unsafe and not all that useful.
- Disallow empty passwords during LDAP authentication (Magnus)
- Fix handling of sub-SELECTs appearing in the arguments of an outer-level aggregate function (Tom)
- Fix bugs associated with fetching a whole-row value from the output of a Sort or Materialize plan node (Tom)
- Revert planner change that disabled partial-index and constraint exclusion optimizations when there were more than 100 clauses in an AND or OR list (Tom)
- Fix hash calculation for data type `interval` (Tom)
  This corrects wrong results for hash joins on interval values. It also changes the contents of hash indexes on interval columns. If you have any such indexes, you must `REINDEX` them after updating.
- Treat `to_char(..., 'TH')` as an uppercase ordinal suffix with `'HH'`/`'HH12'` (Heikki)
  It was previously handled as `'th'` (lowercase).
- Fix overflow for `INTERVAL 'x ms'` when `x` is more than 2 million and integer datetimes are in use (Alex Hunsaker)
- Fix calculation of distance between a point and a line segment (Tom)
  This led to incorrect results from a number of geometric operators.
- Fix `money` data type to work in locales where currency amounts have no fractional digits, e.g. Japan (Itagaki Takahiro)
- Properly round datetime input like `00:12:57.9999999999999999999999999999` (Tom)
- Fix poor choice of page split point in GiST R-tree operator classes (Teodor)
- Avoid performance degradation in bulk inserts into GIN indexes when the input values are (nearly) in sorted order (Tom)
- Correctly enforce NOT NULL domain constraints in some contexts in PL/pgSQL (Tom)
- Fix portability issues in plperl initialization (Andrew Dunstan)
- Fix `pg_ctl` to not go into an infinite loop if `postgresql.conf` is empty (Jeff Davis)
- Make `contrib/hstore` throw an error when a key or value is too long to fit in its data structure, rather than silently truncating it (Andrew Gierth)
Appendix E. Release Notes

- Fix `contrib/xml2`'s `xslt_process()` to properly handle the maximum number of parameters (twenty) (Tom)
- Improve robustness of `libpq`’s code to recover from errors during `COPY FROM STDIN` (Tom)
- Avoid including conflicting readline and editline header files when both libraries are installed (Zdenek Kotala)
- Update time zone data files to tzdata release 2009l for DST law changes in Bangladesh, Egypt, Jordan, Pakistan, Argentina/San_Luis, Cuba, Jordan (historical correction only), Mauritius, Morocco, Palestine, Syria, Tunisia.

E.179. Release 8.2.13

Release date: 2009-03-16

This release contains a variety of fixes from 8.2.12. For information about new features in the 8.2 major release, see Section E.192.

E.179.1. Migration to Version 8.2.13

A dump/restore is not required for those running 8.2.X. However, if you are upgrading from a version earlier than 8.2.11, see Section E.181.

E.179.2. Changes

- Prevent error recursion crashes when encoding conversion fails (Tom)

  This change extends fixes made in the last two minor releases for related failure scenarios. The previous fixes were narrowly tailored for the original problem reports, but we have now recognized that any error thrown by an encoding conversion function could potentially lead to infinite recursion while trying to report the error. The solution therefore is to disable translation and encoding conversion and report the plain-ASCII form of any error message, if we find we have gotten into a recursive error reporting situation. (CVE-2009-0922)

- Disallow `CREATE CONVERSION` with the wrong encodings for the specified conversion function (Heikki)

  This prevents one possible scenario for encoding conversion failure. The previous change is a backstop to guard against other kinds of failures in the same area.

- Fix core dump when `to_char()` is given format codes that are inappropriate for the type of the data argument (Tom)

- Fix possible failure in `contrib/tsearch2` when C locale is used with a multi-byte encoding (Teodor)

  Crashes were possible on platforms where `wchar_t` is narrower than `int`; Windows in particular.

- Fix extreme inefficiency in `contrib/tsearch2` parser’s handling of an email-like string containing multiple `@` characters (Heikki)
- Fix decompilation of `CASE WHEN` with an implicit coercion (Tom)
  This mistake could lead to Assert failures in an Assert-enabled build, or an “unexpected CASE WHEN clause” error message in other cases, when trying to examine or dump a view.

- Fix possible misassignment of the owner of a TOAST table’s rowtype (Tom)
  If `CLUSTER` or a rewriting variant of `ALTER TABLE` were executed by someone other than the table owner, the `pg_type` entry for the table’s TOAST table would end up marked as owned by that someone. This caused no immediate problems, since the permissions on the TOAST rowtype aren’t examined by any ordinary database operation. However, it could lead to unexpected failures if one later tried to drop the role that issued the command (in 8.1 or 8.2), or “owner of data type appears to be invalid” warnings from `pg_dump` after having done so (in 8.3).

- Fix PL/pgSQL to not treat `INTO` after `INSERT` as an INTO-variables clause anywhere in the string, not only at the start; in particular, don’t fail for `INSERT INTO` within `CREATE RULE` (Tom)

- Clean up PL/pgSQL error status variables fully at block exit (Ashesh Vashi and Dave Page)
  This is not a problem for PL/pgSQL itself, but the omission could cause the PL/pgSQL Debugger to crash while examining the state of a function.

- Retry failed calls to `CallNamedPipe()` on Windows (Steve Marshall, Magnus)
  It appears that this function can sometimes fail transiently; we previously treated any failure as a hard error, which could confuse `LISTEN/NOTIFY` as well as other operations.

- Add `MUST` (Mauritius Island Summer Time) to the default list of known timezone abbreviations (Xavier Bugaud)

---

E.180. Release 8.2.12

Release date: 2009-02-02

This release contains a variety of fixes from 8.2.11. For information about new features in the 8.2 major release, see Section E.192.

E.180.1. Migration to Version 8.2.12

A dump/restore is not required for those running 8.2.X. However, if you are upgrading from a version earlier than 8.2.11, see Section E.181.

E.180.2. Changes

- Improve handling of URLs in `headline()` function (Teodor)
- Improve handling of overlength headlines in `headline()` function (Teodor)
- Prevent possible Assert failure or misconversion if an encoding conversion is created with the wrong conversion function for the specified pair of encodings (Tom, Heikki)
• Fix possible Assert failure if a statement executed in PL/pgSQL is rewritten into another kind of statement, for example if an INSERT is rewritten into an UPDATE (Heikki)

• Ensure that a snapshot is available to datatype input functions (Tom)
  This primarily affects domains that are declared with CHECK constraints involving user-defined stable or immutable functions. Such functions typically fail if no snapshot has been set.

• Make it safer for SPI-using functions to be used within datatype I/O; in particular, to be used in domain check constraints (Tom)

• Avoid unnecessary locking of small tables in VACUUM (Heikki)

• Fix a problem that made UPDATE RETURNING tableoid return zero instead of the correct OID (Tom)

• Fix planner misestimation of selectivity when transitive equality is applied to an outer-join clause (Tom)
  This could result in bad plans for queries like ... from a left join b on a.al = b.bl where a.al = 42 ...

• Improve optimizer’s handling of long IN lists (Tom)
  This change avoids wasting large amounts of time on such lists when constraint exclusion is enabled.

• Ensure that the contents of a holdable cursor don’t depend on the contents of TOAST tables (Tom)
  Previously, large field values in a cursor result might be represented as TOAST pointers, which would fail if the referenced table got dropped before the cursor is read, or if the large value is deleted and then vacuumed away. This cannot happen with an ordinary cursor, but it could with a cursor that is held past its creating transaction.

• Fix memory leak when a set-returning function is terminated without reading its whole result (Tom)

• Fix contrib/dblink’s dblink_get_result(text, bool) function (Joe)

• Fix possible garbage output from contrib/sslinfo functions (Tom)

• Fix configure script to properly report failure when unable to obtain linkage information for PL/Perl (Andrew)

• Make all documentation reference postgres-bugs and/or postgres-hackers as appropriate, instead of the now-decommissioned postgres-ports and postgres-patches mailing lists (Tom)

• Update time zone data files to tzdata release 2009a (for Kathmandu and historical DST corrections in Switzerland, Cuba)

E.181. Release 8.2.11

Release date: 2008-11-03

This release contains a variety of fixes from 8.2.10. For information about new features in the 8.2 major release, see Section E.192.
Appendix E. Release Notes

E.181.1. Migration to Version 8.2.11

A dump/restore is not required for those running 8.2.X. However, if you are upgrading from a version earlier than 8.2.7, see Section E.185. Also, if you were running a previous 8.2.X release, it is recommended to REINDEX all GiST indexes after the upgrade.

E.181.2. Changes

- Fix GiST index corruption due to marking the wrong index entry “dead” after a deletion (Teodor)
  This would result in index searches failing to find rows they should have found. Corrupted indexes can be fixed with REINDEX.
- Fix backend crash when the client encoding cannot represent a localized error message (Tom)
  We have addressed similar issues before, but it would still fail if the “character has no equivalent” message itself couldn’t be converted. The fix is to disable localization and send the plain ASCII error message when we detect such a situation.
- Fix possible crash when deeply nested functions are invoked from a trigger (Tom)
- Improve optimization of \texttt{expression IN (expression-list)} queries (Tom, per an idea from Robert Haas)
  Cases in which there are query variables on the right-hand side had been handled less efficiently in 8.2.x and 8.3.x than in prior versions. The fix restores 8.1 behavior for such cases.
- Fix mis-expansion of rule queries when a sub-SELECT appears in a function call in FROM, a multi-row VALUES list, or a RETURNING list (Tom)
  The usual symptom of this problem is an “unrecognized node type” error.
- Fix memory leak during rescan of a hashed aggregation plan (Neil)
- Ensure an error is reported when a newly-defined PL/pgSQL trigger function is invoked as a normal function (Tom)
- Prevent possible collision of relfilenode numbers when moving a table to another tablespace with \texttt{ALTER SET TABLESPACE} (Heikki)
  The command tried to re-use the existing filename, instead of picking one that is known unused in the destination directory.
- Fix incorrect tsearch2 headline generation when single query item matches first word of text (Sushant Sinha)
- Fix improper display of fractional seconds in interval values when using a non-ISO datestyle in an \texttt{--enable-integer-datetimes} build (Ron Mayer)
- Ensure \texttt{SPI_getvalue} and \texttt{SPI_getbinval} behave correctly when the passed tuple and tuple descriptor have different numbers of columns (Tom)
  This situation is normal when a table has had columns added or removed, but these two functions didn’t handle it properly. The only likely consequence is an incorrect error indication.
- Fix ecpg’s parsing of \texttt{CREATE ROLE} (Michael)
• Fix recent breakage of `pg_ctl restart` (Tom)

• Ensure `pg_control` is opened in binary mode (Itagaki Takahiro)
  `pg_controldata` and `pg_resetxlog` did this incorrectly, and so could fail on Windows.

• Update time zone data files to `tzdata` release 2008i (for DST law changes in Argentina, Brazil, Mauritius, Syria)

### E.182. Release 8.2.10

**Release date:** 2008-09-22

This release contains a variety of fixes from 8.2.9. For information about new features in the 8.2 major release, see Section E.192.

#### E.182.1. Migration to Version 8.2.10

A dump/restore is not required for those running 8.2.X. However, if you are upgrading from a version earlier than 8.2.7, see Section E.185.

#### E.182.2. Changes

• Fix bug in btree WAL recovery code (Heikki)
  Recovery failed if the WAL ended partway through a page split operation.

• Fix potential miscalculation of `datfrozenxid` (Alvaro)
  This error may explain some recent reports of failure to remove old `pg_clog` data.

• Widen local lock counters from 32 to 64 bits (Tom)
  This responds to reports that the counters could overflow in sufficiently long transactions, leading to unexpected “lock is already held” errors.

• Fix possible duplicate output of tuples during a GiST index scan (Teodor)

• Fix missed permissions checks when a view contains a simple `UNION ALL` construct (Heikki)
  Permissions for the referenced tables were checked properly, but not permissions for the view itself.

• Add checks in executor startup to ensure that the tuples produced by an `INSERT` or `UPDATE` will match the target table’s current rowtype (Tom)
  `ALTER COLUMN TYPE`, followed by re-use of a previously cached plan, could produce this type of situation. The check protects against data corruption and/or crashes that could ensue.

• Fix possible repeated drops during `DROP OWNED` (Tom)
  This would typically result in strange errors such as “cache lookup failed for relation NNN”.

2748
Appendix E. Release Notes

- Fix `AT TIME ZONE` to first try to interpret its timezone argument as a timezone abbreviation, and only try it as a full timezone name if that fails, rather than the other way around as formerly (Tom)
  The timestamp input functions have always resolved ambiguous zone names in this order. Making `AT TIME ZONE` do so as well improves consistency, and fixes a compatibility bug introduced in 8.1: in ambiguous cases we now behave the same as 8.0 and before did, since in the older versions `AT TIME ZONE` accepted only abbreviations.

- Fix datetime input functions to correctly detect integer overflow when running on a 64-bit platform (Tom)

- Prevent integer overflows during units conversion when displaying a configuration parameter that has units (Tom)

- Improve performance of writing very long log messages to syslog (Tom)

- Allow spaces in the suffix part of an LDAP URL in `pg_hba.conf` (Tom)

- Fix bug in backwards scanning of a cursor on a `SELECT DISTINCT ON` query (Tom)

- Fix planner bug with nested sub-select expressions (Tom)
  If the outer sub-select has no direct dependency on the parent query, but the inner one does, the outer value might not get recalculated for new parent query rows.

- Fix planner to estimate that `GROUP BY` expressions yielding boolean results always result in two groups, regardless of the expressions' contents (Tom)
  This is very substantially more accurate than the regular `GROUP BY` estimate for certain boolean tests like `col IS NULL`.

- Fix PL/pgSQL to not fail when a `FOR` loop's target variable is a record containing composite-type fields (Tom)

- Fix PL/Tcl to behave correctly with Tcl 8.5, and to be more careful about the encoding of data sent to or from Tcl (Tom)

- On Windows, work around a Microsoft bug by preventing libpq from trying to send more than 64kB per system call (Magnus)

- Improve `pg_dump` and `pg_restore`'s error reporting after failure to send a SQL command (Tom)

- Fix `pg_ctl` to properly preserve postmaster command-line arguments across a `restart` (Bruce)

- Update time zone data files to `tzdata` release 2008f (for DST law changes in Argentina, Bahamas, Brazil, Mauritius, Morocco, Pakistan, Palestine, and Paraguay)

E.183. Release 8.2.9

Release date: 2008-06-12

This release contains one serious and one minor bug fix over 8.2.8. For information about new features in the 8.2 major release, see Section E.192.
E.183.1. Migration to Version 8.2.9

A dump/restore is not required for those running 8.2.X. However, if you are upgrading from a version earlier than 8.2.7, see Section E.185.

E.183.2. Changes

• Make \texttt{pg\_get\_ruledef()} parenthesize negative constants (Tom)

  Before this fix, a negative constant in a view or rule might be dumped as, say, \texttt{-42::integer}, which is subtly incorrect: it should be \texttt{(-42)::integer} due to operator precedence rules. Usually this would make little difference, but it could interact with another recent patch to cause PostgreSQL to reject what had been a valid \texttt{SELECT DISTINCT} view query. Since this could result in \texttt{pg\_dump} output failing to reload, it is being treated as a high-priority fix. The only released versions in which dump output is actually incorrect are 8.3.1 and 8.2.7.

• Make \texttt{ALTER AGGREGATE ... OWNER TO} update \texttt{pg\_shdepend} (Tom)

  This oversight could lead to problems if the aggregate was later involved in a \texttt{DROP OWNED} or \texttt{REASSIGN OWNED} operation.

E.184. Release 8.2.8

Release date: never released

This release contains a variety of fixes from 8.2.7. For information about new features in the 8.2 major release, see Section E.192.

E.184.1. Migration to Version 8.2.8

A dump/restore is not required for those running 8.2.X. However, if you are upgrading from a version earlier than 8.2.7, see Section E.185.

E.184.2. Changes

• Fix \texttt{ERRORDATA\_STACK\_SIZE exceeded} crash that occurred on Windows when using UTF-8 database encoding and a different client encoding (Tom)

• Fix \texttt{ALTER TABLE ADD COLUMN ... PRIMARY KEY} so that the new column is correctly checked to see if it’s been initialized to all non-nulls (Brendan Jurd)

  Previous versions neglected to check this requirement at all.

• Fix possible \texttt{CREATE TABLE} failure when inheriting the “same” constraint from multiple parent relations that inherited that constraint from a common ancestor (Tom)
Appendix E. Release Notes

- Fix pg_get_ruledef() to show the alias, if any, attached to the target table of an UPDATE or DELETE (Tom)
- Fix GIN bug that could result in a too many LWLocks taken failure (Teodor)
- Avoid possible crash when decompressing corrupted data (Zdenek Kotala)
- Repair two places where SIGTERM exit of a backend could leave corrupted state in shared memory (Tom)
  Neither case is very important if SIGTERM is used to shut down the whole database cluster together, but there was a problem if someone tried to SIGTERM individual backends.
- Fix conversions between ISO-8859-5 and other encodings to handle Cyrillic “Yo” characters (e and E with two dots) (Sergey Burladyan)
- Fix several datatype input functions, notably array_in(), that were allowing unused bytes in their results to contain uninitialized, unpredictable values (Tom)
  This could lead to failures in which two apparently identical literal values were not seen as equal, resulting in the parser complaining about unmatched ORDER BY and DISTINCT expressions.
- Fix a corner case in regular-expression substring matching (substring(string from pattern)) (Tom)
  The problem occurs when there is a match to the pattern overall but the user has specified a parenthesized subexpression and that subexpression hasn’t got a match. An example is substring(‘foo’ from ‘foo(bar)?’). This should return NULL, since (bar) isn’t matched, but it was mistakenly returning the whole-pattern match instead (ie, foo).
- Update time zone data files to tzdata release 2008c (for DST law changes in Morocco, Iraq, Choibalsan, Pakistan, Syria, Cuba, and Argentina/San_Luis)
- Fix incorrect result from ecpg’s PGTYPEStimestamp_sub() function (Michael)
- Fix broken GiST comparison function for contrib/tsearch2’s tsquery type (Teodor)
- Fix possible crashes in contrib/cube functions (Tom)
- Fix core dump in contrib/xml2’s xpath_table() function when the input query returns a NULL value (Tom)
- Fix contrib/xml2’s makefile to not override CFLAGS (Tom)
- Fix DatumGetBool macro to not fail with gcc 4.3 (Tom)
  This problem affects “old style” (V0) C functions that return boolean. The fix is already in 8.3, but the need to back-patch it was not realized at the time.

E.185. Release 8.2.7

Release date: 2008-03-17

This release contains a variety of fixes from 8.2.6. For information about new features in the 8.2 major release, see Section E.192.
E.185.1. Migration to Version 8.2.7

A dump/restore is not required for those running 8.2.X. However, you might need to REINDEX indexes on textual columns after updating, if you are affected by the Windows locale issue described below.

E.185.2. Changes

- Fix character string comparison for Windows locales that consider different character combinations as equal (Tom)
  This fix applies only on Windows and only when using UTF-8 database encoding. The same fix was made for all other cases over two years ago, but Windows with UTF-8 uses a separate code path that was not updated. If you are using a locale that considers some non-identical strings as equal, you may need to REINDEX to fix existing indexes on textual columns.

- Repair potential deadlock between concurrent VACUUM FULL operations on different system catalogs (Tom)

- Fix longstanding LISTEN/NOTIFY race condition (Tom)
  In rare cases a session that had just executed a LISTEN might not get a notification, even though one would be expected because the concurrent transaction executing NOTIFY was observed to commit later. A side effect of the fix is that a transaction that has executed a not-yet-committed LISTEN command will not see any row in pg_listener for the LISTEN, should it choose to look; formerly it would have. This behavior was never documented one way or the other, but it is possible that some applications depend on the old behavior.

- Disallow LISTEN and UNLISTEN within a prepared transaction (Tom)
  This was formerly allowed but trying to do it had various unpleasant consequences, notably that the originating backend could not exit as long as an UNLISTEN remained uncommitted.

- Disallow dropping a temporary table within a prepared transaction (Heikki)
  This was correctly disallowed by 8.1, but the check was inadvertently broken in 8.2.

- Fix rare crash when an error occurs during a query using a hash index (Heikki)

- Fix memory leaks in certain usages of set-returning functions (Neil)

- Fix input of datetime values for February 29 in years BC (Tom)
  The former coding was mistaken about which years were leap years.

- Fix “unrecognized node type” error in some variants of ALTER OWNER (Tom)

- Ensure pg_stat_activity.waiting flag is cleared when a lock wait is aborted (Tom)

- Fix handling of process permissions on Windows Vista (Dave, Magnus)
  In particular, this fix allows starting the server as the Administrator user.

- Update time zone data files to tzdata release 2008a (in particular, recent Chile changes); adjust timezone abbreviation VET (Venezuela) to mean UTC-4:30, not UTC-4:00 (Tom)

- Fix pg_ctl to correctly extract the postmaster’s port number from command-line options (Itagaki Takahiro, Tom)
Previously, `pg_ctl start -w` could try to contact the postmaster on the wrong port, leading to bogus reports of startup failure.

- Use `-fwrapv` to defend against possible misoptimization in recent gcc versions (Tom)
  
  This is known to be necessary when building PostgreSQL with gcc 4.3 or later.

- Correctly enforce `statement_timeout` values longer than `INT_MAX` microseconds (about 35 minutes) (Tom)
  
  This bug affects only builds with `--enable-integer-datetimes`.

- Fix “unexpected PARAM_SUBLINK ID” planner error when constant-folding simplifies a sub-select (Tom)

- Fix logical errors in constraint-exclusion handling of `IS NULL` and `NOT` expressions (Tom)
  
  The planner would sometimes exclude partitions that should not have been excluded because of the possibility of NULL results.

- Fix another cause of “failed to build any N-way joins” planner errors (Tom)
  
  This could happen in cases where a clauseless join needed to be forced before a join clause could be exploited.

- Fix incorrect constant propagation in outer-join planning (Tom)
  
  The planner could sometimes incorrectly conclude that a variable could be constrained to be equal to a constant, leading to wrong query results.

- Fix display of constant expressions in `ORDER BY` and `GROUP BY` (Tom)
  
  An explicitly casted constant would be shown incorrectly. This could for example lead to corruption of a view definition during dump and reload.

- Fix `libpq` to handle NOTICE messages correctly during `COPY OUT` (Tom)
  
  This failure has only been observed to occur when a user-defined datatype’s output routine issues a NOTICE, but there is no guarantee it couldn’t happen due to other causes.

---

**E.186. Release 8.2.6**

**Release date:** 2008-01-07

This release contains a variety of fixes from 8.2.5, including fixes for significant security issues. For information about new features in the 8.2 major release, see Section E.192.

**E.186.1. Migration to Version 8.2.6**

A dump/restore is not required for those running 8.2.X.
E.186.2. Changes

- Prevent functions in indexes from executing with the privileges of the user running VACUUM, ANALYZE, etc (Tom)

  Functions used in index expressions and partial-index predicates are evaluated whenever a new table entry is made. It has long been understood that this poses a risk of trojan-horse code execution if one modifies a table owned by an untrustworthy user. (Note that triggers, defaults, check constraints, etc. pose the same type of risk.) But functions in indexes pose extra danger because they will be executed by routine maintenance operations such as VACUUM FULL, which are commonly performed automatically under a superuser account. For example, a nefarious user can execute code with superuser privileges by setting up a trojan-horse index definition and waiting for the next routine vacuum. The fix arranges for standard maintenance operations (including VACUUM, ANALYZE, REINDEX, and CLUSTER) to execute as the table owner rather than the calling user, using the same privilege-switching mechanism already used for SECURITY DEFINER functions. To prevent bypassing this security measure, execution of SET SESSION AUTHORIZATION and SET ROLE is now forbidden within a SECURITY DEFINER context. (CVE-2007-6600)

- Repair assorted bugs in the regular-expression package (Tom, Will Drewry)

  Suitably crafted regular-expression patterns could cause crashes, infinite or near-infinite looping, and/or massive memory consumption, all of which pose denial-of-service hazards for applications that accept regex search patterns from untrustworthy sources. (CVE-2007-4769, CVE-2007-4772, CVE-2007-6067)

- Require non-superusers who use /contrib/dblink to use only password authentication, as a security measure (Joe)

  The fix that appeared for this in 8.2.5 was incomplete, as it plugged the hole for only some dblink functions. (CVE-2007-6601, CVE-2007-3278)

- Fix bugs in WAL replay for GIN indexes (Teodor)

- Fix GIN index build to work properly when maintenance_work_mem is 4GB or more (Tom)

- Update time zone data files to tzdata release 2007k (in particular, recent Argentina changes) (Tom)

- Improve planner’s handling of LIKE/regex estimation in non-C locales (Tom)

- Fix planning-speed problem for deep outer-join nests, as well as possible poor choice of join order (Tom)

- Fix planner failure in some cases of WHERE false AND var IN (SELECT ...) (Tom)

- Make CREATE TABLE ... SERIAL and ALTER SEQUENCE ... OWNED BY not change the currval() state of the sequence (Tom)

- Preserve the tablespace and storage parameters of indexes that are rebuilt by ALTER TABLE ... ALTER COLUMN TYPE (Tom)

- Make archive recovery always start a new WAL timeline, rather than only when a recovery stop time was used (Simon)

  This avoids a corner-case risk of trying to overwrite an existing archived copy of the last WAL segment, and seems simpler and cleaner than the original definition.
Appendix E. Release Notes

• Make `VACUUM` not use all of `maintenance_work_mem` when the table is too small for it to be useful (Alvaro)
• Fix potential crash in `translate()` when using a multibyte database encoding (Tom)
• Make `corr()` return the correct result for negative correlation values (Neil)
• Fix overflow in `extract(epoch from interval)` for intervals exceeding 68 years (Tom)
• Fix PL/Perl to not fail when a UTF-8 regular expression is used in a trusted function (Andrew)
• Fix PL/Perl to cope when platform’s Perl defines type `bool` as `int` rather than `char` (Tom)
  While this could theoretically happen anywhere, no standard build of Perl did things this way ... until Mac OS X 10.5.
• Fix PL/Python to work correctly with Python 2.5 on 64-bit machines (Marko Kreen)
• Fix PL/Python to not crash on long exception messages (Alvaro)
• Fix `pg_dump` to correctly handle inheritance child tables that have default expressions different from their parent’s (Tom)
• Fix `libpq` crash when `PGPASSFILE` refers to a file that is not a plain file (Martin Pitt)
• `ecpg` parser fixes (Michael)
• Make `contrib/pgcrypto` defend against OpenSSL libraries that fail on keys longer than 128 bits; which is the case at least on some Solaris versions (Marko Kreen)
• Make `contrib/tablefunc`'s `crosstab()` handle NULL rowid as a category in its own right, rather than crashing (Joe)
• Fix `tsvector` and `tsquery` output routines to escape backslashes correctly (Teodor, Bruce)
• Fix crash of `to_tsvector()` on huge input strings (Teodor)
• Require a specific version of Autoconf to be used when re-generating the `configure` script (Peter)
  This affects developers and packagers only. The change was made to prevent accidental use of untested combinations of Autoconf and PostgreSQL versions. You can remove the version check if you really want to use a different Autoconf version, but it’s your responsibility whether the result works or not.
• Update `gettimeofday` configuration check so that PostgreSQL can be built on newer versions of MinGW (Magnus)

E.187. Release 8.2.5

Release date: 2007-09-17

This release contains a variety of fixes from 8.2.4. For information about new features in the 8.2 major release, see Section E.192.

E.187.1. Migration to Version 8.2.5

A dump/restore is not required for those running 8.2.X.
E.187.2. Changes

- Prevent index corruption when a transaction inserts rows and then aborts close to the end of a concurrent VACUUM on the same table (Tom)
- Fix ALTER DOMAIN ADD CONSTRAINT for cases involving domains over domains (Tom)
- Make CREATE DOMAIN ... DEFAULT NULL work properly (Tom)
- Fix some planner problems with outer joins, notably poor size estimation for t1 LEFT JOIN t2 WHERE t2.col IS NULL (Tom)
- Allow the interval data type to accept input consisting only of milliseconds or microseconds (Neil)
- Allow timezone name to appear before the year in timestamp input (Tom)
- Fixes for GIN indexes used by /contrib/tsearch2 (Teodor)
- Speed up rtree index insertion (Teodor)
- Fix excessive logging of SSL error messages (Tom)
- Fix logging so that log messages are never interleaved when using the syslogger process (Andrew)
- Fix crash when log_min_error_statement logging runs out of memory (Tom)
- Fix incorrect handling of some foreign-key corner cases (Tom)
- Fix stddev_pop(numeric) and var_pop(numeric) (Tom)
- Prevent REINDEX and CLUSTER from failing due to attempting to process temporary tables of other sessions (Alvaro)
- Update the time zone database rules, particularly New Zealand’s upcoming changes (Tom)
- Windows socket and semaphore improvements (Magnus)
- Make pg_ctl -w work properly in Windows service mode (Dave Page)
- Fix memory allocation bug when using MIT Kerberos on Windows (Magnus)
- Suppress timezone name (%Z) in log timestamps on Windows because of possible encoding mismatches (Tom)
- Require non-superusers who use /contrib/dblink to use only password authentication, as a security measure (Joe)
- Restrict /contrib/pgstattuple functions to superusers, for security reasons (Tom)
- Do not let /contrib/intarray try to make its GIN opclass the default (this caused problems at dump/restore) (Tom)

E.188. Release 8.2.4

Release date: 2007-04-23

This release contains a variety of fixes from 8.2.3, including a security fix. For information about new features in the 8.2 major release, see Section E.192.
E.188.1. Migration to Version 8.2.4

A dump/restore is not required for those running 8.2.X.

E.188.2. Changes

- Support explicit placement of the temporary-table schema within `search_path`, and disable searching it for functions and operators (Tom)

  This is needed to allow a security-definer function to set a truly secure value of `search_path`. Without it, an unprivileged SQL user can use temporary objects to execute code with the privileges of the security-definer function (CVE-2007-2138). See `CREATE FUNCTION` for more information.

- Fix `shared_preload_libraries` for Windows by forcing reload in each backend (Korry Douglas)

- Fix `to_char()` so it properly upper/lower cases localized day or month names (Pavel Stehule)

- `/contrib/tsearch2` crash fixes (Teodor)

- Require `COMMIT PREPARED` to be executed in the same database as the transaction was prepared in (Heikki)

- Allow `pg_dump` to do binary backups larger than two gigabytes on Windows (Magnus)

- New traditional (Taiwan) Chinese FAQ (Zhou Daojing)

- Prevent the statistics collector from writing to disk too frequently (Tom)

- Fix potential-data-corruption bug in `VACUUM FULL` handles `UPDATE` chains (Tom, Pavan Deolasee)

- Fix bug in domains that use array types (Tom)

- Fix `pg_dump` so it can dump a serial column’s sequence using `-t` when not also dumping the owning table (Tom)

- Planner fixes, including improving outer join and bitmap scan selection logic (Tom)

- Fix possible wrong answers or crash when a PL/pgSQL function tries to `RETURN` from within an `EXCEPTION` block (Tom)

- Fix `PANIC` during enlargement of a hash index (Tom)

- Fix POSIX-style timezone specs to follow new USA DST rules (Tom)

E.189. Release 8.2.3

**Release date:** 2007-02-07

This release contains two fixes from 8.2.2. For information about new features in the 8.2 major release, see Section E.192.
Appendix E. Release Notes

E.189.1. Migration to Version 8.2.3
A dump/restore is not required for those running 8.2.X.

E.189.2. Changes

- Remove overly-restrictive check for type length in constraints and functional indexes (Tom)
- Fix optimization so MIN/MAX in subqueries can again use indexes (Tom)

E.190. Release 8.2.2

Release date: 2007-02-05
This release contains a variety of fixes from 8.2.1, including a security fix. For information about new features in the 8.2 major release, see Section E.192.

E.190.1. Migration to Version 8.2.2
A dump/restore is not required for those running 8.2.X.

E.190.2. Changes

- Remove security vulnerabilities that allowed connected users to read backend memory (Tom)
  The vulnerabilities involve suppressing the normal check that a SQL function returns the data type it's declared to, and changing the data type of a table column (CVE-2007-0555, CVE-2007-0556). These errors can easily be exploited to cause a backend crash, and in principle might be used to read database content that the user should not be able to access.
- Fix not-so-rare-anymore bug wherein btree index page splits could fail due to choosing an infeasible split point (Heikki Linnakangas)
- Fix Borland C compile scripts (L Bayuk)
- Properly handle `to_char('CC')` for years ending in 00 (Tom)
  Year 2000 is in the twentieth century, not the twenty-first.
- `/contrib/tsearch2` localization improvements (Tatsuo, Teodor)
- Fix incorrect permission check in `information_schema.key_column_usage` view (Tom)
  The symptom is “relation with OID mmmm does not exist” errors. To get this fix without using `initdb`, use `CREATE OR REPLACE VIEW` to install the corrected definition found in `share/information_schema.sql`. Note you will need to do this in each database.
- Improve `VACUUM` performance for databases with many tables (Tom)
Appendix E. Release Notes

- Fix for rare Assert() crash triggered by UNION (Tom)
- Fix potentially incorrect results from index searches using ROW inequality conditions (Tom)
- Tighten security of multi-byte character processing for UTF8 sequences over three bytes long (Tom)
- Fix bogus “permission denied” failures occurring on Windows due to attempts to fsync already-deleted files (Magnus, Tom)
- Fix bug that could cause the statistics collector to hang on Windows (Magnus)
  This would in turn lead to autovacuum not working.
- Fix possible crashes when an already-in-use PL/pgSQL function is updated (Tom)
- Improve PL/pgSQL handling of domain types (Sergiy Vyshnevetskiy, Tom)
- Fix possible errors in processing PL/pgSQL exception blocks (Tom)

E.191. Release 8.2.1

Release date: 2007-01-08

This release contains a variety of fixes from 8.2. For information about new features in the 8.2 major release, see Section E.192.

E.191.1. Migration to Version 8.2.1

A dump/restore is not required for those running 8.2.

E.191.2. Changes

- Fix crash with SELECT ... LIMIT ALL (also LIMIT NULL) (Tom)
- Several /contrib/tsearch2 fixes (Teodor)
- On Windows, make log messages coming from the operating system use ASCII encoding (Hiroshi Saito)
  This fixes a conversion problem when there is a mismatch between the encoding of the operating system and database server.
- Fix Windows linking of pg_dump using win32.mak (Hiroshi Saito)
- Fix planner mistakes for outer join queries (Tom)
- Fix several problems in queries involving sub-SELECTs (Tom)
- Fix potential crash in SPI during subtransaction abort (Tom)
  This affects all PL functions since they all use SPI.
- Improve build speed of PDF documentation (Peter)
• Re-add JST (Japan) timezone abbreviation (Tom)
• Improve optimization decisions related to index scans (Tom)
• Have psql print multi-byte combining characters as before, rather than output as \u (Tom)
• Improve index usage of regular expressions that use parentheses (Tom)
  This improves psql \d performance also.
• Make pg_dumpall assume that databases have public CONNECT privilege, when dumping from a pre-8.2 server (Tom)
  This preserves the previous behavior that anyone can connect to a database if allowed by pg_hba.conf.

E.192. Release 8.2

Release date: 2006-12-05

E.192.1. Overview

This release adds many functionality and performance improvements that were requested by users, including:

• Query language enhancements including INSERT/UPDATE/DELETE RETURNING, multirow VALUES lists, and optional target-table alias in UPDATE/DELETE
• Index creation without blocking concurrent INSERT/UPDATE/DELETE operations
• Many query optimization improvements, including support for reordering outer joins
• Improved sorting performance with lower memory usage
• More efficient locking with better concurrency
• More efficient vacuuming
• Easier administration of warm standby servers
• New FILLFACTOR support for tables and indexes
• Monitoring, logging, and performance tuning additions
• More control over creating and dropping objects
• Table inheritance relationships can be defined for and removed from pre-existing tables
• COPY TO can copy the output of an arbitrary SELECT statement
• Array improvements, including nulls in arrays
• Aggregate-function improvements, including multiple-input aggregates and SQL:2003 statistical functions
• Many contrib/ improvements
E.192.2. Migration to Version 8.2

A dump/restore using pg_dump is required for those wishing to migrate data from any previous release.

Observe the following incompatibilities:

- **Set escape_string_warning to on by default (Bruce)**
  This issues a warning if backslash escapes are used in non-escape (non-"\") strings.

- **Change the row constructor syntax (\texttt{ROW(\ldots)}) so that list elements \texttt{foo.*} will be expanded to a list of their member fields, rather than creating a nested row type field as formerly (Tom)**
  The new behavior is substantially more useful since it allows, for example, triggers to check for data changes with \texttt{IF row(new.*) IS DISTINCT FROM row(old.*)}. The old behavior is still available by omitting \texttt{.*}.

- **Make row comparisons follow SQL standard semantics and allow them to be used in index scans (Tom)**
  Previously, \texttt{row =} and \texttt{<>} comparisons followed the standard but \texttt{<= >} did not. A row comparison can now be used as an index constraint for a multicolumn index matching the row value.

- **Make row \texttt{IS [NOT] NULL} tests follow SQL standard semantics (Tom)**
  The former behavior conformed to the standard for simple cases with \texttt{IS NULL}, but \texttt{IS NOT NULL} would return true if any row field was non-null, whereas the standard says it should return true only when all fields are non-null.

- **Make \texttt{SET CONSTRAINT} affect only one constraint (Kris Jurka)**
  In previous releases, \texttt{SET CONSTRAINT} modified all constraints with a matching name. In this release, the schema search path is used to modify only the first matching constraint. A schema specification is also supported. This more nearly conforms to the SQL standard.

- **Remove \texttt{RULE} permission for tables, for security reasons (Tom)**
  As of this release, only a table’s owner can create or modify rules for the table. For backwards compatibility, \texttt{GRANT/REVOKE RULE} is still accepted, but it does nothing.

- **Array comparison improvements (Tom)**
  Now array dimensions are also compared.

- **Change array concatenation to match documented behavior (Tom)**
  This changes the previous behavior where concatenation would modify the array lower bound.

- **Make command-line options of postmaster and postgres identical (Peter)**
  This allows the postmaster to pass arguments to each backend without using \texttt{-o}. Note that some options are now only available as long-form options, because there were conflicting single-letter options.

- **Deprecate use of postmaster symbolic link (Peter)**
  postmaster and postgres commands now act identically, with the behavior determined by command-line options. The postmaster symbolic link is kept for compatibility, but is not really needed.

- **Change \texttt{log_duration} to output even if the query is not output (Tom)**
  In prior releases, \texttt{log_duration} only printed if the query appeared earlier in the log.

- **Make \texttt{to_char(time)} and \texttt{to_char(interval)}\texttt{ HH} and \texttt{HH12} as 12-hour intervals**
Appendix E. Release Notes

Most applications should use **HH24** unless they want a 12-hour display.

- Zero unmasked bits in conversion from **INET** to **CIDR** (Tom)
  
  This ensures that the converted value is actually valid for **CIDR**.

- Remove **australian_timezones** configuration variable (Joachim Wieland)
  
  This variable has been superseded by a more general facility for configuring timezone abbreviations.

- Improve cost estimation for nested-loop index scans (Tom)
  
  This might eliminate the need to set unrealistically small values of **random_page_cost**. If you have been using a very small **random_page_cost**, please recheck your test cases.

- Change behavior of **pg_dump -n** and **-t** options. (Greg Sabino Mullane)
  
  See the **pg_dump** manual page for details.

- Changelibpq **PQdsplen()** to return a useful value (Martijn van Oosterhout)

- Declare **libpq PQgetssl()** as returning **void ***, rather than **SSL ** (Martijn van Oosterhout)

  This allows applications to use the function without including the OpenSSL headers.

- C-language loadable modules must now include a **PG_MODULE_MAGIC** macro call for version compatibility checking (Martijn van Oosterhout)

- For security’s sake, modules used by a PL/PerlU function are no longer available to PL/Perl functions (Andrew)

  **Note**: This also implies that data can no longer be shared between a PL/Perl function and a PL/PerlU function. Some Perl installations have not been compiled with the correct flags to allow multiple interpreters to exist within a single process. In this situation PL/Perl and PL/PerlU cannot both be used in a single backend. The solution is to get a Perl installation which supports multiple interpreters.

- In **contrib/xml2/**, rename **xml_valid()** to **xml_is_well_formed()** (Tom)

  **xml_valid()** will remain for backward compatibility, but its behavior will change to do schema checking in a future release.

- Remove **contrib/ora2pg/**, now at http://www.samse.fr/GPL/ora2pg

- Remove contrib modules that have been migrated to PgFoundry: **adddepend, dbase, dbmirror, fulltextindex, mac, userlock**

- Remove abandoned contrib modules: **mSQL-interface, tips**

- Remove QNX and BEOS ports (Bruce)

  These ports no longer had active maintainers.
E.192.3. Changes

Below you will find a detailed account of the changes between PostgreSQL 8.2 and the previous major release.

E.192.3.1. Performance Improvements

- Allow the planner to reorder outer joins in some circumstances (Tom)
  
  In previous releases, outer joins would always be evaluated in the order written in the query. This change allows the query optimizer to consider reordering outer joins, in cases where it can determine that the join order can be changed without altering the meaning of the query. This can make a considerable performance difference for queries involving multiple outer joins or mixed inner and outer joins.
- Improve efficiency of `IN` (list-of-expressions) clauses (Tom)
- Improve sorting speed and reduce memory usage (Simon, Tom)
- Improve subtransaction performance (Alvaro, Itagaki Takahiro, Tom)
- Add `FILLFACTOR` to table and index creation (ITAGAKI Takahiro)
  
  This leaves extra free space in each table or index page, allowing improved performance as the database grows. This is particularly valuable to maintain clustering.
- Increase default values for `shared_buffers` and `max_fsm_pages` (Andrew)
- Improve locking performance by breaking the lock manager tables into sections (Tom)
  
  This allows locking to be more fine-grained, reducing contention.
- Reduce locking requirements of sequential scans (Qingqing Zhou)
- Reduce locking required for database creation and destruction (Tom)
- Improve the optimizer’s selectivity estimates for `LIKE`, `ILIKE`, and regular expression operations (Tom)
- Improve planning of joins to inherited tables and `UNION ALL` views (Tom)
- Allow constraint exclusion to be applied to inherited `UPDATE` and `DELETE` queries (Tom)
  
  `SELECT` already honored constraint exclusion.
- Improve planning of constant `WHERE` clauses, such as a condition that depends only on variables inherited from an outer query level (Tom)
- Protocol-level unnamed prepared statements are re-planned for each set of `BIND` values (Tom)
  
  This improves performance because the exact parameter values can be used in the plan.
- Speed up vacuuming of B-Tree indexes (Heikki Linnakangas, Tom)
- Avoid extra scan of tables without indexes during `VACUUM` (Greg Stark)
- Improve multicolumn GiST indexing (Oleg, Teodor)
- Remove dead index entries before B-Tree page split (Junji Teramoto)
E.192.3.2. Server Changes

- Allow a forced switch to a new transaction log file (Simon, Tom)
  This is valuable for keeping warm standby slave servers in sync with the master. Transaction log file switching now also happens automatically during `pg_stop_backup()`. This ensures that all transaction log files needed for recovery can be archived immediately.

- Add WAL informational functions (Simon)
  Add functions for interrogating the current transaction log insertion point and determining WAL filenames from the hex WAL locations displayed by `pg_stop_backup()` and related functions.

- Improve recovery from a crash during WAL replay (Simon)
  The server now does periodic checkpoints during WAL recovery, so if there is a crash, future WAL recovery is shortened. This also eliminates the need for warm standby servers to replay the entire log since the base backup if they crash.

- Improve reliability of long-term WAL replay (Heikki, Simon, Tom)
  Formerly, trying to roll forward through more than 2 billion transactions would not work due to XID wraparound. This meant warm standby servers had to be reloaded from fresh base backups periodically.

- Add `archive_timeout` to force transaction log file switches at a given interval (Simon)
  This enforces a maximum replication delay for warm standby servers.

- Add native LDAP authentication (Magnus Hagander)
  This is particularly useful for platforms that do not support PAM, such as Windows.

- Add `GRANT CONNECT ON DATABASE` (Gevik Babakhani)
  This gives SQL-level control over database access. It works as an additional filter on top of the existing `pg_hba.conf` controls.

- Add support for SSL Certificate Revocation List (CRL) files (Libor Hohoš)
  The server and `libpq` both recognize CRL files now.

- GiST indexes are now clusterable (Teodor)

- Remove routine autovacuum server log entries (Bruce)
  `pg_stat_activity` now shows autovacuum activity.

- Track maximum XID age within individual tables, instead of whole databases (Alvaro)
  This reduces the overhead involved in preventing transaction ID wraparound, by avoiding unnecessary VACUUMs.

- Add last vacuum and analyze timestamp columns to the stats collector (Larry Rosenman)
  These values now appear in the `pg_stat_*_tables` system views.

- Improve performance of statistics monitoring, especially `stats_command_string` (Tom, Bruce)
  This release enables `stats_command_string` by default, now that its overhead is minimal. This means `pg_stat_activity` will now show all active queries by default.

- Add a `waiting` column to `pg_stat_activity` (Tom)
Appendix E. Release Notes

This allows pg_stat_activity to show all the information included in the ps display.

- Add configuration parameter update_process_title to control whether the ps display is updated for every command (Bruce)

  On platforms where it is expensive to update the ps display, it might be worthwhile to turn this off and rely solely on pg_stat_activity for status information.

- Allow units to be specified in configuration settings (Peter)

  For example, you can now set shared_buffers to 32MB rather than mentally converting sizes.

- Add support for include directives in postgresql.conf (Joachim Wieland)

- Improve logging of protocol-level prepare/bind/execute messages (Bruce, Tom)

  Such logging now shows statement names, bind parameter values, and the text of the query being executed. Also, the query text is properly included in logged error messages when enabled by log_min_error_statement.

- Prevent max_stack_depth from being set to unsafe values

  On platforms where we can determine the actual kernel stack depth limit (which is most), make sure that the initial default value of max_stack_depth is safe, and reject attempts to set it to unsafely large values.

- Enable highlighting of error location in query in more cases (Tom)

  The server is now able to report a specific error location for some semantic errors (such as unrecognized column name), rather than just for basic syntax errors as before.

- Fix “failed to re-find parent key” errors in VACUUM (Tom)

- Clean out pg_internal.init cache files during server restart (Simon)

  This avoids a hazard that the cache files might contain stale data after PITR recovery.

- Fix race condition for truncation of a large relation across a gigabyte boundary by VACUUM (Tom)

- Fix bug causing needless deadlock errors on row-level locks (Tom)

- Fix bugs affecting multi-gigabyte hash indexes (Tom)

- Each backend process is now its own process group leader (Tom)

  This allows query cancel to abort subprocesses invoked from a backend or archive/recovery process.

E.192.3.3. Query Changes

- Add INSERT/UPDATE/DELETE RETURNING (Jonah Harris, Tom)

  This allows these commands to return values, such as the computed serial key for a new row. In the UPDATE case, values from the updated version of the row are returned.

- Add support for multiple-row VALUES clauses, per SQL standard (Joe, Tom)

  This allows INSERT to insert multiple rows of constants, or queries to generate result sets using constants. For example, INSERT ... VALUES (...), (...), ..... and SELECT * FROM (VALUES (...), (...), ...) AS alias(f1, ...).
Appendix E. Release Notes

- Allow `UPDATE` and `DELETE` to use an alias for the target table (Atsushi Ogawa)
  The SQL standard does not permit an alias in these commands, but many database systems allow one
  anyway for notational convenience.

- Allow `UPDATE` to set multiple columns with a list of values (Susanne Ebrecht)
  This is basically a short-hand for assigning the columns and values in pairs. The syntax is `UPDATE tab
  SET (column, ...) = (val, ...)`.  

- Make row comparisons work per standard (Tom)
  The forms `<, <=, >, >=` now compare rows lexicographically, that is, compare the first elements, if
  equal compare the second elements, and so on. Formerly they expanded to an AND condition across
  all the elements, which was neither standard nor very useful.

- Add `CASCADE` option to `TRUNCATE` (Joachim Wieland)
  This causes `TRUNCATE` to automatically include all tables that reference the specified table(s) via foreign
  keys. While convenient, this is a dangerous tool — use with caution!

- Support `FOR UPDATE` and `FOR SHARE` in the same `SELECT` command (Tom)

- Add `IS NOT DISTINCT FROM` (Pavel Stehule)
  This operator is similar to equality `=`), but evaluates to true when both left and right operands are `NULL`,
  and to false when just one is, rather than yielding `NULL` in these cases.

- Improve the length output used by `UNION/INTERSECT/EXCEPT` (Tom)
  When all corresponding columns are of the same defined length, that length is used for the result, rather
  than a generic length.

- Allow `ILIKE` to work for multi-byte encodings (Tom)
  Internally, `ILIKE` now calls `lower()` and then uses `LIKE`. Locale-specific regular expression patterns
  still do not work in these encodings.

- Enable `standard_conforming_strings` to be turned on (Kevin Grittner)
  This allows backslash escaping in strings to be disabled, making PostgreSQL more
  standards-compliant. The default is off for backwards compatibility, but future releases will default
  this to on.

- Do not flatten subqueries that contain `volatile` functions in their target lists (Jaime Casanova)
  This prevents surprising behavior due to multiple evaluation of a `volatile` function (such as
  `random()` or `nextval()`). It might cause performance degradation in the presence of functions that
  are unnecessarily marked as `volatile`.

- Add system views `pg_prepared_statements` and `pg_cursors` to show prepared statements and
  open cursors (Joachim Wieland, Neil)
  These are very useful in pooled connection setups.

- Support portal parameters in `EXPLAIN` and `EXECUTE` (Tom)
  This allows, for example, JDBC `?` parameters to work in these commands.

- If SQL-level `PREPARE` parameters are unspecified, infer their types from the content of the query (Neil)
  Protocol-level `PREPARE` already did this.
Appendix E. Release Notes

• Allow LIMIT and OFFSET to exceed two billion (Dhanaraj M)

E.192.3.4. Object Manipulation Changes

• Add TABLESPACE clause to CREATE TABLE AS (Neil)
  This allows a tablespace to be specified for the new table.
• Add ON COMMIT clause to CREATE TABLE AS (Neil)
  This allows temporary tables to be truncated or dropped on transaction commit. The default behavior is for the table to remain until the session ends.
• Add INCLUDING CONSTRAINTS to CREATE TABLE LIKE (Greg Stark)
  This allows easy copying of CHECK constraints to a new table.
• Allow the creation of placeholder (shell) types (Martijn van Oosterhout)
  A shell type declaration creates a type name, without specifying any of the details of the type. Making a shell type is useful because it allows cleaner declaration of the type’s input/output functions, which must exist before the type can be defined “for real”. The syntax is CREATE TYPE typename.
• Aggregate functions now support multiple input parameters (Sergey Koposov, Tom)
• Add new aggregate creation syntax (Tom)
  The new syntax is CREATE AGGREGATE agname (input_type) (parameter_list). This more naturally supports the new multi-parameter aggregate functionality. The previous syntax is still supported.
• Add ALTER ROLE PASSWORD NULL to remove a previously set role password (Peter)
• Add DROP object IF EXISTS for many object types (Andrew)
  This allows DROP operations on non-existent objects without generating an error.
• Add DROP OWNED to drop all objects owned by a role (Alvaro)
• Add REASSIGN OWNED to reassign ownership of all objects owned by a role (Alvaro)
  This, and DROP OWNED above, facilitate dropping roles.
• Add GRANT ON SEQUENCE syntax (Bruce)
  This was added for setting sequence-specific permissions. GRANT ON TABLE for sequences is still supported for backward compatibility.
• Add USAGE permission for sequences that allows only currval() and nextval(), not setval() (Bruce)
  USAGE permission allows more fine-grained control over sequence access. Granting USAGE allows users to increment a sequence, but prevents them from setting the sequence to an arbitrary value using setval().
• Add ALTER TABLE [ NO ] INHERIT (Greg Stark)
  This allows inheritance to be adjusted dynamically, rather than just at table creation and destruction. This is very valuable when using inheritance to implement table partitioning.
• Allow comments on global objects to be stored globally (Kris Jurka)
Previously, comments attached to databases were stored in individual databases, making them ineffective, and there was no provision at all for comments on roles or tablespaces. This change adds a new shared catalog `pg_shdescription` and stores comments on databases, roles, and tablespaces therein.

### E.192.3.5. Utility Command Changes

- **Add option to allow indexes to be created without blocking concurrent writes to the table** (Greg Stark, Tom)

  The new syntax is `CREATE INDEX CONCURRENTLY`. The default behavior is still to block table modification while an index is being created.

- **Provide advisory locking functionality** (Abhijit Menon-Sen, Tom)

  This is a new locking API designed to replace what used to be in `/contrib/userlock`. The userlock code is now on pgfoundry.

- **Allow COPY to dump a SELECT query** (Zoltan Boszormenyi, Karel Zak)

  This allows `COPY` to dump arbitrary SQL queries. The syntax is `COPY (SELECT ...) TO`.

- **Make the COPY command return a command tag that includes the number of rows copied** (Volkan YAZICI)

- **Allow VACUUM to expire rows without being affected by other concurrent VACUUM operations** (Hannu Krossing, Alvaro, Tom)

- **Make initdb detect the operating system locale and set the default DateStyle accordingly** (Peter)

  This makes it more likely that the installed `postgresql.conf` DateStyle value will be as desired.

- **Reduce number of progress messages displayed by initdb** (Tom)

### E.192.3.6. Date/Time Changes

- **Allow full timezone names in timestamp input values** (Joachim Wieland)

- **Support configurable timezone abbreviations** (Joachim Wieland)

  A desired set of timezone abbreviations can be chosen via the configuration parameter `timezone_abbreviations`.

- **Add `pg_timezone_abbrevs` and `pg_timezone_names` views to show supported timezones** (Magnus Hagander)

- **Add `clock_timestamp()`, `statement_timestamp()`, and `transaction_timestamp()`** (Bruce)

  `clock_timestamp()` is the current wall-clock time, `statement_timestamp()` is the time the current statement arrived at the server, and `transaction_timestamp()` is an alias for `now()`.

- **Allow `to_char()` to print localized month and day names** (Euler Taveira de Oliveira)

- **Allow `to_char(time)` and `to_char(interval)` to output AM/PM specifications** (Bruce)
Intervals and times are treated as 24-hour periods, e.g. 25 hours is considered AM.

- Add new function `justify_interval()` to adjust interval units (Mark Dilger)
- Allow timezone offsets up to 14:59 away from GMT
  Kiribati uses GMT+14, so we’d better accept that.
- Interval computation improvements (Michael Glaesemann, Bruce)

### E.192.3.7. Other Data Type and Function Changes

- Allow arrays to contain **NULL** elements (Tom)
- Allow assignment to array elements not contiguous with the existing entries (Tom)
  The intervening array positions will be filled with nulls. This is per SQL standard.
- New built-in operators for array-subset comparisons (`@>`, `<@`, `&`) (Teodor, Tom)
  These operators can be indexed for many data types using GiST or GIN indexes.
- Add convenient arithmetic operations on INET/CIDR values (Stephen R. van den Berg)
  The new operators are `&` (and), `|` (or), `~` (not), `inet + int8`, `inet - int8`, and `inet - inet`.
- Add new aggregate functions from SQL:2003 (Neil)
  The new functions are `var_pop()`, `var_samp()`, `stddev_pop()`, and `stddev_samp()`. `var_samp()` and `stddev_samp()` are merely renamings of the existing aggregates `variance()` and `stddev()` The latter names remain available for backward compatibility.
- Add SQL:2003 statistical aggregates (Sergey Koposov)
  New functions: `regr_intercept()`, `regr_slope()`, `regr_r2()`, `corr()`, `covar_samp()`, `covar_pop()`, `regr_avgx()`, `regr_avgy()`, `regr_sxy()`, `regr_sxx()`, `regr_syy()`, `regr_count()`.
- Allow domains to be based on other domains (Tom)
- Properly enforce domain **CHECK** constraints everywhere (Neil, Tom)
  For example, the result of a user-defined function that is declared to return a domain type is now checked against the domain’s constraints. This closes a significant hole in the domain implementation.
- Fix problems with dumping renamed **SERIAL** columns (Tom)
  The fix is to dump a **SERIAL** column by explicitly specifying its **DEFAULT** and sequence elements, and reconstructing the **SERIAL** column on reload using a new **ALTER SEQUENCE OWNED BY** command. This also allows dropping a **SERIAL** column specification.
- Add a server-side sleep function `pg_sleep()` (Joachim Wieland)
- Add all comparison operators for the `tid` (tuple id) data type (Mark Kirkwood, Greg Stark, Tom)

### E.192.3.8. PL/pgSQL Server-Side Language Changes

- Add `TG_table_name` and `TG_table_schema` to trigger parameters (Andrew)
Appendix E. Release Notes

TG_relname is now deprecated. Comparable changes have been made in the trigger parameters for the other PLs as well.

• Allow FOR statements to return values to scalars as well as records and row types (Pavel Stehule)
• Add a BY clause to the FOR loop, to control the iteration increment (Jaime Casanova)
• Add STRICT to SELECT INTO (Matt Miller)

STRICT mode throws an exception if more or less than one row is returned by the SELECT, for Oracle PL/SQL compatibility.

E.192.3.9. PL/Perl Server-Side Language Changes

• Add table_name and table_schema to trigger parameters (Adam Sjøgren)
• Add prepared queries (Dmitry Karasik)
• Make $_TD trigger data a global variable (Andrew)

Previously, it was lexical, which caused unexpected sharing violations.
• Run PL/Perl and PL/PerlU in separate interpreters, for security reasons (Andrew)

In consequence, they can no longer share data nor loaded modules. Also, if Perl has not been compiled with the requisite flags to allow multiple interpreters, only one of these languages can be used in any given backend process.

E.192.3.10. PL/Python Server-Side Language Changes

• Named parameters are passed as ordinary variables, as well as in the args[] array (Sven Suursoho)
• Add table_name and table_schema to trigger parameters (Andrew)
• Allow returning of composite types and result sets (Sven Suursoho)
• Return result-set as list, iterator, or generator (Sven Suursoho)
• Allow functions to return void (Neil)
• Python 2.5 is now supported (Tom)

E.192.3.11. psql Changes

• Add new command \password for changing role password with client-side password encryption (Peter)
• Allow \c to connect to a new host and port number (David, Volkan YAZICI)
• Add tablespace display to \l+ (Philip Yarra)
• Improve \df slash command to include the argument names and modes (OUT or INOUT) of the function (David Fetter)
• Support binary COPY (Andreas Pflug)
• Add option to run the entire session in a single transaction (Simon)
  Use option -1 or --single-transaction.
• Support for automatically retrieving SELECT results in batches using a cursor (Chris Mair)
  This is enabled using \set FETCH_COUNT n. This feature allows large result sets to be retrieved in
  psql without attempting to buffer the entire result set in memory.
• Make multi-line values align in the proper column (Martijn van Oosterhout)
  Field values containing newlines are now displayed in a more readable fashion.
• Save multi-line statements as a single entry, rather than one line at a time (Sergey E. Koposov)
  This makes up-arrow recall of queries easier. (This is not available on Windows, because that platform
  uses the native command-line editing present in the operating system.)
• Make the line counter 64-bit so it can handle files with more than two billion lines (David Fetter)
• Report both the returned data and the command status tag for INSERT/UPDATE/DELETE RETURNING
  (Tom)

E.192.3.12. pg_dump Changes

• Allow complex selection of objects to be included or excluded by pg_dump (Greg Sabino Mullane)
  pg_dump now supports multiple -n (schema) and -t (table) options, and adds -N and -T options to
  exclude objects. Also, the arguments of these switches can now be wild-card expressions rather than
  single object names, for example -t ‘foo*’, and a schema can be part of a -t or -T switch, for
  example -t schema1.table1.
• Add pg_restore --no-data-for-failed-tables option to suppress loading data if table creation
  failed (i.e., the table already exists) (Martin Pitt)
• Add pg_restore option to run the entire session in a single transaction (Simon)
  Use option -1 or --single-transaction.

E.192.3.13. libpq Changes

• Add PQencryptPassword() to encrypt passwords (Tom)
  This allows passwords to be sent pre-encrypted for commands like ALTER ROLE ... PASSWORD.
• Add function PQisthreadsafe() (Bruce)
  This allows applications to query the thread-safety status of the library.
• Add PQdescribePrepared(), PQdescribePortal(), and related functions to return information
  about previously prepared statements and open cursors (Volkan YAZICI)
• Allow LDAP lookups from pg_service.conf (Laurenz Albe)
• Allow a hostname in ~/.pgpass to match the default socket directory (Bruce)
A blank hostname continues to match any Unix-socket connection, but this addition allows entries that are specific to one of several postmasters on the machine.

**E.192.3.14. ecpg Changes**

- Allow `SHOW` to put its result into a variable (Joachim Wieland)
- Add `COPY TO STDOUT` (Joachim Wieland)
- Add regression tests (Joachim Wieland, Michael)
- Major source code cleanups (Joachim Wieland, Michael)

**E.192.3.15. Windows Port**

- Allow MSVC to compile the PostgreSQL server (Magnus, Hiroshi Saito)
- Add MSVC support for utility commands and `pg_dump` (Hiroshi Saito)
- Add support for Windows code pages 1253, 1254, 1255, and 1257 (Kris Jurka)
- Drop privileges on startup, so that the server can be started from an administrative account (Magnus)
- Stability fixes (Qingqing Zhou, Magnus)
- Add native semaphore implementation (Qingqing Zhou)
  
  The previous code mimicked SysV semaphores.

**E.192.3.16. Source Code Changes**

- Add GIN (Generalized Inverted iNdex) index access method (Teodor, Oleg)
- Remove R-tree indexing (Tom)
  
  Rtree has been re-implemented using GiST. Among other differences, this means that rtree indexes now have support for crash recovery via write-ahead logging (WAL).
- Reduce libraries needlessly linked into the backend (Martijn van Oosterhout, Tom)
- Add a configure flag to allow `libedit` to be preferred over GNU readline (Bruce)
  
  Use `configure --with-libedit-preferred`.
- Allow installation into directories containing spaces (Peter)
- Improve ability to relocate installation directories (Tom)
- Add support for Solaris x86_64 using the Solaris compiler (Pierre Girard, Theo Schlossnagle, Bruce)
- Add DTrace support (Robert Lor)
- Add `PG_VERSION_NUM` for use by third-party applications wanting to test the backend version in C using `>` and `<` comparisons (Bruce)
- Add `XLOG_BLCKSZ` as independent from `BLCKSZ` (Mark Wong)
Appendix E. Release Notes

- Add LWLOCK_STATS define to report locking activity (Tom)
- Emit warnings for unknown configure options (Martijn van Oosterhout)
- Add server support for “plugin” libraries that can be used for add-on tasks such as debugging and performance measurement (Korry Douglas)
  This consists of two features: a table of “rendezvous variables” that allows separately-loaded shared libraries to communicate, and a new configuration parameter local_preload_libraries that allows libraries to be loaded into specific sessions without explicit cooperation from the client application. This allows external add-ons to implement features such as a PL/pgSQL debugger.
- Rename existing configuration parameter preload_libraries to shared_preload_libraries (Tom)
  This was done for clarity in comparison to local_preload_libraries.
- Add new configuration parameter server_version_num (Greg Sabino Mullane)
  This is like server_version, but is an integer, e.g. 80200. This allows applications to make version checks more easily.
- Add a configuration parameter seq_page_cost (Tom)
- Re-implement the regression test script as a C program (Magnus, Tom)
- Allow loadable modules to allocate shared memory and lightweight locks (Marc Munro)
- Add automatic initialization and finalization of dynamically loaded libraries (Ralf Engelschall, Tom)
  New functions _PG_init() and _PG_fini() are called if the library defines such symbols. Hence we no longer need to specify an initialization function in shared_preload_libraries; we can assume that the library used the _PG_init() convention instead.
- Add PG_MODULE_MAGIC header block to all shared object files (Martijn van Oosterhout)
  The magic block prevents version mismatches between loadable object files and servers.
- Add shared library support for AIX (Laurenz Albe)
- New XML documentation section (Bruce)

E.192.3.17. Contrib Changes

- Major tsearch2 improvements (Oleg, Teodor)
  - multibyte encoding support, including UTF8
  - query rewriting support
  - improved ranking functions
  - thesaurus dictionary support
  - Ispell dictionaries now recognize MySpell format, used by OpenOffice
  - GIN support
- Add adminpack module containing Pgadmin administration functions (Dave)
These functions provide additional file system access routines not present in the default PostgreSQL server.

- **Add sslinfo module (Victor Wagner)**
  Reports information about the current connection’s SSL certificate.
- **Add pgrowlocks module (Tatsuo)**
  This shows row locking information for a specified table.
- **Add hstore module (Oleg, Teodor)**
- **Add isn module, replacing isbn_issn (Jeremy Kronuz)**
  This new implementation supports EAN13, UPC, ISBN (books), ISMN (music), and ISSN (serials).
- **Add index information functions to pgstattuple (ITAGAKI Takahiro, Satoshi Nagayasu)**
- **Add pg_freespacemap module to display free space map information (Mark Kirkwood)**
- **pgcrypto now has all planned functionality (Marko Kreen)**
  - Include iMath library in pgcrypto to have the public-key encryption functions always available.
  - Add SHA224 algorithm that was missing in OpenBSD code.
  - Activate builtin code for SHA224/256/384/512 hashes on older OpenSSL to have those algorithms always available.
  - New function gen_random_bytes() that returns cryptographically strong randomness. Useful for generating encryption keys.
  - Remove digest_exists(), hmac_exists() and cipher_exists() functions.

- **Improvements to cube module (Joshua Reich)**
  
  New functions are `cube(float[])`, `cube(float[], float[])`, and `cube_subset(cube, int4[])`.

- **Add async query capability to dblink (Kai Londenberg, Joe Conway)**

- **New operators for array-subset comparisons (∈, ⊈, ⊌, ⊍) (Tom)**
  Various contrib packages already had these operators for their datatypes, but the naming wasn’t consistent. We have now added consistently named array-subset comparison operators to the core code and all the contrib packages that have such functionality. (The old names remain available, but are deprecated.)
  - Add uninstall scripts for all contrib packages that have install scripts (David, Josh Drake)

---

**E.193. Release 8.1.23**

**Release date:** 2010-12-16

This release contains a variety of fixes from 8.1.22. For information about new features in the 8.1 major release, see Section E.216.
This is expected to be the last PostgreSQL release in the 8.1.X series. Users are encouraged to update to a newer release branch soon.

**E.193.1. Migration to Version 8.1.23**

A dump/restore is not required for those running 8.1.X. However, if you are upgrading from a version earlier than 8.1.18, see Section E.198.

**E.193.2. Changes**

- Force the default `wal_sync_method` to be `fdatasync` on Linux (Tom Lane, Marti Raudsepp)
  
  The default on Linux has actually been `fdatasync` for many years, but recent kernel changes caused PostgreSQL to choose `open_datasync` instead. This choice did not result in any performance improvement, and caused outright failures on certain filesystems, notably ext4 with the `data=journal` mount option.

- Fix recovery from base backup when the starting checkpoint WAL record is not in the same WAL segment as its redo point (Jeff Davis)

- Add support for detecting register-stack overrun on IA64 (Tom Lane)
  
  The IA64 architecture has two hardware stacks. Full prevention of stack-overrun failures requires checking both.

- Add a check for stack overflow in `copyObject()` (Tom Lane)
  
  Certain code paths could crash due to stack overflow given a sufficiently complex query.

- Fix detection of page splits in temporary GiST indexes (Heikki Linnakangas)
  
  It is possible to have a “concurrent” page split in a temporary index, if for example there is an open cursor scanning the index when an insertion is done. GiST failed to detect this case and hence could deliver wrong results when execution of the cursor continued.

- Avoid memory leakage while analyzing complex index expressions (Tom Lane)

- Ensure an index that uses a whole-row Var still depends on its table (Tom Lane)
  
  An index declared like `create index i on t (foo(t*))` would not automatically get dropped when its table was dropped.

- Do not “inline” a SQL function with multiple `OUT` parameters (Tom Lane)
  
  This avoids a possible crash due to loss of information about the expected result rowtype.

- Fix constant-folding of `COALESCE()` expressions (Tom Lane)
  
  The planner would sometimes attempt to evaluate sub-expressions that in fact could never be reached, possibly leading to unexpected errors.

- Add print functionality for `InhRelation` nodes (Tom Lane)
  
  This avoids a failure when `debug_print_parse` is enabled and certain types of query are executed.

- Fix incorrect calculation of distance from a point to a horizontal line segment (Tom Lane)
This bug affected several different geometric distance-measurement operators.

- Fix PL/pgSQL’s handling of “simple” expressions to not fail in recursion or error-recovery cases (Tom Lane)
- Fix bug in contrib/cube’s GiST picksplit algorithm (Alexander Korotkov)
  
  This could result in considerable inefficiency, though not actually incorrect answers, in a GiST index on a cube column. If you have such an index, consider REINDEXing it after installing this update.

- Don’t emit “identifier will be truncated” notices in contrib/dblink except when creating new connections (Itagaki Takahiro)
- Fix potential coredump on missing public key in contrib/pgcrypto (Marti Raudsepp)
- Fix memory leak in contrib/xml2’s XPath query functions (Tom Lane)

• Update time zone data files to tzdata release 2010o for DST law changes in Fiji and Samoa; also historical corrections for Hong Kong.

E.194. Release 8.1.22

Release date: 2010-10-04

This release contains a variety of fixes from 8.1.21. For information about new features in the 8.1 major release, see Section E.216.

The PostgreSQL community will stop releasing updates for the 8.1.X release series in November 2010. Users are encouraged to update to a newer release branch soon.

E.194.1. Migration to Version 8.1.22

A dump/restore is not required for those running 8.1.X. However, if you are upgrading from a version earlier than 8.1.18, see Section E.198.

E.194.2. Changes

- Use a separate interpreter for each calling SQL userid in PL/Perl and PL/Tcl (Tom Lane)

  This change prevents security problems that can be caused by subverting Perl or Tcl code that will be executed later in the same session under another SQL user identity (for example, within a SECURITY DEFINER function). Most scripting languages offer numerous ways that that might be done, such as redefining standard functions or operators called by the target function. Without this change, any SQL user with Perl or Tcl language usage rights can do essentially anything with the SQL privileges of the target function’s owner.

  The cost of this change is that intentional communication among Perl and Tcl functions becomes more difficult. To provide an escape hatch, PL/PerlU and PL/TclU functions continue to use only one interpreter per session. This is not considered a security issue since all such functions execute at the trust level of a database superuser already.
Appendix E. Release Notes

It is likely that third-party procedural languages that claim to offer trusted execution have similar security issues. We advise contacting the authors of any PL you are depending on for security-critical purposes.

Our thanks to Tim Bunce for pointing out this issue (CVE-2010-3433).

- Prevent possible crashes in pg_get_expr() by disallowing it from being called with an argument that is not one of the system catalog columns it’s intended to be used with (Heikki Linnakangas, Tom Lane)
- Fix “cannot handle unplanned sub-select” error (Tom Lane)
  This occurred when a sub-select contains a join alias reference that expands into an expression containing another sub-select.
- Prevent show_session_authorization() from crashing within autovacuum processes (Tom Lane)
- Defend against functions returning setof record where not all the returned rows are actually of the same rowtype (Tom Lane)
- Fix possible failure when hashing a pass-by-reference function result (Tao Ma, Tom Lane)
- Take care to fsync the contents of lockfiles (both postmaster.pid and the socket lockfile) while writing them (Tom Lane)
  This omission could result in corrupted lockfile contents if the machine crashes shortly after postmaster start. That could in turn prevent subsequent attempts to start the postmaster from succeeding, until the lockfile is manually removed.
- Avoid recursion while assigning XIDs to heavily-nested subtransactions (Andres Freund, Robert Haas)
  The original coding could result in a crash if there was limited stack space.
- Fix log_line_prefix’s %i escape, which could produce junk early in backend startup (Tom Lane)
- Fix possible data corruption in ALTER TABLE ... SET TABLESPACE when archiving is enabled (Jeff Davis)
- Allow CREATE DATABASE and ALTER DATABASE ... SET TABLESPACE to be interrupted by query-cancel (Guillaume Lelarge)
- In PL/Python, defend against null pointer results from PyObject_AsVoidPtr and PyObject_FromVoidPtr (Peter Eisentraut)
- Improve contrib/dblink’s handling of tables containing dropped columns (Tom Lane)
- Fix connection leak after “duplicate connection name” errors in contrib/dblink (Itagaki Takahiro)
- Fix contrib/dblink to handle connection names longer than 62 bytes correctly (Itagaki Takahiro)
- Update build infrastructure and documentation to reflect the source code repository’s move from CVS to Git (Magnus Hagander and others)
- Update time zone data files to tzdata release 2010l for DST law changes in Egypt and Palestine; also historical corrections for Finland.
  This change also adds new names for two Micronesian timezones: Pacific/Chuuk is now preferred over Pacific/Truk (and the preferred abbreviation is CHUT not TRUT) and Pacific/Pohnpei is preferred over Pacific/Ponape.
E.195. Release 8.1.21

Release date: 2010-05-17

This release contains a variety of fixes from 8.1.20. For information about new features in the 8.1 major release, see Section E.216.

E.195.1. Migration to Version 8.1.21

A dump/restore is not required for those running 8.1.X. However, if you are upgrading from a version earlier than 8.1.18, see Section E.198.

E.195.2. Changes

• Enforce restrictions in plperl using an opmask applied to the whole interpreter, instead of using Safe.pm (Tim Bunce, Andrew Dunstan)

  Recent developments have convinced us that Safe.pm is too insecure to rely on for making plperl trustable. This change removes use of Safe.pm altogether, in favor of using a separate interpreter with an opcode mask that is always applied. Pleasant side effects of the change include that it is now possible to use Perl’s strict pragma in a natural way in plperl, and that Perl’s $a and $b variables work as expected in sort routines, and that function compilation is significantly faster. (CVE-2010-1169)

• Prevent PL/Tcl from executing untrustworthy code from pltcl_modules (Tom)

  PL/Tcl’s feature for autoloading Tcl code from a database table could be exploited for trojan-horse attacks, because there was no restriction on who could create or insert into that table. This change disables the feature unless pltcl_modules is owned by a superuser. (However, the permissions on the table are not checked, so installations that really need a less-than-secure modules table can still grant suitable privileges to trusted non-superusers.) Also, prevent loading code into the unrestricted “normal” Tcl interpreter unless we are really going to execute a pltcl function. (CVE-2010-1170)

• Do not allow an unprivileged user to reset superuser-only parameter settings (Alvaro)

  Previously, if an unprivileged user ran ALTER USER ... RESET ALL for himself, or ALTER DATABASE ... RESET ALL for a database he owns, this would remove all special parameter settings for the user or database, even ones that are only supposed to be changeable by a superuser. Now, the ALTER will only remove the parameters that the user has permission to change.

• Avoid possible crash during backend shutdown if shutdown occurs when a CONTEXT addition would be made to log entries (Tom)

  In some cases the context-printing function would fail because the current transaction had already been rolled back when it came time to print a log message.

• Update pl/perl’s ppport.h for modern Perl versions (Andrew)

• Fix assorted memory leaks in pl/python (Andreas Freund, Tom)

• Prevent infinite recursion in psql when expanding a variable that refers to itself (Tom)

• Ensure that contrib/pgstattuple functions respond to cancel interrupts promptly (Tatsuhito Kasa-hara)
• Make server startup deal properly with the case that `shmget()` returns `EINVAL` for an existing shared memory segment (Tom)

This behavior has been observed on BSD-derived kernels including OS X. It resulted in an entirely-misleading startup failure complaining that the shared memory request size was too large.

• Update time zone data files to tzdata release 2010j for DST law changes in Argentina, Australian Antarctic, Bangladesh, Mexico, Morocco, Pakistan, Palestine, Russia, Syria, Tunisia; also historical corrections for Taiwan.

E.196. Release 8.1.20

Release date: 2010-03-15

This release contains a variety of fixes from 8.1.19. For information about new features in the 8.1 major release, see Section E.216.

E.196.1. Migration to Version 8.1.20

A dump/restore is not required for those running 8.1.X. However, if you are upgrading from a version earlier than 8.1.18, see Section E.198.

E.196.2. Changes

• Add new configuration parameter `ssl_renegotiation_limit` to control how often we do session key renegotiation for an SSL connection (Magnus)

  This can be set to zero to disable renegotiation completely, which may be required if a broken SSL library is used. In particular, some vendors are shipping stopgap patches for CVE-2009-3555 that cause renegotiation attempts to fail.

• Fix possible crashes when trying to recover from a failure in subtransaction start (Tom)

• Fix server memory leak associated with use of savepoints and a client encoding different from server’s encoding (Tom)

• Make `substring()` for bit types treat any negative length as meaning “all the rest of the string” (Tom)

  The previous coding treated only -1 that way, and would produce an invalid result value for other negative values, possibly leading to a crash (CVE-2010-0442).

• Fix integer-to-bit-string conversions to handle the first fractional byte correctly when the output bit width is wider than the given integer by something other than a multiple of 8 bits (Tom)

• Fix some cases of pathologically slow regular expression matching (Tom)

• Fix the `STOP WAL LOCATION` entry in backup history files to report the next WAL segment’s name when the end location is exactly at a segment boundary (Itagaki Takahiro)
• Fix some more cases of temporary-file leakage (Heikki)

This corrects a problem introduced in the previous minor release. One case that failed is when a plpgsql function returning set is called within another function’s exception handler.

• When reading pg_hba.conf and related files, do not treat @something as a file inclusion request if the @ appears inside quote marks; also, never treat @ by itself as a file inclusion request (Tom)

This prevents erratic behavior if a role or database name starts with @. If you need to include a file whose path name contains spaces, you can still do so, but you must write @"/path to/file" rather than putting the quotes around the whole construct.

• Prevent infinite loop on some platforms if a directory is named as an inclusion target in pg_hba.conf and related files (Tom)

• Fix psql’s numericlocale option to not format strings it shouldn’t in latex and troff output formats (Heikki)

• Fix plpgsql failure in one case where a composite column is set to NULL (Tom)

• Add volatile markings in PL/Python to avoid possible compiler-specific misbehavior (Zdenek Kotala)

• Ensure PL/Tcl initializes the Tcl interpreter fully (Tom)

The only known symptom of this oversight is that the Tcl clock command misbehaves if using Tcl 8.5 or later.

• Prevent crash in contrib/dblink when too many key columns are specified to a dblink_build_sql_* function (Rushabh Lathia, Joe Conway)

• Fix assorted crashes in contrib/xml2 caused by sloppy memory management (Tom)

• Update time zone data files to tzdata release 2010e for DST law changes in Bangladesh, Chile, Fiji, Mexico, Paraguay, Samoa.

E.197. Release 8.1.19

Release date: 2009-12-14

This release contains a variety of fixes from 8.1.18. For information about new features in the 8.1 major release, see Section E.216.

E.197.1. Migration to Version 8.1.19

A dump/restore is not required for those running 8.1.X. However, if you are upgrading from a version earlier than 8.1.18, see Section E.198.
E.197.2. Changes

- Protect against indirect security threats caused by index functions changing session-local state (Gurjeet Singh, Tom)
  This change prevents allegedly-immutable index functions from possibly subverting a superuser’s session (CVE-2009-4136).
- Reject SSL certificates containing an embedded null byte in the common name (CN) field (Magnus)
  This prevents unintended matching of a certificate to a server or client name during SSL validation (CVE-2009-4034).
- Fix possible crash during backend-startup-time cache initialization (Tom)
- Prevent signals from interrupting VACUUM at unsafe times (Alvaro)
  This fix prevents a PANIC if a VACUUM FULL is canceled after it’s already committed its tuple movements, as well as transient errors if a plain VACUUM is interrupted after having truncated the table.
- Fix possible crash due to integer overflow in hash table size calculation (Tom)
  This could occur with extremely large planner estimates for the size of a hashjoin’s result.
- Fix very rare crash in inet/cidr comparisons (Chris Mikkelson)
- Ensure that shared tuple-level locks held by prepared transactions are not ignored (Heikki)
- Fix premature drop of temporary files used for a cursor that is accessed within a subtransaction (Heikki)
- Fix PAM password processing to be more robust (Tom)
  The previous code is known to fail with the combination of the Linux pam_krb5 PAM module with Microsoft Active Directory as the domain controller. It might have problems elsewhere too, since it was making unjustified assumptions about what arguments the PAM stack would pass to it.
- Fix processing of ownership dependencies during CREATE OR REPLACE FUNCTION (Tom)
- Ensure that Perl arrays are properly converted to PostgreSQL arrays when returned by a set-returning PL/Perl function (Andrew Dunstan, Abhijit Menon-Sen)
  This worked correctly already for non-set-returning functions.
- Fix rare crash in exception processing in PL/Python (Peter)
- Ensure psql’s flex module is compiled with the correct system header definitions (Tom)
  This fixes build failures on platforms where --enable-largefile causes incompatible changes in the generated code.
- Make the postmaster ignore any application_name parameter in connection request packets, to improve compatibility with future libpq versions (Tom)
- Update time zone data files to tzdata release 2009s for DST law changes in Antarctica, Argentina, Bangladesh, Fiji, Novokuznetsk, Pakistan, Palestine, Samoa, Syria; also historical corrections for Hong Kong.
Appendix E. Release Notes

E.198. Release 8.1.18

Release date: 2009-09-09

This release contains a variety of fixes from 8.1.17. For information about new features in the 8.1 major release, see Section E.216.

E.198.1. Migration to Version 8.1.18

A dump/restore is not required for those running 8.1.X. However, if you have any hash indexes on interval columns, you must REINDEX them after updating to 8.1.18. Also, if you are upgrading from a version earlier than 8.1.15, see Section E.201.

E.198.2. Changes

- Disallow RESET ROLE and RESET SESSION AUTHORIZATION inside security-definer functions (Tom, Heikki)
  This covers a case that was missed in the previous patch that disallowed SET ROLE and SET SESSION AUTHORIZATION inside security-definer functions. (See CVE-2007-6600)
- Fix handling of sub-SELECTs appearing in the arguments of an outer-level aggregate function (Tom)
- Fix hash calculation for data type interval (Tom)
  This corrects wrong results for hash joins on interval values. It also changes the contents of hash indexes on interval columns. If you have any such indexes, you must REINDEX them after updating.
- Treat to_char(..., 'TH') as an uppercase ordinal suffix with 'HH'/''HH12' (Heikki)
  It was previously handled as 'th' (lowercase).
- Fix overflow for INTERVAL ’x ms’ when x is more than 2 million and integer datetimes are in use (Alex Hunsaker)
- Fix calculation of distance between a point and a line segment (Tom)
  This led to incorrect results from a number of geometric operators.
- Fix money data type to work in locales where currency amounts have no fractional digits, e.g. Japan (Itagaki Takahiro)
- Properly round datetime input like 00:12:57.99999999999999999999999999999999 (Tom)
- Fix poor choice of page split point in GiST R-tree operator classes (Teodor)
- Fix portability issues in plperl initialization (Andrew Dunstan)
- Fix pg_ctl to not go into an infinite loop if postgresql.conf is empty (Jeff Davis)
- Fix contrib/xml2's xslt_process() to properly handle the maximum number of parameters (twenty) (Tom)
- Improve robustness of libpq's code to recover from errors during COPY FROM STDIN (Tom)
Appendix E. Release Notes

- Avoid including conflicting readline and editline header files when both libraries are installed (Zdenek Kotala)
- Update time zone data files to tzdata release 2009l for DST law changes in Bangladesh, Egypt, Jordan, Pakistan, Argentina/San_Luis, Cuba, Jordan (historical correction only), Mauritius, Morocco, Palestine, Syria, Tunisia.

E.199. Release 8.1.17

Release date: 2009-03-16

This release contains a variety of fixes from 8.1.16. For information about new features in the 8.1 major release, see Section E.216.

E.199.1. Migration to Version 8.1.17

A dump/restore is not required for those running 8.1.X. However, if you are upgrading from a version earlier than 8.1.15, see Section E.201.

E.199.2. Changes

- Prevent error recursion crashes when encoding conversion fails (Tom)
  This change extends fixes made in the last two minor releases for related failure scenarios. The previous fixes were narrowly tailored for the original problem reports, but we have now recognized that any error thrown by an encoding conversion function could potentially lead to infinite recursion while trying to report the error. The solution therefore is to disable translation and encoding conversion and report the plain-ASCII form of any error message, if we find we have gotten into a recursive error reporting situation. (CVE-2009-0922)
- Disallow CREATE CONVERSION with the wrong encodings for the specified conversion function (Heikki)
  This prevents one possible scenario for encoding conversion failure. The previous change is a backstop to guard against other kinds of failures in the same area.
- Fix core dump when to_char() is given format codes that are inappropriate for the type of the data argument (Tom)
- Fix decompilation of CASE WHEN with an implicit coercion (Tom)
  This mistake could lead to Assert failures in an Assert-enabled build, or an “unexpected CASE WHEN clause” error message in other cases, when trying to examine or dump a view.
- Fix possible misassignment of the owner of a TOAST table’s rowtype (Tom)
  If CLUSTER or a rewriting variant of ALTER TABLE were executed by someone other than the table owner, the pg_type entry for the table’s TOAST table would end up marked as owned by that someone. This caused no immediate problems, since the permissions on the TOAST rowtype aren’t examined by...
any ordinary database operation. However, it could lead to unexpected failures if one later tried to drop the role that issued the command (in 8.1 or 8.2), or “owner of data type appears to be invalid” warnings from pg_dump after having done so (in 8.3).

- Clean up PL/pgSQL error status variables fully at block exit (Ashesh Vashi and Dave Page)
  This is not a problem for PL/pgSQL itself, but the omission could cause the PL/pgSQL Debugger to crash while examining the state of a function.

- Add MUST (Mauritius Island Summer Time) to the default list of known timezone abbreviations (Xavier Bugaud)

E.200. Release 8.1.16
Release date: 2009-02-02
This release contains a variety of fixes from 8.1.15. For information about new features in the 8.1 major release, see Section E.216.

E.200.1. Migration to Version 8.1.16
A dump/restore is not required for those running 8.1.X. However, if you are upgrading from a version earlier than 8.1.15, see Section E.201.

E.200.2. Changes

- Fix crash in autovacuum (Alvaro)
  The crash occurs only after vacuuming a whole database for anti-transaction-wraparound purposes, which means that it occurs infrequently and is hard to track down.

- Improve handling of URLs in headline() function (Teodor)

- Improve handling of overlength headlines in headline() function (Teodor)

- Prevent possible Assert failure or misconversion if an encoding conversion is created with the wrong conversion function for the specified pair of encodings (Tom, Heikki)

- Avoid unnecessary locking of small tables in VACUUM (Heikki)

- Ensure that the contents of a holdable cursor don’t depend on the contents of TOAST tables (Tom)
  Previously, large field values in a cursor result might be represented as TOAST pointers, which would fail if the referenced table got dropped before the cursor is read, or if the large value is deleted and then vacuumed away. This cannot happen with an ordinary cursor, but it could with a cursor that is held past its creating transaction.

- Fix uninitialized variables in contrib/tsearch2’s get_covers() function (Teodor)

- Fix configure script to properly report failure when unable to obtain linkage information for PL/Perl (Andrew)
Appendix E. Release Notes

- Make all documentation reference `pgsql-bugs` and/or `pgsql-hackers` as appropriate, instead of the now-decommissioned `pgsql-ports` and `pgsql-patches` mailing lists (Tom)
- Update time zone data files to tzdata release 2009a (for Kathmandu and historical DST corrections in Switzerland, Cuba)

E.201. Release 8.1.15

Release date: 2008-11-03

This release contains a variety of fixes from 8.1.14. For information about new features in the 8.1 major release, see Section E.216.

E.201.1. Migration to Version 8.1.15

A dump/restore is not required for those running 8.1.X. However, if you are upgrading from a version earlier than 8.1.2, see Section E.214. Also, if you were running a previous 8.1.X release, it is recommended to `REINDEX` all GiST indexes after the upgrade.

E.201.2. Changes

- Fix GiST index corruption due to marking the wrong index entry “dead” after a deletion (Teodor)
  This would result in index searches failing to find rows they should have found. Corrupted indexes can be fixed with `REINDEX`.
- Fix backend crash when the client encoding cannot represent a localized error message (Tom)
  We have addressed similar issues before, but it would still fail if the “character has no equivalent” message itself couldn’t be converted. The fix is to disable localization and send the plain ASCII error message when we detect such a situation.
- Fix possible crash when deeply nested functions are invoked from a trigger (Tom)
- Fix mis-expansion of rule queries when a sub-`SELECT` appears in a function call in `FROM`, a multi-row `VALUES` list, or a `RETURNING` list (Tom)
  The usual symptom of this problem is an “unrecognized node type” error.
- Ensure an error is reported when a newly-defined PL/pgSQL trigger function is invoked as a normal function (Tom)
- Prevent possible collision of `relfilenode` numbers when moving a table to another tablespace with `ALTER SET TABLESPACE` (Heikki)
  The command tried to re-use the existing filename, instead of picking one that is known unused in the destination directory.
- Fix incorrect tsearch2 headline generation when single query item matches first word of text (Sushant Sinha)
• Fix improper display of fractional seconds in interval values when using a non-ISO datestyle in an
--enable-integer-datetimes build (Ron Mayer)
• Ensure SPI_getvalue and SPI_getbinval behave correctly when the passed tuple and tuple de-
scriptor have different numbers of columns (Tom)
   This situation is normal when a table has had columns added or removed, but these two functions didn’t
handle it properly. The only likely consequence is an incorrect error indication.
• Fix ecpg’s parsing of CREATE ROLE (Michael)
• Fix recent breakage of pg_ctl restart (Tom)
• Update time zone data files to tzdata release 2008i (for DST law changes in Argentina, Brazil, Mauri-
tius, Syria)

Release date: 2008-09-22

This release contains a variety of fixes from 8.1.13. For information about new features in the 8.1 major
release, see Section E.216.

E.202.1. Migration to Version 8.1.14

A dump/restore is not required for those running 8.1.X. However, if you are upgrading from a version
earlier than 8.1.2, see Section E.214.

E.202.2. Changes

• Widen local lock counters from 32 to 64 bits (Tom)
   This responds to reports that the counters could overflow in sufficiently long transactions, leading to
unexpected “lock is already held” errors.
• Fix possible duplicate output of tuples during a GiST index scan (Teodor)
• Add checks in executor startup to ensure that the tuples produced by an INSERT or UPDATE will match
the target table’s current rowtype (Tom)
   ALTER COLUMN TYPE, followed by re-use of a previously cached plan, could produce this type of
situation. The check protects against data corruption and/or crashes that could ensue.
• Fix AT TIME ZONE to first try to interpret its timezone argument as a timezone abbreviation, and only
try it as a full timezone name if that fails, rather than the other way around as formerly (Tom)
   The timestamp input functions have always resolved ambiguous zone names in this order. Making AT
TIME ZONE do so as well improves consistency, and fixes a compatibility bug introduced in 8.1: in
ambiguous cases we now behave the same as 8.0 and before did, since in the older versions AT TIME
ZONE accepted only abbreviations.
• Fix datetime input functions to correctly detect integer overflow when running on a 64-bit platform (Tom)
• Improve performance of writing very long log messages to syslog (Tom)
• Fix bug in backwards scanning of a cursor on a `SELECT DISTINCT ON` query (Tom)
• Fix planner bug with nested sub-select expressions (Tom)
  If the outer sub-select has no direct dependency on the parent query, but the inner one does, the outer value might not get recalculated for new parent query rows.
• Fix planner to estimate that `GROUP BY` expressions yielding boolean results always result in two groups, regardless of the expressions’ contents (Tom)
  This is very substantially more accurate than the regular `GROUP BY` estimate for certain boolean tests like `col IS NULL`.
• Fix PL/pgSQL to not fail when a `FOR` loop’s target variable is a record containing composite-type fields (Tom)
• Fix PL/Tcl to behave correctly with Tcl 8.5, and to be more careful about the encoding of data sent to or from Tcl (Tom)
• Fix PL/Python to work with Python 2.5
  This is a back-port of fixes made during the 8.2 development cycle.
• Improve `pg_dump` and `pg_restore`’s error reporting after failure to send a SQL command (Tom)
• Fix `pg_ctl` to properly preserve postmaster command-line arguments across a `restart` (Bruce)
• Update time zone data files to `tzdata` release 2008f (for DST law changes in Argentina, Bahamas, Brazil, Mauritius, Morocco, Pakistan, Palestine, and Paraguay)

**E.203. Release 8.1.13**

**Release date:** 2008-06-12

This release contains one serious and one minor bug fix over 8.1.12. For information about new features in the 8.1 major release, see Section E.216.

**E.203.1. Migration to Version 8.1.13**

A dump/restore is not required for those running 8.1.X. However, if you are upgrading from a version earlier than 8.1.2, see Section E.214.

**E.203.2. Changes**

• Make `pg_get_ruledef()` parenthesize negative constants (Tom)
Before this fix, a negative constant in a view or rule might be dumped as, say, -42::integer, which is subtly incorrect: it should be (-42)::integer due to operator precedence rules. Usually this would make little difference, but it could interact with another recent patch to cause PostgreSQL to reject what had been a valid SELECT DISTINCT view query. Since this could result in pg_dump output failing to reload, it is being treated as a high-priority fix. The only released versions in which dump output is actually incorrect are 8.3.1 and 8.2.7.

- Make ALTER AGGREGATE ... OWNER TO update pg_shdepend (Tom)

This oversight could lead to problems if the aggregate was later involved in a DROP OWNED or REASSIGN OWNED operation.

### E.204. Release 8.1.12

**Release date:** never released

This release contains a variety of fixes from 8.1.11. For information about new features in the 8.1 major release, see Section E.216.

#### E.204.1. Migration to Version 8.1.12

A dump/restore is not required for those running 8.1.X. However, if you are upgrading from a version earlier than 8.1.2, see Section E.214.

#### E.204.2. Changes

- Fix ALTER TABLE ADD COLUMN ... PRIMARY KEY so that the new column is correctly checked to see if it’s been initialized to all non-nulls (Brendan Jurd)
  
  Previous versions neglected to check this requirement at all.

- Fix possible CREATE TABLE failure when inheriting the “same” constraint from multiple parent relations that inherited that constraint from a common ancestor (Tom)

- Fix conversions between ISO-8859-5 and other encodings to handle Cyrillic “Yo” characters (e and E with two dots) (Sergey Burladyan)

- Fix a few datatype input functions that were allowing unused bytes in their results to contain uninitialized, unpredictable values (Tom)
  
  This could lead to failures in which two apparently identical literal values were not seen as equal, resulting in the parser complaining about unmatched ORDER BY and DISTINCT expressions.

- Fix a corner case in regular-expression substring matching (substring(string from pattern)) (Tom)
  
  The problem occurs when there is a match to the pattern overall but the user has specified a parenthesized subexpression and that subexpression hasn’t got a match. An example is substring(‘foo’
Appendix E. Release Notes

from 'foo(bar)?'). This should return NULL, since (bar) isn’t matched, but it was mistakenly returning the whole-pattern match instead (ie, foo).

- Update time zone data files to tzdata release 2008c (for DST law changes in Morocco, Iraq, Choibalsan, Pakistan, Syria, Cuba, Argentina/San_Luis, and Chile)
- Fix incorrect result from ecpg’s PGTYPEStimestamp_sub() function (Michael)
- Fix core dump in contrib/xml2’s xpath_table() function when the input query returns a NULL value (Tom)
- Fix contrib/xml2’s makefile to not override CFLAGS (Tom)
- Fix DatumGetBool macro to not fail with gcc 4.3 (Tom)
  This problem affects “old style” (V0) C functions that return boolean. The fix is already in 8.3, but the need to back-patch it was not realized at the time.
- Fix longstanding LISTEN/NOTIFY race condition (Tom)
  In rare cases a session that had just executed a LISTEN might not get a notification, even though one would be expected because the concurrent transaction executing NOTIFY was observed to commit later.
  A side effect of the fix is that a transaction that has executed a not-yet-committed LISTEN command will not see any row in pg_listener for the LISTEN, should it choose to look; formerly it would have. This behavior was never documented one way or the other, but it is possible that some applications depend on the old behavior.
- Disallow LISTEN and UNLISTEN within a prepared transaction (Tom)
  This was formerly allowed but trying to do it had various unpleasant consequences, notably that the originating backend could not exit as long as an UNLISTEN remained uncommitted.
- Fix rare crash when an error occurs during a query using a hash index (Heikki)
- Fix input of datetime values for February 29 in years BC (Tom)
  The former coding was mistaken about which years were leap years.
- Fix “unrecognized node type” error in some variants of ALTER OWNER (Tom)
- Fix pg_ctl to correctly extract the postmaster’s port number from command-line options (Itagaki Takahiro, Tom)
  Previously, pg_ctl start -w could try to contact the postmaster on the wrong port, leading to bogus reports of startup failure.
- Use -fwrapv to defend against possible misoptimization in recent gcc versions (Tom)
  This is known to be necessary when building PostgreSQL with gcc 4.3 or later.
- Fix display of constant expressions in ORDER BY and GROUP BY (Tom)
  An explicitly casted constant would be shown incorrectly. This could for example lead to corruption of a view definition during dump and reload.
- Fix libpq to handle NOTICE messages correctly during COPY OUT (Tom)
  This failure has only been observed to occur when a user-defined datatype’s output routine issues a NOTICE, but there is no guarantee it couldn’t happen due to other causes.
E.205. Release 8.1.11

Release date: 2008-01-07

This release contains a variety of fixes from 8.1.10, including fixes for significant security issues. For information about new features in the 8.1 major release, see Section E.216.

This is the last 8.1.X release for which the PostgreSQL community will produce binary packages for Windows. Windows users are encouraged to move to 8.2.X or later, since there are Windows-specific fixes in 8.2.X that are impractical to back-port. 8.1.X will continue to be supported on other platforms.

E.205.1. Migration to Version 8.1.11

A dump/restore is not required for those running 8.1.X. However, if you are upgrading from a version earlier than 8.1.2, see Section E.214.

E.205.2. Changes

• Prevent functions in indexes from executing with the privileges of the user running VACUUM, ANALYZE, etc (Tom)

  Functions used in index expressions and partial-index predicates are evaluated whenever a new table entry is made. It has long been understood that this poses a risk of trojan-horse code execution if one modifies a table owned by an untrustworthy user. (Note that triggers, defaults, check constraints, etc. pose the same type of risk.) But functions in indexes pose extra danger because they will be executed by routine maintenance operations such as VACUUM FULL, which are commonly performed automatically under a superuser account. For example, a nefarious user can execute code with superuser privileges by setting up a trojan-horse index definition and waiting for the next routine vacuum. The fix arranges for standard maintenance operations (including VACUUM, ANALYZE, REINDEX, and CLUSTER) to execute as the table owner rather than the calling user, using the same privilege-switching mechanism already used for SECURITY DEFINER functions. To prevent bypassing this security measure, execution of SET SESSION AUTHORIZATION and SET ROLE is now forbidden within a SECURITY DEFINER context. (CVE-2007-6600)

• Repair assorted bugs in the regular-expression package (Tom, Will Drewry)

  Suitably crafted regular-expression patterns could cause crashes, infinite or near-infinite looping, and/or massive memory consumption, all of which pose denial-of-service hazards for applications that accept regex search patterns from untrustworthy sources. (CVE-2007-4769, CVE-2007-4772, CVE-2007-6067)

• Require non-superusers who use /contrib/dblink to use only password authentication, as a security measure (Joe)

  The fix that appeared for this in 8.1.10 was incomplete, as it plugged the hole for only some dblink functions. (CVE-2007-6601, CVE-2007-3278)

• Update time zone data files to tzdata release 2007k (in particular, recent Argentina changes) (Tom)

• Improve planner’s handling of LIKE/regex estimation in non-C locales (Tom)
• Fix planner failure in some cases of \texttt{WHERE} false AND var IN (SELECT ...) (Tom)

• Preserve the tablespace of indexes that are rebuilt by \texttt{ALTER TABLE ... ALTER COLUMN TYPE} (Tom)

• Make archive recovery always start a new WAL timeline, rather than only when a recovery stop time was used (Simon)
  
  This avoids a corner-case risk of trying to overwrite an existing archived copy of the last WAL segment, and seems simpler and cleaner than the original definition.

• Make \texttt{VACUUM} not use all of \texttt{maintenance_work_mem} when the table is too small for it to be useful (Alvaro)

• Fix potential crash in \texttt{translate()} when using a multibyte database encoding (Tom)

• Fix overflow in \texttt{extract(epoch from interval)} for intervals exceeding 68 years (Tom)

• Fix PL/Perl to not fail when a UTF-8 regular expression is used in a trusted function (Andrew)

• Fix PL/Perl to cope when platform’s Perl defines type \texttt{bool} as \texttt{int} rather than \texttt{char} (Tom)
  
  While this could theoretically happen anywhere, no standard build of Perl did things this way ... until Mac OS X 10.5.

• Fix PL/Python to not crash on long exception messages (Alvaro)

• Fix \texttt{pg_dump} to correctly handle inheritance child tables that have default expressions different from their parent’s (Tom)

• Fix \texttt{libpq} crash when \texttt{PGPASSFILE} refers to a file that is not a plain file (Martin Pitt)

• \texttt{ecpg} parser fixes (Michael)

• Make \texttt{contrib/pgcrypto} defend against OpenSSL libraries that fail on keys longer than 128 bits; which is the case at least on some Solaris versions (Marko Kreen)

• Make \texttt{contrib/tablefunc’s crosstab()} handle NULL rowid as a category in its own right, rather than crashing (Joe)

• Fix \texttt{tsvector} and \texttt{tsquery} output routines to escape backslashes correctly (Teodor, Bruce)

• Fix crash of \texttt{to_tsvector()} on huge input strings (Teodor)

• Require a specific version of Autoconf to be used when re-generating the \texttt{configure} script (Peter)
  
  This affects developers and packagers only. The change was made to prevent accidental use of untested combinations of Autoconf and PostgreSQL versions. You can remove the version check if you really want to use a different Autoconf version, but it’s your responsibility whether the result works or not.

E.206. Release 8.1.10

\textbf{Release date:} 2007-09-17

This release contains a variety of fixes from 8.1.9. For information about new features in the 8.1 major release, see Section E.216.
E.206.1. Migration to Version 8.1.10

A dump/restore is not required for those running 8.1.X. However, if you are upgrading from a version earlier than 8.1.2, see Section E.214.

E.206.2. Changes

- Prevent index corruption when a transaction inserts rows and then aborts close to the end of a concurrent VACUUM on the same table (Tom)
- Make CREATE DOMAIN ... DEFAULT NULL work properly (Tom)
- Allow the interval data type to accept input consisting only of milliseconds or microseconds (Neil)
- Speed up rtree index insertion (Teodor)
- Fix excessive logging of SSL error messages (Tom)
- Fix logging so that log messages are never interleaved when using the syslogger process (Andrew)
- Fix crash when log_min_error_statement logging runs out of memory (Tom)
- Fix incorrect handling of some foreign-key corner cases (Tom)
- Prevent REINDEX and CLUSTER from failing due to attempting to process temporary tables of other sessions (Alvaro)
- Update the time zone database rules, particularly New Zealand's upcoming changes (Tom)
- Windows socket improvements (Magnus)
- Suppress timezone name (%Z) in log timestamps on Windows because of possible encoding mismatches (Tom)
- Require non-superusers who use /contrib/dblink to use only password authentication, as a security measure (Joe)

E.207. Release 8.1.9

Release date: 2007-04-23

This release contains a variety of fixes from 8.1.8, including a security fix. For information about new features in the 8.1 major release, see Section E.216.

E.207.1. Migration to Version 8.1.9

A dump/restore is not required for those running 8.1.X. However, if you are upgrading from a version earlier than 8.1.2, see Section E.214.
E.207.2. Changes

- Support explicit placement of the temporary-table schema within `search_path`, and disable searching it for functions and operators (Tom)

  This is needed to allow a security-definer function to set a truly secure value of `search_path`. Without it, an unprivileged SQL user can use temporary objects to execute code with the privileges of the security-definer function (CVE-2007-2138). See `CREATE FUNCTION` for more information.

- `/contrib/tsearch2` crash fixes (Teodor)

- Require `COMMIT PREPARED` to be executed in the same database as the transaction was prepared in (Heikki)

- Fix potential-data-corruption bug in how `VACUUM FULL` handles `UPDATE` chains (Tom, Pavan Deolasee)

- Planner fixes, including improving outer join and bitmap scan selection logic (Tom)

- Fix PANIC during enlargement of a hash index (bug introduced in 8.1.6) (Tom)

- Fix POSIX-style timezone specs to follow new USA DST rules (Tom)

E.208. Release 8.1.8

Release date: 2007-02-07

This release contains one fix from 8.1.7. For information about new features in the 8.1 major release, see Section E.216.

E.208.1. Migration to Version 8.1.8

A dump/restore is not required for those running 8.1.X. However, if you are upgrading from a version earlier than 8.1.2, see Section E.214.

E.208.2. Changes

- Remove overly-restrictive check for type length in constraints and functional indexes (Tom)

E.209. Release 8.1.7

Release date: 2007-02-05

This release contains a variety of fixes from 8.1.6, including a security fix. For information about new features in the 8.1 major release, see Section E.216.
Appendix E. Release Notes

E.209.1. Migration to Version 8.1.7

A dump/restore is not required for those running 8.1.X. However, if you are upgrading from a version earlier than 8.1.2, see Section E.214.

E.209.2. Changes

• Remove security vulnerabilities that allowed connected users to read backend memory (Tom)
  The vulnerabilities involve suppressing the normal check that a SQL function returns the data type it's declared to, and changing the data type of a table column (CVE-2007-0555, CVE-2007-0556). These errors can easily be exploited to cause a backend crash, and in principle might be used to read database content that the user should not be able to access.
• Fix rare bug wherein btree index page splits could fail due to choosing an infeasible split point (Heikki Linnakangas)
• Improve VACUUM performance for databases with many tables (Tom)
• Fix autovacuum to avoid leaving non-permanent transaction IDs in non-connectable databases (Alvaro)
  This bug affects the 8.1 branch only.
• Fix for rare Assert() crash triggered by UNION (Tom)
• Tighten security of multi-byte character processing for UTF8 sequences over three bytes long (Tom)
• Fix bogus “permission denied” failures occurring on Windows due to attempts to fsync already-deleted files (Magnus, Tom)
• Fix possible crashes when an already-in-use PL/pgSQL function is updated (Tom)

E.210. Release 8.1.6

Release date: 2007-01-08

This release contains a variety of fixes from 8.1.5. For information about new features in the 8.1 major release, see Section E.216.

E.210.1. Migration to Version 8.1.6

A dump/restore is not required for those running 8.1.X. However, if you are upgrading from a version earlier than 8.1.2, see Section E.214.

E.210.2. Changes

• Improve handling of getaddrinfo() on AIX (Tom)
This fixes a problem with starting the statistics collector, among other things.

- Fix `pg_restore` to handle a tar-format backup that contains large objects (blobs) with comments (Tom)
- Fix “failed to re-find parent key” errors in `VACUUM` (Tom)
- Clean out `pg_internal.init` cache files during server restart (Simon)
  This avoids a hazard that the cache files might contain stale data after PITR recovery.
- Fix race condition for truncation of a large relation across a gigabyte boundary by `VACUUM` (Tom)
- Fix bug causing needless deadlock errors on row-level locks (Tom)
- Fix bugs affecting multi-gigabyte hash indexes (Tom)
- Fix possible deadlock in Windows signal handling (Teodor)
- Fix error when constructing an `ARRAY[]` made up of multiple empty elements (Tom)
- Fix `ecpg` memory leak during connection (Michael)
- Fix for Darwin (OS X) compilation (Tom)
- `to_number()` and `to_char(numeric)` are now STABLE, not IMMUTABLE, for new initdb installs (Tom)
  This is because `lc_numeric` can potentially change the output of these functions.
- Improve index usage of regular expressions that use parentheses (Tom)
  This improves `psql \d` performance also.
- Update timezone database
  This affects Australian and Canadian daylight-savings rules in particular.

### E.211. Release 8.1.5

**Release date:** 2006-10-16

This release contains a variety of fixes from 8.1.4. For information about new features in the 8.1 major release, see Section E.216.

### E.211.1. Migration to Version 8.1.5

A dump/restore is not required for those running 8.1.X. However, if you are upgrading from a version earlier than 8.1.2, see Section E.214.

### E.211.2. Changes

- Disallow aggregate functions in `UPDATE` commands, except within sub-SELECTs (Tom)
The behavior of such an aggregate was unpredictable, and in 8.1.X could cause a crash, so it has been disabled. The SQL standard does not allow this either.

- Fix core dump when an untyped literal is taken as ANYARRAY
- Fix core dump in duration logging for extended query protocol when a COMMIT or ROLLBACK is executed
- Fix mishandling of AFTER triggers when query contains a SQL function returning multiple rows (Tom)
- Fix ALTER TABLE ... TYPE to recheck NOT NULL for USING clause (Tom)
- Fix string_to_array() to handle overlapping matches for the separator string
  For example, string_to_array(‘123xx456xxx789’, ‘xx’).
- Fix to_timestamp() for AM/PM formats (Bruce)
- Fix autovacuum’s calculation that decides whether ANALYZE is needed (Alvaro)
- Fix corner cases in pattern matching for psql’s \d commands
- Fix index-corrupting bugs in /contrib/ltree (Teodor)
- Numerous robustness fixes in ecpg (Joachim Wieland)
- Fix backslash escaping in /contrib/dbmirror
- Minor fixes in /contrib/dblink and /contrib/tsearch2
- Efficiency improvements in hash tables and bitmap index scans (Tom)
- Fix instability of statistics collection on Windows (Tom, Andrew)
- Fix statement_timeout to use the proper units on Win32 (Bruce)
  In previous Win32 8.1.X versions, the delay was off by a factor of 100.
- Fixes for MSVC and Borland C++ compilers (Hiroshi Saito)
- Fixes for AIX and Intel compilers (Tom)
- Fix rare bug in continuous archiving (Tom)

---

E.212. Release 8.1.4

Release date: 2006-05-23

This release contains a variety of fixes from 8.1.3, including patches for extremely serious security issues. For information about new features in the 8.1 major release, see Section E.216.

E.212.1. Migration to Version 8.1.4

A dump/restore is not required for those running 8.1.X. However, if you are upgrading from a version earlier than 8.1.2, see Section E.214.

Full security against the SQL-injection attacks described in CVE-2006-2313 and CVE-2006-2314 might require changes in application code. If you have applications that embed untrustworthy strings into SQL
Appendix E. Release Notes

commands, you should examine them as soon as possible to ensure that they are using recommended escaping techniques. In most cases, applications should be using subroutines provided by libraries or drivers (such as libpq's PQescapeStringConn()) to perform string escaping, rather than relying on ad hoc code to do it.

E.212.2. Changes

• Change the server to reject invalidly-encoded multibyte characters in all cases (Tatsuo, Tom)
  While PostgreSQL has been moving in this direction for some time, the checks are now applied uniformly to all encodings and all textual input, and are now always errors not merely warnings. This change defends against SQL-injection attacks of the type described in CVE-2006-2313.

• Reject unsafe uses of ‘\’ in string literals
  As a server-side defense against SQL-injection attacks of the type described in CVE-2006-2314, the server now only accepts ‘” and not ‘\’ as a representation of ASCII single quote in SQL string literals. By default, ‘\’ is rejected only when client_encoding is set to a client-only encoding (SJIS, BIG5, GBK, GB18030, or UHC), which is the scenario in which SQL injection is possible. A new configuration parameter backslash_quote is available to adjust this behavior when needed. Note that full security against CVE-2006-2314 might require client-side changes; the purpose of backslash_quote is in part to make it obvious that insecure clients are insecure.

• Modify libpq’s string-escaping routines to be aware of encoding considerations and standard_conforming_strings
  This fixes libpq-using applications for the security issues described in CVE-2006-2313 and CVE-2006-2314, and also future-proofs them against the planned changeover to SQL-standard string literal syntax. Applications that use multiple PostgreSQL connections concurrently should migrate to PQescapeStringConn() and PQescapeByteaConn() to ensure that escaping is done correctly for the settings in use in each database connection. Applications that do string escaping “by hand” should be modified to rely on library routines instead.

• Fix weak key selection in pgcrypto (Marko Kreen)
  Errors in fortuna PRNG reseeding logic could cause a predictable session key to be selected by pgp_sym_encrypt() in some cases. This only affects non-OpenSSL-using builds.

• Fix some incorrect encoding conversion functions
  win1251_to_iso, win866_to_iso, euc_tw_to_big5, euc_tw_to_mic, mic_to_euc_tw were all broken to varying extents.

• Clean up stray remaining uses of ‘\’ in strings (Bruce, Jan)
• Make autovacuum visible in pg_stat_activity (Alvaro)
• Disable full_page_writes (Tom)
  In certain cases, having full_page_writes off would cause crash recovery to fail. A proper fix will appear in 8.2; for now it’s just disabled.

• Various planner fixes, particularly for bitmap index scans and MIN/MAX optimization (Tom)
• Fix incorrect optimization in merge join (Tom)
Outer joins could sometimes emit multiple copies of unmatched rows.

- Fix crash from using and modifying a plpgsql function in the same transaction
- Fix WAL replay for case where a B-Tree index has been truncated
- Fix `SIMILAR TO` for patterns involving | (Tom)
- Fix `SELECT INTO` and `CREATE TABLE AS` to create tables in the default tablespace, not the base directory (Kris Jurka)
- Fix server to use custom DH SSL parameters correctly (Michael Fuhr)
- Improve `qsort` performance (Dann Corbit)
  
  Currently this code is only used on Solaris.
- Fix for OS/X Bonjour on x86 systems (Ashley Clark)
- Fix various minor memory leaks
- Fix problem with password prompting on some Win32 systems (Robert Kinberg)
- Improve pg_dump’s handling of default values for domains
- Fix pg_dumpall to handle identically-named users and groups reasonably (only possible when dumping from a pre-8.1 server) (Tom)
  
  The user and group will be merged into a single role with `LOGIN` permission. Formerly the merged role wouldn’t have `LOGIN` permission, making it unusable as a user.
- Fix `pg_restore -n` to work as documented (Tom)

### E.213. Release 8.1.3

**Release date:** 2006-02-14

This release contains a variety of fixes from 8.1.2, including one very serious security issue. For information about new features in the 8.1 major release, see Section E.216.

#### E.213.1. Migration to Version 8.1.3

A dump/restore is not required for those running 8.1.X. However, if you are upgrading from a version earlier than 8.1.2, see Section E.214.

#### E.213.2. Changes

- Fix bug that allowed any logged-in user to `SET ROLE` to any other database user id (CVE-2006-0553)
  
  Due to inadequate validity checking, a user could exploit the special case that `SET ROLE` normally uses to restore the previous role setting after an error. This allowed ordinary users to acquire superuser status, for example. The escalation-of-privilege risk exists only in 8.1.0-8.1.2. However, in all releases back to 7.3 there is a related bug in `SET SESSION AUTHORIZATION` that allows unprivileged users to
crash the server, if it has been compiled with Asserts enabled (which is not the default). Thanks to Akio Ishida for reporting this problem.

- Fix bug with row visibility logic in self-inserted rows (Tom)
  
  Under rare circumstances a row inserted by the current command could be seen as already valid, when it should not be. Repairs bug created in 8.0.4, 7.4.9, and 7.3.11 releases.

- Fix race condition that could lead to “file already exists” errors during pg_clog and pg_subtrans file creation (Tom)

- Fix cases that could lead to crashes if a cache-invalidation message arrives at just the wrong time (Tom)

- Properly check `DOMAIN` constraints for `UNKNOWN` parameters in prepared statements (Neil)

- Ensure `ALTER COLUMN TYPE` will process `FOREIGN KEY`, `UNIQUE`, and `PRIMARY KEY` constraints in the proper order (Nakano Yoshihisa)

- Fixes to allow restoring dumps that have cross-schema references to custom operators or operator classes (Tom)

- Allow `pg_restore` to continue properly after a `COPY` failure; formerly it tried to treat the remaining `COPY` data as SQL commands (Stephen Frost)

- Fix `pg_ctl unregister` crash when the data directory is not specified (Magnus)

- Fix `libpq PQprint` HTML tags (Christoph Zwerschke)

- Fix `ecpg` crash on AMD64 and PPC (Neil)

- Allow `SETOF` and `%TYPE` to be used together in function result type declarations

- Recover properly if error occurs during argument passing in PL/python (Neil)

- Fix memory leak in `plperl_return_next` (Neil)

- Fix PL/perl’s handling of locales on Win32 to match the backend (Andrew)

- Various optimizer fixes (Tom)

- Fix crash when `log_min_messages` is set to `DEBUG3` or above in `postgresql.conf` on Win32 (Bruce)

- Fix `pgxs -L` library path specification for Win32, Cygwin, OS X, AIX (Bruce)

- Check that SID is enabled while checking for Win32 admin privileges (Magnus)

- Properly reject out-of-range date inputs (Kris Jurka)

- Portability fix for testing presence of `finite` and `isinf` during configure (Tom)

- Improve speed of `COPY IN` via `libpq`, by avoiding a kernel call per data line (Alon Goldshuv)

- Improve speed of `/contrib/tsearch2` index creation (Tom)

---

**E.214. Release 8.1.2**

**Release date:** 2006-01-09
Appendix E. Release Notes

This release contains a variety of fixes from 8.1.1. For information about new features in the 8.1 major release, see Section E.216.

E.214.1. Migration to Version 8.1.2

A dump/restore is not required for those running 8.1.X. However, you might need to \texttt{REINDEX} indexes on textual columns after updating, if you are affected by the locale or plperl issues described below.

E.214.2. Changes

- Fix Windows code so that postmaster will continue rather than exit if there is no more room in Shmem-BackendArray (Magnus)
  The previous behavior could lead to a denial-of-service situation if too many connection requests arrive close together. This applies \textit{only} to the Windows port.
- Fix bug introduced in 8.0 that could allow ReadBuffer to return an already-used page as new, potentially causing loss of recently-committed data (Tom)
- Fix for protocol-level Describe messages issued outside a transaction or in a failed transaction (Tom)
- Fix character string comparison for locales that consider different character combinations as equal, such as Hungarian (Tom)
  This might require \texttt{REINDEX} to fix existing indexes on textual columns.
- Set locale environment variables during postmaster startup to ensure that plperl won’t change the locale later
  This fixes a problem that occurred if the postmaster was started with environment variables specifying a different locale than what initdb had been told. Under these conditions, any use of plperl was likely to lead to corrupt indexes. You might need \texttt{REINDEX} to fix existing indexes on textual columns if this has happened to you.
- Allow more flexible relocation of installation directories (Tom)
  Previous releases supported relocation only if all installation directory paths were the same except for the last component.
- Prevent crashes caused by the use of \texttt{ISO-8859-5} and \texttt{ISO-8859-9} encodings (Tatsuo)
- Fix longstanding bug in \texttt{strpos()} and regular expression handling in certain rarely used Asian multi-byte character sets (Tatsuo)
- Fix bug where \texttt{COPY CSV} mode considered any \\ to terminate the copy data
  The new code requires \\ to appear alone on a line, as per documentation.
- Make \texttt{COPY CSV} mode quote a literal data value of \\ to ensure it cannot be interpreted as the end-of-data marker (Bruce)
- Various fixes for functions returning \texttt{RECORDs} (Tom)
- Fix processing of \texttt{postgresql.conf} so a final line with no newline is processed properly (Tom)
Appendix E. Release Notes

- Fix bug in /contrib/pgcrypto gen_salt, which caused it not to use all available salt space for MD5 and XDES algorithms (Marko Kreen, Solar Designer)
  Salts for Blowfish and standard DES are unaffected.
- Fix autovacuum crash when processing expression indexes
- Fix /contrib/dblink to throw an error, rather than crashing, when the number of columns specified is different from what’s actually returned by the query (Joe)

E.215. Release 8.1.1

Release date: 2005-12-12

This release contains a variety of fixes from 8.1.0. For information about new features in the 8.1 major release, see Section E.216.

E.215.1. Migration to Version 8.1.1

A dump/restore is not required for those running 8.1.X.

E.215.2. Changes

- Fix incorrect optimizations of outer-join conditions (Tom)
- Fix problems with wrong reported column names in cases involving sub-selects flattened by the optimizer (Tom)
- Fix update failures in scenarios involving CHECK constraints, toasted columns, and indexes (Tom)
- Fix bgwriter problems after recovering from errors (Tom)
  The background writer was found to leak buffer pins after write errors. While not fatal in itself, this might lead to mysterious blockages of later VACUUM commands.
- Prevent failure if client sends Bind protocol message when current transaction is already aborted
- /contrib/tsearch2 and /contrib/ltree fixes (Teodor)
- Fix problems with translated error messages in languages that require word reordering, such as Turkish; also problems with unexpected truncation of output strings and wrong display of the smallest possible bigint value (Andrew, Tom)
  These problems only appeared on platforms that were using our port/snprintf.c code, which includes BSD variants if --enable-nls was given, and perhaps others. In addition, a different form of the translated-error-message problem could appear on Windows depending on which version of libintl was used.
- Re-allow AM/PM, HH, HH12, and D format specifiers for to_char(time) and to_char(interval). (to_char(interval) should probably use HH24.) (Bruce)
E.216. Release Notes

- AIX, HPUX, and MSVC compile fixes (Tom, Hiroshi Saito)
- Optimizer improvements (Tom)
- Retry file reads and writes after Windows NO_SYSTEM_RESOURCES error (Qingqing Zhou)
- Prevent autovacuum from crashing during ANALYZE of expression index (Alvaro)
- Fix problems with ON COMMIT DELETE ROWS temp tables
- Fix problems when a trigger alters the output of a SELECT DISTINCT query
- Add 8.1.0 release note item on how to migrate invalid UTF-8 byte sequences (Paul Lindner)

E.216. Release 8.1

Release date: 2005-11-08

E.216.1. Overview

Major changes in this release:

Improve concurrent access to the shared buffer cache (Tom)

Access to the shared buffer cache was identified as a significant scalability problem, particularly on multi-CPU systems. In this release, the way that locking is done in the buffer manager has been overhauled to reduce lock contention and improve scalability. The buffer manager has also been changed to use a “clock sweep” replacement policy.

Allow index scans to use an intermediate in-memory bitmap (Tom)

In previous releases, only a single index could be used to do lookups on a table. With this feature, if a query has WHERE tab.col1 = 4 and tab.col2 = 9, and there is no multicolumn index on col1 and col2, but there is an index on col1 and another on col2, it is possible to search both indexes and combine the results in memory, then do heap fetches for only the rows matching both the col1 and col2 restrictions. This is very useful in environments that have a lot of unstructured queries where it is impossible to create indexes that match all possible access conditions. Bitmap scans are useful even with a single index, as they reduce the amount of random access needed; a bitmap index scan is efficient for retrieving fairly large fractions of the complete table, whereas plain index scans are not.

Add two-phase commit (Heikki Linnakangas, Alvaro, Tom)

Two-phase commit allows transactions to be "prepared" on several computers, and once all computers have successfully prepared their transactions (none failed), all transactions can be committed. Even if a machine crashes after a prepare, the prepared transaction can be committed after the machine is restarted. New syntax includes PREPARE TRANSACTION and COMMIT/ROLLBACK PREPARED. A new system view pg_prepared_xacts has also been added.
Create a new role system that replaces users and groups (Stephen Frost)

Roles are a combination of users and groups. Like users, they can have login capability, and like groups, a role can have other roles as members. Roles basically remove the distinction between users and groups. For example, a role can:

• Have login capability (optionally)
• Own objects
• Hold access permissions for database objects
• Inherit permissions from other roles it is a member of

Once a user logs into a role, she obtains capabilities of the login role plus any inherited roles, and can use \texttt{SET ROLE} to switch to other roles she is a member of. This feature is a generalization of the SQL standard’s concept of roles. This change also replaces \texttt{pg\_shadow} and \texttt{pg\_group} by new role-capable catalogs \texttt{pg\_authid} and \texttt{pg\_auth\_members}. The old tables are redefined as read-only views on the new role tables.

Automatically use indexes for \texttt{MIN()} and \texttt{MAX()} (Tom)

In previous releases, the only way to use an index for \texttt{MIN()} or \texttt{MAX()} was to rewrite the query as \texttt{SELECT col FROM tab ORDER BY col LIMIT 1}. Index usage now happens automatically.

Move /contrib/pg\_autovacuum into the main server (Alvaro)

Integrating autovacuum into the server allows it to be automatically started and stopped in sync with the database server, and allows autovacuum to be configured from \texttt{postgresql.conf}.

Add shared row level locks using \texttt{SELECT \ldots FOR SHARE} (Alvaro)

While PostgreSQL’s MVCC locking allows \texttt{SELECT} to never be blocked by writers and therefore does not need shared row locks for typical operations, shared locks are useful for applications that require shared row locking. In particular this reduces the locking requirements imposed by referential integrity checks.

Add dependencies on shared objects, specifically roles (Alvaro)

This extension of the dependency mechanism prevents roles from being dropped while there are still database objects they own. Formerly it was possible to accidentally “orphan” objects by deleting their owner. While this could be recovered from, it was messy and unpleasant.

Improve performance for partitioned tables (Simon)

The new \texttt{constraint\_exclusion} configuration parameter avoids lookups on child tables where constraints indicate that no matching rows exist in the child table.

This allows for a basic type of table partitioning. If child tables store separate key ranges and this is enforced using appropriate \texttt{CHECK} constraints, the optimizer will skip child table accesses when the constraint guarantees no matching rows exist in the child table.

E.216.2. Migration to Version 8.1

A dump/restore using \texttt{pg\_dump} is required for those wishing to migrate data from any previous release.
The 8.0 release announced that the to_char() function for intervals would be removed in 8.1. However, since no better API has been suggested, to_char(interval) has been enhanced in 8.1 and will remain in the server.

Observe the following incompatibilities:

• add_missing_from is now false by default (Neil)

By default, we now generate an error if a table is used in a query without a FROM reference. The old behavior is still available, but the parameter must be set to 'true' to obtain it.

It might be necessary to set add_missing_from to true in order to load an existing dump file, if the dump contains any views or rules created using the implicit-FROM syntax. This should be a one-time annoyance, because PostgreSQL 8.1 will convert such views and rules to standard explicit-FROM syntax. Subsequent dumps will therefore not have the problem.

• Cause input of a zero-length string ("") for float4/float8/oid to throw an error, rather than treating it as a zero (Neil)

This change is consistent with the current handling of zero-length strings for integers. The schedule for this change was announced in 8.0.

• default_with_oids is now false by default (Neil)

With this option set to false, user-created tables no longer have an OID column unless WITH OIDS is specified in CREATE TABLE. Though OIDs have existed in all releases of PostgreSQL, their use is limited because they are only four bytes long and the counter is shared across all installed databases. The preferred way of uniquely identifying rows is via sequences and the SERIAL type, which have been supported since PostgreSQL 6.4.

• Add E” syntax so eventually ordinary strings can treat backslashes literally (Bruce)

Currently PostgreSQL processes a backslash in a string literal as introducing a special escape sequence, e.g. \n or \010. While this allows easy entry of special values, it is nonstandard and makes porting of applications from other databases more difficult. For this reason, the PostgreSQL project is planning to remove the special meaning of backslashes in strings. For backward compatibility and for users who want special backslash processing, a new string syntax has been created. This new string syntax is formed by writing an E immediately preceding the single quote that starts the string, e.g. E’hi
’. While this release does not change the handling of backslashes in strings, it does add new configuration parameters to help users migrate applications for future releases:

• standard_conforming_strings — does this release treat backslashes literally in ordinary strings?

• escape_string_warning — warn about backslashes in ordinary (non-E) strings

The standard_conforming_strings value is read-only. Applications can retrieve the value to know how backslashes are processed. (Presence of the parameter can also be taken as an indication that E” string syntax is supported.) In a future release, standard_conforming_strings will be true, meaning backslashes will be treated literally in non-E strings. To prepare for this change, use E” strings in places that need special backslash processing, and turn on escape_string_warning to find additional strings that need to be converted to use E”. Also, use two single-quotes (") to embed a literal single-quote in a string, rather than the PostgreSQL-supported syntax of backslash single-quote (\'). The former is standards-conforming and does not require the use of the E” string syntax. You can also use the $$ string syntax, which does not treat backslashes specially.
• Make `REINDEX DATABASE` reindex all indexes in the database (Tom)

Formerly, `REINDEX DATABASE` reindexed only system tables. This new behavior seems more intuitive. A new command `REINDEX SYSTEM` provides the old functionality of reindexing just the system tables.

• Read-only large object descriptors now obey MVCC snapshot semantics

When a large object is opened with `INV_READ` (and not `INV_WRITE`), the data read from the descriptor will now reflect a “snapshot” of the large object’s state at the time of the transaction snapshot in use by the query that called `lo_open()`. To obtain the old behavior of always returning the latest committed data, include `INV_WRITE` in the mode flags for `lo_open()`.

• Add proper dependencies for arguments of sequence functions (Tom)

In previous releases, sequence names passed to `nextval()`, `currval()`, and `setval()` were stored as simple text strings, meaning that renaming or dropping a sequence used in a `DEFAULT` clause made the clause invalid. This release stores all newly-created sequence function arguments as internal OIDs, allowing them to track sequence renaming, and adding dependency information that prevents improper sequence removal. It also makes such `DEFAULT` clauses immune to schema renaming and search path changes.

Some applications might rely on the old behavior of run-time lookup for sequence names. This can still be done by explicitly casting the argument to `text`, for example `nextval('myseq'::text)`.

Pre-8.1 database dumps loaded into 8.1 will use the old text-based representation and therefore will not have the features of OID-stored arguments. However, it is possible to update a database containing text-based `DEFAULT` clauses. First, save this query into a file, such as `fixseq.sql`:

```sql
SELECT 'ALTER TABLE ' ||
    pg_catalog.quote_ident(n.nspname) || '.' ||
    pg_catalog.quote_ident(c.relname) ||
    ' ALTER COLUMN ' || pg_catalog.quote_ident(a.attname) ||
    ' SET DEFAULT ' ||
    regexp_replace(d.adsrc,
        $$val\(\('[^']'*')::text\):::regclass$$,
        $$val(\1$$,
        'g') ||
    ';' FROM pg_namespace n, pg_class c, pg_attribute a, pg_attrdef d
WHERE n.oid = c.relnamespace AND
    c.oid = a.attrelid AND
    a.attnum = d.adnum AND
    d.adsrc ~ $$val\(\('[^']*'::text\):::regclass$$;
```

Next, run the query against a database to find what adjustments are required, like this for database `db1`:

```
psql -t -f fixseq.sql db1
```

This will show the `ALTER TABLE` commands needed to convert the database to the newer OID-based representation. If the commands look reasonable, run this to update the database:

```
psql -t -f fixseq.sql db1 | psql -e db1
```

This process must be repeated in each database to be updated.

• In `psql`, treat unquoted `{digit}+` sequences as octal (Bruce)

In previous releases, `{digit}+` sequences were treated as decimal, and only `\0{digit}+` were treated as octal. This change was made for consistency.
Appendix E. Release Notes

- Remove grammar productions for prefix and postfix % and ^ operators (Tom)

  These have never been documented and complicated the use of the modulus operator (%) with negative numbers.

- Make \&< and \&> for polygons consistent with the box "over" operators (Tom)

- `CREATE LANGUAGE` can ignore the provided arguments in favor of information from `pg_pltemplate` (Tom)

  A new system catalog `pg_pltemplate` has been defined to carry information about the preferred definitions of procedural languages (such as whether they have validator functions). When an entry exists in this catalog for the language being created, `CREATE LANGUAGE` will ignore all its parameters except the language name and instead use the catalog information. This measure was taken because of increasing problems with obsolete language definitions being loaded by old dump files. As of 8.1, `pg_dump` will dump procedural language definitions as just `CREATE LANGUAGE name`, relying on a template entry to exist at load time. We expect this will be a more future-proof representation.

- Make `pg_cancel_backend(int)` return a boolean rather than an integer (Neil)

- Some users are having problems loading UTF-8 data into 8.1.X. This is because previous versions allowed invalid UTF-8 byte sequences to be entered into the database, and this release properly accepts only valid UTF-8 sequences. One way to correct a dumpfile is to run the command `iconv -c -f UTF-8 -t UTF-8 -o cleanfile.sql dumpfile.sql`. The `-c` option removes invalid character sequences. A diff of the two files will show the sequences that are invalid. `iconv` reads the entire input file into memory so it might be necessary to use split to break up the dump into multiple smaller files for processing.

E.216.3. Additional Changes

Below you will find a detailed account of the additional changes between PostgreSQL 8.1 and the previous major release.

E.216.3.1. Performance Improvements

- Improve GiST and R-tree index performance (Neil)

- Improve the optimizer, including auto-resizing of hash joins (Tom)

- Overhaul internal API in several areas

- Change WAL record CRCs from 64-bit to 32-bit (Tom)

  We determined that the extra cost of computing 64-bit CRCs was significant, and the gain in reliability too marginal to justify it.

- Prevent writing large empty gaps in WAL pages (Tom)

- Improve spinlock behavior on SMP machines, particularly Opterons (Tom)

- Allow nonconsecutive index columns to be used in a multicolmumn index (Tom)

  For example, this allows an index on columns a,b,c to be used in a query with `WHERE a = 4 and c = 10`. 
• Skip WAL logging for `CREATE TABLE AS / SELECT INTO` (Simon)

Since a crash during `CREATE TABLE AS` would cause the table to be dropped during recovery, there is no reason to WAL log as the table is loaded. (Logging still happens if WAL archiving is enabled, however.)

• Allow concurrent GiST index access (Teodor, Oleg)

• Add configuration parameter `full_page_writes` to control writing full pages to WAL (Bruce)

To prevent partial disk writes from corrupting the database, PostgreSQL writes a complete copy of each database disk page to WAL the first time it is modified after a checkpoint. This option turns off that functionality for more speed. This is safe to use with battery-backed disk caches where partial page writes cannot happen.

• Use `O_DIRECT` if available when using `O_SYNC` for `wal_sync_method` (Itagaki Takahiro)

`O_DIRECT` causes disk writes to bypass the kernel cache, and for WAL writes, this improves performance.

• Improve `COPY` FROM performance (Alon Goldshuv)

This was accomplished by reading `COPY` input in larger chunks, rather than character by character.

• Improve the performance of `COUNT()`, `SUM`, `AVG()`, `STDDEV()`, and `VARIANCE()` (Neil, Tom)

### E.216.3.2. Server Changes

• Prevent problems due to transaction ID (XID) wraparound (Tom)

The server will now warn when the transaction counter approaches the wraparound point. If the counter becomes too close to wraparound, the server will stop accepting queries. This ensures that data is not lost before needed vacuuming is performed.

• Fix problems with object IDs (OIDs) conflicting with existing system objects after the OID counter has wrapped around (Tom)

• Add warning about the need to increase `max_fsm_relations` and `max_fsm_pages` during VACUUM (Ron Mayer)

• Add `temp_buffers` configuration parameter to allow users to determine the size of the local buffer area for temporary table access (Tom)

• Add session start time and client IP address to `pg_stat_activity` (Magnus)

• Adjust `pg_stat` views for bitmap scans (Tom)

  The meanings of some of the fields have changed slightly.

• Enhance `pg_locks` view (Tom)

• Log queries for client-side `PREPARE` and `EXECUTE` (Simon)

• Allow Kerberos name and user name case sensitivity to be specified in `postgresql.conf` (Magnus)

• Add configuration parameter `krb_server_hostname` so that the server host name can be specified as part of service principal (Todd Kover)
If not set, any service principal matching an entry in the keytab can be used. This is new Kerberos matching behavior in this release.

• Add log_line_prefix options for millisecond timestamps (%m) and remote host (%h) (Ed L.)

• Add WAL logging for GiST indexes (Teodor, Oleg)

  GiST indexes are now safe for crash and point-in-time recovery.

• Remove old *.backup files when we do pg_stop_backup() (Bruce)

  This prevents a large number of *.backup files from existing in pg_xlog/.

• Add configuration parameters to control TCP/IP keep-alive times for idle, interval, and count (Oliver Jowett)

  These values can be changed to allow more rapid detection of lost client connections.

• Add per-user and per-database connection limits (Petr Jelinek)

  Using ALTER USER and ALTER DATABASE, limits can now be enforced on the maximum number of sessions that can concurrently connect as a specific user or to a specific database. Setting the limit to zero disables user or database connections.

• Allow more than two gigabytes of shared memory and per-backend work memory on 64-bit machines (Koichi Suzuki)

• New system catalog pg_pltemplate allows overriding obsolete procedural-language definitions in dump files (Tom)

### E.216.3.3. Query Changes

• Add temporary views (Koju Iijima, Neil)

• Fix HAVING without any aggregate functions or GROUP BY so that the query returns a single group (Tom)

  Previously, such a case would treat the HAVING clause the same as a WHERE clause. This was not per spec.

• Add USING clause to allow additional tables to be specified to DELETE (Euler Taveira de Oliveira, Neil)

  In prior releases, there was no clear method for specifying additional tables to be used for joins in a DELETE statement. UPDATE already has a FROM clause for this purpose.

• Add support for \x hex escapes in backend and ecpg strings (Bruce)

  This is just like the standard C \x escape syntax. Octal escapes were already supported.

• Add BETWEEN SYMMETRIC query syntax (Pavel Stehule)

  This feature allows BETWEEN comparisons without requiring the first value to be less than the second. For example, 2 BETWEEN [ASYMMETRIC] 3 AND 1 returns false, while 2 BETWEEN SYMMETRIC 3 AND 1 returns true. BETWEEN ASYMMETRIC was already supported.

• Add NOWAIT option to SELECT ... FOR UPDATE/SHARE (Hans-Juergen Schoenig)
While the statement_timeout configuration parameter allows a query taking more than a certain amount of time to be canceled, the NOWAIT option allows a query to be canceled as soon as a SELECT ... FOR UPDATE/SHARE command cannot immediately acquire a row lock.

E.216.3.4. Object Manipulation Changes

- Track dependencies of shared objects (Alvaro)

PostgreSQL allows global tables (users, databases, tablespaces) to reference information in multiple databases. This addition adds dependency information for global tables, so, for example, user ownership can be tracked across databases, so a user who owns something in any database can no longer be removed. Dependency tracking already existed for database-local objects.

- Allow limited ALTER OWNER commands to be performed by the object owner (Stephen Frost)

Prior releases allowed only superusers to change object owners. Now, ownership can be transferred if the user executing the command owns the object and would be able to create it as the new owner (that is, the user is a member of the new owning role and that role has the CREATE permission that would be needed to create the object afresh).

- Add ALTER object SET SCHEMA capability for some object types (tables, functions, types) (Bernd Helmle)

This allows objects to be moved to different schemas.

- Add ALTER TABLE ENABLE/DISABLE TRIGGER to disable triggers (Satoshi Nagayasu)

E.216.3.5. Utility Command Changes

- Allow TRUNCATE to truncate multiple tables in a single command (Alvaro)

Because of referential integrity checks, it is not allowed to truncate a table that is part of a referential integrity constraint. Using this new functionality, TRUNCATE can be used to truncate such tables, if both tables involved in a referential integrity constraint are truncated in a single TRUNCATE command.

- Properly process carriage returns and line feeds in COPY CSV mode (Andrew)

In release 8.0, carriage returns and line feeds in CSV COPY TO were processed in an inconsistent manner. (This was documented on the TODO list.)

- Add COPY WITH CSV HEADER to allow a header line as the first line in COPY (Andrew)

This allows handling of the common CSV usage of placing the column names on the first line of the data file. For COPY TO, the first line contains the column names, and for COPY FROM, the first line is ignored.

- On Windows, display better sub-second precision in EXPLAIN ANALYZE (Magnus)

- Add trigger duration display to EXPLAIN ANALYZE (Tom)

Prior releases included trigger execution time as part of the total execution time, but did not show it separately. It is now possible to see how much time is spent in each trigger.

- Add support for \x hex escapes in COPY (Sergey Ten)
Previous releases only supported octal escapes.

- Make `SHOW ALL` include variable descriptions (Matthias Schmidt)

  
  ```
  SHOW varname still only displays the variable’s value and does not include the description.
  ```

- Make initdb create a new standard database called `postgres`, and convert utilities to use `postgres` rather than `template1` for standard lookups (Dave)

  In prior releases, `template1` was used both as a default connection for utilities like `createuser`, and as a template for new databases. This caused `CREATE DATABASE` to sometimes fail, because a new database cannot be created if anyone else is in the template database. With this change, the default connection database is now `postgres`, meaning it is much less likely someone will be using `template1` during `CREATE DATABASE`.

- Create new `reindexdb` command-line utility by moving `/contrib/reindexdb` into the server (Euler Taveira de Oliveira)

### E.216.3.6. Data Type and Function Changes

- Add `MAX()` and `MIN()` aggregates for array types (Koju Iijima)

- Fix `to_date()` and `to_timestamp()` to behave reasonably when `CC` and `YY` fields are both used (Karel Zak)

  If the format specification contains `CC` and a year specification is `YYY` or longer, ignore the `CC`. If the year specification is `YY` or shorter, interpret `CC` as the previous century.

- Add `md5(bytea)` (Abhijit Menon-Sen)

  ```
  md5(text) already existed.
  ```

- Add support for `numeric ^ numeric` based on `power(numeric, numeric)`

  The function already existed, but there was no operator assigned to it.

- Fix `NUMERIC` modulus by properly truncating the quotient during computation (Bruce)

  In previous releases, modulus for large values sometimes returned negative results due to rounding of the quotient.

- Add a function `lastval()` (Dennis Björklund)

  ```
  lastval() is a simplified version of currval(). It automatically determines the proper sequence name based on the most recent `nextval()` or `setval()` call performed by the current session.
  ```

- Add `to_timestamp(DOUBLE PRECISION)` (Michael Glaesemann)

  Converts Unix seconds since 1970 to a `TIMESTAMP WITH TIMEZONE`.

- Add `pg_postmaster_start_time()` function (Euler Taveira de Oliveira, Matthias Schmidt)

- Allow the full use of time zone names in `AT TIME ZONE`, not just the short list previously available (Magnus)

  Previously, only a predefined list of time zone names were supported by `AT TIME ZONE`. Now any supported time zone name can be used, e.g.:

  ```
  SELECT CURRENT_TIMESTAMP AT TIME ZONE 'Europe/London';
  ```
Appendix E. Release Notes

In the above query, the time zone used is adjusted based on the daylight saving time rules that were in effect on the supplied date.

- **Add GREATEST() and LEAST() variadic functions (Pavel Stehule)**
  These functions take a variable number of arguments and return the greatest or least value among the arguments.

- **Add pg_column_size() (Mark Kirkwood)**
  This returns storage size of a column, which might be compressed.

- **Add regexp_replace() (Atsushi Ogawa)**
  This allows regular expression replacement, like sed. An optional flag argument allows selection of global (replace all) and case-insensitive modes.

- **Fix interval division and multiplication (Bruce)**
  Previous versions sometimes returned unjustified results, like ‘4 months’::interval / 5 returning ‘1 mon -6 days’.

- **Fix roundoff behavior in timestamp, time, and interval output (Tom)**
  This fixes some cases in which the seconds field would be shown as 60 instead of incrementing the higher-order fields.

- **Add a separate day field to type interval so a one day interval can be distinguished from a 24 hour interval (Michael Glaesemann)**
  Days that contain a daylight saving time adjustment are not 24 hours long, but typically 23 or 25 hours. This change creates a conceptual distinction between intervals of “so many days” and intervals of “so many hours”. Adding 1 day to a timestamp now gives the same local time on the next day even if a daylight saving time adjustment occurs between, whereas adding 24 hours will give a different local time when this happens. For example, under US DST rules:
  
  ‘2005-04-03 00:00:00-05’ + ‘1 day’ = ‘2005-04-04 00:00:00-04’
  ‘2005-04-03 00:00:00-05’ + ‘24 hours’ = ‘2005-04-04 01:00:00-04’

- **Add justify_days() and justify_hours() (Michael Glaesemann)**
  These functions, respectively, adjust days to an appropriate number of full months and days, and adjust hours to an appropriate number of full days and hours.

- **Move /contrib/dbsize into the backend, and rename some of the functions (Dave Page, Andreas Pflug)**

  - pg_tablespace_size()
  - pg_database_size()
  - pg_relation_size()
  - pg_total_relation_size()
  - pg_size_pretty()

  pg_total_relation_size() includes indexes and TOAST tables.

- **Add functions for read-only file access to the cluster directory (Dave Page, Andreas Pflug)**
• pg_stat_file()
• pg_read_file()
• pg_ls_dir()

• Add `pg_reload_conf()` to force reloading of the configuration files (Dave Page, Andreas Pflug)
• Add `pg_rotate_logfile()` to force rotation of the server log file (Dave Page, Andreas Pflug)
• Change `pg_stat_*` views to include TOAST tables (Tom)

### E.216.3.7. Encoding and Locale Changes

• Rename some encodings to be more consistent and to follow international standards (Bruce)
  - UNICODE is now UTF8
  - ALT is now WIN866
  - WIN is now WIN1251
  - TCVN is now WIN1258

  The original names still work.
• Add support for WIN1252 encoding (Roland Volkmann)
• Add support for four-byte UTF8 characters (John Hansen)
  Previously only one, two, and three-byte UTF8 characters were supported. This is particularly important for support for some Chinese character sets.
• Allow direct conversion between EUC_JP and SJIS to improve performance (Atsushi Ogawa)
• Allow the UTF8 encoding to work on Windows (Magnus)
  This is done by mapping UTF8 to the Windows-native UTF16 implementation.

### E.216.3.8. General Server-Side Language Changes

• Fix `ALTER LANGUAGE RENAME` (Sergey Yatskevich)
• Allow function characteristics, like strictness and volatility, to be modified via `ALTER FUNCTION` (Neil)
• Increase the maximum number of function arguments to 100 (Tom)
• Allow SQL and PL/pgSQL functions to use `OUT` and `INOUT` parameters (Tom)

  `OUT` is an alternate way for a function to return values. Instead of using `RETURN`, values can be returned by assigning to parameters declared as `OUT` or `INOUT`. This is notationally simpler in some cases, particularly so when multiple values need to be returned. While returning multiple values from a function was possible in previous releases, this greatly simplifies the process. (The feature will be extended to other server-side languages in future releases.)
Appendix E. Release Notes

• Move language handler functions into the pg_catalog schema
  This makes it easier to drop the public schema if desired.
• Add SPI_getnspname() to SPI (Neil)

E.216.3.9. PL/pgSQL Server-Side Language Changes

• Overhaul the memory management of PL/pgSQL functions (Neil)
  The parsetree of each function is now stored in a separate memory context. This allows this memory to be easily reclaimed when it is no longer needed.
• Check function syntax at CREATE FUNCTION time, rather than at runtime (Neil)
  Previously, most syntax errors were reported only when the function was executed.
• Allow OPEN to open non-SELECT queries like EXPLAIN and SHOW (Tom)
• No longer require functions to issue a RETURN statement (Tom)
  This is a byproduct of the newly added OUT and INOUT functionality. RETURN can be omitted when it is not needed to provide the function’s return value.
• Add support for an optional INTO clause to PL/pgSQL’s EXECUTE statement (Pavel Stehule, Neil)
• Make CREATE TABLE AS set ROW_COUNT (Tom)
• Define SQLSTATE and SQLERRM to return the SQLSTATE and error message of the current exception (Pavel Stehule, Neil)
  These variables are only defined inside exception blocks.
• Allow the parameters to the RAISE statement to be expressions (Pavel Stehule, Neil)
• Add a loop CONTINUE statement (Pavel Stehule, Neil)
• Allow block and loop labels (Pavel Stehule)

E.216.3.10. PL/Perl Server-Side Language Changes

• Allow large result sets to be returned efficiently (Abhijit Menon-Sen)
  This allows functions to use return_next() to avoid building the entire result set in memory.
• Allow one-row-at-a-time retrieval of query results (Abhijit Menon-Sen)
  This allows functions to use spi_query() and spi_fetchrow() to avoid accumulating the entire result set in memory.
• Force PL/Perl to handle strings as UTF8 if the server encoding is UTF8 (David Kamholz)
• Add a validator function for PL/Perl (Andrew)
  This allows syntax errors to be reported at definition time, rather than execution time.
• Allow PL/Perl to return a Perl array when the function returns an array type (Andrew)
  This basically maps PostgreSQL arrays to Perl arrays.
Appendix E. Release Notes

- Allow Perl nonfatal warnings to generate NOTICE messages (Andrew)
- Allow Perl’s strict mode to be enabled (Andrew)

E.216.3.11. psql Changes

- Add \set ON_ERRORROLLBACK to allow statements in a transaction to error without affecting the rest of the transaction (Greg Sabino Mullane)
  This is basically implemented by wrapping every statement in a sub-transaction.
- Add support for \x hex strings in psql variables (Bruce)
  Octal escapes were already supported.
- Add support for triff -ms output format (Roger Leigh)
- Allow the history file location to be controlled by HISTFILE (Andreas Seltenreich)
  This allows configuration of per-database history storage.
- Prevent \x (expanded mode) from affecting the output of \d tablename (Neil)
- Add -L option to psql to log sessions (Lorne Sunley)
  This option was added because some operating systems do not have simple command-line activity logging functionality.
- Make \d show the tablespaces of indexes (Qingqing Zhou)
- Allow psql help (\h) to make a best guess on the proper help information (Greg Sabino Mullane)
  This allows the user to just add \h to the front of the syntax error query and get help on the supported syntax. Previously any additional query text beyond the command name had to be removed to use \h.
- Add \pset numericlocale to allow numbers to be output in a locale-aware format (Eugen Nedelcu)
  For example, using C locale 100000 would be output as 100,000.0 while a European locale might output this value as 100,000,0.
- Make startup banner show both server version number and psql’s version number, when they are different (Bruce)
  Also, a warning will be shown if the server and psql are from different major releases.

E.216.3.12. pg_dump Changes

- Add -n / --schema switch to pg_restore (Richard van den Berg)
  This allows just the objects in a specified schema to be restored.
- Allow pg_dump to dump large objects even in text mode (Tom)
  With this change, large objects are now always dumped; the former -b switch is a no-op.
- Allow pg_dump to dump a consistent snapshot of large objects (Tom)
- Dump comments for large objects (Tom)
• Add --encoding to pg_dump (Magnus Hagander)

This allows a database to be dumped in an encoding that is different from the server’s encoding. This is valuable when transferring the dump to a machine with a different encoding.

• Rely on pg_pltemplate for procedural languages (Tom)

If the call handler for a procedural language is in the pg_catalog schema, pg_dump does not dump the handler. Instead, it dumps the language using just CREATE LANGUAGE name, relying on the pg_pltemplate catalog to provide the language’s creation parameters at load time.

E.216.3.13. libpq Changes

• Add a PGPASSFILE environment variable to specify the password file’s filename (Andrew)

• Add lo_create(), that is similar to lo_creat() but allows the OID of the large object to be specified (Tom)

• Make libpq consistently return an error to the client application on malloc() failure (Neil)

E.216.3.14. Source Code Changes

• Fix pgxs to support building against a relocated installation

• Add spinlock support for the Itanium processor using Intel compiler (Vikram Kalsi)

• Add Kerberos 5 support for Windows (Magnus)

• Add Chinese FAQ (laser@pgsql.com)

• Rename Rendezvous to Bonjour to match OS/X feature renaming (Bruce)

• Add support for fsync_writethrough on Darwin (Chris Campbell)

• Streamline the passing of information within the server, the optimizer, and the lock system (Tom)

• Allow pg_config to be compiled using MSVC (Andrew)

  This is required to build DBD::Pg using MSVC.

• Remove support for Kerberos V4 (Magnus)

  Kerberos 4 had security vulnerabilities and is no longer maintained.

• Code cleanups (Coverity static analysis performed by EnterpriseDB)

• Modify postgresql.conf to use documentation defaults on/off rather than true/false (Bruce)

• Enhance pg_config to be able to report more build-time values (Tom)

• Allow libpq to be built thread-safe on Windows (Dave Page)

• Allow IPv6 connections to be used on Windows (Andrew)

• Add Server Administration documentation about I/O subsystem reliability (Bruce)

• Move private declarations from gist.h to gist_private.h (Neil)
In previous releases, `gist.h` contained both the public GiST API (intended for use by authors of GiST index implementations) as well as some private declarations used by the implementation of GiST itself. The latter have been moved to a separate file, `gist_private.h`. Most GiST index implementations should be unaffected.

- Overhaul GiST memory management (Neil)
  GiST methods are now always invoked in a short-lived memory context. Therefore, memory allocated via `palloc()` will be reclaimed automatically, so GiST index implementations do not need to manually release allocated memory via `pfree()`.

### E.216.3.15. Contrib Changes

- Add `/contrib/pg_buffercache` contrib module (Mark Kirkwood)
  This displays the contents of the buffer cache, for debugging and performance tuning purposes.
- Remove `/contrib/array` because it is obsolete (Tom)
- Clean up the `/contrib/lo` module (Tom)
- Move `/contrib/findoidjoins` to `/src/tools` (Tom)
- Remove the `<<`, `>>`, `&<<`, and `&>>` operators from `/contrib/cube`
  These operators were not useful.
- Improve `/contrib/btree_gist` (Janko Richter)
- Improve `/contrib/pgbench` (Tomoaki Sato, Tatsuo)
  There is now a facility for testing with SQL command scripts given by the user, instead of only a hard-wired command sequence.
- Improve `/contrib/pgcrypto` (Marko Kreen)
  - Implementation of OpenPGP symmetric-key and public-key encryption
    - Both RSA and Elgamal public-key algorithms are supported.
  - Stand alone build: include SHA256/384/512 hashes, Fortuna PRNG
  - OpenSSL build: support 3DES, use internal AES with OpenSSL < 0.9.7
  - Take build parameters (OpenSSL, zlib) from `configure` result
    - There is no need to edit the `Makefile` anymore.
  - Remove support for `libmhash` and `libmcrypt`

### E.217. Release 8.0.26

**Release date:** 2010-10-04
This release contains a variety of fixes from 8.0.25. For information about new features in the 8.0 major release, see Section E.243.

This is expected to be the last PostgreSQL release in the 8.0.X series. Users are encouraged to update to a newer release branch soon.

E.217.1. Migration to Version 8.0.26

A dump/restore is not required for those running 8.0.X. However, if you are upgrading from a version earlier than 8.0.22, see Section E.221.

E.217.2. Changes

- Use a separate interpreter for each calling SQL userid in PL/Perl and PL/Tcl (Tom Lane)

  This change prevents security problems that can be caused by subverting Perl or Tcl code that will be executed later in the same session under another SQL user identity (for example, within a SECURITY DEFINER function). Most scripting languages offer numerous ways that that might be done, such as redefining standard functions or operators called by the target function. Without this change, any SQL user with Perl or Tcl language usage rights can do essentially anything with the SQL privileges of the target function’s owner.

  The cost of this change is that intentional communication among Perl and Tcl functions becomes more difficult. To provide an escape hatch, PL/PerlU and PL/TclU functions continue to use only one interpreter per session. This is not considered a security issue since all such functions execute at the trust level of a database superuser already.

  It is likely that third-party procedural languages that claim to offer trusted execution have similar security issues. We advise contacting the authors of any PL you are depending on for security-critical purposes.

  Our thanks to Tim Bunce for pointing out this issue (CVE-2010-3433).

- Prevent possible crashes in pg_get_expr() by disallowing it from being called with an argument that is not one of the system catalog columns it’s intended to be used with (Heikki Linnakangas, Tom Lane)

- Fix “cannot handle unplanned sub-select” error (Tom Lane)

  This occurred when a sub-select contains a join alias reference that expands into an expression containing another sub-select.

- Defend against functions returning setof record where not all the returned rows are actually of the same rowtype (Tom Lane)

- Take care to fsync the contents of lockfiles (both postmaster.pid and the socket lockfile) while writing them (Tom Lane)

  This omission could result in corrupted lockfile contents if the machine crashes shortly after postmaster start. That could in turn prevent subsequent attempts to start the postmaster from succeeding, until the lockfile is manually removed.

- Avoid recursion while assigning XIDs to heavily-nested subtransactions (Andres Freund, Robert Haas)
The original coding could result in a crash if there was limited stack space.

- Fix `log_line_prefix's %i escape, which could produce junk early in backend startup (Tom Lane)
- Fix possible data corruption in `ALTER TABLE ... SET TABLESPACE` when archiving is enabled (Jeff Davis)
- Allow `CREATE DATABASE` and `ALTER DATABASE ... SET TABLESPACE` to be interrupted by query-cancel (Guillaume Lelarge)
- In PL/Python, defend against null pointer results from `PyCObject_AsVoidPtr` and `PyCObject_FromVoidPtr` (Peter Eisentraut)
- Improve contrib/dblink’s handling of tables containing dropped columns (Tom Lane)
- Fix connection leak after “duplicate connection name” errors in contrib/dblink (Itagaki Takahiro)
- Fix contrib/dblink to handle connection names longer than 62 bytes correctly (Itagaki Takahiro)
- Update build infrastructure and documentation to reflect the source code repository’s move from CVS to Git (Magnus Hagander and others)
- Update time zone data files to tzdata release 2010l for DST law changes in Egypt and Palestine; also historical corrections for Finland.

This change also adds new names for two Micronesian time zones: Pacific/Chuuk is now preferred over Pacific/Truk (and the preferred abbreviation is CHUT not TRUT) and Pacific/Pohnpei is preferred over Pacific/Ponape.

### E.218. Release 8.0.25

**Release date:** 2010-05-17

This release contains a variety of fixes from 8.0.24. For information about new features in the 8.0 major release, see Section E.243.

The PostgreSQL community will stop releasing updates for the 8.0.X release series in July 2010. Users are encouraged to update to a newer release branch soon.

### E.218.1. Migration to Version 8.0.25

A dump/restore is not required for those running 8.0.X. However, if you are upgrading from a version earlier than 8.0.22, see Section E.221.

### E.218.2. Changes

- Enforce restrictions in `plperl` using an opmask applied to the whole interpreter, instead of using `Safe.pm` (Tim Bunce, Andrew Dunstan)

Recent developments have convinced us that `Safe.pm` is too insecure to rely on for making `plperl` trustable. This change removes use of `Safe.pm` altogether, in favor of using a separate interpreter with
Appendix E. Release Notes

an opcode mask that is always applied. Pleasant side effects of the change include that it is now possible to use Perl's `strict` pragma in a natural way in `plperl`, and that Perl's `$a` and `$b` variables work as expected in sort routines, and that function compilation is significantly faster. (CVE-2010-1169)

- Prevent PL/Tcl from executing untrustworthy code from `pltcl_modules` (Tom)

  PL/Tcl’s feature for autoloading Tcl code from a database table could be exploited for trojan-horse attacks, because there was no restriction on who could create or insert into that table. This change disables the feature unless `pltcl_modules` is owned by a superuser. (However, the permissions on the table are not checked, so installations that really need a less-than-secure modules table can still grant suitable privileges to trusted non-superusers.) Also, prevent loading code into the unrestricted “normal” Tcl interpreter unless we are really going to execute a `pltclu` function. (CVE-2010-1170)

- Do not allow an unprivileged user to reset superuser-only parameter settings (Alvaro)

  Previously, if an unprivileged user ran `ALTER USER ... RESET ALL` for himself, or `ALTER DATABASE ... RESET ALL` for a database he owns, this would remove all special parameter settings for the user or database, even ones that are only supposed to be changeable by a superuser. Now, the `ALTER` will only remove the parameters that the user has permission to change.

- Avoid possible crash during backend shutdown if shutdown occurs when a `CONTEXT` addition would be made to log entries (Tom)

  In some cases the context-printing function would fail because the current transaction had already been rolled back when it came time to print a log message.

- Update `pl/perl`'s `ppport.h` for modern Perl versions (Andrew)

- Fix assorted memory leaks in `pl/python` (Andreas Freund, Tom)

- Prevent infinite recursion in `psql` when expanding a variable that refers to itself (Tom)

- Ensure that `contrib/pgstattuple` functions respond to cancel interrupts promptly (Tatsuhito Kashiwara)

- Make server startup deal properly with the case that `shmget()` returns `EINVAL` for an existing shared memory segment (Tom)

  This behavior has been observed on BSD-derived kernels including OS X. It resulted in an entirely-misleading startup failure complaining that the shared memory request size was too large.

- Update time zone data files to `tzdata` release 2010j for DST law changes in Argentina, Australian Antarctic, Bangladesh, Mexico, Morocco, Pakistan, Palestine, Russia, Syria, Tunisia; also historical corrections for Taiwan.

E.219. Release 8.0.24

Release date: 2010-03-15

This release contains a variety of fixes from 8.0.23. For information about new features in the 8.0 major release, see Section E.243.

The PostgreSQL community will stop releasing updates for the 8.0.X release series in July 2010. Users are encouraged to update to a newer release branch soon.
Appendix E. Release Notes

E.219.1. Migration to Version 8.0.24

A dump/restore is not required for those running 8.0.X. However, if you are upgrading from a version earlier than 8.0.22, see Section E.221.

E.219.2. Changes

- Add new configuration parameter `ssl_renegotiation_limit` to control how often we do session key renegotiation for an SSL connection (Magnus)
  
  This can be set to zero to disable renegotiation completely, which may be required if a broken SSL library is used. In particular, some vendors are shipping stopgap patches for CVE-2009-3555 that cause renegotiation attempts to fail.

- Fix possible crashes when trying to recover from a failure in subtransaction start (Tom)

- Fix server memory leak associated with use of savepoints and a client encoding different from server’s encoding (Tom)

- Make `substring()` for bit types treat any negative length as meaning “all the rest of the string” (Tom)
  
  The previous coding treated only -1 that way, and would produce an invalid result value for other negative values, possibly leading to a crash (CVE-2010-0442).

- Fix integer-to-bit-string conversions to handle the first fractional byte correctly when the output bit width is wider than the given integer by something other than a multiple of 8 bits (Tom)

- Fix some cases of pathologically slow regular expression matching (Tom)

- Fix the `STOP WAL LOCATION` entry in backup history files to report the next WAL segment’s name when the end location is exactly at a segment boundary (Itagaki Takahiro)

- When reading `pg_hba.conf` and related files, do not treat `@something` as a file inclusion request if the `@` appears inside quote marks; also, never treat `@` by itself as a file inclusion request (Tom)
  
  This prevents erratic behavior if a role or database name starts with `@`. If you need to include a file whose path name contains spaces, you can still do so, but you must write `@"/path to/file"` rather than putting the quotes around the whole construct.

- Prevent infinite loop on some platforms if a directory is named as an inclusion target in `pg_hba.conf` and related files (Tom)

- Fix `plpgsql` failure in one case where a composite column is set to NULL (Tom)

- Add `volatile` markings in PL/Python to avoid possible compiler-specific misbehavior (Zdenek Kotala)

- Ensure PL/Tcl initializes the Tcl interpreter fully (Tom)
  
  The only known symptom of this oversight is that the Tcl `clock` command misbehaves if using Tcl 8.5 or later.

- Prevent crash in `contrib/dblink` when too many key columns are specified to a `dblink_build_sql_*` function (Rushabh Lathia, Joe Conway)

- Fix assorted crashes in `contrib/xml2` caused by sloppy memory management (Tom)
Appendix E. Release Notes

- Update time zone data files to tzdata release 2010e for DST law changes in Bangladesh, Chile, Fiji, Mexico, Paraguay, Samoa.

E.220. Release 8.0.23

Release date: 2009-12-14

This release contains a variety of fixes from 8.0.22. For information about new features in the 8.0 major release, see Section E.243.

E.220.1. Migration to Version 8.0.23

A dump/restore is not required for those running 8.0.X. However, if you are upgrading from a version earlier than 8.0.22, see Section E.221.

E.220.2. Changes

- Protect against indirect security threats caused by index functions changing session-local state (Gurjeet Singh, Tom)

  This change prevents allegedly-immutable index functions from possibly subverting a superuser’s session (CVE-2009-4136).

- Reject SSL certificates containing an embedded null byte in the common name (CN) field (Magnus)

  This prevents unintended matching of a certificate to a server or client name during SSL validation (CVE-2009-4034).

- Fix possible crash during backend-startup-time cache initialization (Tom)

- Prevent signals from interrupting VACUUM at unsafe times (Alvaro)

  This fix prevents a PANIC if a VACUUM FULL is canceled after it’s already committed its tuple movements, as well as transient errors if a plain VACUUM is interrupted after having truncated the table.

- Fix possible crash due to integer overflow in hash table size calculation (Tom)

  This could occur with extremely large planner estimates for the size of a hashjoin’s result.

- Fix very rare crash in inet/cidr comparisons (Chris Mikkelson)

- Fix premature drop of temporary files used for a cursor that is accessed within a subtransaction (Heikki)

- Fix PAM password processing to be more robust (Tom)

  The previous code is known to fail with the combination of the Linux pam_krb5 PAM module with Microsoft Active Directory as the domain controller. It might have problems elsewhere too, since it was making unjustified assumptions about what arguments the PAM stack would pass to it.

- Fix rare crash in exception processing in PL/Python (Peter)

- Ensure psql’s flex module is compiled with the correct system header definitions (Tom)
This fixes build failures on platforms where `--enable-largefile` causes incompatible changes in the generated code.

- Make the postmaster ignore any application_name parameter in connection request packets, to improve compatibility with future libpq versions (Tom)
- Update time zone data files to tzdata release 2009s for DST law changes in Antarctica, Argentina, Bangladesh, Fiji, Novokuznetsk, Pakistan, Palestine, Samoa, Syria; also historical corrections for Hong Kong.

### E.221. Release 8.0.22

**Release date:** 2009-09-09

This release contains a variety of fixes from 8.0.21. For information about new features in the 8.0 major release, see Section E.243.

#### E.221.1. Migration to Version 8.0.22

A dump/restore is not required for those running 8.0.X. However, if you have any hash indexes on interval columns, you must REINDEX them after updating to 8.0.22. Also, if you are upgrading from a version earlier than 8.0.6, see Section E.237.

#### E.221.2. Changes

- Disallow `RESET ROLE` and `RESET SESSION AUTHORIZATION` inside security-definer functions (Tom, Heikki)
  
  This covers a case that was missed in the previous patch that disallowed `SET ROLE` and `SET SESSION AUTHORIZATION` inside security-definer functions. (See CVE-2007-6600)

- Fix handling of sub-SELECTs appearing in the arguments of an outer-level aggregate function (Tom)

- Fix hash calculation for data type `interval` (Tom)
  
  This corrects wrong results for hash joins on interval values. It also changes the contents of hash indexes on interval columns. If you have any such indexes, you must REINDEX them after updating.

- Treat `to_char(..., 'TH')` as an uppercase ordinal suffix with ‘HH’/’HH12’ (Heikki)
  
  It was previously handled as ‘th’ (lowercase).

- Fix overflow for `INTERVAL ‘x ms’` when x is more than 2 million and integer datetimes are in use (Alex Hunsaker)

- Fix calculation of distance between a point and a line segment (Tom)
  
  This led to incorrect results from a number of geometric operators.

- Fix `money` data type to work in locales where currency amounts have no fractional digits, e.g. Japan (Itagaki Takahiro)
Appendix E. Release Notes

• Properly round datetime input like 00:12:57.9999999999999999999999999999999999 (Tom)
• Fix poor choice of page split point in GiST R-tree operator classes (Teodor)
• Fix portability issues in plperl initialization (Andrew Dunstan)
• Fix pg_ctl to not go into an infinite loop if postgresql.conf is empty (Jeff Davis)
• Fix contrib/xml2’s xslt_process() to properly handle the maximum number of parameters (twenty) (Tom)
• Improve robustness of libpq’s code to recover from errors during COPY FROM STDIN (Tom)
• Avoid including conflicting readline and editline header files when both libraries are installed (Zdenek Kotala)
• Update time zone data files to tzdata release 2009l for DST law changes in Bangladesh, Egypt, Jordan, Pakistan, Argentina/San_Luis, Cuba, Jordan (historical correction only), Mauritius, Morocco, Palestine, Syria, Tunisia.

E.222. Release 8.0.21

Release date: 2009-03-16

This release contains a variety of fixes from 8.0.20. For information about new features in the 8.0 major release, see Section E.243.

E.222.1. Migration to Version 8.0.21

A dump/restore is not required for those running 8.0.X. However, if you are upgrading from a version earlier than 8.0.6, see Section E.237.

E.222.2. Changes

• Prevent error recursion crashes when encoding conversion fails (Tom)

  This change extends fixes made in the last two minor releases for related failure scenarios. The previous fixes were narrowly tailored for the original problem reports, but we have now recognized that any error thrown by an encoding conversion function could potentially lead to infinite recursion while trying to report the error. The solution therefore is to disable translation and encoding conversion and report the plain-ASCII form of any error message, if we find we have gotten into a recursive error reporting situation. (CVE-2009-0922)

•Disallow CREATE CONVERSION with the wrong encodings for the specified conversion function (Heikki)

  This prevents one possible scenario for encoding conversion failure. The previous change is a backstop to guard against other kinds of failures in the same area.
• Fix core dump when \texttt{to\_char()} is given format codes that are inappropriate for the type of the data argument (Tom)
• Add \texttt{MUST} (Mauritius Island Summer Time) to the default list of known timezone abbreviations (Xavier Bugaud)

\section*{E.223. Release 8.0.20}

\textbf{Release date:} 2009-02-02

This release contains a variety of fixes from 8.0.19. For information about new features in the 8.0 major release, see Section E.243.

\section*{E.223.1. Migration to Version 8.0.20}

A dump/restore is not required for those running 8.0.X. However, if you are upgrading from a version earlier than 8.0.6, see Section E.237.

\section*{E.223.2. Changes}

• Improve handling of URLs in \texttt{headline()} function (Teodor)
• Improve handling of overlength headlines in \texttt{headline()} function (Teodor)
• Prevent possible Assert failure or misconversion if an encoding conversion is created with the wrong conversion function for the specified pair of encodings (Tom, Heikki)
• Avoid unnecessary locking of small tables in \texttt{VACUUM} (Heikki)
• Fix uninitialized variables in \texttt{contrib/tsearch2's get\_covers()} function (Teodor)
• Make all documentation reference \texttt{pgsql\_bugs} and/or \texttt{pgsql\_hackers} as appropriate, instead of the now-decommissioned \texttt{pgsql\_ports} and \texttt{pgsql\_patches} mailing lists (Tom)
• Update time zone data files to \texttt{tzdata} release 2009a (for Kathmandu and historical DST corrections in Switzerland, Cuba)

\section*{E.224. Release 8.0.19}

\textbf{Release date:} 2008-11-03

This release contains a variety of fixes from 8.0.18. For information about new features in the 8.0 major release, see Section E.243.
E.224.1. Migration to Version 8.0.19

A dump/restore is not required for those running 8.0.X. However, if you are upgrading from a version earlier than 8.0.6, see Section E.237.

E.224.2. Changes

- Fix backend crash when the client encoding cannot represent a localized error message (Tom)
  
  We have addressed similar issues before, but it would still fail if the “character has no equivalent” message itself couldn’t be converted. The fix is to disable localization and send the plain ASCII error message when we detect such a situation.

- Fix possible crash when deeply nested functions are invoked from a trigger (Tom)

- Ensure an error is reported when a newly-defined PL/pgSQL trigger function is invoked as a normal function (Tom)

- Fix incorrect tsearch2 headline generation when single query item matches first word of text (Sushant Sinha)

- Fix improper display of fractional seconds in interval values when using a non-ISO datestyle in an --enable-integer-datetimes build (Ron Mayer)

- Ensure SPI_getvalue and SPI_getbinval behave correctly when the passed tuple and tuple descriptor have different numbers of columns (Tom)
  
  This situation is normal when a table has had columns added or removed, but these two functions didn’t handle it properly. The only likely consequence is an incorrect error indication.

- Fix ecpg’s parsing of CREATE USER (Michael)

- Fix recent breakage of pg_ctl restart (Tom)

- Update time zone data files to tzdata release 2008i (for DST law changes in Argentina, Brazil, Mauritius, Syria)

E.225. Release 8.0.18

Release date: 2008-09-22

This release contains a variety of fixes from 8.0.17. For information about new features in the 8.0 major release, see Section E.243.

E.225.1. Migration to Version 8.0.18

A dump/restore is not required for those running 8.0.X. However, if you are upgrading from a version earlier than 8.0.6, see Section E.237.
E.225.2. Changes

- Widen local lock counters from 32 to 64 bits (Tom)
  This responds to reports that the counters could overflow in sufficiently long transactions, leading to unexpected “lock is already held” errors.

- Add checks in executor startup to ensure that the tuples produced by an INSERT or UPDATE will match the target table’s current rowtype (Tom)
  ALTER COLUMN TYPE, followed by re-use of a previously cached plan, could produce this type of situation. The check protects against data corruption and/or crashes that could ensue.

- Fix datetime input functions to correctly detect integer overflow when running on a 64-bit platform (Tom)

- Improve performance of writing very long log messages to syslog (Tom)

- Fix bug in backwards scanning of a cursor on a SELECT DISTINCT ON query (Tom)

- Fix planner to estimate that GROUP BY expressions yielding boolean results always result in two groups, regardless of the expressions’ contents (Tom)
  This is very substantially more accurate than the regular GROUP BY estimate for certain boolean tests like col IS NULL.

- Fix PL/Tcl to behave correctly with Tcl 8.5, and to be more careful about the encoding of data sent to or from Tcl (Tom)

- Fix PL/Python to work with Python 2.5
  This is a back-port of fixes made during the 8.2 development cycle.

- Improve pg_dump and pg_restore’s error reporting after failure to send a SQL command (Tom)

- Fix pg_ctl to properly preserve postmaster command-line arguments across a restart (Bruce)

- Update time zone data files to tzdata release 2008f (for DST law changes in Argentina, Bahamas, Brazil, Mauritius, Morocco, Pakistan, Palestine, and Paraguay)

E.226. Release 8.0.17

Release date: 2008-06-12
This release contains one serious bug fix over 8.0.16. For information about new features in the 8.0 major release, see Section E.243.

E.226.1. Migration to Version 8.0.17

A dump/restore is not required for those running 8.0.X. However, if you are upgrading from a version earlier than 8.0.6, see Section E.237.
Appendix E. Release Notes

E.226.2. Changes

- Make `pg_get_ruledef()` parenthesize negative constants (Tom)

Before this fix, a negative constant in a view or rule might be dumped as, say, `-42::integer`, which is subtly incorrect: it should be `(-42)::integer` due to operator precedence rules. Usually this would make little difference, but it could interact with another recent patch to cause PostgreSQL to reject what had been a valid `SELECT DISTINCT` view query. Since this could result in `pg_dump` output failing to reload, it is being treated as a high-priority fix. The only released versions in which dump output is actually incorrect are 8.3.1 and 8.2.7.

E.227. Release 8.0.16

Release date: never released

This release contains a variety of fixes from 8.0.15. For information about new features in the 8.0 major release, see Section E.243.

E.227.1. Migration to Version 8.0.16

A dump/restore is not required for those running 8.0.X. However, if you are upgrading from a version earlier than 8.0.6, see Section E.237.

E.227.2. Changes

- Fix `ALTER TABLE ADD COLUMN ... PRIMARY KEY` so that the new column is correctly checked to see if it’s been initialized to all non-nulls (Brendan Jurd)

  Previous versions neglected to check this requirement at all.

- Fix possible `CREATE TABLE` failure when inheriting the “same” constraint from multiple parent relations that inherited that constraint from a common ancestor (Tom)

- Fix conversions between ISO-8859-5 and other encodings to handle Cyrillic “Yo” characters (е and Е with two dots) (Sergey Burladyan)

- Fix a few datatype input functions that were allowing unused bytes in their results to contain uninitialized, unpredictable values (Tom)

  This could lead to failures in which two apparently identical literal values were not seen as equal, resulting in the parser complaining about unmatched `ORDER BY` and `DISTINCT` expressions.

- Fix a corner case in regular-expression substring matching (`substring(string from pattern)`) (Tom)

  The problem occurs when there is a match to the pattern overall but the user has specified a parenthesized subexpression and that subexpression hasn’t got a match. An example is `substring('foo'
Appendix E. Release Notes

from ’foo(bar)?’). This should return NULL, since (bar) isn’t matched, but it was mistakenly returning the whole-pattern match instead (ie, foo).

- Update time zone data files to tzdata release 2008c (for DST law changes in Morocco, Iraq, Choibalsan, Pakistan, Syria, Cuba, Argentina/San_Luis, and Chile)
- Fix incorrect result from ecpg’s PGTYPEStimestamp_sub() function (Michael)
- Fix core dump in contrib/xml2’s xpath_table() function when the input query returns a NULL value (Tom)
- Fix contrib/xml2’s makefile to not override CFLAGS (Tom)
- Fix DatumGetBool macro to not fail with gcc 4.3 (Tom)
  This problem affects “old style” (V0) C functions that return boolean. The fix is already in 8.3, but the need to back-patch it was not realized at the time.
- Fix longstanding LISTEN/NOTIFY race condition (Tom)
  In rare cases a session that had just executed a LISTEN might not get a notification, even though one would be expected because the concurrent transaction executing NOTIFY was observed to commit later.
  A side effect of the fix is that a transaction that has executed a not-yet-committed LISTEN command will not see any row in pg_listener for the LISTEN, should it choose to look; formerly it would have. This behavior was never documented one way or the other, but it is possible that some applications depend on the old behavior.
- Fix rare crash when an error occurs during a query using a hash index (Heikki)
- Fix input of datetime values for February 29 in years BC (Tom)
  The former coding was mistaken about which years were leap years.
- Fix “unrecognized node type” error in some variants of ALTER OWNER (Tom)
- Fix pg_ctl to correctly extract the postmaster’s port number from command-line options (Itagaki Takahiro, Tom)
  Previously, pg_ctl start -w could try to contact the postmaster on the wrong port, leading to bogus reports of startup failure.
- Use -fwrapv to defend against possible misoptimization in recent gcc versions (Tom)
  This is known to be necessary when building PostgreSQL with gcc 4.3 or later.
- Fix display of constant expressions in ORDER BY and GROUP BY (Tom)
  An explicitly casted constant would be shown incorrectly. This could for example lead to corruption of a view definition during dump and reload.
- Fix libpq to handle NOTICE messages correctly during COPY OUT (Tom)
  This failure has only been observed to occur when a user-defined datatype’s output routine issues a NOTICE, but there is no guarantee it couldn’t happen due to other causes.
Appendix E. Release Notes

E.228. Release 8.0.15

Release date: 2008-01-07

This release contains a variety of fixes from 8.0.14, including fixes for significant security issues. For information about new features in the 8.0 major release, see Section E.243.

This is the last 8.0.X release for which the PostgreSQL community will produce binary packages for Windows. Windows users are encouraged to move to 8.2.X or later, since there are Windows-specific fixes in 8.2.X that are impractical to back-port. 8.0.X will continue to be supported on other platforms.

E.228.1. Migration to Version 8.0.15

A dump/restore is not required for those running 8.0.X. However, if you are upgrading from a version earlier than 8.0.6, see Section E.237.

E.228.2. Changes

• Prevent functions in indexes from executing with the privileges of the user running VACUUM, ANALYZE, etc (Tom)

Functions used in index expressions and partial-index predicates are evaluated whenever a new table entry is made. It has long been understood that this poses a risk of trojan-horse code execution if one modifies a table owned by an untrustworthy user. (Note that triggers, defaults, check constraints, etc. pose the same type of risk.) But functions in indexes pose extra danger because they will be executed by routine maintenance operations such as VACUUM FULL, which are commonly performed automatically under a superuser account. For example, a nefarious user can execute code with superuser privileges by setting up a trojan-horse index definition and waiting for the next routine vacuum. The fix arranges for standard maintenance operations (including VACUUM, ANALYZE, REINDEX, and CLUSTER) to execute as the table owner rather than the calling user, using the same privilege-switching mechanism already used for SECURITY DEFINER functions. To prevent bypassing this security measure, execution of SET SESSION AUTHORIZATION and SET ROLE is now forbidden within a SECURITY DEFINER context. (CVE-2007-6600)

• Repair assorted bugs in the regular-expression package (Tom, Will Drewry)

Suitably crafted regular-expression patterns could cause crashes, infinite or near-infinite looping, and/or massive memory consumption, all of which pose denial-of-service hazards for applications that accept regex search patterns from untrustworthy sources. (CVE-2007-4769, CVE-2007-4772, CVE-2007-6067)

• Require non-superusers who use /contrib/dblink to use only password authentication, as a security measure (Joe)

The fix that appeared for this in 8.0.14 was incomplete, as it plugged the hole for only some dblink functions. (CVE-2007-6601, CVE-2007-3278)

• Update time zone data files to tzdata release 2007k (in particular, recent Argentina changes) (Tom)

• Fix planner failure in some cases of WHERE false AND var IN (SELECT ...) (Tom)
• Preserve the tablespace of indexes that are rebuilt by ALTER TABLE ... ALTER COLUMN TYPE (Tom)

• Make archive recovery always start a new WAL timeline, rather than only when a recovery stop time was used (Simon)

  This avoids a corner-case risk of trying to overwrite an existing archived copy of the last WAL segment, and seems simpler and cleaner than the original definition.

• Make VACUUM not use all of maintenance_work_mem when the table is too small for it to be useful (Alvaro)

• Fix potential crash in translate() when using a multibyte database encoding (Tom)

• Fix PL/Perl to cope when platform’s Perl defines type bool as int rather than char (Tom)

  While this could theoretically happen anywhere, no standard build of Perl did things this way ... until Mac OS X 10.5.

• Fix PL/Python to not crash on long exception messages (Alvaro)

• Fix pg_dump to correctly handle inheritance child tables that have default expressions different from their parent’s (Tom)

• ecpg parser fixes (Michael)

• Make contrib/tablefunc's crosstab() handle NULL rowid as a category in its own right, rather than crashing (Joe)

• Fix tsvector and tsquery output routines to escape backslashes correctly (Teodor, Bruce)

• Fix crash of to_tsvector() on huge input strings (Teodor)

• Require a specific version of Autoconf to be used when re-generating the configure script (Peter)

  This affects developers and packagers only. The change was made to prevent accidental use of untested combinations of Autoconf and PostgreSQL versions. You can remove the version check if you really want to use a different Autoconf version, but it’s your responsibility whether the result works or not.

**E.229. Release 8.0.14**

**Release date:** 2007-09-17

This release contains a variety of fixes from 8.0.13. For information about new features in the 8.0 major release, see Section E.243.

**E.229.1. Migration to Version 8.0.14**

A dump/restore is not required for those running 8.0.X. However, if you are upgrading from a version earlier than 8.0.6, see Section E.237.
E.229.2. Changes

- Prevent index corruption when a transaction inserts rows and then aborts close to the end of a concurrent `VACUUM` on the same table (Tom)
- Make `CREATE DOMAIN ... DEFAULT NULL` work properly (Tom)
- Fix excessive logging of SSL error messages (Tom)
- Fix logging so that log messages are never interleaved when using the `syslogger` process (Andrew)
- Fix crash when `log_min_error_statement` logging runs out of memory (Tom)
- Fix incorrect handling of some foreign-key corner cases (Tom)
- Prevent `CLUSTER` from failing due to attempting to process temporary tables of other sessions (Alvaro)
- Update the time zone database rules, particularly New Zealand’s upcoming changes (Tom)
- Windows socket improvements (Magnus)
- Suppress timezone name (`%Z`) in log timestamps on Windows because of possible encoding mismatches (Tom)
- Require non-superusers who use `/contrib/dblink` to use only password authentication, as a security measure (Joe)

E.230. Release 8.0.13

**Release date:** 2007-04-23

This release contains a variety of fixes from 8.0.12, including a security fix. For information about new features in the 8.0 major release, see Section E.243.

E.230.1. Migration to Version 8.0.13

A dump/restore is not required for those running 8.0.X. However, if you are upgrading from a version earlier than 8.0.6, see Section E.237.

E.230.2. Changes

- Support explicit placement of the temporary-table schema within `search_path`, and disable searching it for functions and operators (Tom)
  
  This is needed to allow a security-definer function to set a truly secure value of `search_path`. Without it, an unprivileged SQL user can use temporary objects to execute code with the privileges of the security-definer function (CVE-2007-2138). See `CREATE FUNCTION` for more information.
- `/contrib/tsearch2` crash fixes (Teodor)
- Fix potential-data-corruption bug in how `VACUUM FULL` handles `UPDATE` chains (Tom, Pavan Deolasee)
• Fix PANIC during enlargement of a hash index (bug introduced in 8.0.10) (Tom)
• Fix POSIX-style timezone specs to follow new USA DST rules (Tom)

E.231. Release 8.0.12

Release date: 2007-02-07
This release contains one fix from 8.0.11. For information about new features in the 8.0 major release, see Section E.243.

E.231.1. Migration to Version 8.0.12
A dump/restore is not required for those running 8.0.X. However, if you are upgrading from a version earlier than 8.0.6, see Section E.237.

E.231.2. Changes

• Remove overly-restrictive check for type length in constraints and functional indexes (Tom)

E.232. Release 8.0.11

Release date: 2007-02-05
This release contains a variety of fixes from 8.0.10, including a security fix. For information about new features in the 8.0 major release, see Section E.243.

E.232.1. Migration to Version 8.0.11
A dump/restore is not required for those running 8.0.X. However, if you are upgrading from a version earlier than 8.0.6, see Section E.237.

E.232.2. Changes

• Remove security vulnerabilities that allowed connected users to read backend memory (Tom)
  The vulnerabilities involve suppressing the normal check that a SQL function returns the data type it’s declared to, and changing the data type of a table column (CVE-2007-0555, CVE-2007-0556). These errors can easily be exploited to cause a backend crash, and in principle might be used to read database content that the user should not be able to access.
• Fix rare bug wherein btree index page splits could fail due to choosing an infeasible split point (Heikki Linnakangas)
• Fix for rare Assert() crash triggered by UNION (Tom)
• Tighten security of multi-byte character processing for UTF8 sequences over three bytes long (Tom)

E.233. Release 8.0.10

Release date: 2007-01-08
This release contains a variety of fixes from 8.0.9. For information about new features in the 8.0 major release, see Section E.243.

E.233.1. Migration to Version 8.0.10
A dump/restore is not required for those running 8.0.X. However, if you are upgrading from a version earlier than 8.0.6, see Section E.237.

E.233.2. Changes

• Improve handling of getaddrinfo() on AIX (Tom)
  This fixes a problem with starting the statistics collector, among other things.
• Fix “failed to re-find parent key” errors in VACUUM (Tom)
• Fix race condition for truncation of a large relation across a gigabyte boundary by VACUUM (Tom)
• Fix bugs affecting multi-gigabyte hash indexes (Tom)
• Fix possible deadlock in Windows signal handling (Teodor)
• Fix error when constructing an ARRAY[] made up of multiple empty elements (Tom)
• Fix ecpg memory leak during connection (Michael)
• to_number() and to_char(numeric) are now STABLE, not IMMUTABLE, for new initdb installs (Tom)
  This is because lc_numeric can potentially change the output of these functions.
• Improve index usage of regular expressions that use parentheses (Tom)
  This improves psql \d performance also.
• Update timezone database
  This affects Australian and Canadian daylight-savings rules in particular.
E.234. Release 8.0.9

Release date: 2006-10-16

This release contains a variety of fixes from 8.0.8. For information about new features in the 8.0 major release, see Section E.243.

E.234.1. Migration to Version 8.0.9

A dump/restore is not required for those running 8.0.X. However, if you are upgrading from a version earlier than 8.0.6, see Section E.237.

E.234.2. Changes

• Fix crash when referencing NEW row values in rule WHERE expressions (Tom)
• Fix core dump when an untyped literal is taken as ANYARRAY
• Fix mishandling of AFTER triggers when query contains a SQL function returning multiple rows (Tom)
• Fix ALTER TABLE ... TYPE to recheck NOT NULL for USING clause (Tom)
• Fix string_to_array() to handle overlapping matches for the separator string
  For example, string_to_array('123xx456xxx789', 'xx').
• Fix corner cases in pattern matching for psql’s \d commands
• Fix index-corrupting bugs in /contrib/ltree (Teodor)
• Numerous robustness fixes in ecpg (Joachim Wieland)
• Fix backslash escaping in /contrib/dbmirror
• Fix instability of statistics collection on Win32 (Tom, Andrew)
• Fixes for AIX and Intel compilers (Tom)

E.235. Release 8.0.8

Release date: 2006-05-23

This release contains a variety of fixes from 8.0.7, including patches for extremely serious security issues. For information about new features in the 8.0 major release, see Section E.243.

E.235.1. Migration to Version 8.0.8

A dump/restore is not required for those running 8.0.X. However, if you are upgrading from a version earlier than 8.0.6, see Section E.237.
Full security against the SQL-injection attacks described in CVE-2006-2313 and CVE-2006-2314 might require changes in application code. If you have applications that embed untrustworthy strings into SQL commands, you should examine them as soon as possible to ensure that they are using recommended escaping techniques. In most cases, applications should be using subroutines provided by libraries or drivers (such as libpq’s PQescapeStringConn()) to perform string escaping, rather than relying on ad hoc code to do it.

## E.235.2. Changes

- **Change the server to reject invalidly-encoded multibyte characters in all cases (Tatsuo, Tom)**
  While PostgreSQL has been moving in this direction for some time, the checks are now applied uniformly to all encodings and all textual input, and are now always errors not merely warnings. This change defends against SQL-injection attacks of the type described in CVE-2006-2313.

- **Reject unsafe uses of \' in string literals**
  As a server-side defense against SQL-injection attacks of the type described in CVE-2006-2314, the server now only accepts ‘” and not \’ as a representation of ASCII single quote in SQL string literals. By default, \’ is rejected only when client_encoding is set to a client-only encoding (SJIS, BIG5, GBK, GB18030, or UHC), which is the scenario in which SQL injection is possible. A new configuration parameter `backslash_quote` is available to adjust this behavior when needed. Note that full security against CVE-2006-2314 might require client-side changes; the purpose of `backslash_quote` is in part to make it obvious that insecure clients are insecure.

- **Modify libpq’s string-escaping routines to be aware of encoding considerations and standard_conforming_strings**
  This fixes libpq-using applications for the security issues described in CVE-2006-2313 and CVE-2006-2314, and also future-proofs them against the planned changeover to SQL-standard string literal syntax. Applications that use multiple PostgreSQL connections concurrently should migrate to PQescapeStringConn() and PQescapeByteaConn() to ensure that escaping is done correctly for the settings in use in each database connection. Applications that do string escaping “by hand” should be modified to rely on library routines instead.

- **Fix some incorrect encoding conversion functions**
  `win1251_to_iso`, `alt_to_iso`, `euc_tw_to_big5`, `euc_tw_to_mic`, `mic_to_euc_tw` were all broken to varying extents.

- **Clean up stray remaining uses of \’ in strings (Bruce, Jan)**

- **Fix bug that sometimes caused OR’d index scans to miss rows they should have returned**

- **Fix WAL replay for case where a btree index has been truncated**

- **Fix SIMILAR TO for patterns involving | (Tom)**

- **Fix SELECT INTO and CREATE TABLE AS to create tables in the default tablespace, not the base directory (Kris Jurka)**

- **Fix server to use custom DH SSL parameters correctly (Michael Fuhr)**

- **Fix for Bonjour on Intel Macs (Ashley Clark)**
• Fix various minor memory leaks
• Fix problem with password prompting on some Win32 systems (Robert Kinberg)

E.236. Release 8.0.7

Release date: 2006-02-14

This release contains a variety of fixes from 8.0.6. For information about new features in the 8.0 major release, see Section E.243.

E.236.1. Migration to Version 8.0.7

A dump/restore is not required for those running 8.0.X. However, if you are upgrading from a version earlier than 8.0.6, see Section E.237.

E.236.2. Changes

• Fix potential crash in \texttt{SET SESSION AUTHORIZATION} (CVE-2006-0553)
  An unprivileged user could crash the server process, resulting in momentary denial of service to other users, if the server has been compiled with Asserts enabled (which is not the default). Thanks to Akio Ishida for reporting this problem.
• Fix bug with row visibility logic in self-inserted rows (Tom)
  Under rare circumstances a row inserted by the current command could be seen as already valid, when it should not be. Repairs bug created in 8.0.4, 7.4.9, and 7.3.11 releases.
• Fix race condition that could lead to “file already exists” errors during \texttt{pg_clog} and \texttt{pg_subtrans} file creation (Tom)
• Fix cases that could lead to crashes if a cache-invalidation message arrives at just the wrong time (Tom)
• Properly check \texttt{DOMAIN} constraints for \texttt{UNKNOWN} parameters in prepared statements (Neil)
• Ensure \texttt{ALTER COLUMN TYPE} will process \texttt{FOREIGN KEY}, \texttt{UNIQUE}, and \texttt{PRIMARY KEY} constraints in the proper order (Nakano Yoshihisa)
• Fixes to allow restoring dumps that have cross-schema references to custom operators or operator classes (Tom)
• Allow \texttt{pg_restore} to continue properly after a \texttt{COPY} failure; formerly it tried to treat the remaining \texttt{COPY} data as SQL commands (Stephen Frost)
• Fix \texttt{pg_ctl unregister} crash when the data directory is not specified (Magnus)
• Fix ecpg crash on AMD64 and PPC (Neil)
• Recover properly if error occurs during argument passing in PL/python (Neil)
• Fix PL/perl’s handling of locales on Win32 to match the backend (Andrew)
• Fix crash when `log_min_messages` is set to `DEBUG3` or above in `postgresql.conf` on Win32 (Bruce)

• Fix `pgxs -L` library path specification for Win32, Cygwin, OS X, AIX (Bruce)

• Check that SID is enabled while checking for Win32 admin privileges (Magnus)

• Properly reject out-of-range date inputs (Kris Jurka)

• Portability fix for testing presence of `finite` and `isinf` during configure (Tom)

---

**E.237. Release 8.0.6**

**Release date:** 2006-01-09

This release contains a variety of fixes from 8.0.5. For information about new features in the 8.0 major release, see Section E.243.

**E.237.1. Migration to Version 8.0.6**

A dump/restore is not required for those running 8.0.X. However, if you are upgrading from a version earlier than 8.0.3, see Section E.240. Also, you might need to `REINDEX` indexes on textual columns after updating, if you are affected by the locale or plperl issues described below.

**E.237.2. Changes**

• Fix Windows code so that postmaster will continue rather than exit if there is no more room in Shmem-BackendArray (Magnus)

  The previous behavior could lead to a denial-of-service situation if too many connection requests arrive close together. This applies only to the Windows port.

• Fix bug introduced in 8.0 that could allow ReadBuffer to return an already-used page as new, potentially causing loss of recently-committed data (Tom)

• Fix for protocol-level Describe messages issued outside a transaction or in a failed transaction (Tom)

• Fix character string comparison for locales that consider different character combinations as equal, such as Hungarian (Tom)

  This might require `REINDEX` to fix existing indexes on textual columns.

• Set locale environment variables during postmaster startup to ensure that plperl won’t change the locale later

  This fixes a problem that occurred if the postmaster was started with environment variables specifying a different locale than what initdb had been told. Under these conditions, any use of plperl was likely to lead to corrupt indexes. You might need `REINDEX` to fix existing indexes on textual columns if this has happened to you.

• Allow more flexible relocation of installation directories (Tom)
Previous releases supported relocation only if all installation directory paths were the same except for the last component.

- Fix longstanding bug in strpos() and regular expression handling in certain rarely used Asian multi-byte character sets (Tatsuo)
- Various fixes for functions returning RECORDS (Tom)
- Fix bug in /contrib/pgcrypto gen_salt, which caused it not to use all available salt space for MD5 and XDES algorithms (Marko Kreen, Solar Designer)
  Salts for Blowfish and standard DES are unaffected.
- Fix /contrib/dblink to throw an error, rather than crashing, when the number of columns specified is different from what's actually returned by the query (Joe)

E.238. Release 8.0.5

Release date: 2005-12-12

This release contains a variety of fixes from 8.0.4. For information about new features in the 8.0 major release, see Section E.243.

E.238.1. Migration to Version 8.0.5

A dump/restore is not required for those running 8.0.X. However, if you are upgrading from a version earlier than 8.0.3, see Section E.240.

E.238.2. Changes

- Fix race condition in transaction log management
  There was a narrow window in which an I/O operation could be initiated for the wrong page, leading to an Assert failure or data corruption.
- Fix bgwriter problems after recovering from errors (Tom)
  The background writer was found to leak buffer pins after write errors. While not fatal in itself, this might lead to mysterious blockages of later VACUUM commands.
- Prevent failure if client sends Bind protocol message when current transaction is already aborted
- /contrib/ltree fixes (Teodor)
- AIX and HPUX compile fixes (Tom)
- Retry file reads and writes after Windows NO_SYSTEM_RESOURCES error (Qingqing Zhou)
- Fix intermittent failure when log_line_prefix includes %%i
- Fix psql performance issue with long scripts on Windows (Merlin Moncure)
- Fix missing updates of pg_group flat file
• Fix longstanding planning error for outer joins
  This bug sometimes caused a bogus error “RIGHT JOIN is only supported with merge-joinable join conditions”.
• Postpone timezone initialization until after postmaster.pid is created
  This avoids confusing startup scripts that expect the pid file to appear quickly.
• Prevent core dump in pg_autovacuum when a table has been dropped
• Fix problems with whole-row references (foo.*) to subquery results

E.239. Release 8.0.4

Release date: 2005-10-04
This release contains a variety of fixes from 8.0.3. For information about new features in the 8.0 major release, see Section E.243.

E.239.1. Migration to Version 8.0.4
A dump/restore is not required for those running 8.0.X. However, if you are upgrading from a version earlier than 8.0.3, see Section E.240.

E.239.2. Changes

• Fix error that allowed VACUUM to remove ctid chains too soon, and add more checking in code that follows ctid links
  This fixes a long-standing problem that could cause crashes in very rare circumstances.
• Fix CHAR() to properly pad spaces to the specified length when using a multiple-byte character set (Yoshiyuki Asaba)
  In prior releases, the padding of CHAR() was incorrect because it only padded to the specified number of bytes without considering how many characters were stored.
• Force a checkpoint before committing CREATE DATABASE
  This should fix recent reports of “index is not a btree” failures when a crash occurs shortly after CREATE DATABASE.
• Fix the sense of the test for read-only transaction in COPY
  The code formerly prohibited COPY TO, where it should prohibit COPY FROM.
• Handle consecutive embedded newlines in COPY CSV-mode input
• Fix date_trunc(week) for dates near year end
• Fix planning problem with outer-join ON clauses that reference only the inner-side relation
Appendix E. Release Notes

- Further fixes for \texttt{x FULL JOIN y ON true} corner cases
- Fix overenthusiastic optimization of \texttt{x IN (SELECT DISTINCT ...)} and related cases
- Fix mis-planning of queries with small \texttt{LIMIT} values due to poorly thought out “fuzzy” cost comparison
- Make \texttt{array_in} and \texttt{array_recv} more paranoid about validating their OID parameter
- Fix missing rows in queries like \texttt{UPDATE a=... WHERE a... with GiST index on column a}
- Improve robustness of datetime parsing
- Improve checking for partially-written WAL pages
- Improve robustness of signal handling when SSL is enabled
- Improve MIPS and M68K spinlock code
- Don’t try to open more than \texttt{max_files_per_process} files during postmaster startup
- Various memory leakage fixes
- Various portability improvements
- Update timezone data files
- Improve handling of DLL load failures on Windows
- Improve random-number generation on Windows
- Make \texttt{psql -f filename} return a nonzero exit code when opening the file fails
- Change \texttt{pg_dump} to handle inherited check constraints more reliably
- Fix password prompting in \texttt{pg_restore} on Windows
- Fix PL/pgSQL to handle \texttt{var := var} correctly when the variable is of pass-by-reference type
- Fix PL/Perl \texttt{$_SHARED} so it’s actually shared
- Fix \texttt{contrib/pg_autovacuum} to allow sleep intervals over 2000 sec
- Update \texttt{contrib/tsearch2} to use current Snowball code

E.240. Release 8.0.3

Release date: 2005-05-09

This release contains a variety of fixes from 8.0.2, including several security-related issues. For information about new features in the 8.0 major release, see Section E.243.

E.240.1. Migration to Version 8.0.3

A dump/restore is not required for those running 8.0.X. However, it is one possible way of handling two significant security problems that have been found in the initial contents of 8.0.X system catalogs. A dump/initdb/reload sequence using 8.0.3’s initdb will automatically correct these problems.

The larger security problem is that the built-in character set encoding conversion functions can be invoked from SQL commands by unprivileged users, but the functions were not designed for such use and are not
secure against malicious choices of arguments. The fix involves changing the declared parameter list of these functions so that they can no longer be invoked from SQL commands. (This does not affect their normal use by the encoding conversion machinery.)

The lesser problem is that the `contrib/tsearch2` module creates several functions that are improperly declared to return `internal` when they do not accept `internal` arguments. This breaks type safety for all functions using `internal` arguments.

It is strongly recommended that all installations repair these errors, either by initdb or by following the manual repair procedure given below. The errors at least allow unprivileged database users to crash their server process, and might allow unprivileged users to gain the privileges of a database superuser.

If you wish not to do an initdb, perform the same manual repair procedures shown in the 7.4.8 release notes.

### E.240.2. Changes

- Change encoding function signature to prevent misuse
- Change `contrib/tsearch2` to avoid unsafe use of `INTERNAL` function results
- Guard against incorrect second parameter to `record_out`
- Repair ancient race condition that allowed a transaction to be seen as committed for some purposes (eg `SELECT FOR UPDATE`) slightly sooner than for other purposes
  - This is an extremely serious bug since it could lead to apparent data inconsistencies being briefly visible to applications.
- Repair race condition between relation extension and VACUUM
  - This could theoretically have caused loss of a page’s worth of freshly-inserted data, although the scenario seems of very low probability. There are no known cases of it having caused more than an Assert failure.
- Fix comparisons of `TIME WITH TIME ZONE` values
  - The comparison code was wrong in the case where the `--enable-integer-datetimes` configuration switch had been used. NOTE: if you have an index on a `TIME WITH TIME ZONE` column, it will need to be REINDEXed after installing this update, because the fix corrects the sort order of column values.
- Fix `EXTRACT(EPOCH)` for `TIME WITH TIME ZONE` values
- Fix mis-display of negative fractional seconds in `INTERVAL` values
  - This error only occurred when the `--enable-integer-datetimes` configuration switch had been used.
- Fix `pg_dump` to dump trigger names containing `%` correctly (Neil)
- Still more 64-bit fixes for `contrib/intagg`
- Prevent incorrect optimization of functions returning `RECORD`
- Prevent crash on `COALESCE (NULL, NULL)`
Appendix E. Release Notes

- Fix Borland makefile for libpq
- Fix contrib/btree_gist for timetz type (Teodor)
- Make pg_ctl check the PID found in postmaster.pid to see if it is still a live process
- Fix pg_dump/pg_restore problems caused by addition of dump timestamps
- Fix interaction between materializing holdable cursors and firing deferred triggers during transaction commit
- Fix memory leak in SQL functions returning pass-by-reference data types

E.241. Release 8.0.2

Release date: 2005-04-07

This release contains a variety of fixes from 8.0.1. For information about new features in the 8.0 major release, see Section E.243.

E.241.1. Migration to Version 8.0.2

A dump/restore is not required for those running 8.0.*. This release updates the major version number of the PostgreSQL libraries, so it might be necessary to re-link some user applications if they cannot find the properly-numbered shared library.

E.241.2. Changes

- Increment the major version number of all interface libraries (Bruce)
  This should have been done in 8.0.0. It is required so 7.4.X versions of PostgreSQL client applications, like psql, can be used on the same machine as 8.0.X applications. This might require re-linking user applications that use these libraries.
- Add Windows-only wal_sync_method setting of fsync_writethrough (Magnus, Bruce)
  This setting causes PostgreSQL to write through any disk-drive write cache when writing to WAL. This behavior was formerly called fsync, but was renamed because it acts quite differently from fsync on other platforms.
- Enable the wal_sync_method setting of open_datarasync on Windows, and make it the default for that platform (Magnus, Bruce)
  Because the default is no longer fsync_writethrough, data loss is possible during a power failure if the disk drive has write caching enabled. To turn off the write cache on Windows, from the Device Manager, choose the drive properties, then Policies.
- New cache management algorithm 2Q replaces ARC (Tom)
  This was done to avoid a pending US patent on ARC. The 2Q code might be a few percentage points slower than ARC for some work loads. A better cache management algorithm will appear in 8.1.
Appendix E. Release Notes

• Planner adjustments to improve behavior on freshly-created tables (Tom)

• Allow plpgsql to assign to an element of an array that is initially NULL (Tom)
  Formerly the array would remain NULL, but now it becomes a single-element array. The main SQL engine was changed to handle UPDATE of a null array value this way in 8.0, but the similar case in plpgsql was overlooked.

• Convert 
  and 
  to 
  in plpython function bodies (Michael Fuhr)
  This prevents syntax errors when plpython code is written on a Windows or Mac client.

• Allow SPI cursors to handle utility commands that return rows, such as EXPLAIN (Tom)

• Fix CLUSTER failure after ALTER TABLE SET WITHOUT OIDS (Tom)

• Reduce memory usage of ALTER TABLE ADD COLUMN (Neil)

• Fix ALTER LANGUAGE RENAME (Tom)

• Document the Windows-only register and unregister options of pg_ctl (Magnus)

• Ensure operations done during backend shutdown are counted by statistics collector
  This is expected to resolve reports of pg_autovacuum not vacuuming the system catalogs often enough — it was not being told about catalog deletions caused by temporary table removal during backend exit.

• Change the Windows default for configuration parameter log_destination to eventlog (Magnus)
  By default, a server running on Windows will now send log output to the Windows event logger rather than standard error.

• Make Kerberos authentication work on Windows (Magnus)

• Allow ALTER DATABASE RENAME by superusers who aren’t flagged as having CREATEDB privilege (Tom)

• Modify WAL log entries for CREATE and DROP DATABASE to not specify absolute paths (Tom)
  This allows point-in-time recovery on a different machine with possibly different database location. Note that CREATE TABLESPACE still poses a hazard in such situations.

• Fix crash from a backend exiting with an open transaction that created a table and opened a cursor on it (Tom)

• Fix array_map() so it can call PL functions (Tom)

• Several contrib/tsearch2 and contrib/btree_gist fixes (Teodor)

• Fix crash of some contrib/pgcrypto functions on some platforms (Marko Kreen)

• Fix contrib/intagg for 64-bit platforms (Tom)

• Fix ecpg bugs in parsing of CREATE statement (Michael)

• Work around gcc bug on powerpc and amd64 causing problems in ecpg (Christof Petig)

• Do not use locale-aware versions of upper(), lower(), and initcap() when the locale is C (Bruce)
  This allows these functions to work on platforms that generate errors for non-7-bit data when the locale is C.

• Fix quote_ident() to quote names that match keywords (Tom)

• Fix to_date() to behave reasonably when CC and YY fields are both used (Karel)
Appendix E. Release Notes

- Prevent `to_char(interval)` from failing when given a zero-month interval (Tom)
- Fix wrong week returned by `date_trunc('week')` (Bruce)
  
  `date_trunc('week')` returned the wrong year for the first few days of January in some years.
- Use the correct default mask length for class D addresses in INET data types (Tom)

E.242. Release 8.0.1

**Release date:** 2005-01-31

This release contains a variety of fixes from 8.0.0, including several security-related issues. For information about new features in the 8.0 major release, see Section E.243.

E.242.1. Migration to Version 8.0.1

A dump/restore is not required for those running 8.0.0.

E.242.2. Changes

- Disallow `LOAD` to non-superusers
  
  On platforms that will automatically execute initialization functions of a shared library (this includes at least Windows and ELF-based Unixen), `LOAD` can be used to make the server execute arbitrary code. Thanks to NGS Software for reporting this.
- Check that creator of an aggregate function has the right to execute the specified transition functions
  
  This oversight made it possible to bypass denial of EXECUTE permission on a function.
- Fix security and 64-bit issues in contrib/intagg
- Add needed STRICT marking to some contrib functions (Kris Jurka)
- Avoid buffer overrun when plpgsql cursor declaration has too many parameters (Neil)
- Make `ALTER TABLE ADD COLUMN` enforce domain constraints in all cases
- Fix planning error for FULL and RIGHT outer joins
  
  The result of the join was mistakenly supposed to be sorted the same as the left input. This could not only deliver mis-sorted output to the user, but in case of nested merge joins could give outright wrong answers.
- Improve planning of grouped aggregate queries
- `ROLLBACK TO savepoint` closes cursors created since the savepoint
- Fix inadequate backend stack size on Windows
- Avoid SHGetSpecialFolderPath() on Windows (Magnus)
- Fix some problems in running `pg_autovacuum` as a Windows service (Dave Page)
Appendix E. Release Notes

- Multiple minor bug fixes in pg_dump/pg_restore
- Fix ecpg segfault with named structs used in typedefs (Michael)

E.243. Release 8.0

Release date: 2005-01-19

E.243.1. Overview

Major changes in this release:

Microsoft Windows Native Server

This is the first PostgreSQL release to run natively on Microsoft Windows® as a server. It can run as a Windows service. This release supports NT-based Windows releases like Windows 2000 SP4, Windows XP, and Windows 2003. Older releases like Windows 95, Windows 98, and Windows ME are not supported because these operating systems do not have the infrastructure to support PostgreSQL. A separate installer project has been created to ease installation on Windows — see http://www.postgresql.org/ftp/win32/.

Although tested throughout our release cycle, the Windows port does not have the benefit of years of use in production environments that PostgreSQL has on Unix platforms. Therefore it should be treated with the same level of caution as you would a new product.

Previous releases required the Unix emulation toolkit Cygwin in order to run the server on Windows operating systems. PostgreSQL has supported native clients on Windows for many years.

Savepoints

Savepoints allow specific parts of a transaction to be aborted without affecting the remainder of the transaction. Prior releases had no such capability; there was no way to recover from a statement failure within a transaction except by aborting the whole transaction. This feature is valuable for application writers who require error recovery within a complex transaction.

Point-In-Time Recovery

In previous releases there was no way to recover from disk drive failure except to restore from a previous backup or use a standby replication server. Point-in-time recovery allows continuous backup of the server. You can recover either to the point of failure or to some transaction in the past.

Tablespaces

Tablespaces allow administrators to select different file systems for storage of individual tables, indexes, and databases. This improves performance and control over disk space usage. Prior releases used initlocation and manual symlink management for such tasks.

Improved Buffer Management, CHECKPOINT, VACUUM

This release has a more intelligent buffer replacement strategy, which will make better use of available shared buffers and improve performance. The performance impact of vacuum and checkpoints is also lessened.
Appendix E. Release Notes

Change Column Types

A column’s data type can now be changed with `ALTER TABLE`.

New Perl Server-Side Language

A new version of the plperl server-side language now supports a persistent shared storage area, triggers, returning records and arrays of records, and SPI calls to access the database.

Comma-separated-value (CSV) support in `COPY`

`COPY` can now read and write comma-separated-value files. It has the flexibility to interpret nonstandard quoting and separation characters too.

E.243.2. Migration to Version 8.0

A dump/restore using `pg_dump` is required for those wishing to migrate data from any previous release.

Observe the following incompatibilities:

- In `READ COMMITTED` serialization mode, volatile functions now see the results of concurrent transactions committed up to the beginning of each statement within the function, rather than up to the beginning of the interactive command that called the function.
- Functions declared `STABLE` or `IMMUTABLE` always use the snapshot of the calling query, and therefore do not see the effects of actions taken after the calling query starts, whether in their own transaction or other transactions. Such a function must be read-only, too, meaning that it cannot use any SQL commands other than `SELECT`.
- Nondeferred `AFTER` triggers are now fired immediately after completion of the triggering query, rather than upon finishing the current interactive command. This makes a difference when the triggering query occurred within a function: the trigger is invoked before the function proceeds to its next operation.
- Server configuration parameters `virtual_host` and `tcpip_socket` have been replaced with a more general parameter `listen_addresses`. Also, the server now listens on `localhost` by default, which eliminates the need for the `-i` postmaster switch in many scenarios.
- Server configuration parameters `SortMem` and `VacuumMem` have been renamed to `work_mem` and `maintenance_work_mem` to better reflect their use. The original names are still supported in `SET` and `SHOW`.
- Server configuration parameters `log_pid`, `log_timestamp`, and `log_source_port` have been replaced with a more general parameter `log_line_prefix`.
- Server configuration parameter `syslog` has been replaced with a more logical `log_destination` variable to control the log output destination.
- Server configuration parameter `log_statement` has been changed so it can selectively log just database modification or data definition statements. Server configuration parameter `log_duration` now prints only when `log_statement` prints the query.
- Server configuration parameter `max_expr_depth` parameter has been replaced with `max_stack_depth` which measures the physical stack size rather than the expression nesting depth. This helps prevent session termination due to stack overflow caused by recursive functions.
- The `length()` function no longer counts trailing spaces in `CHAR(n)` values.
Appendix E. Release Notes

• Casting an integer to BIT(N) selects the rightmost N bits of the integer, not the leftmost N bits as before.
• Updating an element or slice of a NULL array value now produces a nonnull array result, namely an array containing just the assigned-to positions.
• Syntax checking of array input values has been tightened up considerably. Junk that was previously allowed in odd places with odd results now causes an error. Empty-string element values must now be written as "", rather than writing nothing. Also changed behavior with respect to whitespace surrounding array elements: trailing whitespace is now ignored, for symmetry with leading whitespace (which has always been ignored).
• Overflow in integer arithmetic operations is now detected and reported as an error.
• The arithmetic operators associated with the single-byte "char" data type have been removed.
• The extract() function (also called date_part) now returns the proper year for BC dates. It previously returned one less than the correct year. The function now also returns the proper values for millennium and century.
• CIDR values now must have their nonmasked bits be zero. For example, we no longer allow 204.248.199.1/31 as a CIDR value. Such values should never have been accepted by PostgreSQL and will now be rejected.
• EXECUTE now returns a completion tag that matches the executed statement.
• psql’s \copy command now reads or writes to the query’s stdin/stdout, rather than psql’s stdin/stdout. The previous behavior can be accessed via new pstdin/pstdout parameters.
• The JDBC client interface has been removed from the core distribution, and is now hosted at http://jdbc.postgresql.org.
• The Tcl client interface has also been removed. There are several Tcl interfaces now hosted at http://gborg.postgresql.org.
• The server now uses its own time zone database, rather than the one supplied by the operating system. This will provide consistent behavior across all platforms. In most cases, there should be little noticeable difference in time zone behavior, except that the time zone names used by SET/SHOW TimeZone might be different from what your platform provides.
• Configure’s threading option no longer requires users to run tests or edit configuration files; threading options are now detected automatically.
• Now that tablespaces have been implemented, initlocation has been removed.
• The API for user-defined GiST indexes has been changed. The Union and PickSplit methods are now passed a pointer to a special GistEntryVector structure, rather than a bytea.

E.243.3. Deprecated Features

Some aspects of PostgreSQL’s behavior have been determined to be suboptimal. For the sake of backward compatibility these have not been removed in 8.0, but they are considered deprecated and will be removed in the next major release.

• The 8.1 release will remove the to_char() function for intervals.
• The server now warns of empty strings passed to `oid/float4/float8` data types, but continues to interpret them as zeroes as before. In the next major release, empty strings will be considered invalid input for these data types.

• By default, tables in PostgreSQL 8.0 and earlier are created with OIDs. In the next release, this will not be the case: to create a table that contains OIDs, the `WITH OIDS` clause must be specified or the `default_with_oids` configuration parameter must be set. Users are encouraged to explicitly specify `WITH OIDS` if their tables require OIDs for compatibility with future releases of PostgreSQL.

E.243.4. Changes

Below you will find a detailed account of the changes between release 8.0 and the previous major release.

E.243.4.1. Performance Improvements

• Support cross-data-type index usage (Tom)
  Before this change, many queries would not use an index if the data types did not match exactly. This improvement makes index usage more intuitive and consistent.

• New buffer replacement strategy that improves caching (Jan)
  Prior releases used a least-recently-used (LRU) cache to keep recently referenced pages in memory. The LRU algorithm did not consider the number of times a specific cache entry was accessed, so large table scans could force out useful cache pages. The new cache algorithm uses four separate lists to track most recently used and most frequently used cache pages and dynamically optimize their replacement based on the work load. This should lead to much more efficient use of the shared buffer cache. Administrators who have tested shared buffer sizes in the past should retest with this new cache replacement policy.

• Add subprocess to write dirty buffers periodically to reduce checkpoint writes (Jan)
  In previous releases, the checkpoint process, which runs every few minutes, would write all dirty buffers to the operating system’s buffer cache then flush all dirty operating system buffers to disk. This resulted in a periodic spike in disk usage that often hurt performance. The new code uses a background writer to trickle disk writes at a steady pace so checkpoints have far fewer dirty pages to write to disk. Also, the new code does not issue a global `sync()` call, but instead `fsync()`s just the files written since the last checkpoint. This should improve performance and minimize degradation during checkpoints.

• Add ability to prolong vacuum to reduce performance impact (Jan)
  On busy systems, `VACUUM` performs many I/O requests which can hurt performance for other users. This release allows you to slow down `VACUUM` to reduce its impact on other users, though this increases the total duration of `VACUUM`.

• Improve B-tree index performance for duplicate keys (Dmitry Tkach, Tom)
  This improves the way indexes are scanned when many duplicate values exist in the index.

• Use dynamically-generated table size estimates while planning (Tom)
  Formerly the planner estimated table sizes using the values seen by the last `VACUUM` or `ANALYZE`, both as to physical table size (number of pages) and number of rows. Now, the current physical table size is obtained from the kernel, and the number of rows is estimated by multiplying the table size by the
row density (rows per page) seen by the last \texttt{VACUUM} or \texttt{ANALYZE}. This should produce more reliable estimates in cases where the table size has changed significantly since the last housekeeping command.

- Improved index usage with \texttt{OR} clauses (Tom)
  
  This allows the optimizer to use indexes in statements with many \texttt{OR} clauses that would not have been indexed in the past. It can also use multi-column indexes where the first column is specified and the second column is part of an \texttt{OR} clause.

- Improve matching of partial index clauses (Tom)
  
  The server is now smarter about using partial indexes in queries involving complex \texttt{WHERE} clauses.

- Improve performance of the GEQO optimizer (Tom)
  
  The GEQO optimizer is used to plan queries involving many tables (by default, twelve or more). This release speeds up the way queries are analyzed to decrease time spent in optimization.

- Miscellaneous optimizer improvements
  
  There is not room here to list all the minor improvements made, but numerous special cases work better than in prior releases.

- Improve lookup speed for C functions (Tom)
  
  This release uses a hash table to lookup information for dynamically loaded C functions. This improves their speed so they perform nearly as quickly as functions that are built into the server executable.

- Add type-specific \texttt{ANALYZE} statistics capability (Mark Cave-Ayland)
  
  This feature allows more flexibility in generating statistics for nonstandard data types.

- \texttt{ANALYZE} now collects statistics for expression indexes (Tom)
  
  Expression indexes (also called functional indexes) allow users to index not just columns but the results of expressions and function calls. With this release, the optimizer can gather and use statistics about the contents of expression indexes. This will greatly improve the quality of planning for queries in which an expression index is relevant.

- New two-stage sampling method for \texttt{ANALYZE} (Manfred Koizar)
  
  This gives better statistics when the density of valid rows is very different in different regions of a table.

- Speed up \texttt{TRUNCATE} (Tom)
  
  This buys back some of the performance loss observed in 7.4, while still keeping \texttt{TRUNCATE} transaction-safe.

\section*{E.243.4.2. Server Changes}

- Add WAL file archiving and point-in-time recovery (Simon Riggs)

- Add tablespaces so admins can control disk layout (Gavin)

- Add a built-in log rotation program (Andreas Pflug)
  
  It is now possible to log server messages conveniently without relying on either syslog or an external log rotation program.
Appendix E. Release Notes

- Add new read-only server configuration parameters to show server compile-time settings: block_size, integer_datetimes, max_function_args, max_identifier_length, max_index_keys (Joe)
- Make quoting of sameuser, samegroup, and all remove special meaning of these terms in pg_hba.conf (Andrew)
- Use clearer IPv6 name ::1/128 for localhost in default pg_hba.conf (Andrew)
- Use CIDR format in pg_hba.conf examples (Andrew)
- Rename server configuration parameters SortMem and VacuumMem to work_mem and maintenance_work_mem (Old names still supported) (Tom)
  This change was made to clarify that bulk operations such as index and foreign key creation use maintenance_work_mem, while work_mem is for workspaces used during query execution.
- Allow logging of session disconnections using server configuration log_disconnections (Andrew)
- Add new server configuration parameter log_line_prefix to allow control of information emitted in each log line (Andrew)
  Available information includes user name, database name, remote IP address, and session start time.
- Remove server configuration parameters log_pid, log_timestamp, log_source_port; functionality superseded by log_line_prefix (Andrew)
- Replace the virtual_host and tcpip_socket parameters with a unified listen_addresses parameter (Andrew, Tom)
  virtual_host could only specify a single IP address to listen on. listen_addresses allows multiple addresses to be specified.
- Listen on localhost by default, which eliminates the need for the -i postmaster switch in many scenarios (Andrew)
  Listening on localhost (127.0.0.1) opens no new security holes but allows configurations like Windows and JDBC, which do not support local sockets, to work without special adjustments.
- Remove syslog server configuration parameter, and add more logical log_destination variable to control log output location (Magnus)
- Change server configuration parameter log_statement to take values all, mod, ddl, or none to select which queries are logged (Bruce)
  This allows administrators to log only data definition changes or only data modification statements.
- Some logging-related configuration parameters could formerly be adjusted by ordinary users, but only in the “more verbose” direction. They are now treated more strictly: only superusers can set them. However, a superuser can use ALTER USER to provide per-user settings of these values for non-superusers. Also, it is now possible for superusers to set values of superuser-only configuration parameters via PGOPTIONS.
- Allow configuration files to be placed outside the data directory (mlw)
  By default, configuration files are kept in the cluster’s top directory. With this addition, configuration files can be placed outside the data directory, easing administration.
- Plan prepared queries only when first executed so constants can be used for statistics (Oliver Jowett)
Appendix E. Release Notes

Prepared statements plan queries once and execute them many times. While prepared queries avoid
the overhead of re-planning on each use, the quality of the plan suffers from not knowing the exact
parameters to be used in the query. In this release, planning of unnamed prepared statements is delayed
until the first execution, and the actual parameter values of that execution are used as optimization hints.
This allows use of out-of-line parameter passing without incurring a performance penalty.

- Allow DECLARE CURSOR to take parameters (Oliver Jowett)
  It is now useful to issue DECLARE CURSOR in a Parse message with parameters. The parameter values
  sent at Bind time will be substituted into the execution of the cursor’s query.

- Fix hash joins and aggregates of inet and cidr data types (Tom)
  Release 7.4 handled hashing of mixed inet and cidr values incorrectly. (This bug did not exist in
  prior releases because they wouldn’t try to hash either data type.)

- Make log_duration print only when log_statement prints the query (Ed L.)

E.243.4.3. Query Changes

- Add savepoints (nested transactions) (Alvaro)

- Unsupported isolation levels are now accepted and promoted to the nearest supported level (Peter)
  The SQL specification states that if a database doesn’t support a specific isolation level, it should use
  the next more restrictive level. This change complies with that recommendation.

- Allow BEGIN WORK to specify transaction isolation levels like START TRANSACTION does (Bruce)

- Fix table permission checking for cases in which rules generate a query type different from the origi-
  nally submitted query (Tom)

- Implement dollar quoting to simplify single-quote usage (Andrew, Tom, David Fetter)
  In previous releases, because single quotes had to be used to quote a function’s body, the use of single
  quotes inside the function text required use of two single quotes or other error-prone notations. With
  this release we add the ability to use “dollar quoting” to quote a block of text. The ability to use different
  quoting delimiters at different nesting levels greatly simplifies the task of quoting correctly, especially
  in complex functions. Dollar quoting can be used anywhere quoted text is needed.

- Make CASE val WHEN compval THEN ... evaluate val only once (Tom)
  CASE no longer evaluates the tested expression multiple times. This has benefits when the expression is
  complex or is volatile.

- Test HAVING before computing target list of an aggregate query (Tom)
  Fixes improper failure of cases such as SELECT SUM(win)/SUM(lose) ... GROUP BY ...
  HAVING SUM(lose) > 0. This should work but formerly could fail with divide-by-zero.

- Replace max_expr_depth parameter with max_stack_depth parameter, measured in kilobytes of
  stack size (Tom)
  This gives us a fairly bulletproof defense against crashing due to runaway recursive functions. Instead
  of measuring the depth of expression nesting, we now directly measure the size of the execution stack.

- Allow arbitrary row expressions (Tom)
This release allows SQL expressions to contain arbitrary composite types, that is, row values. It also allows functions to more easily take rows as arguments and return row values.

- Allow LIKE/ILIKE to be used as the operator in row and subselect comparisons (Fabien Coelho)
- Avoid locale-specific case conversion of basic ASCII letters in identifiers and keywords (Tom)
  This solves the “Turkish problem” with mangling of words containing I and i. Folding of characters outside the 7-bit-ASCII set is still locale-aware.
- Improve syntax error reporting (Fabien, Tom)
  Syntax error reports are more useful than before.
- Change EXECUTE to return a completion tag matching the executed statement (Kris Jurka)
  Previous releases return an EXECUTE tag for any EXECUTE call. In this release, the tag returned will reflect the command executed.
- Avoid emitting NATURAL CROSS JOIN in rule listings (Tom)
  Such a clause makes no logical sense, but in some cases the rule decompiler formerly produced this syntax.

E.243.4.4. Object Manipulation Changes

- Add COMMENT ON for casts, conversions, languages, operator classes, and large objects (Christopher)
- Add new server configuration parameter default_with_oids to control whether tables are created with OIDs by default (Neil)
  This allows administrators to control whether CREATE TABLE commands create tables with or without OID columns by default. (Note: the current factory default setting for default_with_oids is TRUE, but the default will become FALSE in future releases.)
- Add WITH/WITHOUT OIDS clause to CREATE TABLE AS (Neil)
- Allow ALTER TABLE DROP COLUMN to drop an OID column (ALTER TABLE SET WITHOUT OIDS still works) (Tom)
- Allow composite types as table columns (Tom)
- Allow ALTER ... ADD COLUMN with defaults and NOT NULL constraints; works per SQL spec (Rod)
  It is now possible for ADD COLUMN to create a column that is not initially filled with NULLs, but with a specified default value.
- Add ALTER COLUMN TYPE to change column’s type (Rod)
  It is now possible to alter a column’s data type without dropping and re-adding the column.
- Allow multiple ALTER actions in a single ALTER TABLE command (Rod)
  This is particularly useful for ALTER commands that rewrite the table (which include ALTER COLUMN TYPE and ADD COLUMN with a default). By grouping ALTER commands together, the table need be rewritten only once.
- Allow ALTER TABLE to add SERIAL columns (Tom)
  This falls out from the new capability of specifying defaults for new columns.
Appendix E. Release Notes

• Allow changing the owners of aggregates, conversions, databases, functions, operators, operator classes, schemas, types, and tablespaces (Christopher, Euler Taveira de Oliveira)
  Previously this required modifying the system tables directly.
• Allow temporary object creation to be limited to SECURITY DEFINER functions (Sean Chittenden)
• Add ALTER TABLE ... SET WITHOUT CLUSTER (Christopher)
  Prior to this release, there was no way to clear an auto-cluster specification except to modify the system tables.
• Constraint/Index/SERIAL names are now table_column_type with numbers appended to guarantee uniqueness within the schema (Tom)
  The SQL specification states that such names should be unique within a schema.
• Add pg get_serial_sequence() to return a SERIAL column’s sequence name (Christopher)
  This allows automated scripts to reliably find the SERIAL sequence name.
• Warn when primary/foreign key data type mismatch requires costly lookup
• New ALTER INDEX command to allow moving of indexes between tablespaces (Gavin)
• Make ALTER TABLE OWNER change dependent sequence ownership too (Alvaro)

E.243.4.5. Utility Command Changes

• Allow CREATE SCHEMA to create triggers, indexes, and sequences (Neil)
• Add ALSO keyword to CREATE RULE (Fabien Coelho)
  This allows ALSO to be added to rule creation to contrast it with INSTEAD rules.
• Add NOWAIT option to LOCK (Tatsuo)
  This allows the LOCK command to fail if it would have to wait for the requested lock.
• Allow COPY to read and write comma-separated-value (CSV) files (Andrew, Bruce)
• Generate error if the COPY delimiter and NULL string conflict (Bruce)
• GRANT/REVOKE behavior follows the SQL spec more closely
• Avoid locking conflict between CREATE INDEX and CHECKPOINT (Tom)
  In 7.3 and 7.4, a long-running B-tree index build could block concurrent CHECKPOINTS from completing, thereby causing WAL bloat because the WAL log could not be recycled.
• Database-wide ANALYZE does not hold locks across tables (Tom)
  This reduces the potential for deadlocks against other backends that want exclusive locks on tables. To get the benefit of this change, do not execute database-wide ANALYZE inside a transaction block (BEGIN block); it must be able to commit and start a new transaction for each table.
• REINDEX does not exclusively lock the index’s parent table anymore
  The index itself is still exclusively locked, but readers of the table can continue if they are not using the particular index being rebuilt.
• Erase MD5 user passwords when a user is renamed (Bruce)
Appendix E. Release Notes

PostgreSQL uses the user name as salt when encrypting passwords via MD5. When a user’s name is changed, the salt will no longer match the stored MD5 password, so the stored password becomes useless. In this release a notice is generated and the password is cleared. A new password must then be assigned if the user is to be able to log in with a password.

- New pg_ctl kill option for Windows (Andrew)
  Windows does not have a kill command to send signals to backends so this capability was added to pg_ctl.
- Information schema improvements
- Add --pwfile option to initdb so the initial password can be set by GUI tools (Magnus)
- Detect locale/encoding mismatch in initdb (Peter)
- Add register command to pg_ctl to register Windows operating system service (Dave Page)

E.243.4.6. Data Type and Function Changes

- More complete support for composite types (row types) (Tom)
  Composite values can be used in many places where only scalar values worked before.
- Reject nonrectangular array values as erroneous (Joe)
  Formerly, array_in would silently build a surprising result.
- Overflow in integer arithmetic operations is now detected (Tom)
- The arithmetic operators associated with the single-byte "char" data type have been removed.
  Formerly, the parser would select these operators in many situations where an “unable to select an operator” error would be more appropriate, such as null * null. If you actually want to do arithmetic on a "char" column, you can cast it to integer explicitly.
- Syntax checking of array input values considerably tightened up (Joe)
  Junk that was previously allowed in odd places with odd results now causes an ERROR, for example, non-whitespace after the closing right brace.
- Empty-string array element values must now be written as " ", rather than writing nothing (Joe)
  Formerly, both ways of writing an empty-string element value were allowed, but now a quoted empty string is required. The case where nothing at all appears will probably be considered to be a NULL element value in some future release.
- Array element trailing whitespace is now ignored (Joe)
  Formerly leading whitespace was ignored, but trailing whitespace between an element value and the delimiter or right brace was significant. Now trailing whitespace is also ignored.
- Emit array values with explicit array bounds when lower bound is not one (Joe)
- Accept YYYY-monthname-DD as a date string (Tom)
- Make netmask and hostmask functions return maximum-length mask length (Tom)
- Change factorial function to return numeric (Gavin)
Returning numeric allows the factorial function to work for a wider range of input values.

- `to_char/to_date()` date conversion improvements (Kurt Roeckx, Fabien Coelho)
- Make `length()` disregard trailing spaces in `CHAR(n)` (Gavin)
  This change was made to improve consistency: trailing spaces are semantically insignificant in `CHAR(n)` data, so they should not be counted by `length()`.
- Warn about empty string being passed to `OID/float4/float8` data types (Neil)
  8.1 will throw an error instead.
- Allow leading or trailing whitespace in `int2/int4/int8/float4/float8` input routines (Neil)
- Better support for IEEE Infinity and NaN values in `float4/float8` (Neil)
  These should now work on all platforms that support IEEE-compliant floating point arithmetic.
- Add `week` option to `date_trunc()` (Robert Creager)
- Fix `to_char` for 1 BC (previously it returned 1 AD) (Bruce)
- Fix `date_part(year)` for BC dates (previously it returned one less than the correct year) (Bruce)
- Fix `date_part()` to return the proper millennium and century (Fabien Coelho)
  In previous versions, the century and millennium results had a wrong number and started in the wrong year, as compared to standard reckoning of such things.
- Add `ceiling()` as an alias for `ceil()`, and `power()` as an alias for `pow()` for standards compliance (Neil)
- Change `ln()`, `log()`, `power()`, and `sqrt()` to emit the correct SQLSTATE error codes for certain error conditions, as specified by SQL:2003 (Neil)
- Add `width_bucket()` function as defined by SQL:2003 (Neil)
- Add `generate_series()` functions to simplify working with numeric sets (Joe)
- Fix `upper/lower/initcap()` functions to work with multibyte encodings (Tom)
- Add boolean and bitwise integer `AND/OR` aggregates (Fabien Coelho)
- New session information functions to return network addresses for client and server (Sean Chittenden)
- Add function to determine the area of a closed path (Sean Chittenden)
- Add function to send cancel request to other backends (Magnus)
- Add `interval` plus `datetime` operators (Tom)
  The reverse ordering, `datetime` plus `interval`, was already supported, but both are required by the SQL standard.
- Casting an integer to `BIT(N)` selects the rightmost N bits of the integer (Tom)
  In prior releases, the leftmost N bits were selected, but this was deemed unhelpful, not to mention inconsistent with casting from bit to int.
- Require `CIDR` values to have all nonmasked bits be zero (Kevin Brintnall)
E.243.4.7. Server-Side Language Changes

- In **READ COMMITTED** serialization mode, volatile functions now see the results of concurrent transactions committed up to the beginning of each statement within the function, rather than up to the beginning of the interactive command that called the function.

- Functions declared **STABLE** or **IMMUTABLE** always use the snapshot of the calling query, and therefore do not see the effects of actions taken after the calling query starts, whether in their own transaction or other transactions. Such a function must be read-only, too, meaning that it cannot use any SQL commands other than **SELECT**. There is a considerable performance gain from declaring a function **STABLE** or **IMMUTABLE** rather than **VOLATILE**.

- Nondeferred **AFTER** triggers are now fired immediately after completion of the triggering query, rather than upon finishing the current interactive command. This makes a difference when the triggering query occurred within a function: the trigger is invoked before the function proceeds to its next operation. For example, if a function inserts a new row into a table, any nondeferred foreign key checks occur before proceeding with the function.

- Allow function parameters to be declared with names (Dennis Björklund)
  This allows better documentation of functions. Whether the names actually do anything depends on the specific function language being used.

- Allow PL/pgSQL parameter names to be referenced in the function (Dennis Björklund)
  This basically creates an automatic alias for each named parameter.

- Do minimal syntax checking of PL/pgSQL functions at creation time (Tom)
  This allows us to catch simple syntax errors sooner.

- More support for composite types (row and record variables) in PL/pgSQL
  For example, it now works to pass a rowtype variable to another function as a single variable.

- Default values for PL/pgSQL variables can now reference previously declared variables

- Improve parsing of PL/pgSQL FOR loops (Tom)
  Parsing is now driven by presence of "..." rather than data type of **FOR** variable. This makes no difference for correct functions, but should result in more understandable error messages when a mistake is made.

- Major overhaul of PL/Perl server-side language (Command Prompt, Andrew Dunstan)

- In PL/Tcl, SPI commands are now run in subtransactions. If an error occurs, the subtransaction is cleaned up and the error is reported as an ordinary Tcl error, which can be trapped with **catch**. Formerly, it was not possible to catch such errors.

- Accept **ELSEIF** in PL/pgSQL (Neil)
  Previously PL/pgSQL only allowed **ELSIF**, but many people are accustomed to spelling this keyword **ELSEIF**.

Appendix E. Release Notes
E.243.4.8. psql Changes

- Improve psql information display about database objects (Christopher)
- Allow psql to display group membership in \du and \dg (Markus Bertheau)
- Prevent psql \dn from showing temporary schemas (Bruce)
- Allow psql to handle tilde user expansion for file names (Zach Irmen)
- Allow psql to display fancy prompts, including color, via readline (Reece Hart, Chet Ramey)
- Make psql \copy match COPY command syntax fully (Tom)
- Show the location of syntax errors (Fabien Coelho, Tom)
- Add CLUSTER information to psql \d display (Bruce)
- Change psql \copy stdin/stdout to read from command input/output (Bruce)
- Add ps.stdin/ps.stdout to read from psql’s stdin/stdout (Mark Feit)
- Add global psql configuration file, psqlrc.sample (Bruce)
  This allows a central file where global psql startup commands can be stored.
- Have psql \d+ indicate if the table has an OID column (Neil)
- On Windows, use binary mode in psql when reading files so control-Z is not seen as end-of-file
- Have \dn+ show permissions and description for schemas (Dennis Björklund)
- Improve tab completion support (Stefan Kaltenbrunn, Greg Sabino Mullane)
- Allow boolean settings to be set using upper or lower case (Michael Paesold)

E.243.4.9. pg_dump Changes

- Use dependency information to improve the reliability of pg_dump (Tom)
  This should solve the longstanding problems with related objects sometimes being dumped in the wrong order.
- Have pg_dump output objects in alphabetical order if possible (Tom)
  This should make it easier to identify changes between dump files.
- Allow pg_restore to ignore some SQL errors (Fabien Coelho)
  This makes pg_restore’s behavior similar to the results of feeding a pg_dump output script to psql.
  In most cases, ignoring errors and plowing ahead is the most useful thing to do. Also added was a pg_restore option to give the old behavior of exiting on an error.
- pg_restore -l display now includes objects’ schema names
- New begin/end markers in pg_dump text output (Bruce)
- Add start/stop times for pg_dump/pg_dumpall in verbose mode (Bruce)
- Allow most pg_dump options in pg_dumpall (Christopher)
• Have pg_dump use **ALTER OWNER** rather than **SET SESSION AUTHORIZATION** by default (Christopher)

**E.243.4.10. libpq Changes**

• Make libpq’s **SIGPIPE** handling thread-safe (Bruce)
• Add **PQmbdsplen()** which returns the display length of a character (Tatsuo)
• Add thread locking to SSL and Kerberos connections (Manfred Spraul)
• Allow **PQoidValue(), PQcmdTuples(), and PQoidStatus()** to work on **EXECUTE** commands (Neil)
• Add **PQserverVersion()** to provide more convenient access to the server version number (Greg Sabino Mullane)
• Add **PQprepare/PQsendPrepared()** functions to support preparing statements without necessarily specifying the data types of their parameters (Abhijit Menon-Sen)
• Many ECPG improvements, including **SET DESCRIPTOR** (Michael)

**E.243.4.11. Source Code Changes**

• Allow the database server to run natively on Windows (Claudio, Magnus, Andrew)
• Shell script commands converted to C versions for Windows support (Andrew)
• Create an extension makefile framework (Fabien Coelho, Peter)
  This simplifies the task of building extensions outside the original source tree.
• Support relocatable installations (Bruce)
  Directory paths for installed files (such as the **/share** directory) are now computed relative to the actual location of the executables, so that an installation tree can be moved to another place without reconfiguring and rebuilding.
• Use **--with-docdir** to choose installation location of documentation; also allow **--infodir** (Peter)
• Add **--without-docdir** to prevent installation of documentation (Peter)
• Upgrade to DocBook V4.2 SGML (Peter)
• New **PostgreSQL** CVS tag (Marc)
  This was done to make it easier for organizations to manage their own copies of the PostgreSQL CVS repository. File version stamps from the master repository will not get munged by checking into or out of a copied repository.
• Clarify locking code (Manfred Koizar)
• Buffer manager cleanup (Neil)
• Decouple platform tests from CPU spinlock code (Bruce, Tom)
• Add inlined test-and-set code on PA-RISC for gcc (ViSolve, Tom)
Appendix E. Release Notes

• Improve i386 spinlock code (Manfred Spraul)
• Clean up spinlock assembly code to avoid warnings from newer gcc releases (Tom)
• Remove JDBC from source tree; now a separate project
• Remove the libpgtcl client interface; now a separate project
• More accurately estimate memory and file descriptor usage (Tom)
• Improvements to the Mac OS X startup scripts (Ray A.)
• New \texttt{fsync()} test program (Bruce)
• Major documentation improvements (Neil, Peter)
• Remove \texttt{pg\_encoding}; not needed anymore
• Remove \texttt{pg\_id}; not needed anymore
• Remove \texttt{initlocation}; not needed anymore
• Auto-detect thread flags (no more manual testing) (Bruce)
• Use Olson’s public domain timezone library (Magnus)
• With threading enabled, use thread flags on Unixware for backend executables too (Bruce)
  Unixware cannot mix threaded and nonthreaded object files in the same executable, so everything must
  be compiled as threaded.
• \texttt{psql} now uses a flex-generated lexical analyzer to process command strings
• Reimplement the linked list data structure used throughout the backend (Neil)
  This improves performance by allowing list append and length operations to be more efficient.
• Allow dynamically loaded modules to create their own server configuration parameters (Thomas Hall-
gren)
• New Brazilian version of FAQ (Euler Taveira de Oliveira)
• Add French FAQ (Guillaume Lelarge)
• New \texttt{pgevent} for Windows logging
• Make \texttt{libpq} and ECPG build as proper shared libraries on OS X (Tom)

\textbf{E.243.4.12. Contrib Changes}

• Overhaul of \texttt{contrib/dblink} (Joe)
• \texttt{contrib/dbmirror} improvements (Steven Singer)
• New \texttt{contrib/xml2} (John Gray, Torchbox)
• Updated \texttt{contrib/mysql}
• New version of \texttt{contrib/btree\_gist} (Teodor)
• New \texttt{contrib/trgm}, trigram matching for PostgreSQL (Teodor)
• Many \texttt{contrib/tsearch2} improvements (Teodor)
Appendix E. Release Notes

- Add double metaphone to contrib/fuzzystrmatch (Andrew)
- Allow contrib/pg_autovacuum to run as a Windows service (Dave Page)
- Add functions to contrib/dbsize (Andreas Pflug)
- Removed contrib/pg_logger: obsoleted by integrated logging subprocess
- Removed contrib/rserv: obsoleted by various separate projects

E.244. Release 7.4.30

Release date: 2010-10-04

This release contains a variety of fixes from 7.4.29. For information about new features in the 7.4 major release, see Section E.274.

This is expected to be the last PostgreSQL release in the 7.4.X series. Users are encouraged to update to a newer release branch soon.

E.244.1. Migration to Version 7.4.30

A dump/restore is not required for those running 7.4.X. However, if you are upgrading from a version earlier than 7.4.26, see Section E.248.

E.244.2. Changes

- Use a separate interpreter for each calling SQL userid in PL/Perl and PL/Tcl (Tom Lane)

  This change prevents security problems that can be caused by subverting Perl or Tcl code that will be executed later in the same session under another SQL user identity (for example, within a SECURITY DEFINER function). Most scripting languages offer numerous ways that that might be done, such as redefining standard functions or operators called by the target function. Without this change, any SQL user with Perl or Tcl language usage rights can do essentially anything with the SQL privileges of the target function’s owner.

  The cost of this change is that intentional communication among Perl and Tcl functions becomes more difficult. To provide an escape hatch, PL/PerlU and PL/TclU functions continue to use only one interpreter per session. This is not considered a security issue since all such functions execute at the trust level of a database superuser already.

  It is likely that third-party procedural languages that claim to offer trusted execution have similar security issues. We advise contacting the authors of any PL you are depending on for security-critical purposes.

  Our thanks to Tim Bunce for pointing out this issue (CVE-2010-3433).

- Prevent possible crashes in pg_get_expr() by disallowing it from being called with an argument that is not one of the system catalog columns it’s intended to be used with (Heikki Linnakangas, Tom Lane)
Appendix E. Release Notes

- Fix “cannot handle unplanned sub-select” error (Tom Lane)
  This occurred when a sub-select contains a join alias reference that expands into an expression containing another sub-select.

- Take care to fsync the contents of lockfiles (both `postmaster.pid` and the socket lockfile) while writing them (Tom Lane)
  This omission could result in corrupted lockfile contents if the machine crashes shortly after postmaster start. That could in turn prevent subsequent attempts to start the postmaster from succeeding, until the lockfile is manually removed.

- Improve contrib/dblink’s handling of tables containing dropped columns (Tom Lane)

- Fix connection leak after “duplicate connection name” errors in contrib/dblink (Itagaki Takahiro)

- Update build infrastructure and documentation to reflect the source code repository’s move from CVS to Git (Magnus Hagander and others)

E.245. Release 7.4.29

Release date: 2010-05-17

This release contains a variety of fixes from 7.4.28. For information about new features in the 7.4 major release, see Section E.274.

The PostgreSQL community will stop releasing updates for the 7.4.X release series in July 2010. Users are encouraged to update to a newer release branch soon.

E.245.1. Migration to Version 7.4.29

A dump/restore is not required for those running 7.4.X. However, if you are upgrading from a version earlier than 7.4.26, see Section E.248.

E.245.2. Changes

- Enforce restrictions in `plperl` using an opmask applied to the whole interpreter, instead of using `Safe.pm` (Tim Bunce, Andrew Dunstan)
  Recent developments have convinced us that `Safe.pm` is too insecure to rely on for making `plperl` trustable. This change removes use of `Safe.pm` altogether, in favor of using a separate interpreter with an opcode mask that is always applied. Pleasant side effects of the change include that it is now possible to use Perl’s `strict` pragma in a natural way in `plperl`, and that Perl’s `$a` and `$b` variables work as expected in sort routines, and that function compilation is significantly faster. (CVE-2010-1169)

- Prevent PL/Tcl from executing untrustworthy code from `pltcl_modules` (Tom)
  PL/Tcl’s feature for autoloadable Tk code from a database table could be exploited for trojan-horse attacks, because there was no restriction on who could create or insert into that table. This change disables the feature unless `pltcl_modules` is owned by a superuser. (However, the permissions on the
table are not checked, so installations that really need a less-than-secure modules table can still grant suitable privileges to trusted non-superusers.) Also, prevent loading code into the unrestricted “normal” Tcl interpreter unless we are really going to execute a `pltclu` function. (CVE-2010-1170)

- Do not allow an unprivileged user to reset superuser-only parameter settings (Alvaro)

  Previously, if an unprivileged user ran `ALTER USER ... RESET ALL` for himself, or `ALTER DATABASE ... RESET ALL` for a database he owns, this would remove all special parameter settings for the user or database, even ones that are only supposed to be changeable by a superuser. Now, the `ALTER` will only remove the parameters that the user has permission to change.

- Avoid possible crash during backend shutdown if shutdown occurs when a `CONTEXT` addition would be made to log entries (Tom)

  In some cases the context-printing function would fail because the current transaction had already been rolled back when it came time to print a log message.

- Update `pl/perl`’s `ppport.h` for modern Perl versions (Andrew)

- Fix assorted memory leaks in `pl/python` (Andreas Freund, Tom)

- Ensure that `contrib/pgstattuple` functions respond to cancel interrupts promptly (Tatsuhito Kashiwara)

- Make server startup deal properly with the case that `shmget()` returns `EINVAL` for an existing shared memory segment (Tom)

  This behavior has been observed on BSD-derived kernels including OS X. It resulted in an entirely-misleading startup failure complaining that the shared memory request size was too large.

## E.246. Release 7.4.28

**Release date:** 2010-03-15

This release contains a variety of fixes from 7.4.27. For information about new features in the 7.4 major release, see Section E.274.

The PostgreSQL community will stop releasing updates for the 7.4.X release series in July 2010. Users are encouraged to update to a newer release branch soon.

### E.246.1. Migration to Version 7.4.28

A dump/restore is not required for those running 7.4.X. However, if you are upgrading from a version earlier than 7.4.26, see Section E.248.

### E.246.2. Changes

- Add new configuration parameter `ssl_renegotiation_limit` to control how often we do session key renegotiation for an SSL connection (Magnus)
This can be set to zero to disable renegotiation completely, which may be required if a broken SSL library is used. In particular, some vendors are shipping stopgap patches for CVE-2009-3555 that cause renegotiation attempts to fail.

- Make substring() for bit types treat any negative length as meaning “all the rest of the string” (Tom)
  
  The previous coding treated only -1 that way, and would produce an invalid result value for other negative values, possibly leading to a crash (CVE-2010-0442).

- Fix some cases of pathologically slow regular expression matching (Tom)

- When reading pg_hba.conf and related files, do not treat @something as a file inclusion request if the @ appears inside quote marks; also, never treat @ by itself as a file inclusion request (Tom)

  This prevents erratic behavior if a role or database name starts with @. If you need to include a file whose path name contains spaces, you can still do so, but you must write @"/path to/file" rather than putting the quotes around the whole construct.

- Prevent infinite loop on some platforms if a directory is named as an inclusion target in pg_hba.conf and related files (Tom)

- Ensure PL/Tcl initializes the Tcl interpreter fully (Tom)

  The only known symptom of this oversight is that the Tcl clock command misbehaves if using Tcl 8.5 or later.

- Prevent crash in contrib/dblink when too many key columns are specified to a dblink_build_sql_* function (Rushabh Lathia, Joe Conway)

---

**E.247. Release 7.4.27**

**Release date:** 2009-12-14

This release contains a variety of fixes from 7.4.26. For information about new features in the 7.4 major release, see Section E.274.

**E.247.1. Migration to Version 7.4.27**

A dump/restore is not required for those running 7.4.X. However, if you are upgrading from a version earlier than 7.4.26, see Section E.248.

**E.247.2. Changes**

- Protect against indirect security threats caused by index functions changing session-local state (Gurjeet Singh, Tom)

  This change prevents allegedly-immutable index functions from possibly subverting a superuser’s session (CVE-2009-4136).
Appendix E. Release Notes

- Reject SSL certificates containing an embedded null byte in the common name (CN) field (Magnus)
  This prevents unintended matching of a certificate to a server or client name during SSL validation (CVE-2009-4034).
- Fix possible crash during backend-startup-time cache initialization (Tom)
- Prevent signals from interrupting VACUUM at unsafe times (Alvaro)
  This fix prevents a PANIC if a VACUUM FULL is canceled after it’s already committed its tuple movements, as well as transient errors if a plain VACUUM is interrupted after having truncated the table.
- Fix possible crash due to integer overflow in hash table size calculation (Tom)
  This could occur with extremely large planner estimates for the size of a hashjoin’s result.
- Fix very rare crash in inet/cidr comparisons (Chris Mikkelson)
- Fix PAM password processing to be more robust (Tom)
  The previous code is known to fail with the combination of the Linux pam_krb5 PAM module with Microsoft Active Directory as the domain controller. It might have problems elsewhere too, since it was making unjustified assumptions about what arguments the PAM stack would pass to it.
- Make the postmaster ignore any application_name parameter in connection request packets, to improve compatibility with future libpq versions (Tom)

E.248. Release 7.4.26

Release date: 2009-09-09

This release contains a variety of fixes from 7.4.25. For information about new features in the 7.4 major release, see Section E.274.

E.248.1. Migration to Version 7.4.26

A dump/restore is not required for those running 7.4.X. However, if you have any hash indexes on interval columns, you must REINDEX them after updating to 7.4.26. Also, if you are upgrading from a version earlier than 7.4.11, see Section E.263.

E.248.2. Changes

- Disallow \texttt{RESET ROLE} and \texttt{RESET SESSION AUTHORIZATION} inside security-definer functions (Tom, Heikki)
  This covers a case that was missed in the previous patch that disallowed \texttt{SET ROLE} and \texttt{SET SESSION AUTHORIZATION} inside security-definer functions. (See CVE-2007-6600)
- Fix handling of sub-SELECTs appearing in the arguments of an outer-level aggregate function (Tom)
- Fix hash calculation for data type \texttt{interval} (Tom)
Appendix E. Release Notes

This corrects wrong results for hash joins on interval values. It also changes the contents of hash indexes on interval columns. If you have any such indexes, you must **REINDEX** them after updating.

- Fix overflow for `INTERVAL 'x ms'` when `x` is more than 2 million and integer datetimes are in use (Alex Hunsaker)
- Fix calculation of distance between a point and a line segment (Tom)
  This led to incorrect results from a number of geometric operators.
- Fix `money` data type to work in locales where currency amounts have no fractional digits, e.g. Japan (Itagaki Takahiro)
- Properly round datetime input like `00:12:57.9999999999999999999999999999999` (Tom)
- Fix poor choice of page split point in GiST R-tree operator classes (Teodor)
- Fix portability issues in plperl initialization (Andrew Dunstan)
- Improve robustness of libpq’s code to recover from errors during **COPY FROM STDIN** (Tom)
- Avoid including conflicting readline and editline header files when both libraries are installed (Zdenek Kotala)

---

**E.249. Release 7.4.25**

**Release date:** 2009-03-16

This release contains a variety of fixes from 7.4.24. For information about new features in the 7.4 major release, see Section E.274.

**E.249.1. Migration to Version 7.4.25**

A dump/restore is not required for those running 7.4.X. However, if you are upgrading from a version earlier than 7.4.11, see Section E.263.

**E.249.2. Changes**

- Prevent error recursion crashes when encoding conversion fails (Tom)
  This change extends fixes made in the last two minor releases for related failure scenarios. The previous fixes were narrowly tailored for the original problem reports, but we have now recognized that *any* error thrown by an encoding conversion function could potentially lead to infinite recursion while trying to report the error. The solution therefore is to disable translation and encoding conversion and report the plain-ASCII form of any error message, if we find we have gotten into a recursive error reporting situation. (CVE-2009-0922)
- Disallow `CREATE CONVERSION` with the wrong encodings for the specified conversion function (Heikki)
This prevents one possible scenario for encoding conversion failure. The previous change is a backstop to guard against other kinds of failures in the same area.

- Fix core dump when `to_char()` is given format codes that are inappropriate for the type of the data argument (Tom)
- Add MUST (Mauritius Island Summer Time) to the default list of known timezone abbreviations (Xavier Bugaud)

### E.250. Release 7.4.24

**Release date:** 2009-02-02

This release contains a variety of fixes from 7.4.23. For information about new features in the 7.4 major release, see Section E.274.

#### E.250.1. Migration to Version 7.4.24

A dump/restore is not required for those running 7.4.X. However, if you are upgrading from a version earlier than 7.4.11, see Section E.263.

#### E.250.2. Changes

- Improve handling of URLs in `headline()` function (Teodor)
- Improve handling of overlength headlines in `headline()` function (Teodor)
- Prevent possible Assert failure or misconversion if an encoding conversion is created with the wrong conversion function for the specified pair of encodings (Tom, Heikki)
- Avoid unnecessary locking of small tables in `VACUUM` (Heikki)
- Fix uninitialized variables in `contrib/tsearch2`'s `get_covers()` function (Teodor)
- Fix bug in `to_char()`’s handling of TH format codes (Andreas Scherbaum)
- Make all documentation reference `pgsql-bugs` and/or `pgsql-hackers` as appropriate, instead of the now-decommissioned `pgsql-ports` and `pgsql-patches` mailing lists (Tom)

### E.251. Release 7.4.23

**Release date:** 2008-11-03

This release contains a variety of fixes from 7.4.22. For information about new features in the 7.4 major release, see Section E.274.
Appendix E. Release Notes

E.251.1. Migration to Version 7.4.23

A dump/restore is not required for those running 7.4.X. However, if you are upgrading from a version earlier than 7.4.11, see Section E.263.

E.251.2. Changes

- Fix backend crash when the client encoding cannot represent a localized error message (Tom)
  We have addressed similar issues before, but it would still fail if the “character has no equivalent” message itself couldn’t be converted. The fix is to disable localization and send the plain ASCII error message when we detect such a situation.
- Fix incorrect tsearch2 headline generation when single query item matches first word of text (Sushant Sinha)
- Fix improper display of fractional seconds in interval values when using a non-ISO datestyle in an --enable-integer-datetimes build (Ron Mayer)
- Ensure SPI_getvalue and SPI_getbinval behave correctly when the passed tuple and tuple descriptor have different numbers of columns (Tom)
  This situation is normal when a table has had columns added or removed, but these two functions didn’t handle it properly. The only likely consequence is an incorrect error indication.
- Fix ecpg’s parsing of CREATE USER (Michael)

E.252. Release 7.4.22

Release date: 2008-09-22
This release contains a variety of fixes from 7.4.21. For information about new features in the 7.4 major release, see Section E.274.

E.252.1. Migration to Version 7.4.22

A dump/restore is not required for those running 7.4.X. However, if you are upgrading from a version earlier than 7.4.11, see Section E.263.

E.252.2. Changes

- Fix datetime input functions to correctly detect integer overflow when running on a 64-bit platform (Tom)
- Improve performance of writing very long log messages to syslog (Tom)
- Fix bug in backwards scanning of a cursor on a SELECT DISTINCT ON query (Tom)
Appendix E. Release Notes

- Fix planner to estimate that `GROUP BY` expressions yielding boolean results always result in two groups, regardless of the expressions’ contents (Tom)
  
  This is very substantially more accurate than the regular `GROUP BY` estimate for certain boolean tests like `col IS NULL`.

- Improve `pg_dump` and `pg_restore`’s error reporting after failure to send a SQL command (Tom)

E.253. Release 7.4.21

**Release date:** 2008-06-12

This release contains one serious bug fix over 7.4.20. For information about new features in the 7.4 major release, see Section E.274.

E.253.1. Migration to Version 7.4.21

A dump/restore is not required for those running 7.4.X. However, if you are upgrading from a version earlier than 7.4.11, see Section E.263.

E.253.2. Changes

- Make `pg_get_ruledef()` parenthesize negative constants (Tom)

  Before this fix, a negative constant in a view or rule might be dumped as, say, `-42::integer`, which is subtly incorrect: it should be `(-42)::integer` due to operator precedence rules. Usually this would make little difference, but it could interact with another recent patch to cause PostgreSQL to reject what had been a valid `SELECT DISTINCT` view query. Since this could result in `pg_dump` output failing to reload, it is being treated as a high-priority fix. The only released versions in which dump output is actually incorrect are 8.3.1 and 8.2.7.

E.254. Release 7.4.20

**Release date:** never released

This release contains a variety of fixes from 7.4.19. For information about new features in the 7.4 major release, see Section E.274.

E.254.1. Migration to Version 7.4.20

A dump/restore is not required for those running 7.4.X. However, if you are upgrading from a version earlier than 7.4.11, see Section E.263.
E.254.2. Changes

- Fix conversions between ISO-8859-5 and other encodings to handle Cyrillic “Yo” characters (e and Е with two dots) (Sergey Burladyan)
- Fix a few datatype input functions that were allowing unused bytes in their results to contain uninitialized, unpredictable values (Tom)
  This could lead to failures in which two apparently identical literal values were not seen as equal, resulting in the parser complaining about unmatched ORDER BY and DISTINCT expressions.
- Fix a corner case in regular-expression substring matching (substring(string from pattern)) (Tom)
  The problem occurs when there is a match to the pattern overall but the user has specified a parenthesized subexpression and that subexpression hasn’t got a match. An example is substring(’foo’ from ’foo(bar)?’). This should return NULL, since (bar) isn’t matched, but it was mistakenly returning the whole-pattern match instead (ie, foo).
- Fix incorrect result from ecpg’s PGTYPEStimestamp_sub() function (Michael)
- Fix DatumGetBool macro to not fail with gcc 4.3 (Tom)
  This problem affects “old style” (V0) C functions that return boolean. The fix is already in 8.3, but the need to back-patch it was not realized at the time.
- Fix longstanding LISTEN/NOTIFY race condition (Tom)

  In rare cases a session that had just executed a LISTEN might not get a notification, even though one would be expected because the concurrent transaction executing NOTIFY was observed to commit later.

  A side effect of the fix is that a transaction that has executed a not-yet-committed LISTEN command will not see any row in pg_listener for the LISTEN, should it choose to look; formerly it would have. This behavior was never documented one way or the other, but it is possible that some applications depend on the old behavior.
- Fix display of constant expressions in ORDER BY and GROUP BY (Tom)

  An explicitly casted constant would be shown incorrectly. This could for example lead to corruption of a view definition during dump and reload.
- Fix libpq to handle NOTICE messages correctly during COPY OUT (Tom)

  This failure has only been observed to occur when a user-defined datatype’s output routine issues a NOTICE, but there is no guarantee it couldn’t happen due to other causes.

E.255. Release 7.4.19

Release date: 2008-01-07

This release contains a variety of fixes from 7.4.18, including fixes for significant security issues. For information about new features in the 7.4 major release, see Section E.274.
Appendix E. Release Notes

E.255.1. Migration to Version 7.4.19

A dump/restore is not required for those running 7.4.X. However, if you are upgrading from a version earlier than 7.4.11, see Section E.263.

E.255.2. Changes

- Prevent functions in indexes from executing with the privileges of the user running VACUUM, ANALYZE, etc (Tom)
  Functions used in index expressions and partial-index predicates are evaluated whenever a new table entry is made. It has long been understood that this poses a risk of trojan-horse code execution if one modifies a table owned by an untrustworthy user. (Note that triggers, defaults, check constraints, etc. pose the same type of risk.) But functions in indexes pose extra danger because they will be executed by routine maintenance operations such as VACUUM FULL, which are commonly performed automatically under a superuser account. For example, a nefarious user can execute code with superuser privileges by setting up a trojan-horse index definition and waiting for the next routine vacuum. The fix arranges for standard maintenance operations (including VACUUM, ANALYZE, REINDEX, and CLUSTER) to execute as the table owner rather than the calling user, using the same privilege-switching mechanism already used for SECURITY DEFINER functions. To prevent bypassing this security measure, execution of SET SESSION AUTHORIZATION and SET ROLE is now forbidden within a SECURITY DEFINER context. (CVE-2007-6600)

- Repair assorted bugs in the regular-expression package (Tom, Will Drewry)
  Suitably crafted regular-expression patterns could cause crashes, infinite or near-infinite looping, and/or massive memory consumption, all of which pose denial-of-service hazards for applications that accept regex search patterns from untrustworthy sources. (CVE-2007-4769, CVE-2007-4772, CVE-2007-6067)

- Require non-superusers who use /contrib/dblink to use only password authentication, as a security measure (Joe)
  The fix that appeared for this in 7.4.18 was incomplete, as it plugged the hole for only some dblink functions. (CVE-2007-6601, CVE-2007-3278)

- Fix planner failure in some cases of WHERE false AND var IN (SELECT ...) (Tom)
- Fix potential crash in translate() when using a multibyte database encoding (Tom)
- Fix PL/Python to not crash on long exception messages (Alvaro)
- ecpg parser fixes (Michael)
- Make contrib/tablefunc\'s crosstab() handle NULL rowid as a category in its own right, rather than crashing (Joe)
- Fix tsvector and tsquery output routines to escape backslashes correctly (Teodor, Bruce)
- Fix crash of to_tsvector() on huge input strings (Teodor)
- Require a specific version of Autoconf to be used when re-generating the configure script (Peter)
This affects developers and packagers only. The change was made to prevent accidental use of untested combinations of Autoconf and PostgreSQL versions. You can remove the version check if you really want to use a different Autoconf version, but it’s your responsibility whether the result works or not.

E.256. Release 7.4.18

Release date: 2007-09-17

This release contains fixes from 7.4.17. For information about new features in the 7.4 major release, see Section E.274.

E.256.1. Migration to Version 7.4.18

A dump/restore is not required for those running 7.4.X. However, if you are upgrading from a version earlier than 7.4.11, see Section E.263.

E.256.2. Changes

• Prevent index corruption when a transaction inserts rows and then aborts close to the end of a concurrent VACUUM on the same table (Tom)
• Make CREATE DOMAIN ... DEFAULT NULL work properly (Tom)
• Fix excessive logging of SSL error messages (Tom)
• Fix crash when log_min_error_statement logging runs out of memory (Tom)
• Prevent CLUSTER from failing due to attempting to process temporary tables of other sessions (Alvaro)
• Require non-superusers who use /contrib/dblink to use only password authentication, as a security measure (Joe)

E.257. Release 7.4.17

Release date: 2007-04-23

This release contains fixes from 7.4.16, including a security fix. For information about new features in the 7.4 major release, see Section E.274.

E.257.1. Migration to Version 7.4.17

A dump/restore is not required for those running 7.4.X. However, if you are upgrading from a version earlier than 7.4.11, see Section E.263.
E.257.2. Changes

- Support explicit placement of the temporary-table schema within `search_path`, and disable searching it for functions and operators (Tom)

This is needed to allow a security-definer function to set a truly secure value of `search_path`. Without it, an unprivileged SQL user can use temporary objects to execute code with the privileges of the security-definer function (CVE-2007-2138). See `CREATE FUNCTION` for more information.

- `/contrib/tsearch2` crash fixes (Teodor)

- Fix potential-data-corruption bug in how `VACUUM FULL` handles `UPDATE` chains (Tom, Pavan Deolasee)

- Fix `PANIC` during enlargement of a hash index (bug introduced in 7.4.15) (Tom)

E.258. Release 7.4.16

**Release date:** 2007-02-05

This release contains a variety of fixes from 7.4.15, including a security fix. For information about new features in the 7.4 major release, see Section E.274.

E.258.1. Migration to Version 7.4.16

A dump/restore is not required for those running 7.4.X. However, if you are upgrading from a version earlier than 7.4.11, see Section E.263.

E.258.2. Changes

- Remove security vulnerability that allowed connected users to read backend memory (Tom)

The vulnerability involves suppressing the normal check that a SQL function returns the data type it’s declared to, or changing the data type of a table column used in a SQL function (CVE-2007-0555). This error can easily be exploited to cause a backend crash, and in principle might be used to read database content that the user should not be able to access.

- Fix rare bug wherein btree index page splits could fail due to choosing an infeasible split point (Heikki Linnakangas)

- Fix for rare Assert() crash triggered by `UNION` (Tom)

- Tighten security of multi-byte character processing for UTF8 sequences over three bytes long (Tom)
E.259. Release 7.4.15

**Release date:** 2007-01-08

This release contains a variety of fixes from 7.4.14. For information about new features in the 7.4 major release, see Section E.274.

**E.259.1. Migration to Version 7.4.15**

A dump/restore is not required for those running 7.4.X. However, if you are upgrading from a version earlier than 7.4.11, see Section E.263.

**E.259.2. Changes**

- Improve handling of `getaddrinfo()` on AIX (Tom)
  
  This fixes a problem with starting the statistics collector, among other things.

- Fix “failed to re-find parent key” errors in `VACUUM` (Tom)

- Fix bugs affecting multi-gigabyte hash indexes (Tom)

- Fix error when constructing an `ARRAY[]` made up of multiple empty elements (Tom)

- `to_number()` and `to_char(numeric)` are now **STABLE**, not **IMMUTABLE**, for new initdb installs (Tom)

  This is because `lc_numeric` can potentially change the output of these functions.

- Improve index usage of regular expressions that use parentheses (Tom)

  This improves `psql` \d performance also.

E.260. Release 7.4.14

**Release date:** 2006-10-16

This release contains a variety of fixes from 7.4.13. For information about new features in the 7.4 major release, see Section E.274.

**E.260.1. Migration to Version 7.4.14**

A dump/restore is not required for those running 7.4.X. However, if you are upgrading from a version earlier than 7.4.11, see Section E.263.
E.260.2. Changes

- Fix core dump when an untyped literal is taken as ANYARRAY
- Fix `string_to_array()` to handle overlapping matches for the separator string
  For example, `string_to_array(’123xx456xxx789’, ’xx’).
- Fix corner cases in pattern matching for psql’s \d commands
- Fix index-corrupting bugs in /contrib/ltree (Teodor)
- Fix backslash escaping in /contrib/dbmirror
- Adjust regression tests for recent changes in US DST laws

E.261. Release 7.4.13

Release date: 2006-05-23

This release contains a variety of fixes from 7.4.12, including patches for extremely serious security issues. For information about new features in the 7.4 major release, see Section E.274.

E.261.1. Migration to Version 7.4.13

A dump/restore is not required for those running 7.4.X. However, if you are upgrading from a version earlier than 7.4.11, see Section E.263.

Full security against the SQL-injection attacks described in CVE-2006-2313 and CVE-2006-2314 might require changes in application code. If you have applications that embed untrustworthy strings into SQL commands, you should examine them as soon as possible to ensure that they are using recommended escaping techniques. In most cases, applications should be using subroutines provided by libraries or drivers (such as libpq's PQescapeStringConn()) to perform string escaping, rather than relying on ad hoc code to do it.

E.261.2. Changes

- Change the server to reject invalidly-encoded multibyte characters in all cases (Tatsuo, Tom)
  While PostgreSQL has been moving in this direction for some time, the checks are now applied uniformly to all encodings and all textual input, and are now always errors not merely warnings. This change defends against SQL-injection attacks of the type described in CVE-2006-2313.
- Reject unsafe uses of \’ in string literals
  As a server-side defense against SQL-injection attacks of the type described in CVE-2006-2314, the server now only accepts ” and not \’ as a representation of ASCII single quote in SQL string literals. By default, \’ is rejected only when client_encoding is set to a client-only encoding (SJIS, BIG5,
GBK, GB18030, or UHC), which is the scenario in which SQL injection is possible. A new configuration parameter \texttt{backslash_quote} is available to adjust this behavior when needed. Note that full security against CVE-2006-2314 might require client-side changes; the purpose of \texttt{backslash_quote} is in part to make it obvious that insecure clients are insecure.

- Modify \texttt{libpq}'s string-escaping routines to be aware of encoding considerations and \texttt{standard_conforming_strings}

This fixes \texttt{libpq}-using applications for the security issues described in CVE-2006-2313 and CVE-2006-2314, and also future-proofs them against the planned changeover to SQL-standard string literal syntax. Applications that use multiple PostgreSQL connections concurrently should migrate to \texttt{PQescapeStringConn()} and \texttt{PQescapeByteaConn()} to ensure that escaping is done correctly for the settings in use in each database connection. Applications that do string escaping “by hand” should be modified to rely on library routines instead.

- Fix some incorrect encoding conversion functions
  \texttt{win1251_to_iso}, \texttt{alt_to_iso}, \texttt{euc_tw_to_big5}, \texttt{euc_tw_to_mic}, \texttt{mic_to_euc_tw} were all broken to varying extents.

- Clean up stray remaining uses of \texttt{\textbackslash \textbackslash} in strings (Bruce, Jan)

- Fix bug that sometimes caused OR’d index scans to miss rows they should have returned

- Fix \texttt{WAL} replay for case where a btree index has been truncated

- Fix \texttt{SIMILAR TO} for patterns involving \texttt{|} (Tom)

- Fix server to use custom DH SSL parameters correctly (Michael Fuhr)

- Fix for Bonjour on Intel Macs (Ashley Clark)

- Fix various minor memory leaks

\section*{E.262. Release 7.4.12}

\textbf{Release date:} 2006-02-14

This release contains a variety of fixes from 7.4.11. For information about new features in the 7.4 major release, see Section E.274.

\subsection*{E.262.1. Migration to Version 7.4.12}

A dump/restore is not required for those running 7.4.X. However, if you are upgrading from a version earlier than 7.4.11, see Section E.263.

\subsection*{E.262.2. Changes}

- Fix potential crash in \texttt{SET SESSION AUTHORIZATION} (CVE-2006-0553)
An unprivileged user could crash the server process, resulting in momentary denial of service to other users, if the server has been compiled with Asserts enabled (which is not the default). Thanks to Akio Ishida for reporting this problem.

- Fix bug with row visibility logic in self-inserted rows (Tom)
  Under rare circumstances a row inserted by the current command could be seen as already valid, when it should not be. Repairs bug created in 7.4.9 and 7.3.11 releases.

- Fix race condition that could lead to “file already exists” errors during pg_clog file creation (Tom)

- Properly check `DOMAIN` constraints for `UNKNOWN` parameters in prepared statements (Neil)

- Fix to allow restoring dumps that have cross-schema references to custom operators (Tom)

- Portability fix for testing presence of `finite` and `isinf` during configure (Tom)

---

### E.263. Release 7.4.11

**Release date:** 2006-01-09

This release contains a variety of fixes from 7.4.10. For information about new features in the 7.4 major release, see Section E.274.

### E.263.1. Migration to Version 7.4.11

A dump/restore is not required for those running 7.4.X. However, if you are upgrading from a version earlier than 7.4.8, see Section E.266. Also, you might need to `REINDEX` indexes on textual columns after updating, if you are affected by the locale or plperl issues described below.

### E.263.2. Changes

- Fix for protocol-level Describe messages issued outside a transaction or in a failed transaction (Tom)
- Fix character string comparison for locales that consider different character combinations as equal, such as Hungarian (Tom)
  This might require `REINDEX` to fix existing indexes on textual columns.
- Set locale environment variables during postmaster startup to ensure that plperl won’t change the locale later
  This fixes a problem that occurred if the postmaster was started with environment variables specifying a different locale than what initdb had been told. Under these conditions, any use of plperl was likely to lead to corrupt indexes. You might need `REINDEX` to fix existing indexes on textual columns if this has happened to you.
- Fix longstanding bug in strpos() and regular expression handling in certain rarely used Asian multi-byte character sets (Tatsuo)
• Fix bug in `/contrib/pgcrypto` `gen_salt`, which caused it not to use all available salt space for MD5 and XDES algorithms (Marko Kreen, Solar Designer)

  Salts for Blowfish and standard DES are unaffected.

• Fix `/contrib/dblink` to throw an error, rather than crashing, when the number of columns specified is different from what’s actually returned by the query (Joe)

### E.264. Release 7.4.10

**Release date:** 2005-12-12

This release contains a variety of fixes from 7.4.9. For information about new features in the 7.4 major release, see Section E.274.

### E.264.1. Migration to Version 7.4.10

A dump/restore is not required for those running 7.4.X. However, if you are upgrading from a version earlier than 7.4.8, see Section E.266.

### E.264.2. Changes

• Fix race condition in transaction log management

  There was a narrow window in which an I/O operation could be initiated for the wrong page, leading to an Assert failure or data corruption.

• Prevent failure if client sends Bind protocol message when current transaction is already aborted

• `/contrib/ltree` fixes (Teodor)

• AIX and HPUX compile fixes (Tom)

• Fix longstanding planning error for outer joins

  This bug sometimes caused a bogus error “RIGHT JOIN is only supported with merge-joinable join conditions”.

• Prevent core dump in `pg_autovacuum` when a table has been dropped

### E.265. Release 7.4.9

**Release date:** 2005-10-04

This release contains a variety of fixes from 7.4.8. For information about new features in the 7.4 major release, see Section E.274.
E.265.1. Migration to Version 7.4.9

A dump/restore is not required for those running 7.4.X. However, if you are upgrading from a version earlier than 7.4.8, see Section E.266.

E.265.2. Changes

• Fix error that allowed VACUUM to remove ctid chains too soon, and add more checking in code that follows ctid links
  
  This fixes a long-standing problem that could cause crashes in very rare circumstances.

• Fix CHAR() to properly pad spaces to the specified length when using a multiple-byte character set
  
  In prior releases, the padding of CHAR() was incorrect because it only padded to the specified number of bytes without considering how many characters were stored.

• Fix the sense of the test for read-only transaction in COPY
  
  The code formerly prohibited COPY TO, where it should prohibit COPY FROM.

• Fix planning problem with outer-join ON clauses that reference only the inner-side relation

• Further fixes for x FULL JOIN y ON true corner cases

• Make array_in and array_recv more paranoid about validating their OID parameter

• Fix missing rows in queries like UPDATE a=... WHERE a... with GiST index on column a

• Improve robustness of datetime parsing

• Improve checking for partially-written WAL pages

• Improve robustness of signal handling when SSL is enabled

• Don’t try to open more than max_files_per_process files during postmaster startup

• Various memory leakage fixes

• Various portability improvements

• Fix PL/pgSQL to handle var := var correctly when the variable is of pass-by-reference type

• Update contrib/tsearch2 to use current Snowball code

E.266. Release 7.4.8

Release date: 2005-05-09

This release contains a variety of fixes from 7.4.7, including several security-related issues. For information about new features in the 7.4 major release, see Section E.274.
E.266.1. Migration to Version 7.4.8

A dump/restore is not required for those running 7.4.X. However, it is one possible way of handling two significant security problems that have been found in the initial contents of 7.4.X system catalogs. A dump/initdb/reload sequence using 7.4.8’s initdb will automatically correct these problems.

The larger security problem is that the built-in character set encoding conversion functions can be invoked from SQL commands by unprivileged users, but the functions were not designed for such use and are not secure against malicious choices of arguments. The fix involves changing the declared parameter list of these functions so that they can no longer be invoked from SQL commands. (This does not affect their normal use by the encoding conversion machinery.)

The lesser problem is that the contrib/tsearch2 module creates several functions that are misdeclared to return internal when they do not accept internal arguments. This breaks type safety for all functions using internal arguments.

It is strongly recommended that all installations repair these errors, either by initdb or by following the manual repair procedures given below. The errors at least allow unprivileged database users to crash their server process, and might allow unprivileged users to gain the privileges of a database superuser.

If you wish not to do an initdb, perform the following procedures instead. As the database superuser, do:

```
BEGIN;
UPDATE pg_proc SET proargtypes[3] = 'internal’::regtype
WHERE pronamespace = 11 AND pronargs = 5
    AND proargtypes[2] = 'cstring’::regtype;
-- The command should report having updated 90 rows;
-- if not, rollback and investigate instead of committing!
COMMIT;
```

Next, if you have installed contrib/tsearch2, do:

```
BEGIN;
UPDATE pg_proc SET proargtypes[0] = 'internal’::regtype
WHERE oid IN (‘dex_init(text)’::regprocedure,
              ‘snb_en_init(text)’::regprocedure,
              ‘snb_ru_init(text)’::regprocedure,
              ‘spell_init(text)’::regprocedure,
              ‘syn_init(text)’::regprocedure);
-- The command should report having updated 5 rows;
-- if not, rollback and investigate instead of committing!
COMMIT;
```

If this command fails with a message like “function "dex_init(text)” does not exist”, then either tsearch2 is not installed in this database, or you already did the update.

The above procedures must be carried out in each database of an installation, including template1, and ideally including template0 as well. If you do not fix the template databases then any subsequently created databases will contain the same errors. template1 can be fixed in the same way as any other database, but fixing template0 requires additional steps. First, from any database issue:

```
UPDATE pg_database SET datallowconn = true WHERE datname = ‘template0’;
```
Appendix E. Release Notes

Next connect to `template0` and perform the above repair procedures. Finally, do:

```sql
-- re-freeze template0:
VACUUM FREEZE;
-- and protect it against future alterations:
UPDATE pg_database SET datallowconn = false WHERE datname = 'template0';
```

### E.266.2. Changes

- Change encoding function signature to prevent misuse
- Change `contrib/tsearch2` to avoid unsafe use of `INTERNAL` function results
- Repair ancient race condition that allowed a transaction to be seen as committed for some purposes (e.g., `SELECT FOR UPDATE`) slightly sooner than for other purposes
  
  This is an extremely serious bug since it could lead to apparent data inconsistencies being briefly visible to applications.
- Repair race condition between relation extension and `VACUUM`
  
  This could theoretically have caused loss of a page’s worth of freshly-inserted data, although the scenario seems of very low probability. There are no known cases of it having caused more than an Assert failure.
- Fix comparisons of `TIME WITH TIME ZONE` values
  
  The comparison code was wrong in the case where the `--enable-integer-datetimes` configuration switch had been used. NOTE: if you have an index on a `TIME WITH TIME ZONE` column, it will need to be `REINDEX`ed after installing this update, because the fix corrects the sort order of column values.
- Fix `EXTRACT(EPOCH)` for `TIME WITH TIME ZONE` values
- Fix mis-display of negative fractional seconds in `INTERVAL` values
  
  This error only occurred when the `--enable-integer-datetimes` configuration switch had been used.
- Ensure operations done during backend shutdown are counted by statistics collector
  
  This is expected to resolve reports of `pg_autovacuum` not vacuuming the system catalogs often enough — it was not being told about catalog deletions caused by temporary table removal during backend exit.
- Additional buffer overrun checks in `plpgsql` (Neil)
- Fix `pg_dump` to dump trigger names containing `%` correctly (Neil)
- Fix `contrib/pgcrypto` for newer OpenSSL builds (Marko Kreen)
- Still more 64-bit fixes for `contrib/intagg`
- Prevent incorrect optimization of functions returning `RECORD`
- Prevent `to_char(interval)` from dumping core for month-related formats
Appendix E. Release Notes

- Prevent crash on `COALESCE(NULL, NULL)`
- Fix `array_map` to call PL functions correctly
- Fix permission checking in `ALTER DATABASE RENAME`
- Fix `ALTER LANGUAGE RENAME`
- Make `RemoveFromWaitQueue` clean up after itself
  
  This fixes a lock management error that would only be visible if a transaction was kicked out of a wait for a lock (typically by query cancel) and then the holder of the lock released it within a very narrow window.
- Fix problem with untyped parameter appearing in `INSERT ... SELECT`
- Fix `CLUSTER` failure after `ALTER TABLE SET WITHOUT OIDS`

E.267. Release 7.4.7

Release date: 2005-01-31

This release contains a variety of fixes from 7.4.6, including several security-related issues. For information about new features in the 7.4 major release, see Section E.274.

E.267.1. Migration to Version 7.4.7

A dump/restore is not required for those running 7.4.X.

E.267.2. Changes

- Disallow `LOAD` to non-superusers
  
  On platforms that will automatically execute initialization functions of a shared library (this includes at least Windows and ELF-based Unixen), `LOAD` can be used to make the server execute arbitrary code. Thanks to NGS Software for reporting this.
- Check that creator of an aggregate function has the right to execute the specified transition functions
  
  This oversight made it possible to bypass denial of EXECUTE permission on a function.
- Fix security and 64-bit issues in contrib/intagg
- Add needed `STRICT` marking to some contrib functions (Kris Jurka)
- Avoid buffer overrun when plpgsql cursor declaration has too many parameters (Neil)
- Fix planning error for `FULL` and `RIGHT` outer joins
  
  The result of the join was mistakenly supposed to be sorted the same as the left input. This could not only deliver mis-sorted output to the user, but in case of nested merge joins could give outright wrong answers.
• Fix plperl for quote marks in tuple fields
• Fix display of negative intervals in SQL and GERMAN datestyles
• Make age(timestamptz) do calculation in local timezone not GMT

E.268. Release 7.4.6

Release date: 2004-10-22

This release contains a variety of fixes from 7.4.5. For information about new features in the 7.4 major release, see Section E.274.

E.268.1. Migration to Version 7.4.6

A dump/restore is not required for those running 7.4.X.

E.268.2. Changes

• Repair possible failure to update hint bits on disk
  Under rare circumstances this oversight could lead to “could not access transaction status” failures, which qualifies it as a potential-data-loss bug.
• Ensure that hashed outer join does not miss tuples
  Very large left joins using a hash join plan could fail to output unmatched left-side rows given just the right data distribution.
• Disallow running pg_ctl as root
  This is to guard against any possible security issues.
• Avoid using temp files in /tmp in make_oidjoins_check
  This has been reported as a security issue, though it’s hardly worthy of concern since there is no reason for non-developers to use this script anyway.
• Prevent forced backend shutdown from re-emitting prior command result
  In rare cases, a client might think that its last command had succeeded when it really had been aborted by forced database shutdown.
• Repair bug in pg_stat_get_backend_idset
  This could lead to misbehavior in some of the system-statistics views.
• Fix small memory leak in postmaster
• Fix “expected both swapped tables to have TOAST tables” bug
  This could arise in cases such as CLUSTER after ALTER TABLE DROP COLUMN.
• Prevent pg_ctl restart from adding -D multiple times
• Fix problem with NULL values in GiST indexes
• :: is no longer interpreted as a variable in an ECPG prepare statement

E.269. Release 7.4.5

Release date: 2004-08-18
This release contains one serious bug fix over 7.4.4. For information about new features in the 7.4 major release, see Section E.274.

E.269.1. Migration to Version 7.4.5
A dump/restore is not required for those running 7.4.X.

E.269.2. Changes

• Repair possible crash during concurrent B-tree index insertions
  This patch fixes a rare case in which concurrent insertions into a B-tree index could result in a server panic. No permanent damage would result, but it’s still worth a re-release. The bug does not exist in pre-7.4 releases.

E.270. Release 7.4.4

Release date: 2004-08-16
This release contains a variety of fixes from 7.4.3. For information about new features in the 7.4 major release, see Section E.274.

E.270.1. Migration to Version 7.4.4
A dump/restore is not required for those running 7.4.X.

E.270.2. Changes

• Prevent possible loss of committed transactions during crash
  Due to insufficient interlocking between transaction commit and checkpointing, it was possible for transactions committed just before the most recent checkpoint to be lost, in whole or in part, following a database crash and restart. This is a serious bug that has existed since PostgreSQL 7.1.
Appendix E. Release Notes

- Check HAVING restriction before evaluating result list of an aggregate plan
- Avoid crash when session’s current user ID is deleted
- Fix hashed crosstab for zero-rows case (Joe)
- Force cache update after renaming a column in a foreign key
- Pretty-print UNION queries correctly
- Make psql handle \r\n newlines properly in COPY IN
- pg_dump handled ACLs with grant options incorrectly
- Fix thread support for OS X and Solaris
- Updated JDBC driver (build 215) with various fixes
- ECPG fixes
- Translation updates (various contributors)

E.271. Release 7.4.3

Release date: 2004-06-14

This release contains a variety of fixes from 7.4.2. For information about new features in the 7.4 major release, see Section E.274.

E.271.1. Migration to Version 7.4.3

A dump/restore is not required for those running 7.4.X.

E.271.2. Changes

- Fix temporary memory leak when using non-hashed aggregates (Tom)
- ECPG fixes, including some for Informix compatibility (Michael)
- Fixes for compiling with thread-safety, particularly Solaris (Bruce)
- Fix error in COPY IN termination when using the old network protocol (ljb)
- Several important fixes in pg_autovacuum, including fixes for large tables, unsigned oids, stability, temp tables, and debug mode (Matthew T. O’Connor)
- Fix problem with reading tar-format dumps on NetBSD and BSD/OS (Bruce)
- Several JDBC fixes
- Fix ALTER SEQUENCE RESTART where last_value equals the restart value (Tom)
- Repair failure to recalculate nested sub-selects (Tom)
- Fix problems with non-constant expressions in LIMIT/OFFSET
• Support FULL JOIN with no join clause, such as X FULL JOIN Y ON TRUE (Tom)
• Fix another zero-column table bug (Tom)
• Improve handling of non-qualified identifiers in GROUP BY clauses in sub-selects (Tom)
  Select-list aliases within the sub-select will now take precedence over names from outer query levels.
• Do not generate “NATURAL CROSS JOIN” when decompiling rules (Tom)
• Add checks for invalid field length in binary COPY (Tom)
  This fixes a difficult-to-exploit security hole.
• Avoid locking conflict between ANALYZE and LISTEN/NOTIFY
• Numerous translation updates (various contributors)

E.272. Release 7.4.2

Release date: 2004-03-08

This release contains a variety of fixes from 7.4.1. For information about new features in the 7.4 major release, see Section E.274.

E.272.1. Migration to Version 7.4.2

A dump/restore is not required for those running 7.4.X. However, it might be advisable as the easiest method of incorporating fixes for two errors that have been found in the initial contents of 7.4.X system catalogs. A dump/initdb/reload sequence using 7.4.2’s initdb will automatically correct these problems.

The more severe of the two errors is that data type anyarray has the wrong alignment label; this is a problem because the pg_statistic system catalog uses anyarray columns. The mislabeling can cause planner misestimations and even crashes when planning queries that involve WHERE clauses on double-aligned columns (such as float8 and timestamp). It is strongly recommended that all installations repair this error, either by initdb or by following the manual repair procedure given below.

The lesser error is that the system view pg_settings ought to be marked as having public update access, to allow UPDATE pg_settings to be used as a substitute for SET. This can also be fixed either by initdb or manually, but it is not necessary to fix unless you want to use UPDATE pg_settings.

If you wish not to do an initdb, the following procedure will work for fixing pg_statistic. As the database superuser, do:

-- clear out old data in pg_statistic:
DELETE FROM pg_statistic;
VACUUM pg_statistic;
-- this should update 1 row:
UPDATE pg_type SET typalign = 'd' WHERE oid = 2277;
-- this should update 6 rows:
UPDATE pg_attribute SET attalign = 'd' WHERE atttypid = 2277;
--
-- At this point you MUST start a fresh backend to avoid a crash!
Appendix E. Release Notes

--
-- repopulate pg_statistic:
ANALYZE;

This can be done in a live database, but beware that all backends running in the altered database must be
restarted before it is safe to repopulate pg_statistic.

To repair the pg_settings error, simply do:

GRANT SELECT, UPDATE ON pg_settings TO PUBLIC;

The above procedures must be carried out in each database of an installation, including template1, and
ideally including template0 as well. If you do not fix the template databases then any subsequently
created databases will contain the same errors. template1 can be fixed in the same way as any other
database, but fixing template0 requires additional steps. First, from any database issue:

UPDATE pg_database SET datallowconn = true WHERE datname = ’template0’;

Next connect to template0 and perform the above repair procedures. Finally, do:

-- re-freeze template0:
VACUUM FREEZE;
-- and protect it against future alterations:
UPDATE pg_database SET datallowconn = false WHERE datname = ’template0’;

E.272.2. Changes

Release 7.4.2 incorporates all the fixes included in release 7.3.6, plus the following fixes:

- Fix pg_statistics alignment bug that could crash optimizer
  See above for details about this problem.
- Allow non-super users to update pg_settings
- Fix several optimizer bugs, most of which led to “variable not found in subplan target lists” errors
- Avoid out-of-memory failure during startup of large multiple index scan
- Fix multibyte problem that could lead to “out of memory” error during COPY IN
- Fix problems with SELECT INTO/CREATE TABLE AS from tables without OIDs
- Fix problems with alter_table regression test during parallel testing
- Fix problems with hitting open file limit, especially on OS X (Tom)
- Partial fix for Turkish-locale issues
  initdb will succeed now in Turkish locale, but there are still some inconveniences associated with the
  i/I problem.
- Make pg_dump set client encoding on restore
• Other minor pg_dump fixes
• Allow ecpg to again use C keywords as column names (Michael)
• Added ecpg WHENEVER NOT_FOUND to SELECT/INSERT/UPDATE/DELETE (Michael)
• Fix ecpg crash for queries calling set-returning functions (Michael)
• Various other ecpg fixes (Michael)
• Fixes for Borland compiler
• Thread build improvements (Bruce)
• Various other build fixes
• Various JDBC fixes

E.273. Release 7.4.1

Release date: 2003-12-22

This release contains a variety of fixes from 7.4. For information about new features in the 7.4 major release, see Section E.274.

E.273.1. Migration to Version 7.4.1

A dump/restore is not required for those running 7.4.

If you want to install the fixes in the information schema you need to reload it into the database. This is either accomplished by initializing a new cluster by running initdb, or by running the following sequence of SQL commands in each database (ideally including template1) as a superuser in psql, after installing the new release:

```
DROP SCHEMA information_schema CASCADE;
\i /usr/local/pgsql/share/information_schema.sql
```

Substitute your installation path in the second command.

E.273.2. Changes

• Fixed bug in CREATE SCHEMA parsing in ECPG (Michael)
• Fix compile error when --enable-thread-safety and --with-perl are used together (Peter)
• Fix for subqueries that used hash joins (Tom)
  Certain subqueries that used hash joins would crash because of improperly shared structures.
• Fix free space map compaction bug (Tom)
  This fixes a bug where compaction of the free space map could lead to a database server shutdown.
• Fix for Borland compiler build of libpq (Bruce)
• Fix netmask() and hostmask() to return the maximum-length masklen (Tom)
  Fix these functions to return values consistent with pre-7.4 releases.
• Several contrib/pg_autovacuum fixes
  Fixes include improper variable initialization, missing vacuum after TRUNCATE, and duration computation overflow for long vacuums.
• Allow compile of contrib/cube under Cygwin (Jason Tishler)
• Fix Solaris use of password file when no passwords are defined (Tom)
  Fix crash on Solaris caused by use of any type of password authentication when no passwords were defined.
• JDBC fix for thread problems, other fixes
• Fix for bytea index lookups (Joe)
• Fix information schema for bit data types (Peter)
• Force zero_damaged_pages to be on during recovery from WAL
• Prevent some obscure cases of “variable not in subplan target lists”
• Make PQescapeBytea and byteaout consistent with each other (Joe)
• Escape bytea output for bytes > 0x7e(Joe)
  If different client encodings are used for bytea output and input, it is possible for bytea values to be corrupted by the differing encodings. This fix escapes all bytes that might be affected.
• Added missing SPI_finish() calls to dblink’s get_tuple_of_interest() (Joe)
• New Czech FAQ
• Fix information schema view constraint_column_usage for foreign keys (Peter)
• ECPG fixes (Michael)
• Fix bug with multiple IN subqueries and joins in the subqueries (Tom)
• Allow COUNT(‘x’) to work (Tom)
• Install ECPG include files for Informix compatibility into separate directory (Peter)
  Some names of ECPG include files for Informix compatibility conflicted with operating system include files. By installing them in their own directory, name conflicts have been reduced.
• Fix SSL memory leak (Neil)
  This release fixes a bug in 7.4 where SSL didn’t free all memory it allocated.
• Prevent pg_service.conf from using service name as default dbname (Bruce)
• Fix local ident authentication on FreeBSD (Tom)
E.274. Release 7.4

Release date: 2003-11-17

E.274.1. Overview

Major changes in this release:

**IN**/NOT **IN** subqueries are now much more efficient

In previous releases, **IN**/NOT **IN** subqueries were joined to the upper query by sequentially scanning the subquery looking for a match. The 7.4 code uses the same sophisticated techniques used by ordinary joins and so is much faster. An **IN** will now usually be as fast as or faster than an equivalent **EXISTS** subquery; this reverses the conventional wisdom that applied to previous releases.

Improved **GROUP BY** processing by using hash buckets

In previous releases, rows to be grouped had to be sorted first. The 7.4 code can do **GROUP BY** without sorting, by accumulating results into a hash table with one entry per group. It will still use the sort technique, however, if the hash table is estimated to be too large to fit in `sort_mem`.

New multikey hash join capability

In previous releases, hash joins could only occur on single keys. This release allows multicoloumn hash joins.

Queries using the explicit **JOIN** syntax are now better optimized

Prior releases evaluated queries using the explicit **JOIN** syntax only in the order implied by the syntax. 7.4 allows full optimization of these queries, meaning the optimizer considers all possible join orderings and chooses the most efficient. Outer joins, however, must still follow the declared ordering.

Faster and more powerful regular expression code

The entire regular expression module has been replaced with a new version by Henry Spencer, originally written for Tcl. The code greatly improves performance and supports several flavors of regular expressions.

Function-inlining for simple SQL functions

Simple SQL functions can now be inlined by including their SQL in the main query. This improves performance by eliminating per-call overhead. That means simple SQL functions now behave like macros.

Full support for IPv6 connections and IPv6 address data types

Previous releases allowed only IPv4 connections, and the IP data types only supported IPv4 addresses. This release adds full IPv6 support in both of these areas.

Major improvements in SSL performance and reliability

Several people very familiar with the SSL API have overhauled our SSL code to improve SSL key negotiation and error recovery.
Make free space map efficiently reuse empty index pages, and other free space management improvements

In previous releases, B-tree index pages that were left empty because of deleted rows could only be reused by rows with index values similar to the rows originally indexed on that page. In 7.4, VACUUM records empty index pages and allows them to be reused for any future index rows.

SQL-standard information schema

The information schema provides a standardized and stable way to access information about the schema objects defined in a database.

Cursors conform more closely to the SQL standard

The commands FETCH and MOVE have been overhauled to conform more closely to the SQL standard.

Cursors can exist outside transactions

These cursors are also called holdable cursors.

New client-to-server protocol

The new protocol adds error codes, more status information, faster startup, better support for binary data transmission, parameter values separated from SQL commands, prepared statements available at the protocol level, and cleaner recovery from COPY failures. The older protocol is still supported by both server and clients.

libpq and ECPG applications are now fully thread-safe

While previous libpq releases already supported threads, this release improves thread safety by fixing some non-thread-safe code that was used during database connection startup. The configure option `--enable-thread-safety` must be used to enable this feature.

New version of full-text indexing

A new full-text indexing suite is available in contrib/tsearch2.

New autovacuum tool

The new autovacuum tool in contrib/autovacuum monitors the database statistics tables for INSERT/UPDATE/DELETE activity and automatically vacuums tables when needed.

Array handling has been improved and moved into the server core

Many array limitations have been removed, and arrays behave more like fully-supported data types.

E.274.2. Migration to Version 7.4

A dump/restore using pg_dump is required for those wishing to migrate data from any previous release.

Observe the following incompatibilities:

- The server-side autocommit setting was removed and reimplemented in client applications and languages. Server-side autocommit was causing too many problems with languages and applications that wanted to control their own autocommit behavior, so autocommit was removed from the server and added to individual client APIs as appropriate.

- Error message wording has changed substantially in this release. Significant effort was invested to make the messages more consistent and user-oriented. If your applications try to detect different error
conditions by parsing the error message, you are strongly encouraged to use the new error code facility instead.

- Inner joins using the explicit \texttt{JOIN} syntax might behave differently because they are now better optimized.

- A number of server configuration parameters have been renamed for clarity, primarily those related to logging.

- \texttt{FETCH 0} or \texttt{MOVE 0} now does nothing. In prior releases, \texttt{FETCH 0} would fetch all remaining rows, and \texttt{MOVE 0} would move to the end of the cursor.

- \texttt{FETCH} and \texttt{MOVE} now return the actual number of rows fetched/moved, or zero if at the beginning/end of the cursor. Prior releases would return the row count passed to the command, not the number of rows actually fetched or moved.

- \texttt{COPY} now can process files that use carriage-return or carriage-return/line-feed end-of-line sequences. Literal carriage-returns and line-feeds are no longer accepted in data values; use \texttt{\textbackslash r} and \texttt{\textbackslash n} instead.

- Trailing spaces are now trimmed when converting from type \texttt{char(n)} to \texttt{varchar(n)} or \texttt{text}. This is what most people always expected to happen anyway.

- The data type \texttt{float(p)} now measures \texttt{p} in binary digits, not decimal digits. The new behavior follows the SQL standard.

- Ambiguous date values now must match the ordering specified by the \texttt{datestyle} setting. In prior releases, a date specification of \texttt{10/20/03} was interpreted as a date in October even if \texttt{datestyle} specified that the day should be first. 7.4 will throw an error if a date specification is invalid for the current setting of \texttt{datestyle}.

- The functions \texttt{oidrand}, \texttt{oidsrand}, and \texttt{userfntest} have been removed. These functions were determined to be no longer useful.

- String literals specifying time-varying date/time values, such as \texttt{’now’} or \texttt{’today’} will no longer work as expected in column default expressions; they now cause the time of the table creation to be the default, not the time of the insertion. Functions such as \texttt{now()}, \texttt{current_timestamp}, or \texttt{current_date} should be used instead.

In previous releases, there was special code so that strings such as \texttt{’now’} were interpreted at \texttt{INSERT} time and not at table creation time, but this work around didn’t cover all cases. Release 7.4 now requires that defaults be defined properly using functions such as \texttt{now()} or \texttt{current_timestamp}. These will work in all situations.

- The dollar sign \texttt{($) is no longer allowed in operator names. It can instead be a non-first character in identifiers. This was done to improve compatibility with other database systems, and to avoid syntax problems when parameter placeholders \texttt{($n)} are written adjacent to operators.

\textbf{E.274.3. Changes}

Below you will find a detailed account of the changes between release 7.4 and the previous major release.
E.274.3.1. Server Operation Changes

- Allow IPv6 server connections (Nigel Kukard, Johan Jordaan, Bruce, Tom, Kurt Roeckx, Andrew Dunstan)
- Fix SSL to handle errors cleanly (Nathan Mueller)
  In prior releases, certain SSL API error reports were not handled correctly. This release fixes those problems.
- SSL protocol security and performance improvements (Sean Chittenden)
  SSL key renegotiation was happening too frequently, causing poor SSL performance. Also, initial key handling was improved.
- Print lock information when a deadlock is detected (Tom)
  This allows easier debugging of deadlock situations.
- Update /tmp socket modification times regularly to avoid their removal (Tom)
  This should help prevent /tmp directory cleaner administration scripts from removing server socket files.
- Enable PAM for Mac OS X (Aaron Hillegass)
- Make B-tree indexes fully WAL-safe (Tom)
  In prior releases, under certain rare cases, a server crash could cause B-tree indexes to become corrupt. This release removes those last few rare cases.
- Allow B-tree index compaction and empty page reuse (Tom)
- Fix inconsistent index lookups during split of first root page (Tom)
  In prior releases, when a single-page index split into two pages, there was a brief period when another database session could miss seeing an index entry. This release fixes that rare failure case.
- Improve free space map allocation logic (Tom)
- Preserve free space information between server restarts (Tom)
  In prior releases, the free space map was not saved when the postmaster was stopped, so newly started servers had no free space information. This release saves the free space map, and reloads it when the server is restarted.
- Add start time to pg_stat_activity (Neil)
- New code to detect corrupt disk pages; erase with zero_damaged_pages (Tom)
- New client/server protocol: faster, no username length limit, allow clean exit from COPY (Tom)
- Add transaction status, table ID, column ID to client/server protocol (Tom)
- Add binary I/O to client/server protocol (Tom)
- Remove autocommit server setting; move to client applications (Tom)
- New error message wording, error codes, and three levels of error detail (Tom, Joe, Peter)
E.274.3.2. Performance Improvements

- Add hashing for GROUP BY aggregates (Tom)
- Make nested-loop joins be smarter about multicolonmn indexes (Tom)
- Allow multikey hash joins (Tom)
- Improve constant folding (Tom)
- Add ability to inline simple SQL functions (Tom)
- Reduce memory usage for queries using complex functions (Tom)
  
  In prior releases, functions returning allocated memory would not free it until the query completed. This release allows the freeing of function-allocated memory when the function call completes, reducing the total memory used by functions.
- Improve GEQO optimizer performance (Tom)
  
  This release fixes several inefficiencies in the way the GEQO optimizer manages potential query paths.
- Allow IN/NOT IN to be handled via hash tables (Tom)
- Improve NOT IN (subquery) performance (Tom)
- Allow most IN subqueries to be processed as joins (Tom)
- Pattern matching operations can use indexes regardless of locale (Peter)
  
  There is no way for non-ASCII locales to use the standard indexes for LIKE comparisons. This release adds a way to create a special index for LIKE.
- Allow the postmaster to preload libraries using preload_libraries (Joe)
  
  For shared libraries that require a long time to load, this option is available so the library can be preloaded in the postmaster and inherited by all database sessions.
- Improve optimizer cost computations, particularly for subqueries (Tom)
- Avoid sort when subquery ORDER BY matches upper query (Tom)
- Deduce that WHERE a.x = b.y AND b.y = 42 also means a.x = 42 (Tom)
- Allow hash/merge joins on complex joins (Tom)
- Allow hash joins for more data types (Tom)
- Allow join optimization of explicit inner joins, disable with join_collapse_limit (Tom)
- Add parameter from_collapse_limit to control conversion of subqueries to joins (Tom)
- Use faster and more powerful regular expression code from Tcl (Henry Spencer, Tom)
- Use bit-mapped relation sets in the optimizer (Tom)
- Improve connection startup time (Tom)
  
  The new client/server protocol requires fewer network packets to start a database session.
- Improve trigger/constraint performance (Stephan)
- Improve speed of col IN (const, const, const, ...) (Tom)
- Fix hash indexes which were broken in rare cases (Tom)
• Improve hash index concurrency and speed (Tom)
  Prior releases suffered from poor hash index performance, particularly for high concurrency situations. This release fixes that, and the development group is interested in reports comparing B-tree and hash index performance.
• Align shared buffers on 32-byte boundary for copy speed improvement (Manfred Spraul)
  Certain CPU’s perform faster data copies when addresses are 32-byte aligned.
• Data type numeric reimplemented for better performance (Tom)
  numeric used to be stored in base 100. The new code uses base 10000, for significantly better performance.

E.274.3.3. Server Configuration Changes

• Rename server parameter server_min_messages to log_min_messages (Bruce)
  This was done so most parameters that control the server logs begin with log_.
• Rename show_*_stats to log_*_stats (Bruce)
• Rename show_source_port to log_source_port (Bruce)
• Rename hostname_lookup to log_hostname (Bruce)
• Add checkpoint_warning to warn of excessive checkpointing (Bruce)
  In prior releases, it was difficult to determine if checkpoint was happening too frequently. This feature adds a warning to the server logs when excessive checkpointing happens.
• New read-only server parameters for localization (Tom)
• Change debug server log messages to output as DEBUG rather than LOG (Bruce)
• Prevent server log variables from being turned off by non-superusers (Bruce)
  This is a security feature so non-superusers cannot disable logging that was enabled by the administrator.
• log_min_messages/client_min_messages now controls debug_* output (Bruce)
  This centralizes client debug information so all debug output can be sent to either the client or server logs.
• Add Mac OS X Rendezvous server support (Chris Campbell)
  This allows Mac OS X hosts to query the network for available PostgreSQL servers.
• Add ability to print only slow statements using log_min_duration_statement (Christopher)
  This is an often requested debugging feature that allows administrators to see only slow queries in their server logs.
• Allow pg_hba.conf to accept netmasks in CIDR format (Andrew Dunstan)
  This allows administrators to merge the host IP address and netmask fields into a single CIDR field in pg_hba.conf.
• New read-only parameter is_superuser (Tom)
• New parameter `log_error_verbosity` to control error detail (Tom)
  This works with the new error reporting feature to supply additional error information like hints, file names and line numbers.

• `postgres --describe-config` now dumps server config variables (Aizaz Ahmed, Peter)
  This option is useful for administration tools that need to know the configuration variable names and their minimums, maximums, defaults, and descriptions.

• Add new columns in `pg_settings`: `context`, `type`, `source`, `min_val`, `max_val` (Joe)

• Make default `shared_buffers` 1000 and `max_connections` 100, if possible (Tom)
  Prior versions defaulted to 64 shared buffers so PostgreSQL would start on even very old systems. This release tests the amount of shared memory allowed by the platform and selects more reasonable default values if possible. Of course, users are still encouraged to evaluate their resource load and size `shared_buffers` accordingly.

• New `pg_hba.conf` record type `hostnossl` to prevent SSL connections (Jon Jensen)
  In prior releases, there was no way to prevent SSL connections if both the client and server supported SSL. This option allows that capability.

• Remove parameter `geqo_random_seed` (Tom)

• Add server parameter `regex_flavor` to control regular expression processing (Tom)

• Make `pg_ctl` better handle nonstandard ports (Greg)

## E.274.3.4. Query Changes

• New SQL-standard information schema (Peter)

• Add read-only transactions (Peter)

• Print key name and value in foreign-key violation messages (Dmitry Tkach)

• Allow users to see their own queries in `pg_stat_activity` (Kevin Brown)
  In prior releases, only the superuser could see query strings using `pg_stat_activity`. Now ordinary users can see their own query strings.

• Fix aggregates in subqueries to match SQL standard (Tom)
  The SQL standard says that an aggregate function appearing within a nested subquery belongs to the outer query if its argument contains only outer-query variables. Prior PostgreSQL releases did not handle this fine point correctly.

• Add option to prevent auto-addition of tables referenced in query (Nigel J. Andrews)
  By default, tables mentioned in the query are automatically added to the FROM clause if they are not already there. This is compatible with historic POSTGRES behavior but is contrary to the SQL standard. This option allows selecting standard-compatible behavior.

• Allow `UPDATE ... SET col = DEFAULT` (Rod)
  This allows `UPDATE` to set a column to its declared default value.

• Allow expressions to be used in `LIMIT/OFFSET` (Tom)
In prior releases, LIMIT/OFFSET could only use constants, not expressions.

- Implement `CREATE TABLE AS EXECUTE` (Neil, Peter)

### E.274.3.5. Object Manipulation Changes

- Make `CREATE SEQUENCE` grammar more conforming to SQL:2003 (Neil)
- Add statement-level triggers (Neil)
  
  While this allows a trigger to fire at the end of a statement, it does not allow the trigger to access all rows modified by the statement. This capability is planned for a future release.
- Add check constraints for domains (Rod)
  
  This greatly increases the usefulness of domains by allowing them to use check constraints.
- Add `ALTER DOMAIN` (Rod)
  
  This allows manipulation of existing domains.
- Fix several zero-column table bugs (Tom)
  
  PostgreSQL supports zero-column tables. This fixes various bugs that occur when using such tables.
- Have `ALTER TABLE ... ADD PRIMARY KEY` add not-null constraint (Rod)
  
  In prior releases, `ALTER TABLE ... ADD PRIMARY` would add a unique index, but not a not-null constraint. That is fixed in this release.
- Add `ALTER TABLE ... WITHOUT OIDS` (Rod)
  
  This allows control over whether new and updated rows will have an OID column. This is most useful for saving storage space.
- Add `ALTER SEQUENCE` to modify minimum, maximum, increment, cache, cycle values (Rod)
- Add `ALTER TABLE ... CLUSTER ON` (Alvaro Herrera)
  
  This command is used by `pg_dump` to record the cluster column for each table previously clustered. This information is used by database-wide cluster to cluster all previously clustered tables.
- Improve automatic type casting for domains (Rod, Tom)
- Allow dollar signs in identifiers, except as first character (Tom)
- Disallow dollar signs in operator names, so `x=$1` works (Tom)
- Allow copying table schema using `LIKE subtable`, also SQL:2003 feature `INCLUDING DEFAULTS` (Rod)
- Add `WITH GRANT OPTION` clause to `GRANT` (Peter)
  
  This enabled `GRANT` to give other users the ability to grant privileges on an object.

### E.274.3.6. Utility Command Changes

- Add `ON COMMIT` clause to `CREATE TABLE` for temporary tables (Gavin)
This adds the ability for a table to be dropped or all rows deleted on transaction commit.

- Allow cursors outside transactions using `WITH HOLD` (Neil)
  
  In previous releases, cursors were removed at the end of the transaction that created them. Cursors can now be created with the `WITH HOLD` option, which allows them to continue to be accessed after the creating transaction has committed.

- `FETCH 0` and `MOVE 0` now do nothing (Bruce)
  
  In previous releases, `FETCH 0` fetched all remaining rows, and `MOVE 0` moved to the end of the cursor.

- Cause `FETCH` and `MOVE` to return the number of rows fetched/moved, or zero if at the beginning/end of cursor, per SQL standard (Bruce)
  
  In prior releases, the row count returned by `FETCH` and `MOVE` did not accurately reflect the number of rows processed.

- Properly handle `SCROLL` with cursors, or report an error (Neil)
  
  Allowing random access (both forward and backward scrolling) to some kinds of queries cannot be done without some additional work. If `SCROLL` is specified when the cursor is created, this additional work will be performed. Furthermore, if the cursor has been created with `NO SCROLL`, no random access is allowed.

- Implement SQL-compatible options `FIRST`, `LAST`, `ABSOLUTE n`, `RELATIVE n` for `FETCH` and `MOVE` (Tom)

- Allow `EXPLAIN` on `DECLARE CURSOR` (Tom)

- Allow `CLUSTER` to use index marked as pre-clustered by default (Alvaro Herrera)

- Allow `CLUSTER` to cluster all tables (Alvaro Herrera)
  
  This allows all previously clustered tables in a database to be reclustered with a single command.

- Prevent `CLUSTER` on partial indexes (Tom)

- Allow DOS and Mac line-endings in `COPY` files (Bruce)

-Disallow literal carriage return as a data value, backslash-carriage-return and \r are still allowed (Bruce)

- `COPY` changes (binary, \.) (Tom)

- Recover from `COPY` failure cleanly (Tom)

- Prevent possible memory leaks in `COPY` (Tom)

- Make `TRUNCATE` transaction-safe (Rod)
  
  `TRUNCATE` can now be used inside a transaction. If the transaction aborts, the changes made by the `TRUNCATE` are automatically rolled back.

- Allow prepare/bind of utility commands like `FETCH` and `EXPLAIN` (Tom)

- Add `EXPLAIN EXECUTE` (Neil)

- Improve `VACUUM` performance on indexes by reducing WAL traffic (Tom)

- Functional indexes have been generalized into indexes on expressions (Tom)
  
  In prior releases, functional indexes only supported a simple function applied to one or more column names. This release allows any type of scalar expression.
Appendix E. Release Notes

- Have `SHOW TRANSACTION ISOLATION` match input to `SET TRANSACTION ISOLATION` (Tom)
- Have `COMMENT ON DATABASE` on nonlocal database generate a warning, rather than an error (Rod)
  Database comments are stored in database-local tables so comments on a database have to be stored in each database.
- Improve reliability of `LISTEN/NOTIFY` (Tom)
- Allow `REINDEX` to reliably reindex nonshared system catalog indexes (Tom)
  This allows system tables to be reindexed without the requirement of a standalone session, which was necessary in previous releases. The only tables that now require a standalone session for reindexing are the global system tables `pg_database`, `pg_shadow`, and `pg_group`.

E.274.3.7. Data Type and Function Changes

- New server parameter `extra_float_digits` to control precision display of floating-point numbers (Pedro Ferreira, Tom)
  This controls output precision which was causing regression testing problems.
- Allow `+1300` as a numeric time-zone specifier, for FJST (Tom)
- Remove rarely used functions `oidrand`, `oidsrand`, and `userfntest` functions (Neil)
- Add `md5()` function to main server, already in `contrib/pgcrypto` (Joe)
  An MD5 function was frequently requested. For more complex encryption capabilities, use `contrib/pgcrypto`.
- Increase date range of `timestamp` (John Cochran)
- Change `EXTRACT(EPOCH FROM timestamp)` so `timestamp without time zone` is assumed to be in local time, not GMT (Tom)
- Trap division by zero in case the operating system doesn’t prevent it (Tom)
- Change the numeric data type internally to base 10000 (Tom)
- New `hostmask()` function (Greg Wickham)
- Fixes for `to_char()` and `to_timestamp()` (Karel)
- Allow functions that can take any argument data type and return any data type, using `anyelement` and `anyarray` (Joe)
  This allows the creation of functions that can work with any data type.
- Arrays can now be specified as `ARRAY[1,2,3]`, `ARRAY[['a','b'],['c','d']]`, or `ARRAY[ARRAY[ARRAY[2]]]` (Joe)
- Allow proper comparisons for arrays, including `ORDER BY` and `DISTINCT` support (Joe)
- Allow indexes on array columns (Joe)
- Allow array concatenation with `||` (Joe)
- Allow `WHERE qualification expr op ANY/SOME/ALL (array_expr)` (Joe)
Appendix E. Release Notes

This allows arrays to behave like a list of values, for purposes like
\[
\text{SELECT } * \text{ FROM tab \ WHERE col IN (array\_val)}.
\]

- New array functions `array_append`, `array_cat`, `array_lower`, `array_prepend`, `array_to_string`, `array_upper`, `string_to_array` (Joe)
- Allow user defined aggregates to use polymorphic functions (Joe)
- Allow assignments to empty arrays (Joe)
- Allow 60 in seconds fields of `time`, `timestamp`, and `interval` input values (Tom)
  Sixty-second values are needed for leap seconds.
- Allow `cidr` data type to be cast to `text` (Tom)
- Disallow invalid time zone names in `SET TIMEZONE`
- Trim trailing spaces when `char` is cast to `varchar` or `text` (Tom)
- Make `float(p)` measure the precision `p` in binary digits, not decimal digits (Tom)
- Add IPv6 support to the `inet` and `cidr` data types (Michael Graff)
- Add `family()` function to report whether address is IPv4 or IPv6 (Michael Graff)
- Have `SHOW datestyle` generate output similar to that used by `SET datestyle` (Tom)
- Make `EXTRACT(TIMEZONE)` and `SET/SHOW TIME ZONE` follow the SQL convention for the sign of time zone offsets, i.e., positive is east from UTC (Tom)
- Fix `date_trunc('quarter', ...)` (Böjthe Zoltán)
  Prior releases returned an incorrect value for this function call.
- Make `initcap()` more compatible with Oracle (Mike Nolan)
  `initcap()` now uppercases a letter appearing after any non-alphanumeric character, rather than only after whitespace.
- Allow only `datestyle` field order for date values not in ISO-8601 format (Greg)
- Add new `datestyle` values `MDY`, `DMY`, and `YMD` to set input field order; honor US and European for backward compatibility (Tom)
- String literals like ‘now’ or ‘today’ will no longer work as a column default. Use functions such as `now()`, `current_timestamp` instead. (change required for prepared statements) (Tom)
- Treat NaN as larger than any other value in `min()`/`max()` (Tom)
  NaN was already sorted after ordinary numeric values for most purposes, but `min()` and `max()` didn’t get this right.
- Prevent interval from suppressing :00 seconds display
- New functions `pg_get_triggerdef(prettyprint)` and `pg_conversion_is_visible()` (Christopher)
- Allow time to be specified as `040506` or `0405` (Tom)
- Input date order must now be `YYYY-MM-DD` (with 4-digit year) or match `datestyle`
- Make `pg_get_constraintdef` support unique, primary-key, and check constraints (Christopher)
E.274.3.8. Server-Side Language Changes

- Prevent PL/pgSQL crash when `RETURN NEXT` is used on a zero-row record variable (Tom)
- Make PL/Python’s `spi_execute` interface handle null values properly (Andrew Bosma)
- Allow PL/pgSQL to declare variables of composite types without `%ROWTYPE` (Tom)
- Fix PL/Python’s `_quote()` function to handle big integers
- Make PL/Python an untrusted language, now called `plpythonu` (Kevin Jacobs, Tom)
  The Python language no longer supports a restricted execution environment, so the trusted version of
  PL/Python was removed. If this situation changes, a version of PL/Python that can be used by non-
  superusers will be readded.
- Allow polymorphic PL/pgSQL functions (Joe, Tom)
- Allow polymorphic SQL functions (Joe)
- Improved compiled function caching mechanism in PL/pgSQL with full support for polymorphism
  (Joe)
- Add new parameter $0 in PL/pgSQL representing the function’s actual return type (Joe)
- Allow PL/Tcl and PL/Python to use the same trigger on multiple tables (Tom)
- Fixed PL/Tcl’s `spi_prepare` to accept fully qualified type names in the parameter type list (Jan)

E.274.3.9. psql Changes

- Add `\pset pager always` to always use pager (Greg)
  This forces the pager to be used even if the number of rows is less than the screen height. This is
  valuable for rows that wrap across several screen rows.
- Improve tab completion (Rod, Ross Reedstrom, Ian Barwick)
- Reorder `\?` help into groupings (Harald Armin Massa, Bruce)
- Add backslash commands for listing schemas, casts, and conversions (Christopher)
- `\encoding` now changes based on the server parameter `client_encoding` (Tom)
  In previous versions, `\encoding` was not aware of encoding changes made using `SET client_encoding`.
- Save editor buffer into readline history (Ross)
  When `\e` is used to edit a query, the result is saved in the readline history for retrieval using the up
  arrow.
- Improve `\d` display (Christopher)
- Enhance HTML mode to be more standards-conforming (Greg)
- New `\set AUTOCOMMIT off` capability (Tom)
  This takes the place of the removed server parameter `autocommit`.
- New `\set VERBOSITY` to control error detail (Tom)
This controls the new error reporting details.

- New prompt escape sequence %x to show transaction status (Tom)
- Long options for psql are now available on all platforms

E.274.3.10. pg_dump Changes

- Multiple pg_dump fixes, including tar format and large objects
- Allow pg_dump to dump specific schemas (Neil)
- Make pg_dump preserve column storage characteristics (Christopher)
  
  This preserves ALTER TABLE ... SET STORAGE information.
- Make pg_dump preserve CLUSTER characteristics (Christopher)
- Have pg_dumpall use GRANT/REVOKE to dump database-level privileges (Tom)
- Allow pg_dumpall to support the options -a, -s, -x of pg_dump (Tom)
- Prevent pg_dump from lowercasing identifiers specified on the command line (Tom)
- pg_dump options --use-set-session-authorization and --no-reconnect now do nothing, all dumps use SET SESSION AUTHORIZATION
  
  pg_dump no longer reconnects to switch users, but instead always uses SET SESSION AUTHORIZATION. This will reduce password prompting during restores.
- Long options for pg_dump are now available on all platforms
  
  PostgreSQL now includes its own long-option processing routines.

E.274.3.11. libpq Changes

- Add function PQfreemem for freeing memory on Windows, suggested for NOTIFY (Bruce)
  
  Windows requires that memory allocated in a library be freed by a function in the same library, hence free() doesn’t work for freeing memory allocated by libpq. PQfreemem is the proper way to free libpq memory, especially on Windows, and is recommended for other platforms as well.
- Document service capability, and add sample file (Bruce)
  
  This allows clients to look up connection information in a central file on the client machine.
- Make PQsetdbLogin have the same defaults as PQconnectdb (Tom)
- Allow libpq to cleanly fail when result sets are too large (Tom)
- Improve performance of function PQunescapeBytea (Ben Lamb)
- Allow thread-safe libpq with configure option --enable-thread-safety (Lee Kindness, Philip Yarra)
- Allow function pqInternalNotice to accept a format string and arguments instead of just a preformatted message (Tom, Sean Chittenden)
Appendix E. Release Notes

• Control SSL negotiation with `sslmode` values disable, allow, prefer, and require (Jon Jensen)
• Allow new error codes and levels of text (Tom)
• Allow access to the underlying table and column of a query result (Tom)
  This is helpful for query-builder applications that want to know the underlying table and column names associated with a specific result set.
• Allow access to the current transaction status (Tom)
• Add ability to pass binary data directly to the server (Tom)
• Add function `PQexecPrepared` and `PQsendQueryPrepared` functions which perform bind/execute of previously prepared statements (Tom)

E.274.3.12. JDBC Changes

• Allow `setNull` on updateable result sets
• Allow `executeBatch` on a prepared statement (Barry)
• Support SSL connections (Barry)
• Handle schema names in result sets (Paul Sorenson)
• Add refcursor support (Nic Ferrier)

E.274.3.13. Miscellaneous Interface Changes

• Prevent possible memory leak or core dump during libpqtl shutdown (Tom)
• Add Informix compatibility to ECPG (Michael)
  This allows ECPG to process embedded C programs that were written using certain Informix extensions.
• Add type `decimal` to ECPG that is fixed length, for Informix (Michael)
• Allow thread-safe embedded SQL programs with `configure` option `--enable-thread-safety` (Lee Kindness, Bruce)
  This allows multiple threads to access the database at the same time.
• Moved Python client PyGreSQL to http://www.pygresql.org (Marc)

E.274.3.14. Source Code Changes

• Prevent need for separate platform geometry regression result files (Tom)
• Improved PPC locking primitive (Reinhard Max)
• New function `palloc0` to allocate and clear memory (Bruce)
• Fix locking code for s390x CPU (64-bit) (Tom)
Appendix E. Release Notes

- Allow OpenBSD to use local ident credentials (William Ahern)
- Make query plan trees read-only to executor (Tom)
- Add Darwin startup scripts (David Wheeler)
- Allow libpq to compile with Borland C++ compiler (Lester Godwin, Karl Waclawek)
- Use our own version of `getopt_long()` if needed (Peter)
- Convert administration scripts to C (Peter)
- Bison >= 1.85 is now required to build the PostgreSQL grammar, if building from CVS
- Merge documentation into one book (Peter)
- Add Windows compatibility functions (Bruce)
- Allow client interfaces to compile under MinGW (Bruce)
- New `ereport()` function for error reporting (Tom)
- Support Intel compiler on Linux (Peter)
- Improve Linux startup scripts (Slawomir Sudnik, Darko Prenosil)
- Add support for AMD Opteron and Itanium (Jeffrey W. Baker, Bruce)
- Remove `--enable-recode` option from configure
  - This was no longer needed now that we have `CREATE CONVERSION`.
- Generate a compile error if spinlock code is not found (Bruce)
  - Platforms without spinlock code will now fail to compile, rather than silently using semaphores. This failure can be disabled with a new `configure` option.

E.274.3.15. Contrib Changes

- Change dbmirror license to BSD
- Improve earthdistance (Bruno Wolff III)
- Portability improvements to pgcrypto (Marko Kreen)
- Prevent crash in xml (John Gray, Michael Richards)
- Update oracle
- Update mysql
- Update cube (Bruno Wolff III)
- Update earthdistance to use cube (Bruno Wolff III)
- Update btree_gist (Oleg)
- New tsearch2 full-text search module (Oleg, Teodor)
- Add hash-based crosstab function to tablefuncs (Joe)
- Add serial column to order `connectby()` siblings in tablefuncs (Nabil Sayegh, Joe)
- Add named persistent connections to dblink (Shridhar Daithanka)
Appendix E. Release Notes

- New pg_autovacuum allows automatic VACUUM (Matthew T. O’Connor)
- Make pgbench honor environment variables PGHOST, PGPORT, PGUSER (Tatsuo)
- Improve intarray (Teodor Sigaev)
- Improve pgstattuple (Rod)
- Fix bug in metaphone() in fuzzystmatch
- Improve adddepend (Rod)
- Update spi/timetravel (Bójthe Zoltán)
- Fix dbase -s option and improve non-ASCII handling (Thomas Behr, Márcio Smiderle)
- Remove array module because features now included by default (Joe)

E.275. Release 7.3.21

Release date: 2008-01-07

This release contains a variety of fixes from 7.3.20, including fixes for significant security issues. This is expected to be the last PostgreSQL release in the 7.3.X series. Users are encouraged to update to a newer release branch soon.

E.275.1. Migration to Version 7.3.21

A dump/restore is not required for those running 7.3.X. However, if you are upgrading from a version earlier than 7.3.13, see Section E.283.

E.275.2. Changes

- Prevent functions in indexes from executing with the privileges of the user running VACUUM, ANALYZE, etc (Tom)

  Functions used in index expressions and partial-index predicates are evaluated whenever a new table entry is made. It has long been understood that this poses a risk of trojan-horse code execution if one modifies a table owned by an untrustworthy user. (Note that triggers, defaults, check constraints, etc. pose the same type of risk.) But functions in indexes pose extra danger because they will be executed by routine maintenance operations such as VACUUM, FULL, which are commonly performed automatically under a superuser account. For example, a nefarious user can execute code with superuser privileges by setting up a trojan-horse index definition and waiting for the next routine vacuum. The fix arranges for standard maintenance operations (including VACUUM, ANALYZE, REINDEX, and CLUSTER) to execute as the table owner rather than the calling user, using the same privilege-switching mechanism already used for SECURITY DEFINER functions. To prevent bypassing this security measure, execution of SET SESSION AUTHORIZATION and SET ROLE is now forbidden within a SECURITY DEFINER context. (CVE-2007-6600)
Appendix E. Release Notes

- Require non-superusers who use /contrib/dblink to use only password authentication, as a security measure (Joe)
  The fix that appeared for this in 7.3.20 was incomplete, as it plugged the hole for only some dblink functions. (CVE-2007-6601, CVE-2007-3278)
- Fix potential crash in translate() when using a multibyte database encoding (Tom)
- Make contrib/tablefunc's crosstab() handle NULL rowid as a category in its own right, rather than crashing (Joe)
- Require a specific version of Autoconf to be used when re-generating the configure script (Peter)
  This affects developers and packagers only. The change was made to prevent accidental use of untested combinations of Autoconf and PostgreSQL versions. You can remove the version check if you really want to use a different Autoconf version, but it’s your responsibility whether the result works or not.

E.276. Release 7.3.20

Release date: 2007-09-17
This release contains fixes from 7.3.19.

E.276.1. Migration to Version 7.3.20
A dump/restore is not required for those running 7.3.X. However, if you are upgrading from a version earlier than 7.3.13, see Section E.283.

E.276.2. Changes

- Prevent index corruption when a transaction inserts rows and then aborts close to the end of a concurrent VACUUM on the same table (Tom)
- Make CREATE DOMAIN ... DEFAULT NULL work properly (Tom)
- Fix crash when log_min_error_statement logging runs out of memory (Tom)
- Require non-superusers who use /contrib/dblink to use only password authentication, as a security measure (Joe)

E.277. Release 7.3.19

Release date: 2007-04-23
This release contains fixes from 7.3.18, including a security fix.
E.277.1. Migration to Version 7.3.19

A dump/restore is not required for those running 7.3.X. However, if you are upgrading from a version earlier than 7.3.13, see Section E.283.

E.277.2. Changes

- Support explicit placement of the temporary-table schema within search_path, and disable searching it for functions and operators (Tom)

  This is needed to allow a security-definer function to set a truly secure value of search_path. Without it, an unprivileged SQL user can use temporary objects to execute code with the privileges of the security-definer function (CVE-2007-2138). See CREATE FUNCTION for more information.

- Fix potential-data-corruption bug in how VACUUM FULL handles UPDATE chains (Tom, Pavan Deolasee)

E.278. Release 7.3.18

**Release date:** 2007-02-05

This release contains a variety of fixes from 7.3.17, including a security fix.

E.278.1. Migration to Version 7.3.18

A dump/restore is not required for those running 7.3.X. However, if you are upgrading from a version earlier than 7.3.13, see Section E.283.

E.278.2. Changes

- Remove security vulnerability that allowed connected users to read backend memory (Tom)

  The vulnerability involves changing the data type of a table column used in a SQL function (CVE-2007-0555). This error can easily be exploited to cause a backend crash, and in principle might be used to read database content that the user should not be able to access.

- Fix rare bug wherein btree index page splits could fail due to choosing an infeasible split point (Heikki Linnakangas)

- Tighten security of multi-byte character processing for UTF8 sequences over three bytes long (Tom)
E.279. Release 7.3.17

Release date: 2007-01-08
This release contains a variety of fixes from 7.3.16.

E.279.1. Migration to Version 7.3.17

A dump/restore is not required for those running 7.3.X. However, if you are upgrading from a version earlier than 7.3.13, see Section E.283.

E.279.2. Changes

- to_number() and to_char(numeric) are now STABLE, not IMMUTABLE, for new initdb installs (Tom)
  This is because lc_numeric can potentially change the output of these functions.
- Improve index usage of regular expressions that use parentheses (Tom)
  This improves psql \d performance also.

E.280. Release 7.3.16

Release date: 2006-10-16
This release contains a variety of fixes from 7.3.15.

E.280.1. Migration to Version 7.3.16

A dump/restore is not required for those running 7.3.X. However, if you are upgrading from a version earlier than 7.3.13, see Section E.283.

E.280.2. Changes

- Fix corner cases in pattern matching for psql’s \d commands
- Fix index-corrupting bugs in /contrib/ltree (Teodor)
- Back-port 7.4 spinlock code to improve performance and support 64-bit architectures better
- Fix SSL-related memory leak in libpq
- Fix backslash escaping in /contrib/dbmirror
- Adjust regression tests for recent changes in US DST laws
E.281. Release 7.3.15

**Release date:** 2006-05-23

This release contains a variety of fixes from 7.3.14, including patches for extremely serious security issues.

E.281.1. Migration to Version 7.3.15

A dump/restore is not required for those running 7.3.X. However, if you are upgrading from a version earlier than 7.3.13, see Section E.283.

Full security against the SQL-injection attacks described in CVE-2006-2313 and CVE-2006-2314 might require changes in application code. If you have applications that embed untrustworthy strings into SQL commands, you should examine them as soon as possible to ensure that they are using recommended escaping techniques. In most cases, applications should be using subroutines provided by libraries or drivers (such as libpq's `PQescapeStringConn()`) to perform string escaping, rather than relying on ad hoc code to do it.

E.281.2. Changes

- Change the server to reject invalidly-encoded multibyte characters in all cases (Tatsuo, Tom)
  While PostgreSQL has been moving in this direction for some time, the checks are now applied uniformly to all encodings and all textual input, and are now always errors not merely warnings. This change defends against SQL-injection attacks of the type described in CVE-2006-2313.
- Reject unsafe uses of `\'` in string literals
  As a server-side defense against SQL-injection attacks of the type described in CVE-2006-2314, the server now only accepts `"` and not `\'` as a representation of ASCII single quote in SQL string literals. By default, `\'` is rejected only when `client_encoding` is set to a client-only encoding (SJIS, BIG5, GBK, GB18030, or UHC), which is the scenario in which SQL injection is possible. A new configuration parameter `backslash_quote` is available to adjust this behavior when needed. Note that full security against CVE-2006-2314 might require client-side changes; the purpose of `backslash_quote` is in part to make it obvious that insecure clients are insecure.
- Modify libpq's string-escaping routines to be aware of encoding considerations
  This fixes libpq-using applications for the security issues described in CVE-2006-2313 and CVE-2006-2314. Applications that use multiple PostgreSQL connections concurrently should migrate to `PQescapeStringConn()` and `PQescapeByteaConn()` to ensure that escaping is done correctly for the settings in use in each database connection. Applications that do string escaping “by hand” should be modified to rely on library routines instead.
- Fix some incorrect encoding conversion functions
  `win1251_to_iso`, `alt_to_iso`, `euc_tw_to_big5`, `euc_tw_to_mic`, `mic_to_euc_tw` were all broken to varying extents.
- Clean up stray remaining uses of `\'` in strings (Bruce, Jan)
- Fix server to use custom DH SSL parameters correctly (Michael Fuhr)
• Fix various minor memory leaks

E.282. Release 7.3.14

Release date: 2006-02-14
This release contains a variety of fixes from 7.3.13.

E.282.1. Migration to Version 7.3.14

A dump/restore is not required for those running 7.3.X. However, if you are upgrading from a version earlier than 7.3.13, see Section E.283.

E.282.2. Changes

• Fix potential crash in `SET SESSION AUTHORIZATION` (CVE-2006-0553)
  An unprivileged user could crash the server process, resulting in momentary denial of service to other users, if the server has been compiled with Asserts enabled (which is not the default). Thanks to Akio Ishida for reporting this problem.
• Fix bug with row visibility logic in self-inserted rows (Tom)
  Under rare circumstances a row inserted by the current command could be seen as already valid, when it should not be. Repairs bug created in 7.3.11 release.
• Fix race condition that could lead to “file already exists” errors during `pg_clog` file creation (Tom)
• Fix to allow restoring dumps that have cross-schema references to custom operators (Tom)
• Portability fix for testing presence of `finite` and `isinf` during configure (Tom)

E.283. Release 7.3.13

Release date: 2006-01-09
This release contains a variety of fixes from 7.3.12.

E.283.1. Migration to Version 7.3.13

A dump/restore is not required for those running 7.3.X. However, if you are upgrading from a version earlier than 7.3.10, see Section E.286. Also, you might need to `REINDEX` indexes on textual columns after updating, if you are affected by the locale or plperl issues described below.
E.283.2. Changes

- Fix character string comparison for locales that consider different character combinations as equal, such as Hungarian (Tom)
  
  This might require `REINDEX` to fix existing indexes on textual columns.

- Set locale environment variables during postmaster startup to ensure that `plperl` won’t change the locale later

  This fixes a problem that occurred if the postmaster was started with environment variables specifying a different locale than what `initdb` had been told. Under these conditions, any use of `plperl` was likely to lead to corrupt indexes. You might need `REINDEX` to fix existing indexes on textual columns if this has happened to you.

- Fix longstanding bug in `strpos()` and regular expression handling in certain rarely used Asian multi-byte character sets (Tatsuo)

- Fix bug in `/contrib/pgcrypto gen_salt`, which caused it not to use all available salt space for MD5 and XDES algorithms (Marko Kreen, Solar Designer)
  
  Salts for Blowfish and standard DES are unaffected.

- Fix `/contrib/dblink` to throw an error, rather than crashing, when the number of columns specified is different from what’s actually returned by the query (Joe)

E.284. Release 7.3.12

**Release date:** 2005-12-12

This release contains a variety of fixes from 7.3.11.

E.284.1. Migration to Version 7.3.12

A dump/restore is not required for those running 7.3.X. However, if you are upgrading from a version earlier than 7.3.10, see Section E.286.

E.284.2. Changes

- Fix race condition in transaction log management

  There was a narrow window in which an I/O operation could be initiated for the wrong page, leading to an Assert failure or data corruption.

- `/contrib/ltree` fixes (Teodor)

- Fix longstanding planning error for outer joins
This bug sometimes caused a bogus error “RIGHT JOIN is only supported with merge-joinable join conditions”.

- Prevent core dump in pg_autovacuum when a table has been dropped

## E.285. Release 7.3.11

**Release date:** 2005-10-04

This release contains a variety of fixes from 7.3.10.

### E.285.1. Migration to Version 7.3.11

A dump/restore is not required for those running 7.3.X. However, if you are upgrading from a version earlier than 7.3.10, see Section E.286.

### E.285.2. Changes

- Fix error that allowed **VACUUM** to remove **ctid** chains too soon, and add more checking in code that follows **ctid** links
  
  This fixes a long-standing problem that could cause crashes in very rare circumstances.

- Fix **CHAR()** to properly pad spaces to the specified length when using a multiple-byte character set (Yoshiyuki Asaba)
  
  In prior releases, the padding of **CHAR()** was incorrect because it only padded to the specified number of bytes without considering how many characters were stored.

- Fix missing rows in queries like **UPDATE a=... WHERE a... with GiST index on column a**

- Improve checking for partially-written WAL pages

- Improve robustness of signal handling when SSL is enabled

- Various memory leakage fixes

- Various portability improvements

- Fix PL/pgSQL to handle **var := var** correctly when the variable is of pass-by-reference type

## E.286. Release 7.3.10

**Release date:** 2005-05-09

This release contains a variety of fixes from 7.3.9, including several security-related issues.
Appendix E. Release Notes

E.286.1. Migration to Version 7.3.10

A dump/restore is not required for those running 7.3.X. However, it is one possible way of handling a significant security problem that has been found in the initial contents of 7.3.X system catalogs. A dump/initdb/reload sequence using 7.3.10’s initdb will automatically correct this problem.

The security problem is that the built-in character set encoding conversion functions can be invoked from SQL commands by unprivileged users, but the functions were not designed for such use and are not secure against malicious choices of arguments. The fix involves changing the declared parameter list of these functions so that they can no longer be invoked from SQL commands. (This does not affect their normal use by the encoding conversion machinery.) It is strongly recommended that all installations repair this error, either by initdb or by following the manual repair procedure given below. The error at least allows unprivileged database users to crash their server process, and might allow unprivileged users to gain the privileges of a database superuser.

If you wish not to do an initdb, perform the following procedure instead. As the database superuser, do:

BEGIN;
UPDATE pg_proc SET proargtypes[3] = 'internal'::regtype
WHERE pronamespace = 11 AND pronargs = 5
   AND proargtypes[2] = 'cstring'::regtype;
-- The command should report having updated 90 rows;
-- if not, rollback and investigate instead of committing!
COMMIT;

The above procedure must be carried out in each database of an installation, including template1, and ideally including template0 as well. If you do not fix the template databases then any subsequently created databases will contain the same error. template1 can be fixed in the same way as any other database, but fixing template0 requires additional steps. First, from any database issue:

UPDATE pg_database SET datallowconn = true WHERE datname = 'template0';

Next connect to template0 and perform the above repair procedure. Finally, do:

-- re-freeze template0:
VACUUM FREEZE;
-- and protect it against future alterations:
UPDATE pg_database SET datallowconn = false WHERE datname = 'template0';

E.286.2. Changes

- Change encoding function signature to prevent misuse
- Repair ancient race condition that allowed a transaction to be seen as committed for some purposes (eg SELECT FOR UPDATE) slightly sooner than for other purposes

This is an extremely serious bug since it could lead to apparent data inconsistencies being briefly visible to applications.
• Repair race condition between relation extension and VACUUM

  This could theoretically have caused loss of a page’s worth of freshly-inserted data, although the scenario seems of very low probability. There are no known cases of it having caused more than an Assert failure.

• Fix comparisons of TIME WITH TIME ZONE values

  The comparison code was wrong in the case where the --enable-integer-datetimes configuration switch had been used. NOTE: if you have an index on a TIME WITH TIME ZONE column, it will need to be REINDEXed after installing this update, because the fix corrects the sort order of column values.

• Fix EXTRACT (EPOCH) for TIME WITH TIME ZONE values

• Fix mis-display of negative fractional seconds in INTERVAL values

  This error only occurred when the --enable-integer-datetimes configuration switch had been used.

• Additional buffer overrun checks in plpgsql (Neil)

• Fix pg_dump to dump trigger names containing % correctly (Neil)

• Prevent to_char(interval) from dumping core for month-related formats

• Fix contrib/pgcrypto for newer OpenSSL builds (Marko Kreen)

• Still more 64-bit fixes for contrib/intagg

• Prevent incorrect optimization of functions returning RECORD

E.287. Release 7.3.9

Release date: 2005-01-31

This release contains a variety of fixes from 7.3.8, including several security-related issues.

E.287.1. Migration to Version 7.3.9

A dump/restore is not required for those running 7.3.X.

E.287.2. Changes

• Disallow LOAD to non-superusers

  On platforms that will automatically execute initialization functions of a shared library (this includes at least Windows and ELF-based Unixen), LOAD can be used to make the server execute arbitrary code. Thanks to NGS Software for reporting this.

• Check that creator of an aggregate function has the right to execute the specified transition functions

  This oversight made it possible to bypass denial of EXECUTE permission on a function.
• Fix security and 64-bit issues in contrib/intagg
• Add needed STRICT marking to some contrib functions (Kris Jurka)
• Avoid buffer overrun when plpgsql cursor declaration has too many parameters (Neil)
• Fix planning error for FULL and RIGHT outer joins
  The result of the join was mistakenly supposed to be sorted the same as the left input. This could not
  only deliver mis-sorted output to the user, but in case of nested merge joins could give outright wrong
  answers.
• Fix plperl for quote marks in tuple fields
• Fix display of negative intervals in SQL and GERMAN datestyles

E.288. Release 7.3.8

Release date: 2004-10-22
This release contains a variety of fixes from 7.3.7.

E.288.1. Migration to Version 7.3.8
A dump/restore is not required for those running 7.3.X.

E.288.2. Changes

• Repair possible failure to update hint bits on disk
  Under rare circumstances this oversight could lead to “could not access transaction status” failures,
  which qualifies it as a potential-data-loss bug.
• Ensure that hashed outer join does not miss tuples
  Very large left joins using a hash join plan could fail to output unmatched left-side rows given just the
  right data distribution.
• Disallow running pg_ctl as root
  This is to guard against any possible security issues.
• Avoid using temp files in /tmp in make_oidjoins_check
  This has been reported as a security issue, though it’s hardly worthy of concern since there is no reason
  for non-developers to use this script anyway.
E.289. Release 7.3.7

Release date: 2004-08-16
This release contains one critical fix over 7.3.6, and some minor items.

E.289.1. Migration to Version 7.3.7
A dump/restore is not required for those running 7.3.X.

E.289.2. Changes

• Prevent possible loss of committed transactions during crash
  Due to insufficient interlocking between transaction commit and checkpointing, it was possible for transactions committed just before the most recent checkpoint to be lost, in whole or in part, following a database crash and restart. This is a serious bug that has existed since PostgreSQL 7.1.
• Remove asymmetrical word processing in tsearch (Teodor)
• Properly schema-qualify function names when pg_dump’ing a CAST

E.290. Release 7.3.6

Release date: 2004-03-02
This release contains a variety of fixes from 7.3.5.

E.290.1. Migration to Version 7.3.6
A dump/restore is not required for those running 7.3.*.

E.290.2. Changes

• Revert erroneous changes in rule permissions checking
  A patch applied in 7.3.3 to fix a corner case in rule permissions checks turns out to have disabled rule-related permissions checks in many not-so-corner cases. This would for example allow users to insert into views they weren’t supposed to have permission to insert into. We have therefore reverted the 7.3.3 patch. The original bug will be fixed in 8.0.
• Repair incorrect order of operations in GetNewTransactionId()
  This bug could result in failure under out-of-disk-space conditions, including inability to restart even after disk space is freed.
Appendix E. Release Notes

- Ensure configure selects -fno-strict-aliasing even when an external value for CFLAGS is supplied
  On some platforms, building with -fstrict-aliasing causes bugs.
- Make pg_restore handle 64-bit off_t correctly
  This bug prevented proper restoration from archive files exceeding 4 GB.
- Make contrib/dblink not assume that local and remote type OIDs match (Joe)
- Quote connectby/’s start_with argument properly (Joe)
- Don’t crash when a rowtype argument to a plpgsql function is NULL
- Avoid generating invalid character encoding sequences in corner cases when planning LIKE operations
- Ensure text_position() cannot scan past end of source string in multibyte cases (Korea PostgreSQL Users’ Group)
- Fix index optimization and selectivity estimates for LIKE operations on bytea columns (Joe)

E.291. Release 7.3.5

Release date: 2003-12-03
This has a variety of fixes from 7.3.4.

E.291.1. Migration to Version 7.3.5
A dump/restore is not required for those running 7.3.*.

E.291.2. Changes

- Force zero_damaged_pages to be on during recovery from WAL
- Prevent some obscure cases of “variable not in subplan target lists”
- Force stats processes to detach from shared memory, ensuring cleaner shutdown
- Make PQescapeBytea and byteaout consistent with each other (Joe)
- Added missing SPI_finish() calls to dblink’s get_tuple_of_interest() (Joe)
- Fix for possible foreign key violation when rule rewrites INSERT (Jan)
- Support qualified type names in PL/Tcl’s spi_prepare command (Jan)
- Make pg_dump handle a procedural language handler located in pg_catalog
- Make pg_dump handle cases where a custom opclass is in another schema
- Make pg_dump dump binary-compatible casts correctly (Jan)
- Fix insertion of expressions containing subqueries into rule bodies
- Fix incorrect argument processing in clusterdb script (Anand Ranganathan)
Appendix E. Release Notes

• Fix problems with dropped columns in plpython triggers
• Repair problems with to_char() reading past end of its input string (Karel)
• Fix GB18030 mapping errors (Tatsuo)
• Fix several problems with SSL error handling and asynchronous SSL I/O
• Remove ability to bind a list of values to a single parameter in JDBC (prevents possible SQL-injection attacks)
• Fix some errors in HAVE_INT64_TIMESTAMP code paths
• Fix corner case for btree search in parallel with first root page split

E.292. Release 7.3.4

Release date: 2003-07-24
This has a variety of fixes from 7.3.3.

E.292.1. Migration to Version 7.3.4

A dump/restore is not required for those running 7.3.*.

E.292.2. Changes

• Repair breakage in timestamp-to-date conversion for dates before 2000
• Prevent rare possibility of server startup failure (Tom)
• Fix bugs in interval-to-time conversion (Tom)
• Add constraint names in a few places in pg_dump (Rod)
• Improve performance of functions with many parameters (Tom)
• Fix to_ascii() buffer overruns (Tom)
• Prevent restore of database comments from throwing an error (Tom)
• Work around buggy strxfrm() present in some Solaris releases (Tom)
• Properly escape jdbc setObject() strings to improve security (Barry)

E.293. Release 7.3.3

Release date: 2003-05-22
This release contains a variety of fixes for version 7.3.2.
E.293.1. Migration to Version 7.3.3

A dump/restore is not required for those running version 7.3.*.

E.293.2. Changes

- Repair sometimes-incorrect computation of StartUpID after a crash
- Avoid slowness with lots of deferred triggers in one transaction (Stephan)
- Don’t lock referenced row when UPDATE doesn’t change foreign key’s value (Jan)
- Use -fPIC not -fpic on Sparc (Tom Callaway)
- Repair lack of schema-awareness in contrib/reindexdb
- Fix contrib/intarray error for zero-element result array (Teodor)
- Ensure createuser script will exit on control-C (Oliver)
- Fix errors when the type of a dropped column has itself been dropped
- CHECKPOINT does not cause database panic on failure in noncritical steps
- Accept 60 in seconds fields of timestamp, time, interval input values
- Issue notice, not error, if TIMESTAMP, TIME, or INTERVAL precision too large
- Fix abstime-to-time cast function (fix is not applied unless you initdb)
- Fix pg_proc entry for timestamptz (fix is not applied unless you initdb)
- Make EXTRACT(EPOCH FROM timestamp without time zone) treat input as local time
- ’now’::timestamptz gave wrong answer if timezone changed earlier in transaction
- HAVE_INT64_TIMESTAMP code for time with timezone overwrote its input
- Accept GLOBAL TEMP/TEMPORARY as a synonym for TEMPORARY
- Avoid improper schema-privilege-check failure in foreign-key triggers
- Fix bugs in foreign-key triggers for SET DEFAULT action
- Fix incorrect time-qual check in row fetch for UPDATE and DELETE triggers
- Foreign-key clauses were parsed but ignored in ALTER TABLE ADD COLUMN
- Fix createlang script breakage for case where handler function already exists
- Fix misbehavior on zero-column tables in pg_dump, COPY, ANALYZE, other places
- Fix misbehavior of func_error() on type names containing ’%’
- Fix misbehavior of replace() on strings containing ’%’
- Regular-expression patterns containing certain multibyte characters failed
- Account correctly for NULLs in more cases in join size estimation
- Avoid conflict with system definition of isblank() function or macro
- Fix failure to convert large code point values in EUC_TW conversions (Tatsuo)
• Fix error recovery for SSL_read/SSL_write calls
• Don’t do early constant-folding of type coercion expressions
• Validate page header fields immediately after reading in any page
• Repair incorrect check for ungrouped variables in unnamed joins
• Fix buffer overrun in to_ascii (Guido Notari)
• contrib/ltree fixes (Teodor)
• Fix core dump in deadlock detection on machines where char is unsigned
• Avoid running out of buffers in many-way indexscan (bug introduced in 7.3)
• Fix planner’s selectivity estimation functions to handle domains properly
• Fix dbmirror memory-allocation bug (Steven Singer)
• Prevent infinite loop in ln(numeric) due to roundoff error
• GROUP BY got confused if there were multiple equal GROUP BY items
• Fix bad plan when inherited UPDATE/DELETE references another inherited table
• Prevent clustering on incomplete (partial or non-NULL-storing) indexes
• Service shutdown request at proper time if it arrives while still starting up
• Fix left-links in temporary indexes (could make backwards scans miss entries)
• Fix incorrect handling of client_encoding setting in postgresql.conf (Tatsuo)
• Fix failure to respond to pg_ctl stop -m fast after Async_NotifyHandler runs
• Fix SPI for case where rule contains multiple statements of the same type
• Fix problem with checking for wrong type of access privilege in rule query
• Fix problem with EXCEPT in CREATE RULE
• Prevent problem with dropping temp tables having serial columns
• Fix replace_vars_with_subplan_refs failure in complex views
• Fix regexp slowness in single-byte encodings (Tatsuo)
• Allow qualified type names in CREATE CAST and DROP CAST
• Accept SETOF type[], which formerly had to be written SETOF _type
• Fix pg_dump core dump in some cases with procedural languages
• Force ISO datestyle in pg_dump output, for portability (Oliver)
• pg_dump failed to handle error return from lo_read (Oleg Drokin)
• pg_dumpall failed with groups having no members (Nick Eskelinen)
• pg_dumpall failed to recognize --globals-only switch
• pg_restore failed to restore blobs if -X disable-triggers is specified
• Repair intrafunction memory leak in plpgsql
• pltcl’s elog command dumped core if given wrong parameters (Ian Harding)
• plpython used wrong value of atttypmod (Brad McLean)
Appendix E. Release Notes

- Fix improper quoting of boolean values in Python interface (D’Arcy)
- Added addDataType() method to PGConnection interface for JDBC
- Fixed various problems with updateable ResultSets for JDBC (Shawn Green)
- Fixed various problems with DatabaseMetaData for JDBC (Kris Jurka, Peter Royal)
- Fixed problem with parsing table ACLs in JDBC
- Better error message for character set conversion problems in JDBC

E.294. Release 7.3.2

Release date: 2003-02-04
This release contains a variety of fixes for version 7.3.1.

E.294.1. Migration to Version 7.3.2

A dump/restore is not required for those running version 7.3.*.

E.294.2. Changes

- Restore creation of OID column in CREATE TABLE AS / SELECT INTO
- Fix pg_dump core dump when dumping views having comments
- Dump DEFERRABLE/INITIALLY DEFERRED constraints properly
- Fix UPDATE when child table’s column numbering differs from parent
- Increase default value of max_fsm_relations
- Fix problem when fetching backwards in a cursor for a single-row query
- Make backward fetch work properly with cursor on SELECT DISTINCT query
- Fix problems with loading pg_dump files containing contrib/lo usage
- Fix problem with all-numeric user names
- Fix possible memory leak and core dump during disconnect in libpgtcl
- Make plpython’s spi_execute command handle nulls properly (Andrew Bosma)
- Adjust plpython error reporting so that its regression test passes again
- Work with bison 1.875
- Handle mixed-case names properly in plpgsql’s %type (Neil)
- Fix core dump in pltcl when executing a query rewritten by a rule
- Repair array subscript overruns (per report from Yichen Xie)
Appendix E. Release Notes

• Reduce MAX_TIME_PRECISION from 13 to 10 in floating-point case
• Correctly case-fold variable names in per-database and per-user settings
• Fix coredump in plpgsql’s RETURN NEXT when SELECT into record returns no rows
• Fix outdated use of pg_type.typprtlen in python client interface
• Correctly handle fractional seconds in timestamps in JDBC driver
• Improve performance of getImportedKeys() in JDBC
• Make shared-library symlinks work standardly on HPUX (Giles)
• Repair inconsistent rounding behavior for timestamp, time, interval
• SSL negotiation fixes (Nathan Mueller)
• Make libpq’s ~/.pgpass feature work when connecting with PQconnectDB
• Update my2pg, ora2pg
• Translation updates
• Add casts between types lo and oid in contrib/lo
• fastpath code now checks for privilege to call function

E.295. Release 7.3.1

Release date: 2002-12-18
This release contains a variety of fixes for version 7.3.

E.295.1. Migration to Version 7.3.1

A dump/restore is not required for those running version 7.3. However, it should be noted that the main PostgreSQL interface library, libpq, has a new major version number for this release, which might require recompilation of client code in certain cases.

E.295.2. Changes

• Fix a core dump of COPY TO when client/server encodings don’t match (Tom)
• Allow pg_dump to work with pre-7.2 servers (Philip)
• contrib/adddepend fixes (Tom)
• Fix problem with deletion of per-user/per-database config settings (Tom)
• contrib/vacuumlo fix (Tom)
• Allow ’password’ encryption even when pg_shadow contains MD5 passwords (Bruce)
• contrib/dbmirror fix (Steven Singer)
Appendix E. Release Notes

- Optimizer fixes (Tom)
- contrib/tsearch fixes (Teodor Sigaev, Magnus)
- Allow locale names to be mixed case (Nicolai Tufar)
- Increment libpq library’s major version number (Bruce)
- pg_hba.conf error reporting fixes (Bruce, Neil)
- Add SCO Openserver 5.0.4 as a supported platform (Bruce)
- Prevent EXPLAIN from crashing server (Tom)
- SSL fixes (Nathan Mueller)
- Prevent composite column creation via ALTER TABLE (Tom)

E.296. Release 7.3

Release date: 2002-11-27

E.296.1. Overview

Major changes in this release:

Schemas
Schemas allow users to create objects in separate namespaces, so two people or applications can have tables with the same name. There is also a public schema for shared tables. Table/index creation can be restricted by removing privileges on the public schema.

Drop Column
PostgreSQL now supports the ALTER TABLE ... DROP COLUMN functionality.

Table Functions
Functions returning multiple rows and/or multiple columns are now much easier to use than before. You can call such a “table function” in the SELECT FROM clause, treating its output like a table. Also, PL/pgSQL functions can now return sets.

Prepared Queries
PostgreSQL now supports prepared queries, for improved performance.

Dependency Tracking
PostgreSQL now records object dependencies, which allows improvements in many areas. DROP statements now take either CASCADE or RESTRICT to control whether dependent objects are also dropped.

Privileges
Functions and procedural languages now have privileges, and functions can be defined to run with the privileges of their creator.
Internationalization

Both multibyte and locale support are now always enabled.

Logging

A variety of logging options have been enhanced.

Interfaces

A large number of interfaces have been moved to http://gborg.postgresql.org where they can be de-
veloped and released independently.

Functions/Identifiers

By default, functions can now take up to 32 parameters, and identifiers can be up to 63 bytes long. Also, `OPAQUE` is now deprecated: there are specific "pseudo-datatypes" to represent each of the for-
mer meanings of `OPAQUE` in function argument and result types.

E.296.2. Migration to Version 7.3

A dump/restore using pg_dump is required for those wishing to migrate data from any previous release. If your application examines the system catalogs, additional changes will be required due to the introduction of schemas in 7.3; for more information, see: http://developer.postgresql.org/~momjian/upgrade_tips_7.3.

Observe the following incompatibilities:

- Pre-6.3 clients are no longer supported.
- `pg_hba.conf` now has a column for the user name and additional features. Existing files need to be adjusted.
- Several `postgresql.conf` logging parameters have been renamed.
- `LIMIT #, #` has been disabled; use `LIMIT # OFFSET #`.
- `INSERT` statements with column lists must specify a value for each specified column. For example, `INSERT INTO tab (col1, col2) VALUES ('val1')` is now invalid. It’s still allowed to supply fewer columns than expected if the `INSERT` does not have a column list.
- `serial` columns are no longer automatically `UNIQUE`; thus, an index will not automatically be created.
- A `SET` command inside an aborted transaction is now rolled back.
- `COPY` no longer considers missing trailing columns to be null. All columns need to be specified. (How-
ever, one can achieve a similar effect by specifying a column list in the `COPY` command.)
- The data type `timestamp` is now equivalent to `timestamp without time zone`, instead of `timestamp with time zone`.
- Pre-7.3 databases loaded into 7.3 will not have the new object dependencies for `serial` columns, `unique` constraints, and foreign keys. See the directory `contrib/adddepend/` for a detailed descrip-
tion and a script that will add such dependencies.
- An empty string (") is no longer allowed as the input into an integer field. Formerly, it was silently interpreted as 0.
Appendix E. Release Notes

E.296.3. Changes

E.296.3.1. Server Operation

- Add pg_locks view to show locks (Neil)
- Security fixes for password negotiation memory allocation (Neil)
- Remove support for version 0 FE/BE protocol (PostgreSQL 6.2 and earlier) (Tom)
- Reserve the last few backend slots for superusers, add parameter superuser_reserved_connections to control this (Nigel J. Andrews)

E.296.3.2. Performance

- Improve startup by calling localtime() only once (Tom)
- Cache system catalog information in flat files for faster startup (Tom)
- Improve caching of index information (Tom)
- Optimizer improvements (Tom, Fernando Nasser)
- Catalog caches now store failed lookups (Tom)
- Hash function improvements (Neil)
- Improve performance of query tokenization and network handling (Peter)
- Speed improvement for large object restore (Mario Weilguni)
- Mark expired index entries on first lookup, saving later heap fetches (Tom)
- Avoid excessive NULL bitmap padding (Manfred Koizar)
- Add BSD-licensed qsort() for Solaris, for performance (Bruce)
- Reduce per-row overhead by four bytes (Manfred Koizar)
- Fix GEQO optimizer bug (Neil Conway)
- Make WITHOUT OID actually save four bytes per row (Manfred Koizar)
- Add default_statistics_target variable to specify ANALYZE buckets (Neil)
- Use local buffer cache for temporary tables so no WAL overhead (Tom)
- Improve free space map performance on large tables (Stephen Marshall, Tom)
- Improved WAL write concurrency (Tom)

E.296.3.3. Privileges

- Add privileges on functions and procedural languages (Peter)
- Add OWNER to CREATE DATABASE so superusers can create databases on behalf of unprivileged users (Gavin Sherry, Tom)
Appendix E. Release Notes

- Add new object privilege bits EXECUTE and USAGE (Tom)
- Add SET SESSION AUTHORIZATION DEFAULT and RESET SESSION AUTHORIZATION (Tom)
- Allow functions to be executed with the privilege of the function owner (Peter)

E.296.3.4. Server Configuration

- Server log messages now tagged with LOG, not DEBUG (Bruce)
- Add user column to pg_hba.conf (Bruce)
- Have log_connections output two lines in log file (Tom)
- Remove debug_level from postgresql.conf, now server_min_messages (Bruce)
- New ALTER DATABASE/USER ... SET command for per-user/database initialization (Peter)
- New parameters server_min_messages and client_min_messages to control which messages are sent to the server logs or client applications (Bruce)
- Allow pg_hba.conf to specify lists of users/databases separated by commas, group names prepended with +, and file names prepended with @ (Bruce)
- Remove secondary password file capability and pg_password utility (Bruce)
- Add variable db_user_namespace for database-local user names (Bruce)
- SSL improvements (Bear Giles)
- Make encryption of stored passwords the default (Bruce)
- Allow pg_statistics to be reset by calling pg_stat_reset() (Christopher)
- Add log_duration parameter (Bruce)
- Rename debug_print_query to log_statement (Bruce)
- Rename show_query_stats to show_statement_stats (Bruce)
- Add param log_min_error_statement to print commands to logs on error (Gavin)

E.296.3.5. Queries

- Make cursors insensitive, meaning their contents do not change (Tom)
- Disable LIMIT #,# syntax; now only LIMIT # OFFSET # supported (Bruce)
- Increase identifier length to 63 (Neil, Bruce)
- UNION fixes for merging >= 3 columns of different lengths (Tom)
- Add DEFAULT key word to INSERT, e.g., INSERT ... (... DEFAULT, ...) (Rod)
- Allow views to have default values using ALTER COLUMN ... SET DEFAULT (Neil)
- Fail on INSERTs with column lists that don’t supply all column values, e.g., INSERT INTO tab (col1, col2) VALUES (’val1’); (Rod)
Appendix E. Release Notes

• Fix for join aliases (Tom)
• Fix for FULL OUTER JOINs (Tom)
• Improve reporting of invalid identifier and location (Tom, Gavin)
• Fix OPEN cursor(args) (Tom)
• Allow ’ctid’ to be used in a view and curtid(viewname) (Hiroshi)
• Fix for CREATE TABLE AS with UNION (Tom)
• SQL99 syntax improvements (Thomas)
• Add statement_timeout variable to cancel queries (Bruce)
• Allow prepared queries with PREPARE/EXECUTE (Neil)
• Allow FOR UPDATE to appear after LIMIT/OFFSET (Bruce)
• Add variable autocommit (Tom, David Van Wie)

E.296.3.6. Object Manipulation

• Make equals signs optional in CREATE DATABASE (Gavin Sherry)
• Make ALTER TABLE OWNER change index ownership too (Neil)
• New ALTER TABLE tabname ALTER COLUMN colname SET STORAGE controls TOAST storage, compression (John Gray)
• Add schema support, CREATE/DROP SCHEMA (Tom)
• Create schema for temporary tables (Tom)
• Add variable search_path for schema search (Tom)
• Add ALTER TABLE SET/DROP NOT NULL (Christopher)
• New CREATE FUNCTION volatility levels (Tom)
• Make rule names unique only per table (Tom)
• Add ‘ON tablename’ clause to DROP RULE and COMMENT ON RULE (Tom)
• Add ALTER TRIGGER RENAME (Joe)
• New current_schema() and current_schemas() inquiry functions (Tom)
• Allow functions to return multiple rows (table functions) (Joe)
• Make WITH optional in CREATE DATABASE, for consistency (Bruce)
• Add object dependency tracking (Rod, Tom)
• Add RESTRICT/CASCADE to DROP commands (Rod)
• Add ALTER TABLE DROP for non-CHECK CONSTRAINT (Rod)
• Autodestroy sequence on DROP of table with SERIAL (Rod)
• Prevent column dropping if column is used by foreign key (Rod)
• Automatically drop constraints/functions when object is dropped (Rod)
Appendix E. Release Notes

- Add CREATE/DROP OPERATOR CLASS (Bill Studenmund, Tom)
- Add ALTER TABLE DROP COLUMN (Christopher, Tom, Hiroshi)
- Prevent inherited columns from being removed or renamed (Alvaro Herrera)
- Fix foreign key constraints to not error on intermediate database states (Stephan)
- Propagate column or table renaming to foreign key constraints
- Add CREATE OR REPLACE VIEW (Gavin, Neil, Tom)
- Add CREATE OR REPLACE RULE (Gavin, Neil, Tom)
- Have rules execute alphabetically, returning more predictable values (Tom)
- Triggers are now fired in alphabetical order (Tom)
- Add /contrib/adddepend to handle pre-7.3 object dependencies (Rod)
- Allow better casting when inserting/updating values (Tom)

E.296.3.7. Utility Commands

- Have COPY TO output embedded carriage returns and newlines as \r and \n (Tom)
- Allow DELIMITER in COPY FROM to be 8-bit clean (Tatsuo)
- Make pg_dump use ALTER TABLE ADD PRIMARY KEY, for performance (Neil)
- Disable brackets in multistatement rules (Bruce)
- Disable VACUUM from being called inside a function (Bruce)
- Allow dropdb and other scripts to use identifiers with spaces (Bruce)
- Restrict database comment changes to the current database
- Allow comments on operators, independent of the underlying function (Rod)
- Rollback SET commands in aborted transactions (Tom)
- EXPLAIN now outputs as a query (Tom)
- Display condition expressions and sort keys in EXPLAIN (Tom)
- Add 'SET LOCAL var = value' to set configuration variables for a single transaction (Tom)
- Allow ANALYZE to run in a transaction (Bruce)
- Improve COPY syntax using new WITH clauses, keep backward compatibility (Bruce)
- Fix pg_dump to consistently output tags in non-ASCII dumps (Bruce)
- Make foreign key constraints clearer in dump file (Rod)
- Add COMMENT ON CONSTRAINT (Rod)
- Allow COPY TO/FROM to specify column names (Brent Verner)
- Dump UNIQUE and PRIMARY KEY constraints as ALTER TABLE (Rod)
- Have SHOW output a query result (Joe)
- Generate failure on short COPY lines rather than pad NULLs (Neil)
• Fix CLUSTER to preserve all table attributes (Alvaro Herrera)
• New pg_settings table to view/modify GUC settings (Joe)
• Add smart quoting, portability improvements to pg_dump output (Peter)
• Dump serial columns out as SERIAL (Tom)
• Enable large file support, >2G for pg_dump (Peter, Philip Warner, Bruce)
• Disallow TRUNCATE on tables that are involved in referential constraints (Rod)
• Have TRUNCATE also auto-truncate the toast table of the relation (Tom)
• Add clusterdb utility that will auto-cluster an entire database based on previous CLUSTER operations (Alvaro Herrera)
• Overhaul pg_dumpall (Peter)
• Allow REINDEX of TOAST tables (Tom)
• Implemented START TRANSACTION, per SQL99 (Neil)
• Fix rare index corruption when a page split affects bulk delete (Tom)
• Fix ALTER TABLE ... ADD COLUMN for inheritance (Alvaro Herrera)

E.296.3.8. Data Types and Functions

• Fix factorial(0) to return 1 (Bruce)
• Date/time/timezone improvements (Thomas)
• Fix for array slice extraction (Tom)
• Fix extract/date_part to report proper microseconds for timestamp (Tatsuo)
• Allow text_substr() and bytea_substr() to read TOAST values more efficiently (John Gray)
• Add domain support (Rod)
• Make WITHOUT TIME ZONE the default for TIMESTAMP and TIME data types (Thomas)
• Allow alternate storage scheme of 64-bit integers for date/time types using --enable-integer-datetimes in configure (Thomas)
• Make timezone(timestamptz) return timestamp rather than a string (Thomas)
• Allow fractional seconds in date/time types for dates prior to 1BC (Thomas)
• Limit timestamp data types to 6 decimal places of precision (Thomas)
• Change timezone conversion functions from timetz() to timezone() (Thomas)
• Add configuration variables datestyle and timezone (Tom)
• Add OVERLAY(), which allows substitution of a substring in a string (Thomas)
• Add SIMILAR TO (Thomas, Tom)
• Add regular expression SUBSTRING(string FROM pat FOR escape) (Thomas)
• Add LOCALTIME and LOCALTIMESTAMP functions (Thomas)
Appendix E. Release Notes

- Add named composite types using CREATE TYPE typename AS (column) (Joe)
- Allow composite type definition in the table alias clause (Joe)
- Add new API to simplify creation of C language table functions (Joe)
- Remove ODBC-compatible empty parentheses from calls to SQL99 functions for which these parentheses do not match the standard (Thomas)
- Allow macaddr data type to accept 12 hex digits with no separators (Mike Wyer)
- Add CREATE/DROP CAST (Peter)
- Add IS DISTINCT FROM operator (Thomas)
- Add SQL99 TREAT() function, synonym for CAST() (Thomas)
- Add pg_backend_pid() to output backend pid (Bruce)
- Add IS OF / IS NOT OF type predicate (Thomas)
- Allow bit string constants without fully-specified length (Thomas)
- Allow conversion between 8-byte integers and bit strings (Thomas)
- Implement hex literal conversion to bit string literal (Thomas)
- Allow table functions to appear in the FROM clause (Joe)
- Increase maximum number of function parameters to 32 (Bruce)
- No longer automatically create index for SERIAL column (Tom)
- Add current_database() (Rod)
- Fix cash_words() to not overflow buffer (Tom)
- Add functions replace(), split_part(), to_hex() (Joe)
- Fix LIKE for bytea as a right-hand argument (Joe)
- Prevent crashes caused by SELECT cash_out(2) (Tom)
- Fix to_char(1,'FM999.99') to return a period (Karel)
- Fix trigger/type/language functions returning OPAQUE to return proper type (Tom)

E.296.3.9. Internationalization

- Add additional encodings: Korean (JOHAB), Thai (WIN874), Vietnamese (TCVN), Arabic (WIN1256), Simplified Chinese (GBK), Korean (UHC) (Eiji Tokuya)
- Enable locale support by default (Peter)
- Add locale variables (Peter)
- Escape bytes >= 0x7f for multibyte in PQescapeBytea/PQunescapeBytea (Tatsuo)
- Add locale awareness to regular expression character classes
- Enable multibyte support by default (Tatsuo)
- Add GB18030 multibyte support (Bill Huang)
Appendix E. Release Notes

• Add CREATE/DROP CONVERSION, allowing loadable encodings (Tatsuo, Kaori)
• Add pg_conversion table (Tatsuo)
• Add SQL99 CONVERT() function (Tatsuo)
• pg_dumpall, pg_controldata, and pg_resetxlog now national-language aware (Peter)
• New and updated translations

E.296.3.10. Server-side Languages

• Allow recursive SQL function (Peter)
• Change PL/Tcl build to use configured compiler and Makefile.shlib (Peter)
• Overhaul the PL/pgSQL FOUND variable to be more Oracle-compatible (Neil, Tom)
• Allow PL/pgSQL to handle quoted identifiers (Tom)
• Allow set-returning PL/pgSQL functions (Neil)
• Make PL/pgSQL schema-aware (Joe)
• Remove some memory leaks (Nigel J. Andrews, Tom)

E.296.3.11. psql

• Don’t lowercase psql \connect database name for 7.2.0 compatibility (Tom)
• Add psql \timing to time user queries (Greg Sabino Mullane)
• Have psql \d show index information (Greg Sabino Mullane)
• New psql \dD shows domains (Jonathan Eisler)
• Allow psql to show rules on views (Paul ?)
• Fix for psql variable substitution (Tom)
• Allow psql \d to show temporary table structure (Tom)
• Allow psql \d to show foreign keys (Rod)
• Fix \? to honor \psset pager (Bruce)
• Have psql reports its version number on startup (Tom)
• Allow \copy to specify column names (Tom)

E.296.3.12. libpq

• Add ~/.pgpass to store host/user password combinations (Alvaro Herrera)
• Add PQunescapeBytea() function to libpq (Patrick Welche)
• Fix for sending large queries over non-blocking connections (Bernhard Herzog)
• Fix for libpq using timers on Win9X (David Ford)
• Allow libpq notify to handle servers with different-length identifiers (Tom)
• Add libpq PQescapeString() and PQescapeBytea() to Windows (Bruce)
• Fix for SSL with non-blocking connections (Jack Bates)
• Add libpq connection timeout parameter (Denis A Ustimenko)

E.296.3.13. JDBC

• Allow JDBC to compile with JDK 1.4 (Dave)
• Add JDBC 3 support (Barry)
• Allows JDBC to set loglevel by adding ?loglevel=X to the connection URL (Barry)
• Add Driver.info() message that prints out the version number (Barry)
• Add updateable result sets (Raghu Nidagal, Dave)
• Add support for callable statements (Paul Bethe)
• Add query cancel capability
• Add refresh row (Dave)
• Fix MD5 encryption handling for multibyte servers (Jun Kawai)
• Add support for prepared statements (Barry)

E.296.3.14. Miscellaneous Interfaces

• Fixed ECPG bug concerning octal numbers in single quotes (Michael)
• Move src/interfaces/libpgeasy to http://gborg.postgresql.org (Marc, Bruce)
• Improve Python interface (Elliot Lee, Andrew Johnson, Greg Copeland)
• Add libpgtcl connection close event (Gerhard Hintermayer)
• Move src/interfaces/libpq++ to http://gborg.postgresql.org (Marc, Bruce)
• Move src/interfaces/odbc to http://gborg.postgresql.org (Marc)
• Move src/interfaces/libpgeasy to http://gborg.postgresql.org (Marc, Bruce)
• Move src/interfaces/perl5 to http://gborg.postgresql.org (Marc, Bruce)
• Remove src/bin/pgaccess from main tree, now at http://www.pgaccess.org (Bruce)
• Add pg_on_connection_loss command to libpgtcl (Gerhard Hintermayer, Tom)
E.296.3.15. Source Code

- Fix for parallel make (Peter)
- AIX fixes for linking Tcl (Andreas Zeugswetter)
- Allow PL/Perl to build under Cygwin (Jason Tishler)
- Improve MIPS compiles (Peter, Oliver Elphick)
- Require Autoconf version 2.53 (Peter)
- Require readline and zlib by default in configure (Peter)
- Allow Solaris to use Intimate Shared Memory (ISM), for performance (Scott Brunza, P.J. Josh Rovero)
- Always enable syslog in compile, remove --enable-syslog option (Tatsuo)
- Always enable multibyte in compile, remove --enable-multibyte option (Tatsuo)
- Always enable locale in compile, remove --enable-locale option (Peter)
- Fix for Win9x DLL creation (Magnus Naeslund)
- Fix for link() usage by WAL code on Windows, BeOS (Jason Tishler)
- Add sys/types.h to c.h, remove from main files (Peter, Bruce)
- Fix AIX hang on SMP machines (Tomoyuki Niijima)
- AIX SMP hang fix (Tomoyuki Niijima)
- Fix pre-1970 date handling on newer glibc libraries (Tom)
- Fix PowerPC SMP locking (Tom)
- Prevent gcc -ffast-math from being used (Peter, Tom)
- Bison $>= 1.50$ now required for developer builds
- Kerberos 5 support now builds with Heimdal (Peter)
- Add appendix in the User’s Guide which lists SQL features (Thomas)
- Improve loadable module linking to use RTLD_NOW (Tom)
- New error levels WARNING, INFO, LOG, DEBUG[1-5] (Bruce)
- New src/port directory holds replaced libc functions (Peter, Bruce)
- New pg_namespace system catalog for schemas (Tom)
- Add pg_class.relnamespace for schemas (Tom)
- Add pg_type.typnamespace for schemas (Tom)
- Add pg_proc.pronamespace for schemas (Tom)
- Restructure aggregates to have pg_proc entries (Tom)
- System relations now have their own namespace, pg_* test not required (Fernando Nasser)
- Rename TOAST index names to be *_index rather than *_idx (Neil)
- Add namespaces for operators, opclasses (Tom)
- Add additional checks to server control file (Thomas)
Appendix E. Release Notes

- New Polish FAQ (Marcin Mazurek)
- Add Posix semaphore support (Tom)
- Document need for reindex (Bruce)
- Rename some internal identifiers to simplify Windows compile (Jan, Katherine Ward)
- Add documentation on computing disk space (Bruce)
- Remove KSQO from GUC (Bruce)
- Fix memory leak in rtree (Kenneth Been)
- Modify a few error messages for consistency (Bruce)
- Remove unused system table columns (Peter)
- Make system columns NOT NULL where appropriate (Tom)
- Clean up use of sprintf in favor of snprintf() (Neil, Jukka Holappa)
- Remove OPAQUE and create specific subtypes (Tom)
- Cleanups in array internal handling (Joe, Tom)
- Disallow pg_atoi("") (Bruce)
- Remove parameter wal_files because WAL files are now recycled (Bruce)
- Add version numbers to heap pages (Tom)

E.296.3.16. Contrib

- Allow inet arrays in /contrib/array (Neil)
- GiST fixes (Teodor Sigaev, Neil)
- Upgrade /contrib/mysql
- Add /contrib/dbsize which shows table sizes without vacuum (Peter)
- Add /contrib/intagg, integer aggregator routines (mlw)
- Improve /contrib/oid2name (Neil, Bruce)
- Improve /contrib/tsearch (Oleg, Teodor Sigaev)
- Cleanups of /contrib/rserver (Alexey V. Borzov)
- Update /contrib/oracle conversion utility (Gilles Darold)
- Update /contrib/dblink (Joe)
- Improve options supported by /contrib/vacuumlo (Mario Weilguni)
- Improvements to /contrib/intarray (Oleg, Teodor Sigaev, Andrey Oktyabrski)
- Add /contrib/reindexdb utility (Shaun Thomas)
- Add indexing to /contrib/isbn_issn (Dan Weston)
- Add /contrib/dbmirror (Steven Singer)
- Improve /contrib/pgbench (Neil)
Appendix E. Release Notes

- Add /contrib/tablefunc table function examples (Joe)
- Add /contrib/ltree data type for tree structures (Teodor Sigaev, Oleg Bartunov)
- Move /contrib/pg_controldata, pg_resetxlog into main tree (Bruce)
- Fixes to /contrib/cube (Bruno Wolff)
- Improve /contrib/fulltextindex (Christopher)

E.297. Release 7.2.8

Release date: 2005-05-09

This release contains a variety of fixes from 7.2.7, including one security-related issue.

E.297.1. Migration to Version 7.2.8

A dump/restore is not required for those running 7.2.X.

E.297.2. Changes

- Repair ancient race condition that allowed a transaction to be seen as committed for some purposes (eg SELECT FOR UPDATE) slightly sooner than for other purposes
  This is an extremely serious bug since it could lead to apparent data inconsistencies being briefly visible to applications.
- Repair race condition between relation extension and VACUUM
  This could theoretically have caused loss of a page’s worth of freshly-inserted data, although the scenario seems of very low probability. There are no known cases of it having caused more than an Assert failure.
- Fix EXTRACT (EPOCH) for TIME WITH TIME ZONE values
- Additional buffer overrun checks in plpgsql (Neil)
- Fix pg_dump to dump index names and trigger names containing % correctly (Neil)
- Prevent to_char(interval) from dumping core for month-related formats
- Fix contrib/pgcrypto for newer OpenSSL builds (Marko Kreen)

E.298. Release 7.2.7

Release date: 2005-01-31
This release contains a variety of fixes from 7.2.6, including several security-related issues.

**E.298.1. Migration to Version 7.2.7**

A dump/restore is not required for those running 7.2.X.

**E.298.2. Changes**

- **Disallow LOAD to non-superusers**
  
  On platforms that will automatically execute initialization functions of a shared library (this includes at least Windows and ELF-based Unixen), LOAD can be used to make the server execute arbitrary code. Thanks to NGS Software for reporting this.

- **Add needed STRICT marking to some contrib functions (Kris Jurka)**

- **Avoid buffer overrun when plpgsql cursor declaration has too many parameters (Neil)**

- **Fix planning error for FULL and RIGHT outer joins**
  
  The result of the join was mistakenly supposed to be sorted the same as the left input. This could not only deliver mis-sorted output to the user, but in case of nested merge joins could give outright wrong answers.

- **Fix display of negative intervals in SQL and GERMAN datestyles**

**E.299. Release 7.2.6**

**Release date:** 2004-10-22

This release contains a variety of fixes from 7.2.5.

**E.299.1. Migration to Version 7.2.6**

A dump/restore is not required for those running 7.2.X.

**E.299.2. Changes**

- **Repair possible failure to update hint bits on disk**
  
  Under rare circumstances this oversight could lead to “could not access transaction status” failures, which qualifies it as a potential-data-loss bug.

- **Ensure that hashed outer join does not miss tuples**
Appendix E. Release Notes

Very large left joins using a hash join plan could fail to output unmatched left-side rows given just the right data distribution.

• Disallow running `pg_ctl` as root
  This is to guard against any possible security issues.

• Avoid using temp files in `/tmp` in `make_oidjoins_check`
  This has been reported as a security issue, though it’s hardly worthy of concern since there is no reason for non-developers to use this script anyway.

• Update to newer versions of Bison

E.300. Release 7.2.5

Release date: 2004-08-16

This release contains a variety of fixes from 7.2.4.

E.300.1. Migration to Version 7.2.5

A dump/restore is not required for those running 7.2.X.

E.300.2. Changes

• Prevent possible loss of committed transactions during crash
  Due to insufficient interlocking between transaction commit and checkpointing, it was possible for transactions committed just before the most recent checkpoint to be lost, in whole or in part, following a database crash and restart. This is a serious bug that has existed since PostgreSQL 7.1.

• Fix corner case for btree search in parallel with first root page split

• Fix buffer overrun in `to_ascii` (Guido Notari)

• Fix core dump in deadlock detection on machines where char is unsigned

• Fix failure to respond to `pg_ctl` stop -m fast after `Async_NotifyHandler` runs

• Repair memory leaks in `pg_dump`

• Avoid conflict with system definition of `isblank()` function or macro

E.301. Release 7.2.4

Release date: 2003-01-30

This release contains a variety of fixes for version 7.2.3, including fixes to prevent possible data loss.
E.301.1. Migration to Version 7.2.4

A dump/restore is not required for those running version 7.2.*.

E.301.2. Changes

• Fix some additional cases of VACUUM "No one parent tuple was found" error
• Prevent VACUUM from being called inside a function (Bruce)
• Ensure pg_clog updates are sync’d to disk before marking checkpoint complete
• Avoid integer overflow during large hash joins
• Make GROUP commands work when pg_group.grolist is large enough to be toasted
• Fix errors in datetime tables; some timezone names weren’t being recognized
• Fix integer overflows in circle_poly(), path_encode(), path_add() (Neil)
• Repair long-standing logic errors in lseg_eq(), lseg_ne(), lseg_center()

E.302. Release 7.2.3

Release date: 2002-10-01

This release contains a variety of fixes for version 7.2.2, including fixes to prevent possible data loss.

E.302.1. Migration to Version 7.2.3

A dump/restore is not required for those running version 7.2.*.

E.302.2. Changes

• Prevent possible compressed transaction log loss (Tom)
• Prevent non-superuser from increasing most recent vacuum info (Tom)
• Handle pre-1970 date values in newer versions of glibc (Tom)
• Fix possible hang during server shutdown
• Prevent spinlock hangs on SMP PPC machines (Tomoyuki Niijima)
• Fix pg_dump to properly dump FULL JOIN USING (Tom)
E.303. Release 7.2.2

Release date: 2002-08-23
This release contains a variety of fixes for version 7.2.1.

E.303.1. Migration to Version 7.2.2
A dump/restore is not required for those running version 7.2.*.

E.303.2. Changes

- Allow EXECUTE of "CREATE TABLE AS ... SELECT" in PL/pgSQL (Tom)
- Fix for compressed transaction log id wraparound (Tom)
- Fix PQescapeBytea/PQunescapeBytea so that they handle bytes > 0x7f (Tatsuo)
- Fix for psql and pg_dump crashing when invoked with non-existent long options (Tatsuo)
- Fix crash when invoking geometric operators (Tom)
- Allow OPEN cursor(args) (Tom)
- Fix for rtree_gist index build (Teodor)
- Fix for dumping user-defined aggregates (Tom)
- contrib/intarray fixes (Oleg)
- Fix for complex UNION/EXCEPT/INTERSECT queries using parens (Tom)
- Fix to pg_convert (Tatsuo)
- Fix for crash with long DATA strings (Thomas, Neil)
- Fix for repeat(), lpad(), rpad() and long strings (Neil)

E.304. Release 7.2.1

Release date: 2002-03-21
This release contains a variety of fixes for version 7.2.

E.304.1. Migration to Version 7.2.1
A dump/restore is not required for those running version 7.2.
E.304.2. Changes

- Ensure that sequence counters do not go backwards after a crash (Tom)
- Fix pgaccess kanji-conversion key binding (Tatsuo)
- Optimizer improvements (Tom)
- Cash I/O improvements (Tom)
- New Russian FAQ
- Compile fix for missing AuthBlockSig (Heiko)
- Additional time zones and time zone fixes (Thomas)
- Allow psql \connect to handle mixed case database and user names (Tom)
- Return proper OID on command completion even with ON INSERT rules (Tom)
- Allow COPY FROM to use 8-bit DELIMITERS (Tatsuo)
- Fix bug in extract/date_part for milliseconds/microseconds (Tatsuo)
- Improve handling of multiple UNIONs with different lengths (Tom)
- contrib/btree_gist improvements (Teodor Sigaev)
- contrib/tsearch dictionary improvements, see README.tsearch for an additional installation step (Thomas T. Thai, Teodor Sigaev)
- Fix for array subscripts handling (Tom)
- Allow EXECUTE of "CREATE TABLE AS ... SELECT" in PL/pgSQL (Tom)

E.305. Release 7.2

Release date: 2002-02-04

E.305.1. Overview

This release improves PostgreSQL for use in high-volume applications.

Major changes in this release:

VACUUM

Vacuuming no longer locks tables, thus allowing normal user access during the vacuum. A new VACUUM FULL command does old-style vacuum by locking the table and shrinking the on-disk copy of the table.

Transactions

There is no longer a problem with installations that exceed four billion transactions.
Appendix E. Release Notes

OIDs

OIDs are now optional. Users can now create tables without OIDs for cases where OID usage is excessive.

Optimizer

The system now computes histogram column statistics during ANALYZE, allowing much better optimizer choices.

Security

A new MD5 encryption option allows more secure storage and transfer of passwords. A new Unix-domain socket authentication option is available on Linux and BSD systems.

Statistics

Administrators can use the new table access statistics module to get fine-grained information about table and index usage.

Internationalization

Program and library messages can now be displayed in several languages.

E.305.2. Migration to Version 7.2

A dump/restore using pg_dump is required for those wishing to migrate data from any previous release.

Observe the following incompatibilities:

- The semantics of the VACUUM command have changed in this release. You might wish to update your maintenance procedures accordingly.
- In this release, comparisons using = NULL will always return false (or NULL, more precisely). Previous releases automatically transformed this syntax to IS NULL. The old behavior can be re-enabled using a postgresql.conf parameter.
- The pg_hba.conf and pg_ident.conf configuration is now only reloaded after receiving a SIGHUP signal, not with each connection.
- The function octet_length() now returns the uncompressed data length.
- The date/time value 'current' is no longer available. You will need to rewrite your applications.
- The timestamp(), time(), and interval() functions are no longer available. Instead of timestamp(), use timestamp 'string' or CAST.

The SELECT ... LIMIT #,# syntax will be removed in the next release. You should change your queries to use separate LIMIT and OFFSET clauses, e.g. LIMIT 10 OFFSET 20.
E.305.3. Changes

E.305.3.1. Server Operation

- Create temporary files in a separate directory (Bruce)
- Delete orphaned temporary files on postmaster startup (Bruce)
- Added unique indexes to some system tables (Tom)
- System table operator reorganization (Oleg Bartunov, Teodor Sigaev, Tom)
- Renamed pg_log to pg_clog (Tom)
- Enable SIGTERM, SIGQUIT to kill backends (Jan)
- Removed compile-time limit on number of backends (Tom)
- Better cleanup for semaphore resource failure (Tatsuo, Tom)
- Allow safe transaction ID wraparound (Tom)
- Removed OIDs from some system tables (Tom)
- Removed "triggered data change violation" error check (Tom)
- SPI portal creation of prepared/saved plans (Jan)
- Allow SPI column functions to work for system columns (Tom)
- Long value compression improvement (Tom)
- Statistics collector for table, index access (Jan)
- Truncate extra-long sequence names to a reasonable value (Tom)
- Measure transaction times in milliseconds (Thomas)
- Fix TID sequential scans (Hiroshi)
- Superuser ID now fixed at 1 (Peter E)
- New pg_ctl "reload" option (Tom)

E.305.3.2. Performance

- Optimizer improvements (Tom)
- New histogram column statistics for optimizer (Tom)
- Reuse write-ahead log files rather than discarding them (Tom)
- Cache improvements (Tom)
- IS NULL, IS NOT NULL optimizer improvement (Tom)
- Improve lock manager to reduce lock contention (Tom)
- Keep relcache entries for index access support functions (Tom)
- Allow better selectivity with NaN and infinities in NUMERIC (Tom)
• R-tree performance improvements (Kenneth Been)
• B-tree splits more efficient (Tom)

E.305.3.3. Privileges

• Change UPDATE, DELETE privileges to be distinct (Peter E)
• New REFERENCES, TRIGGER privileges (Peter E)
• Allow GRANT/REVOKE to/from more than one user at a time (Peter E)
• New has_table_privilege() function (Joe Conway)
• Allow non-superuser to vacuum database (Tom)
• New SET SESSION AUTHORIZATION command (Peter E)
• Fix bug in privilege modifications on newly created tables (Tom)
• Disallow access to pg_statistic for non-superuser, add user-accessible views (Tom)

E.305.3.4. Client Authentication

• Fork postmaster before doing authentication to prevent hangs (Peter E)
• Add ident authentication over Unix domain sockets on Linux, *BSD (Helge Bahmann, Oliver Elphick, Teodor Sigaev, Bruce)
• Add a password authentication method that uses MD5 encryption (Bruce)
• Allow encryption of stored passwords using MD5 (Bruce)
• PAM authentication (Dominic J. Eidson)
• Load pg_hba.conf and pg_ident.conf only on startup and SIGHUP (Bruce)

E.305.3.5. Server Configuration

• Interpretation of some time zone abbreviations as Australian rather than North American now settable at run time (Bruce)
• New parameter to set default transaction isolation level (Peter E)
• New parameter to enable conversion of "expr = NULL" into "expr IS NULL", off by default (Peter E)
• New parameter to control memory usage by VACUUM (Tom)
• New parameter to set client authentication timeout (Tom)
• New parameter to set maximum number of open files (Tom)
E.305.3.6. Queries

- Statements added by INSERT rules now execute after the INSERT (Jan)
- Prevent unadorned relation names in target list (Bruce)
- NULLs now sort after all normal values in ORDER BY (Tom)
- New IS UNKNOWN, IS NOT UNKNOWN Boolean tests (Tom)
- New SHARE UPDATE EXCLUSIVE lock mode (Tom)
- New EXPLAIN ANALYZE command that shows run times and row counts (Martijn van Oosterhout)
- Fix problem with LIMIT and subqueries (Tom)
- Fix for LIMIT, DISTINCT ON pushed into subqueries (Tom)
- Fix nested EXCEPT/INTERSECT (Tom)

E.305.3.7. Schema Manipulation

- Fix SERIAL in temporary tables (Bruce)
- Allow temporary sequences (Bruce)
- Sequences now use int8 internally (Tom)
- New SERIAL8 creates int8 columns with sequences, default still SERIAL4 (Tom)
- Make OIDs optional using WITHOUT OIDS (Tom)
- Add %TYPE syntax to CREATE TYPE (Ian Lance Taylor)
- Add ALTER TABLE / DROP CONSTRAINT for CHECK constraints (Christopher Kings-Lynne)
- New CREATE OR REPLACE FUNCTION to alter existing function (preserving the function OID) (Gavin Sherry)
- Add ALTER TABLE / ADD [ UNIQUE | PRIMARY ] (Christopher Kings-Lynne)
- Allow column renaming in views
- Make ALTER TABLE / RENAME COLUMN update column names of indexes (Brent Verner)
- Fix for ALTER TABLE / ADD CONSTRAINT ... CHECK with inherited tables (Stephan Szabo)
- ALTER TABLE RENAME update foreign-key trigger arguments correctly (Brent Verner)
- DROP AGGREGATE and COMMENT ON AGGREGATE now accept an aggtype (Tom)
- Add automatic return type data casting for SQL functions (Tom)
- Allow GiST indexes to handle NULLs and multikey indexes (Oleg Bartunov, Teodor Sigaev, Tom)
- Enable partial indexes (Martijn van Oosterhout)
### E.305.3.8. Utility Commands

- Add RESET ALL, SHOW ALL (Marko Kreen)
- CREATE/ALTER USER/GROUP now allow options in any order (Vince)
- Add LOCK A, B, C functionality (Neil Padgett)
- New ENCRYPTED/UNENCRYPTED option to CREATE/ALTER USER (Bruce)
- New light-weight VACUUM does not lock table; old semantics are available as VACUUM FULL (Tom)
- Disable COPY TO/FROM on views (Bruce)
- COPY DELIMITERS string must be exactly one character (Tom)
- VACUUM warning about index tuples fewer than heap now only appears when appropriate (Martijn van Oosterhout)
- Fix privilege checks for CREATE INDEX (Tom)
- Disallow inappropriate use of CREATE/DROP INDEX/TRIGGER/VIEW (Tom)

### E.305.3.9. Data Types and Functions

- SUM(), AVG(), COUNT() now uses int8 internally for speed (Tom)
- Add convert(), convert2() (Tatsuo)
- New function bit_length() (Peter E)
- Make the "n" in CHAR(n)/VARCHAR(n) represents letters, not bytes (Tatsuo)
- CHAR(), VARCHAR() now reject strings that are too long (Peter E)
- BIT VARYING now rejects bit strings that are too long (Peter E)
- BIT now rejects bit strings that do not match declared size (Peter E)
- INET, CIDR text conversion functions (Alex Pilosov)
- INET, CIDR operators < < and < <= indexable (Alex Pilosov)
- Bytea \### now requires valid three digit octal number
- Bytea comparison improvements, now supports =, < >, > =, <, and <=
- Bytea now supports B-tree indexes
- Bytea now supports LIKE, LIKE...ESCAPE, NOT LIKE, NOT LIKE...ESCAPE
- Bytea now supports concatenation
- New bytea functions: position, substring, trim, btrim, and length
- New encode() function mode, "escaped", converts minimally escaped bytea to/from text
- Add pg_database_encoding_max_length() (Tatsuo)
- Add pg_client_encoding() function (Tatsuo)
- now() returns time with millisecond precision (Thomas)
Appendix E. Release Notes

- New TIMESTAMP WITHOUT TIMEZONE data type (Thomas)
- Add ISO date/time specification with "T", yyyy-mm-ddThh:mm:ss (Thomas)
- New xid/int comparison functions (Hiroshi)
- Add precision to TIME, TIMESTAMP, and INTERVAL data types (Thomas)
- Modify type coercion logic to attempt binary-compatible functions first (Tom)
- New encode() function installed by default (Marko Kreen)
- Improved to_*() conversion functions (Karel Zak)
- Optimize LIKE/ILIKE when using single-byte encodings (Tatsuo)
- New functions in contrib/pgcrypto: crypt(), hmac(), encrypt(), gen_salt() (Marko Kreen)
- Correct description of translate() function (Bruce)
- Add INTERVAL argument for SET TIME ZONE (Thomas)
- Add INTERVAL YEAR TO MONTH (etc.) syntax (Thomas)
- Optimize length functions when using single-byte encodings (Tatsuo)
- Fix path_inter, path_distance, path_length, dist_ppath to handle closed paths (Curtis Barrett, Tom)
- octet_length(text) now returns non-compressed length (Tatsuo, Bruce)
- Handle "July" full name in date/time literals (Greg Sabino Mullane)
- Some datatype() function calls now evaluated differently
- Add support for Julian and ISO time specifications (Thomas)

E.305.3.10. Internationalization

- National language support in psql, pg_dump, libpq, and server (Peter E)
- Message translations in Chinese (simplified, traditional), Czech, French, German, Hungarian, Russian, Swedish (Peter E, Serguei A. Mokhov, Karel Zak, Weiping He, Zhenbang Wei, Kovacs Zoltan)
- Make trim, ltrim, rtrim, btrim, lpad, rpad, translate multibyte aware (Tatsuo)
- Add LATIN5,6,7,8,9,10 support (Tatsuo)
- Add ISO 8859-5,6,7,8 support (Tatsuo)
- Correct LATIN5 to mean ISO-8859-9, not ISO-8859-5 (Tatsuo)
- Make mic2ascii() non-ASCII aware (Tatsuo)
- Reject invalid multibyte character sequences (Tatsuo)

E.305.3.11. PL/pgSQL

- Now uses portals for SELECT loops, allowing huge result sets (Jan)
- CURSOR and REFCURSOR support (Jan)
• Can now return open cursors (Jan)
• Add ELSEIF (Klaus Reger)
• Improve PL/pgSQL error reporting, including location of error (Tom)
• Allow IS or FOR key words in cursor declaration, for compatibility (Bruce)
• Fix for SELECT ... FOR UPDATE (Tom)
• Fix for PERFORM returning multiple rows (Tom)
• Make PL/pgSQL use the server’s type coercion code (Tom)
• Memory leak fix (Jan, Tom)
• Make trailing semicolon optional (Tom)

E.305.3.12. PL/Perl

• New untrusted PL/Perl (Alex Pilosov)
• PL/Perl is now built on some platforms even if libperl is not shared (Peter E)

E.305.3.13. PL/Tcl

• Now reports errorInfo (Vsevolod Lobko)
• Add spi_lastoid function (bob@redivi.com)

E.305.3.14. PL/Python

• ...is new (Andrew Bosma)

E.305.3.15. psql

• \d displays indexes in unique, primary groupings (Christopher Kings-Lynne)
• Allow trailing semicolons in backslash commands (Greg Sabino Mullane)
• Read password from /dev/tty if possible
• Force new password prompt when changing user and database (Tatsuo, Tom)
• Format the correct number of columns for Unicode (Patrice)

E.305.3.16. libpq

• New function PQescapeString() to escape quotes in command strings (Florian Weimer)
Appendix E. Release Notes

- New function PQescapeBytea() escapes binary strings for use as SQL string literals

E.305.3.17. JDBC

- Return OID of INSERT (Ken K)
- Handle more data types (Ken K)
- Handle single quotes and newlines in strings (Ken K)
- Handle NULL variables (Ken K)
- Fix for time zone handling (Barry Lind)
- Improved Druid support
- Allow eight-bit characters with non-multibyte server (Barry Lind)
- Support BIT, BINARY types (Ned Wolpert)
- Reduce memory usage (Michael Stephens, Dave Cramer)
- Update DatabaseMetaData (Peter E)
- Add DatabaseMetaData.getCatalogs() (Peter E)
- Encoding fixes (Anders Bengtsson)
- Get/setCatalog methods (Jason Davies)
- DatabaseMetaData.getColumns() now returns column defaults (Jason Davies)
- DatabaseMetaData.getColumns() performance improvement (Jeroen van Vianen)
- Some JDBC1 and JDBC2 merging (Anders Bengtsson)
- Transaction performance improvements (Barry Lind)
- Array fixes (Greg Zoller)
- Serialize addition
- Fix batch processing (Rene Pijlman)
- ExecSQL method reorganization (Anders Bengtsson)
- GetColumn() fixes (Jeroen van Vianen)
- Fix isWriteable() function (Rene Pijlman)
- Improved passage of JDBC2 conformance tests (Rene Pijlman)
- Add bytea type capability (Barry Lind)
- Add isNullable() (Rene Pijlman)
- JDBC date/time test suite fixes (Liam Stewart)
- Fix for SELECT 'id' AS xxx FROM table (Dave Cramer)
- Fix DatabaseMetaData to show precision properly (Mark Lillywhite)
- New getImported/getExported keys (Jason Davies)
- MD5 password encryption support (Jeremy Wohl)
• Fix to actually use type cache (Ned Wolpert)

E.305.3.18. ODBC

• Remove query size limit (Hiroshi)
• Remove text field size limit (Hiroshi)
• Fix for SQLPrimaryKeys in multibyte mode (Hiroshi)
• Allow ODBC procedure calls (Hiroshi)
• Improve boolean handing (Aidan Mountford)
• Most configuration options now settable via DSN (Hiroshi)
• Multibyte, performance fixes (Hiroshi)
• Allow driver to be used with iODBC or unixODBC (Peter E)
• MD5 password encryption support (Bruce)
• Add more compatibility functions to odbc.sql (Peter E)

E.305.3.19. ECPG

• EXECUTE ... INTO implemented (Christof Petig)
• Multiple row descriptor support (e.g. CARDINALITY) (Christof Petig)
• Fix for GRANT parameters (Lee Kindness)
• Fix INITIALLY DEFERRED bug
• Various bug fixes (Michael, Christof Petig)
• Auto allocation for indicator variable arrays (int *ind_p=NULL)
• Auto allocation for string arrays (char **foo_pp=NULL)
• ECPGfree_auto_mem fixed
• All function names with external linkage are now prefixed by ECPG
• Fixes for arrays of structures (Michael)

E.305.3.20. Misc. Interfaces

• Python fix fetchone() (Gerhard Haring)
• Use UTF, Unicode in Tcl where appropriate (Vsevolod Lobko, Reinhard Max)
• Add Tcl COPY TO/FROM (ljb)
• Prevent output of default index op class in pg_dump (Tom)
• Fix libpgeasy memory leak (Bruce)
E.305.3.21. Build and Install

- Configure, dynamic loader, and shared library fixes (Peter E)
- Fixes in QNX 4 port (Bernd Tegge)
- Fixes in Cygwin and Windows ports (Jason Tishler, Gerhard Haring, Dmitry Yurtaev, Darko Prenosil, Mikhail Terekhov)
- Fix for Windows socket communication failures (Magnus, Mikhail Terekhov)
- Hurd compile fix (Oliver Elphick)
- BeOS fixes (Cyril Velter)
- Remove configure --enable-unicode-conversion, now enabled by multibyte (Tatsuo)
- AIX fixes (Tatsuo, Andreas)
- Fix parallel make (Peter E)
- Install SQL language manual pages into OS-specific directories (Peter E)
- Rename config.h to pg_config.h (Peter E)
- Reorganize installation layout of header files (Peter E)

E.305.3.22. Source Code

- Remove SEP_CHAR (Bruce)
- New GUC hooks (Tom)
- Merge GUC and command line handling (Marko Kreen)
- Remove EXTEND INDEX (Martijn van Oosterhout, Tom)
- New pgjindent utility to indent java code (Bruce)
- Remove define of true/false when compiling under C++ (Leandro Fanzone, Tom)
- pgindent fixes (Bruce, Tom)
- Replace strcasecmp() with strcmp() where appropriate (Peter E)
- Dynahash portability improvements (Tom)
- Add ‘volatile’ usage in spinlock structures
- Improve signal handling logic (Tom)

E.305.3.23. Contrib

- New contrib/rtree_gist (Oleg Bartunov, Teodor Sigaev)
- New contrib/tsearch full-text indexing (Oleg, Teodor Sigaev)
- Add contrib/dblink for remote database access (Joe Conway)
• contrib/ora2pg Oracle conversion utility (Gilles Darold)
• contrib/xml XML conversion utility (John Gray)
• contrib/fulltextindex fixes (Christopher Kings-Lynne)
• New contrib/fuzzystrmatch with levenshtein and metaphone, soundex merged (Joe Conway)
• Add contrib/intarray boolean queries, binary search, fixes (Oleg Bartunov)
• New pg_upgrade utility (Bruce)
• Add new pg_resetxlog options (Bruce, Tom)

E.306. Release 7.1.3

Release date: 2001-08-15

E.306.1. Migration to Version 7.1.3

A dump/restore is not required for those running 7.1.X.

E.306.2. Changes

Remove unused WAL segments of large transactions (Tom)
Multiaction rule fix (Tom)
PL/pgSQL memory allocation fix (Jan)
VACUUM buffer fix (Tom)
Regression test fixes (Tom)
pg_dump fixes for GRANT/REVOKE/comments on views, user-defined types (Tom)
Fix subselects with DISTINCT ON or LIMIT (Tom)
BeOS fix
Disable COPY TO/FROM a view (Tom)
Cygwin build (Jason Tishler)

E.307. Release 7.1.2

Release date: 2001-05-11

This has one fix from 7.1.1.
E.307.1. Migration to Version 7.1.2

A dump/restore is not required for those running 7.1.X.

E.307.2. Changes

Fix PL/pgSQL SELECTs when returning no rows
Fix for psql backslash core dump
Referential integrity privilege fix
Optimizer fixes
pg_dump cleanups

E.308. Release 7.1.1

Release date: 2001-05-05

This has a variety of fixes from 7.1.

E.308.1. Migration to Version 7.1.1

A dump/restore is not required for those running 7.1.

E.308.2. Changes

Fix for numeric MODULO operator (Tom)
pg_dump fixes (Philip)
pg_dump can dump 7.0 databases (Philip)
readline 4.2 fixes (Peter E)
JOIN fixes (Tom)
AIX, MSWIN, VAX, N32K fixes (Tom)
Multibytes fixes (Tom)
Unicode fixes (Tatsuo)
Optimizer improvements (Tom)
Fix for whole rows in functions (Tom)
Fix for pg_ctl and option strings with spaces (Peter E)
ODBC fixes (Hiroshi)
EXTRACT can now take string argument (Thomas)
Python fixes (Darcy)
E.309. Release 7.1

Release date: 2001-04-13

This release focuses on removing limitations that have existed in the PostgreSQL code for many years.

Major changes in this release:

Write-ahead Log (WAL)

To maintain database consistency in case of an operating system crash, previous releases of PostgreSQL have forced all data modifications to disk before each transaction commit. With WAL, only one log file must be flushed to disk, greatly improving performance. If you have been using -F in previous releases to disable disk flushes, you might want to consider discontinuing its use.

TOAST

TOAST - Previous releases had a compiled-in row length limit, typically 8k - 32k. This limit made storage of long text fields difficult. With TOAST, long rows of any length can be stored with good performance.

Outer Joins

We now support outer joins. The UNION/NOT IN workaround for outer joins is no longer required. We use the SQL92 outer join syntax.

Function Manager

The previous C function manager did not handle null values properly, nor did it support 64-bit CPU’s (Alpha). The new function manager does. You can continue using your old custom functions, but you might want to rewrite them in the future to use the new function manager call interface.

Complex Queries

A large number of complex queries that were unsupported in previous releases now work. Many combinations of views, aggregates, UNION, LIMIT, cursors, subqueries, and inherited tables now work properly. Inherited tables are now accessed by default. Subqueries in FROM are now supported.

E.309.1. Migration to Version 7.1

A dump/restore using pg_dump is required for those wishing to migrate data from any previous release.

E.309.2. Changes

Bug Fixes

---------
Many multibyte/Unicode/locale fixes (Tatsuo and others)
More reliable ALTER TABLE RENAME (Tom)
Kerberos V fixes (David Wragg)
Fix for INSERT INTO...SELECT where targetlist has subqueries (Tom)
Prompt username/password on standard error (Bruce)
Large objects inv_read/inv_write fixes (Tom)
Fixes for to_char(), to_date(), to_ascii(), and to_timestamp() (Karel, Daniel Baldoni)
Appendix E. Release Notes

Prevent query expressions from leaking memory (Tom)
Allow UPDATE of arrays elements (Tom)
Wake up lock waiters during cancel (Hiroshi)
Fix rare cursor crash when using hash join (Tom)
Fix for DROP TABLE/INDEX in rolled-back transaction (Hiroshi)
Fix psql crash from \l+ if MULTIBYTE enabled (Peter E)
Fix truncation of rule names during CREATE VIEW (Ross Reedstrom)
Fix PL/perl (Alex Kapranoff)
Disallow LOCK on views (Mark Hollomon)
Disallow INSERT/UPDATE/DELETE on views (Mark Hollomon)
Disallow DROP RULE, CREATE INDEX, TRUNCATE on views (Mark Hollomon)
Allow PL/pgSQL accept non-ASCII identifiers (Tatsuo)
Allow views to proper handle GROUP BY, aggregates, DISTINCT (Tom)
Fix rare failure with TRUNCATE command (Tom)
Allow UNION/INTERSECT/EXCEPT to be used with ALL, subqueries, views, DISTINCT, ORDER BY, SELECT...INTO (Tom)
Fix parser failures during aborted transactions (Tom)
Allow temporary relations to properly clean up indexes (Bruce)
Fix VACUUM problem with moving rows in same page (Tom)
Modify pg_dump to better handle user-defined items in template1 (Philip)
Allow LIMIT in VIEW (Tom)
Require cursor FETCH to honor LIMIT (Tom)
Allow PRIMARY/FOREIGN Key definitions on inherited columns (Stephan)
Allow ORDER BY, LIMIT in subqueries (Tom)
Allow UNION in CREATE RULE (Tom)
Make ALTER/DROP TABLE rollback-able (Vadim, Tom)
Store initdb collation in pg_control so collation cannot be changed (Tom)
Fix INSERT...SELECT with rules (Tom)
Fix FOR UPDATE inside views and subselects (Tom)
Fix OVERLAPS operators conform to SQL92 spec regarding NULLs (Tom)
Fix lpad() and rpad() to handle length less than input string (Tom)
Fix use of NOTIFY in some rules (Tom)
Overhaul btree code (Tom)
Fix NOT NULL use in Pl/pgSQL variables (Tom)
Overhaul GIST code (Oleg)
Fix CLUSTER to preserve constraints and column default (Tom)
Improved deadlock detection handling (Tom)
Allow multiple SERIAL columns in a table (Tom)
Prevent occasional index corruption (Vadim)

Enhancements
------------
Add OUTER JOINs (Tom)
Function manager overhaul (Tom)
Allow ALTER TABLE RENAME on indexes (Tom)
Improve CLUSTER (Tom)
Improve ps status display for more platforms (Peter E, Marc)
Improve CREATE FUNCTION failure message (Ross)
JDBC improvements (Peter, Travis Bauer, Christopher Cain, William Webber, Gunnar)
Grand Unified Configuration scheme/GUC. Many options can now be set in
data/postgresql.conf, postmaster/postgres flags, or SET commands (Peter E)
Improved handling of file descriptor cache (Tom)
Appendix E. Release Notes

New warning code about auto-created table alias entries (Bruce)
Overhaul initdb process (Tom, Peter E)
Overhaul of inherited tables; inherited tables now accessed by default;
   new ONLY key word prevents it (Chris Bitmead, Tom)
ODBC cleanups/improvements (Nick Gorham, Stephan Szabo, Zoltan Kovacs,
   Michael Fork)
Allow renaming of temp tables (Tom)
Overhaul memory manager contexts (Tom)
pg_dumpall uses CREATE USER or CREATE GROUP rather using COPY (Peter E)
Overhaul pg_dump (Philip Warner)
Allow pg_hba.conf secondary password file to specify only username (Peter E)
Allow TEMPORARY or TEMP key word when creating temporary tables (Bruce)
New memory leak checker (Karel)
New SET SESSION CHARACTERISTICS (Thomas)
Allow nested block comments (Thomas)
Add WITHOUT TIME ZONE type qualifier (Thomas)
New ALTER TABLE ADD CONSTRAINT (Stephan)
Use NUMERIC accumulators for INTEGER aggregates (Tom)
Overhaul aggregate code (Tom)
New VARIANCE and STDDEV() aggregates
Improve dependency ordering of pg_dump (Philip)
New pg_restore command (Philip)
New pg_dump tar output option (Philip)
New pg_dump of large objects (Philip)
New ESCAPE option to LIKE (Thomas)
New case-insensitive LIKE - ILIKE (Thomas)
Allow functional indexes to use binary-compatible type (Tom)
Allow SQL functions to be used in more contexts (Tom)
New pg_config utility (Peter E)
New PL/pgSQL EXECUTE command which allows dynamic SQL and utility statements
   (Jan)
New PL/pgSQL GET DIAGNOSTICS statement for SPI value access (Jan)
New quote_identifiers() and quote_literal() functions (Jan)
New ALTER TABLE table OWNER TO user command (Mark Hollomon)
Allow subselects in FROM, i.e. FROM (SELECT ...) [AS] alias (Tom)
Update PyGreSQL to version 3.1 (D’Arcy)
Store tables as files named by OID (Vadim)
New SQL function setval(seq,val,bool) for use in pg_dump (Philip)
Require DROP VIEW to remove views, no DROP TABLE (Mark)
Allow DROP VIEW view1, view2 (Mark)
Allow multiple objects in DROP INDEX, DROP RULE, and DROP TYPE (Tom)
Allow automatic conversion to/from Unicode (Tatsuo, Eiji)
New /contrib/pgcrypto hashing functions (Marko Kreen)
New pg_dumpall --globals-only option (Peter E)
New CHECKPOINT command for WAL which creates new WAL log file (Vadim)
New AT TIME ZONE syntax (Thomas)
Allow location of Unix domain socket to be configurable (David J. MacKenzie)
Allow postmaster to listen on a specific IP address (David J. MacKenzie)
Allow socket path name to be specified in hostname by using leading slash
   (David J. MacKenzie)
Allow CREATE DATABASE to specify template database (Tom)
New utility to convert MySQL schema dumps to SQL92 and PostgreSQL (Thomas)
New /contrib/rserv replication toolkit (Vadim)
Appendix E. Release Notes

New file format for COPY BINARY (Tom)
New /contrib/oid2name to map numeric files to table names (B Palmer)
New "idle in transaction" ps status message (Marc)
Update to pgaccess 0.98.7 (Constantin Teodorescu)
pg_ctl now defaults to -w (wait) on shutdown, new -l (log) option
Add rudimentary dependency checking to pg_dump (Philip)

Types
-----
Fix INET/CIDR type ordering and add new functions (Tom)
Make OID behave as an unsigned type (Tom)
Allow BIGINT as synonym for INT8 (Peter E)
New int2 and int8 comparison operators (Tom)
New BIT and BIT VARYING types (Adriaan Joubert, Tom, Peter E)
CHAR() no longer faster than VARCHAR() because of TOAST (Tom)
New GIST seg/cube examples (Gene Selkov)
Improved round(numeric) handling (Tom)
Fix CIDR output formatting (Tom)
New CIDR abbrev() function (Tom)

Performance
------------
Write-Ahead Log (WAL) to provide crash recovery with less performance
overhead (Vadim)
ANALYZE stage of VACUUM no longer exclusively locks table (Bruce)
Reduced file seeks (Denis Perchine)
Improve BTREE code for duplicate keys (Tom)
Store all large objects in a single table (Denis Perchine, Tom)
Improve memory allocation performance (Karel, Tom)

Source Code
------------
New function manager call conventions (Tom)
SGI portability fixes (David Kaelbling)
New configure --enable-syslog option (Peter E)
New BSDI README (Bruce)
configure script moved to top level, not /src (Peter E)
Makefile/configuration/compilation overhaul (Peter E)
New configure --with-python option (Peter E)
Solaris cleanups (Peter E)
Overhaul /contrib Makefiles (Karel)
New OpenSSL configuration option (Magnus, Peter E)
AIX fixes (Andreas)
QNIX fixes (Maurizio)
New heap_open(), heap_openr() API (Tom)
Remove colon and semi-colon operators (Thomas)
New pg_class.relkind value for views (Mark Hollomon)
Rename ichar() to chr() (Karel)
New documentation for btrim(), ascii(), chr(), repeat() (Karel)
Fixes for NT/Cygwin (Pete Forman)
AIX port fixes (Andreas)
New BeOS port (David Reid, Cyril Velter)
Add proofreader’s changes to docs (Addison-Wesley, Bruce)
New Alpha spinlock code (Adriaan Joubert, Compaq)
UnixWare port overhaul (Peter E)
New Darwin/Mac OS X port (Peter Bierman, Bruce Hartzler)
New FreeBSD Alpha port (Alfred)
Overhaul shared memory segments (Tom)
Add IBM S/390 support (Neale Ferguson)
Moved macmanuf to /contrib (Larry Rosenman)
Syslog improvements (Larry Rosenman)
New template0 database that contains no user additions (Tom)
New /contrib/cube and /contrib/seg GIST sample code (Gene Selkov)
Allow NetBSD’s libedit instead of readline (Peter)
Improved assembly language source code format (Bruce)
New contrib/pg_logger
New --template option to createdb
New contrib/pg_control utility (Oliver)
New FreeBSD tools ipc_check, start-scripts/freebsd

E.310. Release 7.0.3

Release date: 2000-11-11

This has a variety of fixes from 7.0.2.

E.310.1. Migration to Version 7.0.3

A dump/restore is not required for those running 7.0.*.

E.310.2. Changes

Jdbc fixes (Peter)
Large object fix (Tom)
Fix lean in COPY WITH OIDS leak (Tom)
Fix backwards-index-scan (Tom)
Fix SELECT ... FOR UPDATE so it checks for duplicate keys (Hiroshi)
Add --enable-syslog to configure (Marc)
Fix abort transaction at backend exit in rare cases (Tom)
Fix for psql \l+ when multibyte enabled (Tatsuo)
Allow PL/pgSQL to accept non ascii identifiers (Tatsuo)
Make vacuum always flush buffers (Tom)
Fix to allow cancel while waiting for a lock (Hiroshi)
Fix for memory allocation problem in user authentication code (Tom)
Remove bogus use of int4out() (Tom)
Fixes for multiple subqueries in COALESCE or BETWEEN (Tom)
Fix for failure of triggers on heap open in certain cases (Jeroen van Vianen)
Fix for erroneous selectivity of not-equals (Tom)
Fix for erroneous use of strcmp() (Tom)
Fix for bug where storage manager accesses items beyond end of file (Tom)
Fix to include kernel errno message in all smgr elog messages (Tom)
Fix for ‘.’ not in PATH at build time (SL Baur)
Fix for out-of-file-descriptors error (Tom)
Fix to make pg_dump dump ‘iscachable’ flag for functions (Tom)
Fix for subselect in targetlist of Append node (Tom)
Fix for mergejoin plans (Tom)
Fix TRUNCATE failure on relations with indexes (Tom)
Avoid database-wide restart on write error (Hiroshi)
Fix nodeMaterial to honor chgParam by recomputing its output (Tom)
Fix VACUUM problem with moving chain of update row versions when source and destination of a row version lie on the same page (Tom)
Fix user.c CommandCounterIncrement (Tom)
Fix for AM/PM boundary problem in to_char() (Karel Zak)
Fix TIME aggregate handling (Tom)
Fix to_char() to avoid coredump on NULL input (Tom)
Buffer fix (Tom)
Fix for inserting/copying longer multibyte strings into char() data types (Tatsuo)
Fix for crash of backend, on abort (Tom)

E.311. Release 7.0.2

Release date: 2000-06-05
This is a repackaging of 7.0.1 with added documentation.

E.311.1. Migration to Version 7.0.2

A dump/restore is not required for those running 7.*.

E.311.2. Changes

Added documentation to tarball.
E.312. Release 7.0.1

Release date: 2000-06-01

This is a cleanup release for 7.0.

E.312.1. Migration to Version 7.0.1

A dump/restore is *not* required for those running 7.0.

E.312.2. Changes

Fix many CLUSTER failures (Tom)
Allow ALTER TABLE RENAME works on indexes (Tom)
Fix psql to handle datetime->timestamp and timespan->interval (Bruce)
New configure --with-setproctitle switch to use setproctitle() (Marc, Bruce)
Fix the off by one errors in ResultSet from 6.5.3, and more.
jdbc ResultSet fixes (Joseph Shraibman)
optimizer tunings (Tom)
Fix create user for pgaccess
Fix for UNLISTEN failure
IRIX fixes (David Kaelbling)
QNIX fixes (Andreas Kardos)
Reduce COPY IN lock level (Tom)
Change libpqeasy to use PQconnectdb() style parameters (Bruce)
Fix pg_dump to handle OID indexes (Tom)
Fix small memory leak (Tom)
Solaris fix for createdb/dropdb (Tatsuo)
Fix for non-blocking connections (Alfred Perlstein)
Fix improper recovery after RENAME TABLE failures (Tom)
Copy pg_ident.conf.sample into /lib directory in install (Bruce)
Add SJIS UDC (NEC selection IBM kanji) support (Eiji Tokuya)
Fix too long syslog message (Tatsuo)
Fix problem with quoted indexes that are too long (Tom)
JDBC ResultSet.getTimestamp() fix (Gregory Krasnow & Floyd Marinescu)
ecpg changes (Michael)

E.313. Release 7.0

Release date: 2000-05-08

This release contains improvements in many areas, demonstrating the continued growth of PostgreSQL. There are more improvements and fixes in 7.0 than in any previous release. The developers have confidence that this is the best release yet; we do our best to put out only solid releases, and this one is no exception.
Major changes in this release:

**Foreign Keys**

Foreign keys are now implemented, with the exception of PARTIAL MATCH foreign keys. Many users have been asking for this feature, and we are pleased to offer it.

**Optimizer Overhaul**

Continuing on work started a year ago, the optimizer has been improved, allowing better query plan selection and faster performance with less memory usage.

**Updated psql**

psql, our interactive terminal monitor, has been updated with a variety of new features. See the psql manual page for details.

**Join Syntax**

SQL92 join syntax is now supported, though only as `INNER JOIN` for this release. `JOIN`, `NATURAL JOIN`, `JOIN/USING`, and `JOIN/ON` are available, as are column correlation names.

### E.313.1. Migration to Version 7.0

A dump/restore using `pg_dump` is required for those wishing to migrate data from any previous release of PostgreSQL. For those upgrading from 6.5.*, you can instead use `pg_upgrade` to upgrade to this release; however, a full dump/reload installation is always the most robust method for upgrades.

Interface and compatibility issues to consider for the new release include:

- The date/time types `datetime` and `timespan` have been superseded by the SQL92-defined types `timestamp` and `interval`. Although there has been some effort to ease the transition by allowing PostgreSQL to recognize the deprecated type names and translate them to the new type names, this mechanism cannot be completely transparent to your existing application.

- The optimizer has been substantially improved in the area of query cost estimation. In some cases, this will result in decreased query times as the optimizer makes a better choice for the preferred plan. However, in a small number of cases, usually involving pathological distributions of data, your query times might go up. If you are dealing with large amounts of data, you might want to check your queries to verify performance.

- The JDBC and ODBC interfaces have been upgraded and extended.

- The string function `CHAR_LENGTH` is now a native function. Previous versions translated this into a call to `LENGTH`, which could result in ambiguity with other types implementing `LENGTH` such as the geometric types.

### E.313.2. Changes

**Bug Fixes**

---

Prevent function calls exceeding maximum number of arguments (Tom)

Improve CASE construct (Tom)
Appendix E. Release Notes

Fix SELECT coalesce(f1,0) FROM int4_tbl GROUP BY f1 (Tom)
Fix SELECT sentence.words[0] FROM sentence GROUP BY sentence.words[0] (Tom)
Fix GROUP BY scan bug (Tom)
Improvements in SQL grammar processing (Tom)
Fix for views involved in INSERT ... SELECT ... (Tom)
Fix for SELECT a/2, a/2 FROM test_missing_target GROUP BY a/2 (Tom)
Fix for subselects in INSERT ... SELECT (Tom)
Prevent INSERT ... SELECT ... ORDER BY (Tom)
Fixes for relations greater than 2GB, including vacuum
Improve propagating system table changes to other backends (Tom)
Improve propagating user table changes to other backends (Tom)
Fix handling of temp tables in complex situations (Bruce, Tom)
Allow table locking at table open, improving concurrent reliability (Tom)
Properly quote sequence names in pg_dump (Ross J. Reedstrom)
Prevent DROP DATABASE while others accessing
Prevent any rows from being returned by GROUP BY if no rows processed (Tom)
Fix pg_dump COUNT(1) FROM table WHERE ...' if no rows matching WHERE (Tom)
Fix pg_upgrade so it works for MVCC (Tom)
Fix for SELECT ... WHERE x IN (SELECT ... HAVING SUM(x) > 1) (Tom)
Fix for "f1 datetime DEFAULT 'now'" (Tom)
Fix problems with CURRENT_DATE used in DEFAULT (Tom)
Allow comment-only lines, and ;;; lines too. (Tom)
Improve recovery after failed disk writes, disk full (Hiroshi)
Fix cases where table is mentioned in FROM but not joined (Tom)
Allow HAVING clause without aggregate functions (Tom)
Fix for "---" comment and no trailing newline, as seen in perl interface
Improve pg_dump failure error reports (Bruce)
Allow sorts and hashes to exceed 2GB file sizes (Tom)
Fix for pg_dump dumping of inherited rules (Tom)
Fix for NULL handling comparisons (Tom)
Fix inconsistent state caused by failed CREATE/DROP commands (Hiroshi)
Fix for dbname with dash
Prevent DROP INDEX from interfering with other backends (Tom)
Fix file descriptor leak in verify_password()
Fix for "Unable to identify an operator ="$" problem
Fix ODBC so no segfault if CommLog and Debug enabled (Dirk Niggemann)
Fix for recursive exit call (Massimo)
Fix for extra-long timezones (Jeroen van Vianen)
Make pg_dump preserve primary key information (Peter E)
Prevent databases with single quotes (Peter E)
Prevent DROP DATABASE inside transaction (Peter E)
ecppg memory leak fixes (Stephen Birch)
Fix for SELECT null::text, SELECT int4fac(null) and SELECT 2 + (null) (Tom)
Y2K timestamp fix (Massimo)
Fix for VACUUM 'HEAP_MOVED_IN was not expected' errors (Tom)
Fix for views with tables/columns containing spaces (Tom)
Prevent privileges on indexes (Peter E)
Fix for spinlock stuck problem when error is generated (Hiroshi)
Fix ipcclean on Linux
Fix handling of NULL constraint conditions (Tom)
Fix memory leak in odbc driver (Nick Gorham)
Fix for privilege check on UNION tables (Tom)
Fix to allow SELECT ‘a’ LIKE ‘a’ (Tom)
Appendix E. Release Notes

Fix for SELECT 1 + NULL (Tom)
Fixes to CHAR
Fix log() on numeric type (Tom)
Deprecate ‘:’ and ‘;’ operators
Allow vacuum of temporary tables
Disallow inherited columns with the same name as new columns
Recover or force failure when disk space is exhausted (Hiroshi)
Fix INSERT INTO ... SELECT with AS columns matching result columns
Fix INSERT ... SELECT ... GROUP BY groups by target columns not source columns (Tom)
Fix CREATE TABLE test (a char(5) DEFAULT text, b int4) with INSERT (Tom)
Fix UNION with LIMIT
Fix CREATE TABLE x AS SELECT 1 UNION SELECT 2
Fix CREATE TABLE test(col char(2) DEFAULT user)
Fix mismatched types in CREATE TABLE ... DEFAULT
Fix SELECT * FROM pg_class where oid in (0,-1)
Fix SELECT COUNT('asdf') FROM pg_class WHERE oid=12
Prevent user who can create databases can modifying pg_database table (Peter E)
Fix btree to give a useful elog when key > 1/2 (page - overhead) (Tom)
Fix INSERT of 0.0 into DECIMAL(4,4) field (Tom)

Enhancements
------------
New CLI interface include file sqlcli.h, based on SQL3/SQL98
Remove all limits on query length, row length limit still exists (Tom)
Update jdbc protocol to 2.0 (Jens Glaser <jens@jens.de>)
Add TRUNCATE command to quickly truncate relation (Mike Mascari)
Fix to give super user and createdb user proper update catalog rights (Peter E)
Allow ecpg bool variables to have NULL values (Christof)
Issue ecpg error if NULL value for variable with no NULL indicator (Christof)
Allow ^C to cancel COPY command (Massimo)
Add SET FSYNC and SHOW PG_OPTIONS commands (Massimo)
Function name overloading for dynamically-loaded C functions (Frankpitt)
Add CmdTuples() to libpq++ (Vince)
New CREATE CONSTRAINT TRIGGER and SET CONSTRAINTS commands (Jan)
Allow CREATE FUNCTION/WITH clause to be used for all language types
configure --enable-debug adds -g (Peter E)
configure --disable-debug removes -g (Peter E)
Allow more complex default expressions (Tom)
First real FOREIGN KEY constraint trigger functionality (Jan)
Add FOREIGN KEY ... MATCH FULL ... ON DELETE CASCADE (Jan)
Add FOREIGN KEY ... MATCH <unspecified> referential actions (Don Baccus)
Allow WHERE restriction on ctid (physical heap location) (Hiroshi)
Move pginterface from contrib to interface directory, rename to pgeasy (Bruce)
Change pgeasy connectdb() parameter ordering (Bruce)
Require SELECT DISTINCT target list to have all ORDER BY columns (Tom)
Add Oracle’s COMMENT ON command (Mike Mascari <mascarim@yahoo.com>)
libpq’s PQsetNoticeProcessor function now returns previous hook (Peter E)
Prevent PQsetNoticeProcessor from being set to NULL (Peter E)
Make USING in COPY optional (Bruce)
Allow subselects in the target list (Tom)
Allow subselects on the left side of comparison operators (Tom)
New parallel regression test (Jan)
Change backend-side COPY to write files with permissions 644 not 666 (Tom)
Appendix E. Release Notes

Force permissions on PGDATA directory to be secure, even if it exists (Tom)
Added psql LASTOID variable to return last inserted oid (Peter E)
Allow concurrent vacuum and remove pg_vlock vacuum lock file (Tom)
Add privilege check for vacuum (Peter E)
New libpq functions to allow asynchronous connections: PQconnectStart(),
    PQconnectPoll(), PQresetStart(), PQresetPoll(), PQsetenvStart(),
    PQsetenvPoll(), PQsetenvAbort (Ewan Mellor)
New libpq PQsetenv() function (Ewan Mellor)
create/alter user extension (Peter E)
New postmaster.pid and postmaster.opts under $PGDATA (Tatsuo)
New scripts for create/drop user/db (Peter E)
Major psql overhaul (Peter E)
Add const to libpq interface (Peter E)
New libpq function PQoidValue (Peter E)
Show specific non-aggregate causing problem with GROUP BY (Tom)
Make changes to pg_shadow recreate pg_pwd file (Peter E)
Add aggregate(DISTINCT ...) (Tom)
Allow flag to control COPY input/output of NULLs (Peter E)
Make postgres user have a password by default (Peter E)
Add CREATE/ALTER/DROP GROUP (Peter E)
All administration scripts now support --long options (Peter E, Karel)
Vacuumdb script now supports --all option (Peter E)
ecpg new portable FETCH syntax
Add ecpg EXEC SQL IFDEF, EXEC SQL IFNDEF, EXEC SQL ELSE, EXEC SQL ELIF
    and EXEC SQL ENDIF directives
Add pg_ctl script to control backend start-up (Tatsuo)
Add postmaster.opts.default file to store start-up flags (Tatsuo)
Allow --with-mb=SQL_ASCII
Increase maximum number of index keys to 16 (Bruce)
Increase maximum number of function arguments to 16 (Bruce)
Allow configuration of maximum number of index keys and arguments (Bruce)
Allow unprivileged users to change their passwords (Peter E)
Password authentication enabled; required for new users (Peter E)
Disallow dropping a user who owns a database (Peter E)
Change initdb option --with-mb to --enable-multibyte
Add option for initdb to prompts for superuser password (Peter E)
Allow complex type casts like col::numeric(9,2) and col::int2::float8 (Tom)
Updated user interfaces on initdb, initlocation, pg_dump, ipcclean (Peter E)
New pg_char_to_encoding() and pg_encoding_to_char() functions (Tatsuo)
libpq non-blocking mode (Alfred Perlstein)
Improve conversion of types in casts that don’t specify a length
New plperl internal programming language (Mark Hollomon)
Allow COPY IN to read file that do not end with a newline (Tom)
Indicate when long identifiers are truncated (Tom)
Allow aggregates to use type equivalency (Peter E)
Add Oracle’s to_char(), to_date(), to_datetime(), to_timestamp(), to_number() conversion functions (Karel Zak <zakkr@zf.jcu.cz>)
Add SELECT DISTINCT ON (expr [, expr ...]) targetlist ... (Tom)
Check to be sure ORDER BY is compatible with the DISTINCT operation (Tom)
Add NUMERIC and int8 types to ODBC
Improve EXPLAIN results for Append, Group, Agg, Unique (Tom)
Add ALTER TABLE ... ADD FOREIGN KEY (Stephan Szabo)
Allow SELECT .. FOR UPDATE in PL/pgSQL (Hiroshi)

2962
Enable backward sequential scan even after reaching EOF (Hiroshi)
Add btree indexing of boolean values, >= and <= (Don Baccus)
Print current line number when COPY FROM fails (Massimo)
Recognize POSIX time zone e.g. "PST+8" and "GMT-8" (Thomas)
Add DEC as synonym for DECIMAL (Thomas)
Add SESSION_USER as SQL92 key word, same as CURRENT_USER (Thomas)
Implement SQL92 column aliases (aka correlation names) (Thomas)
Implement SQL92 join syntax (Thomas)
Make INTERVAL reserved word allowed as a column identifier (Thomas)
Implement REINDEX command (Hiroshi)
Accept ALL in aggregate function SUM(ALL col) (Tom)
Prevent GROUP BY from using column aliases (Tom)
New psql \encoding option (Tatsuo)
Allow PQrequestCancel() to terminate when in waiting-for-lock state (Hiroshi)
Allow negation of a negative number in all cases
Add ecpg descriptors (Christof, Michael)
Allow CREATE VIEW v AS SELECT f1::char(8) FROM tbl
Allow casts with length, like foo::char(8)
New libpq functions PQsetClientEncoding(), PQclientEncoding() (Tatsuo)
Add support for SJIS user defined characters (Tatsuo)
Larger views/rules supported
Make libpq's PQconnndefaults() thread-safe (Tom)
Disable // as comment to be ANSI conforming, should use -- (Tom)
Allow column aliases on views CREATE VIEW name (collist)
Fixes for views with subqueries (Tom)
Allow UPDATE table SET fld = (SELECT ...) (Tom)
SET command options no longer require quotes
Update pgaccess to 0.98.6
New SET SEED command
New pg_options.sample file
New SET FSYNC command (Massimo)
Allow pg_descriptions when creating tables
Allow pg_descriptions when creating types, columns, and functions
Allow psql \copy to allow delimiters (Peter E)
Allow psql to print nulls as distinct from "" [null] (Peter E)

Types
-----
Many array fixes (Tom)
Allow bare column names to be subscripted as arrays (Tom)
Improve type casting of int and float constants (Tom)
Cleanups for int8 inputs, range checking, and type conversion (Tom)
Fix for SELECT timespan('21:11:26':time) (Tom)
netmask('x.x.x.x/0') is 255.255.255.255 instead of 0.0.0.0 (Oleg Sharoiko)
Add btree index on NUMERIC (Jan)
Perl fix for large objects containing NUL characters (Douglas Thomson)
ODBC fix for large objects (free)
Fix indexing of cidr data type
Fix for Ethernet MAC addresses (macaddr type) comparisons
Fix for date/time types when overflows happened in computations (Tom)
Allow array on int8 (Peter E)
Fix for rounding/overflow of NUMERIC type, like NUMERIC(4,4) (Tom)
Allow NUMERIC1 arrays
Appendix E. Release Notes

Fix bugs in NUMERIC ceil() and floor() functions (Tom)
Make char_length()/octet_length including trailing blanks (Tom)
Made abstime/reltime use int4 instead of time_t (Peter E)
New lztext data type for compressed text fields
Revise code to handle coercion of int and float constants (Tom)
Start at new code to implement a BIT and BIT VARYING type (Adriaan Joubert)
NUMERIC now accepts scientific notation (Tom)
NUMERIC to int4 rounds (Tom)
Convert float4/8 to NUMERIC properly (Tom)
Allow type conversion with NUMERIC (Thomas)
Make ISO date style (2000-02-16 09:33) the default (Thomas)
Add NATIONAL CHAR [ VARYING ] (Thomas)
Allow NUMERIC round and trunc to accept negative scales (Tom)
New TIME WITH TIME ZONE type (Thomas)
Add MAX()/MIN() on time type (Thomas)
Add abs(), mod(), fac() for int8 (Thomas)
Rename functions to round(), sqrt(), cbrt(), pow() for float8 (Thomas)
Add transcendental math functions (e.g. sin(), acos()) for float8 (Thomas)
Add exp() and ln() for NUMERIC type
Rename NUMERIC power() to pow() (Thomas)
Improved TRANSLATE() function (Edwin Ramirez, Tom)
Allow X=-Y operators (Tom)
Allow SELECT float8(COUNT(*))/(SELECT COUNT(*) FROM t) FROM t GROUP BY f1; (Tom)
Allow LOCALE to use indexes in regular expression searches (Tom)
Allow creation of functional indexes to use default types

Performance
------------
Prevent exponential space consumption with many AND’s and OR’s (Tom)
Collect attribute selectivity values for system columns (Tom)
Reduce memory usage of aggregates (Tom)
Fix for LIKE optimization to use indexes with multibyte encodings (Tom)
Fix r-tree index optimizer selectivity (Thomas)
Improve optimizer selectivity computations and functions (Tom)
Optimize btree searching for cases where many equal keys exist (Tom)
Enable fast LIKE index processing only if index present (Tom)
Re-use free space on index pages with duplicates (Tom)
Improve hash join processing (Tom)
Prevent descending sort if result is already sorted (Hiroshi)
Allow commuting of index scan query qualifications (Tom)
Allow reordering of index scan query qualifications (Tom)
Prefer index scans in cases where ORDER BY/GROUP BY is required (Tom)
Allocate large memory requests in fix-sized chunks for performance (Tom)
Fix vacuum’s performance by reducing memory allocation requests (Tom)
Implement constant-expression simplification (Bernard Frankpitt, Tom)
Use secondary columns to be used to determine start of index scan (Hiroshi)
Prevent quadruple use of disk space when doing internal sorting (Tom)
Faster sorting by calling fewer functions (Tom)
Create system indexes to match all system caches (Bruce, Hiroshi)
Make system caches use system indexes (Bruce)
Make all system indexes unique (Bruce)
Improve pg_statistics management for VACUUM speed improvement (Tom)
Flush backend cache less frequently (Tom, Hiroshi)
COPY now reuses previous memory allocation, improving performance (Tom)
Appendix E. Release Notes

Improve optimization cost estimation (Tom)
Improve optimizer estimate of range queries \(x > \text{lowbound} \text{ AND } x < \text{highbound}\) (Tom)
Use DNF instead of CNF where appropriate (Tom, Taral)
Further cleanup for OR-of-AND WHERE-clauses (Tom)
Make use of index in OR clauses \((x = 1 \text{ AND } y = 2) \text{ OR } (x = 2 \text{ AND } y = 4)\) (Tom)
Smarter optimizer computations for random index page access (Tom)
New SET variable to control optimizer costs (Tom)
Optimizer queries based on LIMIT, OFFSET, and EXISTS qualifications (Tom)
Reduce optimizer internal housekeeping of join paths for speedup (Tom)
Major subquery speedup (Tom)
Fewer fsync writes when fsync is not disabled (Tom)
Improved LIKE optimizer estimates (Tom)
Prevent fsync in SELECT-only queries (Vadim)
Make index creation use psort code, because it is now faster (Tom)
Allow creation of sort temp tables > 1 Gig

Source Tree Changes
-------------------
Fix for linux PPC compile
New generic expression-tree-walker subroutine (Tom)
Change form() to varargform() to prevent portability problems
Improved range checking for large integers on Alphas
Clean up #include in /include directory (Bruce)
Add scripts for checking includes (Bruce)
Remove un-needed #include’s from *.c files (Bruce)
Change #include’s to use <> and "" as appropriate (Bruce)
Enable Windows compilation of libpq
Alpha spinlock fix from Uncle George <gatgu1@voicenet.com>
Overhaul of optimizer data structures (Tom)
Fix to cygipc library (Yutaka Tanida)
Allow psql to work on newer Cygwin snapshots (Dan)
New catalog version number (Tom)
Add Linux ARM
Rename heap_replace to heap_update
Update for QNX (Dr. Andreas Kardos)
New platform-specific regression handling (Tom)
Rename oid8 -> oidvector and int28 -> int2vector (Bruce)
Included all yacc and lex files into the distribution (Peter E.)
Remove lextest, no longer needed (Peter E)
Fix for libpq and psql on Windows (Magnus)
Internally change datetime and timespan into timestamp and interval (Thomas)
Fix for plpgsql on BSD/OS
Add SQL_ASCII test case to the regression test (Tatsuo)
configure --with-mb now deprecated (Tatsuo)
NT fixes
NetBSD fixes (Johnny C. Lam <lamj@stat.cmu.edu>)
Fixes for Alpha compiles
New multibyte encodings
Appendix E. Release Notes

E.314. Release 6.5.3

Release date: 1999-10-13

This is basically a cleanup release for 6.5.2. We have added a new PgAccess that was missing in 6.5.2, and installed an NT-specific fix.

E.314.1. Migration to Version 6.5.3

A dump/restore is not required for those running 6.5.*.

E.314.2. Changes

- Updated version of pgaccess 0.98
- NT-specific patch
- Fix dumping rules on inherited tables

E.315. Release 6.5.2

Release date: 1999-09-15

This is basically a cleanup release for 6.5.1. We have fixed a variety of problems reported by 6.5.1 users.

E.315.1. Migration to Version 6.5.2

A dump/restore is not required for those running 6.5.*.

E.315.2. Changes

- subselect+CASE fixes (Tom)
- Add SHLIB_LINK setting for solaris_i386 and solaris_sparc ports (Daren Sefcik)
- Fixes for CASE in WHERE join clauses (Tom)
- Fix BTScan abort (Tom)
- Repair the check for redundant UNIQUE and PRIMARY KEY indexes (Thomas)
- Improve it so that it checks for multicolumn constraints (Thomas)
- Fix for Windows making problem with MB enabled (Hiroki Kataoka)
- Allow BSD yacc and bison to compile pl code (Bruce)
- Fix SET NAMES working
- int8 fixes (Thomas)
- Fix vacuum’s memory consumption (Hiroshi, Tatsuo)
- Reduce the total memory consumption of vacuum (Tom)
- Fix for timestamp (datetime)
Appendix E. Release Notes

Rule deparsing bugfixes (Tom)
Fix quoting problems in mkMakefile.tcldefs.sh.in and mkMakefile.tkdefs.sh.in (Tom)
This is to re-use space on index pages freed by vacuum (Vadim)
document -x for pg_dump (Bruce)
Fix for unary operators in rule deparser (Tom)
Comment out FileUnlink of excess segments during mdtruncate() (Tom)
IRIX linking fix from Yu Cao >yucao@falcon.kla-tencor.com<
Repair logic error in LIKE: should not return LIKE_ABORT
when reach end of pattern before end of text (Tom)
Repair incorrect cleanup of heap memory allocation during transaction abort (Tom)
Updated version of pgaccess 0.98

E.316. Release 6.5.1

Release date: 1999-07-15

This is basically a cleanup release for 6.5. We have fixed a variety of problems reported by 6.5 users.

E.316.1. Migration to Version 6.5.1

A dump/restore is not required for those running 6.5.

E.316.2. Changes

Add NT README file
Portability fixes for linux_ppc, IRIX, linux_alpha, OpenBSD, alpha
Remove QUERY_LIMIT, use SELECT...LIMIT
Fix for EXPLAIN on inheritance (Tom)
Patch to allow vacuum on multisegment tables (Hiroshi)
R-Tree optimizer selectivity fix (Tom)
ACL file descriptor leak fix (Atsushi Ogawa)
New expression subtree code (Tom)
Avoid disk writes for read-only transactions (Vadim)
Fix for removal of temp tables if last transaction was aborted (Bruce)
Fix to prevent too large row from being created (Bruce)
plpgsql fixes
Allow port numbers 32k - 64k (Bruce)
Add ^ precedence (Bruce)
Rename sort files called pg_temp to pg_sorttemp (Bruce)
Fix for microseconds in time values (Tom)
Tutorial source cleanup
New linux_m68k port
Fix for sorting of NULL's in some cases (Tom)
Shared library dependencies fixed (Tom)
Fixed glitches affecting GROUP BY in subselects (Tom)
Appendix E. Release Notes

E.317. Release 6.5

Release date: 1999-06-09

This release marks a major step in the development team’s mastery of the source code we inherited from Berkeley. You will see we are now easily adding major features, thanks to the increasing size and experience of our world-wide development team.

Here is a brief summary of the more notable changes:

Multiversion concurrency control (MVCC)

This removes our old table-level locking, and replaces it with a locking system that is superior to most commercial database systems. In a traditional system, each row that is modified is locked until committed, preventing reads by other users. MVCC uses the natural multiversion nature of PostgreSQL to allow readers to continue reading consistent data during writer activity. Writers continue to use the compact pg_log transaction system. This is all performed without having to allocate a lock for every row like traditional database systems. So, basically, we no longer are restricted by simple table-level locking; we have something better than row-level locking.

Hot backups from pg_dump

pg_dump takes advantage of the new MVCC features to give a consistent database dump/backup while the database stays online and available for queries.

Numeric data type

We now have a true numeric data type, with user-specified precision.

Temporary tables

Temporary tables are guaranteed to have unique names within a database session, and are destroyed on session exit.

New SQL features

We now have CASE, INTERSECT, and EXCEPT statement support. We have new LIMIT/OFFSET, SET TRANSACTION ISOLATION LEVEL, SELECT ... FOR UPDATE, and an improved LOCK TABLE command.

Speedups

We continue to speed up PostgreSQL, thanks to the variety of talents within our team. We have sped up memory allocation, optimization, table joins, and row transfer routines.

Ports

We continue to expand our port list, this time including Windows NT/ix86 and NetBSD/arm32.
Appendix E. Release Notes

Interfaces

Most interfaces have new versions, and existing functionality has been improved.

Documentation

New and updated material is present throughout the documentation. New FAQs have been contributed for SGI and AIX platforms. The Tutorial has introductory information on SQL from Stefan Simkovics. For the User's Guide, there are reference pages covering the postmaster and more utility programs, and a new appendix contains details on date/time behavior. The Administrator's Guide has a new chapter on troubleshooting from Tom Lane. And the Programmer's Guide has a description of query processing, also from Stefan, and details on obtaining the PostgreSQL source tree via anonymous CVS and CVSup.

E.317.1. Migration to Version 6.5

A dump/restore using pg_dump is required for those wishing to migrate data from any previous release of PostgreSQL. pg_upgrade cannot be used to upgrade to this release because the on-disk structure of the tables has changed compared to previous releases.

The new Multiversion Concurrency Control (MVCC) features can give somewhat different behaviors in multiuser environments. Read and understand the following section to ensure that your existing applications will give you the behavior you need.

E.317.1.1. Multiversion Concurrency Control

Because readers in 6.5 don't lock data, regardless of transaction isolation level, data read by one transaction can be overwritten by another. In other words, if a row is returned by SELECT it doesn't mean that this row really exists at the time it is returned (i.e. sometime after the statement or transaction began) nor that the row is protected from being deleted or updated by concurrent transactions before the current transaction does a commit or rollback.

To ensure the actual existence of a row and protect it against concurrent updates one must use SELECT FOR UPDATE or an appropriate LOCK TABLE statement. This should be taken into account when porting applications from previous releases of PostgreSQL and other environments.

Keep the above in mind if you are using contrib/refint.* triggers for referential integrity. Additional techniques are required now. One way is to use LOCK parent_table IN SHARE ROW EXCLUSIVE MODE command if a transaction is going to update/delete a primary key and use LOCK parent_table IN SHARE MODE command if a transaction is going to update/insert a foreign key.

Note: Note that if you run a transaction in SERIALIZABLE mode then you must execute the LOCK commands above before execution of any DML statement (SELECT/INSERT/DELETE/UPDATE/FETCH/COPY_TO) in the transaction.

These inconveniences will disappear in the future when the ability to read dirty (uncommitted) data (regardless of isolation level) and true referential integrity will be implemented.
E.317.2. Changes

Bug Fixes
--------
Fix text<->float8 and text<->float4 conversion functions (Thomas)
Fix for creating tables with mixed-case constraints (Billy)
Change exp()/pow() behavior to generate error on underflow/overflow (Jan)
Fix bug in pg_dump -z
Memory overrun cleanups (Tatsuo)
Fix for lo_import crash (Tatsuo)
Adjust handling of data type names to suppress double quotes (Thomas)
Use type coercion for matching columns and DEFAULT (Thomas)
Fix deadlock so it only checks once after one second of sleep (Bruce)
Fixes for aggregates and PL/pgsql (Hiroshi)
Fix for subquery crash (Vadim)
Fix for libpq function PQfnumber and case-insensitive names (Bahman Rafatjoo)
Fix for large object write-in-middle, no extra block, memory consumption (Tatsuo)
Fix for pg_dump -d or -D and quote special characters in INSERT
Repair serious problems with dynahash (Tom)
Fix INET/CIDR portability problems
Fix problem with selectivity error in ALTER TABLE ADD COLUMN (Bruce)
Fix executor so mergejoin of different column types works (Tom)
Fix for Alpha OR selectivity bug
Fix OR index selectivity problem (Bruce)
Fix so \d shows proper length for char() and varchar() (Ryan)
Fix tutorial code (Clark)
Improve destroyuser checking (Oliver)
Fix for Kerberos (Rodney McDuff)
Fix for dropping database while dirty buffers (Bruce)
Fix so sequence nextval() can be case-sensitive (Bruce)
Fix !!= operator
Drop buffers before destroying database files (Bruce)
Fix case where executor evaluates functions twice (Tatsuo)
Allow sequence nextval actions to be case-sensitive (Bruce)
Fix optimizer indexing not working for negative numbers (Bruce)
Fix for memory leak in executor with fjiaNull
Fix for aggregate memory leaks (Erik Riedel)
Allow user name containing a dash to grant privileges
Cleanup of NULL in inet types
Clean up system table bugs (Tom)
Fix problems of PAGER and \? command (Masaaki Sakaida)
Reduce default multisegment file size limit to 1GB (Peter)
Fix for dumping of CREATE OPERATOR (Tom)
Fix for backward scanning of cursors (Hiroshi Inoue)
Fix for COPY FROM STDIN when using \i (Tom)
Fix for subselect is compared inside an expression (Jan)
Fix handling of error reporting while returning rows (Tom)
Fix problems with reference to array types (Tom, Jan)
Prevent UPDATE SET oid (Jan)
Fix pg_dump so -t option can handle case-sensitive tablenames
Fixes for GROUP BY in special cases (Tom, Jan)
Fix for memory leak in failed queries (Tom)
Appendix E. Release Notes

DEFAULT now supports mixed-case identifiers (Tom)
Fix for multisegment uses of DROP/RENAME table, indexes (Ole Gjerde)
Disable use of pg_dump with both -o and -d options (Bruce)
Allow pg_dump to properly dump group privileges (Bruce)
Fix GROUP BY in INSERT INTO table SELECT * FROM table2 (Jan)
Fix for computations in views (Jan)
Fix for aggregates on array indexes (Tom)
Fix for DEFAULT handles single quotes in value requiring too many quotes
Fix security problem with non-super users importing/exporting large objects (Tom)
Rollback of transaction that creates table cleaned up properly (Tom)
Fix to allow long table and column names to generate proper serial names (Tom)

Enhancements
-------------
Add "vaccumdb" utility
Speed up libpq by allocating memory better (Tom)
EXPLAIN all indexes used (Tom)
Implement CASE, COALESCE, NULLIF expression (Thomas)
New pg_dump table output format (Constantin)
Add string min()/max() functions (Thomas)
Extend new type coercion techniques to aggregates (Thomas)
New moddatetime contrib (Terry)
Update to pgaccess 0.96 (Constantin)
Add routines for single-byte "char" type (Thomas)
Improved substr() function (Thomas)
Improved multibyte handling (Tatsuo)
Multiversion concurrency control/MVCC (Vadim)
New Serialized mode (Vadim)
Fix for tables over 2gigs (Peter)
New SET TRANSACTION ISOLATION LEVEL (Vadim)
New LOCK TABLE IN ... MODE (Vadim)
Update ODBC driver (Byron)
New NUMERIC data type (Jan)
New SELECT FOR UPDATE (Vadim)
Handle "NaN" and "Infinity" for input values (Jan)
Improved date/year handling (Thomas)
Improved handling of backend connections (Magnus)
New options ELOG_TIMESTAMPS and USE_SYSLOG options for log files (Massimo)
New TCL_ARRAYS option (Massimo)
New INTERSECT and EXCEPT (Stefan)
New pg_index.indisprimary for primary key tracking (D'Arcy)
New pg_dump option to allow dropping of tables before creation (Brook)
Speedup of row output routines (Tom)
New READ COMMITTED isolation level (Vadim)
New TEMP tables/indexes (Bruce)
Prevent sorting if result is already sorted (Jan)
New memory allocation optimization (Jan)
Allow psql to do \p\g (Bruce)
Allow multiple rule actions (Jan)
Added LIMIT/OFFSET functionality (Jan)
Improve optimizer when joining a large number of tables (Bruce)
New intro to SQL from S. Simkovics' Master's Thesis (Stefan, Thomas)
New intro to backend processing from S. Simkovics' Master's Thesis (Stefan)
Appendix E. Release Notes

Improved int8 support (Ryan Bradetich, Thomas, Tom)
New routines to convert between int8 and text/varchar types (Thomas)
New bushy plans, where meta-tables are joined (Bruce)
Enable right-hand queries by default (Bruce)
Allow reliable maximum number of backends to be set at configure time
   (--with-maxbackends and postmaster switch (-N backends)) (Tom)
GEQO default now 10 tables because of optimizer speedups (Tom)
Allow NULL=Var for MS-SQL portability (Michael, Bruce)
Modify contrib check_primary_key() so either "automatic" or "dependent" (Anand)
Allow psql \d on a view show query (Ryan)
Speedup for LIKE (Bruce)
Ecpg fixes/features, see src/interfaces/ecpg/ChangeLog file (Michael)
JDBC fixes/features, see src/interfaces/jdbc/CHANGELOG (Peter)
Make % operator have precedence like / (Bruce)
Add new postgres -O option to allow system table structure changes (Bruce)
Update contrib/pginterface/findoidjoins script (Tom)
Major speedup in vacuum of deleted rows with indexes (Vadim)
Allow non-SQL functions to run different versions based on arguments (Tom)
Add -E option that shows actual queries sent by \dt and friends (Masaaki Sakaida)
Add version number in start-up banners for psql (Masaaki Sakaida)
New contrib/vacuumio removes large objects not referenced (Peter)
New initialization for table sizes so non-vacuumed tables perform better (Tom)
Improve error messages when a connection is rejected (Tom)
Support for arrays of char() and varchar() fields (Massimo)
Overhaul of hash code to increase reliability and performance (Tom)
Update to PyGreSQL 2.4 (D’Arcy)
Changed debug options so -d4 and -d5 produce different node displays (Jan)
New pg_options: pretty_plan, pretty_parse, pretty_rewritten (Jan)
Better optimization statistics for system table access (Tom)
Better handling of non-default block sizes (Massimo)
Improve GEQO optimizer memory consumption (Tom)
UNION now supports ORDER BY of columns not in target list (Jan)
Major libpq++ improvements (Vince Vielhaber)
pg_dump now uses -z (ACL’s) as default (Bruce)
backend cache, memory speedups (Tom)
have pg_dump do everything in one snapshot transaction (Vadim)
fix for large object memory leakage, fix for pg_dumping (Tom)
INET type now respects netmask for comparisons
Make VACUUM ANALYZE only use a readlock (Vadim)
Allow VIEWS on UNIONS (Jan)
pg_dump now can generate consistent snapshots on active databases (Vadim)

Source Tree Changes
---------------------
Improve port matching (Tom)
Portability fixes for SunOS
Add Windows NT backend port and enable dynamic loading (Magnus and Daniel Horak)
New port to Cobalt Qube (Mips) running Linux (Tatsuo)
Port to NetBSD/m68k (Mr. Mutsuki Nakajima)
Port to NetBSD/sun3 (Mr. Mutsuki Nakajima)
Port to NetBSD/macosppc (Toshimi Aoki)
Fix for tcl/tk configuration (Vince)
Removed CURRENT key word for rule queries (Jan)
Appendix E. Release Notes

NT dynamic loading now works (Daniel Horak)
Add ARM32 support (Andrew McMurry)
Better support for HP-UX 11 and UnixWare
Improve file handling to be more uniform, prevent file descriptor leak (Tom)
New install commands for pipgsql (Jan)

E.318. Release 6.4.2

Release date: 1998-12-20
The 6.4.1 release was improperly packaged. This also has one additional bug fix.

E.318.1. Migration to Version 6.4.2
A dump/restore is not required for those running 6.4.*.

E.318.2. Changes
Fix for datetime constant problem on some platforms (Thomas)

E.319. Release 6.4.1

Release date: 1998-12-18
This is basically a cleanup release for 6.4. We have fixed a variety of problems reported by 6.4 users.

E.319.1. Migration to Version 6.4.1
A dump/restore is not required for those running 6.4.

E.319.2. Changes
Add pg_dump -N flag to force double quotes around identifiers. This is the default (Thomas)
Fix for NOT in where clause causing crash (Bruce)
EXPLAIN VERBOSE coredump fix (Vadim)
Fix shared-library problems on Linux
Appendix E. Release Notes

E.320. Release 6.4

Release date: 1998-10-30

There are many new features and improvements in this release. Thanks to our developers and maintainers, nearly every aspect of the system has received some attention since the previous release. Here is a brief, incomplete summary:

- Views and rules are now functional thanks to extensive new code in the rewrite rules system from Jan Wieck. He also wrote a chapter on it for the *Programmer’s Guide*.
- Jan also contributed a second procedural language, PL/pgSQL, to go with the original PL/pgTCL procedural language he contributed last release.
- We have optional multiple-byte character set support from Tatsuo Ishii to complement our existing locale support.
- Client/server communications has been cleaned up, with better support for asynchronous messages and interrupts thanks to Tom Lane.
- The parser will now perform automatic type coercion to match arguments to available operators and functions, and to match columns and expressions with target columns. This uses a generic mechanism
Appendix E. Release Notes

which supports the type extensibility features of PostgreSQL. There is a new chapter in the User's Guide which covers this topic.

• Three new data types have been added. Two types, inet and cidr, support various forms of IP network, subnet, and machine addressing. There is now an 8-byte integer type available on some platforms. See the chapter on data types in the User's Guide for details. A fourth type, serial, is now supported by the parser as an amalgam of the int4 type, a sequence, and a unique index.

• Several more SQL92-compatible syntax features have been added, including INSERT DEFAULT VALUES.

• The automatic configuration and installation system has received some attention, and should be more robust for more platforms than it has ever been.

E.320.1. Migration to Version 6.4

A dump/restore using pg_dump or pg_dumpall is required for those wishing to migrate data from any previous release of PostgreSQL.

E.320.2. Changes

Bug Fixes

----------
Fix for a tiny memory leak in PQsetdb/PQfinish(Bryan)
Remove char2-16 data types, use char/varchar(Darren)
Pqfn not handles a NOTICE message(Anders)
Reduced busywaiting overhead for spinlocks with many backends (dg)
Stuck spinlock detection (dg)
Fix up "ISO-style" timespan decoding and encoding(Thomas)
Fix problem with table drop after rollback of transaction(Vadim)
Change error message and remove non-functional update message(Vadim)
Fix for COPY array checking
Fix for SELECT 1 UNION SELECT NULL
Fix for buffer leaks in large object calls(Pascal)
Change owner from oid to int4 type(Bruce)
Fix a bug in the oracle compatibility functions btrim() ltrim() and rtrim()
Fix for shared invalidation cache overflow(Massimo)
Prevent file descriptor leaks in failed COPY’s(Bruce)
Fix memory leak in libpqtc’s pg_select(Constantin)
Fix problems with username/passwords over 8 characters(Tom)
Fix problems with handling of asynchronous NOTIFY in backend(Tom)
Fix of many bad system table entries(Tom)

Enhancements

----------
Upgrade ecpg and ecpglib, see src/interfaces/ecpc/ChangeLog(Michael)
Show the index used in an EXPLAIN(Zeugswetter)
EXPLAIN invokes rule system and shows plan(s) for rewritten queries(Jan)
Multibyte awareness of many data types and functions, via configure(Tatsuo)
Appendix E. Release Notes

New configure --with-mb option (Tatsuo)
New initdb --pgencoding option (Tatsuo)
New createdb -E multibyte option (Tatsuo)
Select version(); now returns PostgreSQL version (Jeroen)
libpq now allows asynchronous clients (Tom)
Allow cancel from client of backend query (Tom)
psql now cancels query with Control-C (Tom)
libpq users need not issue dummy queries to get NOTIFY messages (Tom)
NOTIFY now sends sender’s PID, so you can tell whether it was your own (Tom)
Define "tz_hour" and "tz_minute" arguments to date_part() (Thomas)
Add routines to convert between varchar and bpchar (Thomas)
Add bit flags to support timezonehour and minute in data retrieval (Thomas)
Allow more variations on valid floating point numbers (e.g. ".1", "1e6") (Thomas)
Fixes for unary minus parsing with leading spaces (Thomas)
Implement TIMEZONE_HOUR, TIMEZONE_MINUTE per SQL92 specs (Thomas)
Check for and properly ignore FOREIGN KEY column constraints (Thomas)
Define USER as synonym for CURRENT_USER per SQL92 specs (Thomas)
Enable HAVING clause but no fixes elsewhere yet.
Make "char" type a synonym for "char(1)" (actually implemented as bpchar) (Thomas)
Save string type if specified for DEFAULT clause handling (Thomas)
Coerce operations involving different data types (Thomas)
Allow some index use for columns of different types (Thomas)
Add capabilities for automatic type conversion (Thomas)
Cleanups for large objects, so file is truncated on open (Peter)
Readline cleanups (Tom)
Allow psql \f \ to make spaces as delimiter (Bruce)
Pass pg_attribute.atttypmod to the frontend for column field lengths (Tom, Bruce)
Msql compatibility library in /contrib (Aldrin)
Remove the requirement that ORDER/GROUP BY clause identifiers be included in the target list (David)
Convert columns to match columns in UNION clauses (Thomas)
Remove fork() / exec() and only do fork() (Bruce)
Jdbc cleanups (Peter)
Show backend status on ps command line (only works on some platforms) (Bruce)
Pg_hba.conf now has a sameuser option in the database field
Make lo_unlink take oid param, not int4
New DISABLE COMPLEX_MACRO for compilers that cannot handle our macros (Bruce)
Libpq now handles NOTIFY as a Tcl event, need not send dummy queries (Tom)
libpq cleanups (Tom)
Add --error option to libpq’s pg_result command (Tom)
New locale patch, see docs/README/locale (Oleg)
Fix for pg_dump so CONSTRAINT and CHECK syntax is correct (ccb)
New contrib/lo code for large object orphan removal (Peter)
New psql command "SET CLIENT_ENCODING TO 'encoding'" for multibytes feature, see /doc/README.mb (Tatsuo)
contrib/noupdate code to revoke update permission on a column
libpq can now be compiled on Windows (Magnus)
Add PQsetdbLogin() in libpq
New 8-byte integer type, checked by configure for OS support (Thomas)
Better support for quoted table/column names (Thomas)
Surround table and column names with double-quotes in pg_dump (Thomas)
Appendix E. Release Notes

PQreset() now works with passwords (Tom)
Handle case of GROUP BY target list column number out of range (David)
Allow UNION in subselects
Add auto-size to screen to \d? commands (Bruce)
Use UNION to show all \d? results in one query (Bruce)
Add \d? field search feature (Bruce)
Pg_dump issues fewer \connect requests (Tom)
Make pg_dump -z flag work better, document it in manual page (Tom)
Add HAVING clause with full support for subselects and unions (Stephan)
Full text indexing routines in contrib/fulltextindex (Maarten)
Transaction ids now stored in shared memory (Vadim)
New PGCLIENTENCODING when issuing COPY command (Tatsuo)
Support for SQL92 syntax "SET NAMES" (Tatsuo)
Support for LATIN2-5 (Tatsuo)
Add UNICODE regression test case (Tatsuo)
Lock manager cleanup, new locking modes for LLL (Vadim)
Allow index use with OR clauses (Bruce)
Allows "SELECT NULL ORDER BY 1;"
Explain VERBOSE prints the plan, and now pretty-prints the plan to the postmaster log file (Bruce)
Add indexes display to \d command (Bruce)
Allow GROUP BY on functions (David)
New pg_class.relkind for large objects (Bruce)
New way to send libpq NOTICE messages to a different location (Tom)
New \w write command to psql (Bruce)
New /contrib/findoidjoins scans oid columns to find join relationships (Bruce)
Allow binary-compatible indexes to be considered when checking for valid Indexes for restriction clauses containing a constant (Thomas)
New ISBN/ISSN code in /contrib/isbn_issn
Allow NOT LIKE, IN, NOT IN, BETWEEN, and NOT BETWEEN constraint (Thomas)
New rewrite system fixes many problems with rules and views (Jan)
  * Rules on relations work
  * Event qualifications on insert/update/delete work
  * New OLD variable to reference CURRENT, CURRENT will be remove in future
  * Update rules can reference NEW and OLD in rule qualifications/actions
  * Insert/update/delete rules on views work
  * Multiple rule actions are now supported, surrounded by parentheses
  * Regular users can create views/rules on tables they have RULE permits
  * Rules and views inherit the privileges of the creator
  * No rules at the column level
  * No UPDATE NEW/OLD rules
  * New pg_tables, pg_indexes, pg_rules and pg_views system views
  * Only a single action on SELECT rules
  * Total rewrite overhaul, perhaps for 6.5
  * handle subselects
  * handle aggregates on views
  * handle insert into select from view works
System indexes are now multikey (Bruce)
Oidint2, oidint4, and oidname types are removed (Bruce)
Use system cache for more system table lookups (Bruce)
New backend programming language PL/pgSQL in backend/pl (Jan)
New SERIAL data type, auto-creates sequence/index (Thomas)
Enable assert checking without a recompile (Massimo)
User lock enhancements (Massimo)
New setval() command to set sequence value (Massimo)
Auto-remove unix socket file on start-up if no postmaster running (Massimo)
Conditional trace package (Massimo)
New UNLISTEN command (Massimo)
psql and libpq now compile under Windows using win32.mak (Magnus)
Lo_read no longer stores trailing NULL (Bruce)
Identifiers are now truncated to 31 characters internally (Bruce)
Createuser options now available on the command line
Code for 64-bit integer supported added, configure tested, int8 type (Thomas)
Prevent file descriptor leak from failed COPY (Bruce)
New pg_upgrade command (Bruce)
Updated /contrib directories (Massimo)
New CREATE TABLE DEFAULT VALUES statement available (Thomas)
New INSERT INTO TABLE DEFAULT VALUES statement available (Thomas)
New DECLARE and FETCH feature (Thomas)
libpq’s internal structures now not exported (Tom)
Allow up to 8 key indexes (Bruce)
Remove ARCHIVE key word, that is no longer used (Thomas)
pg_dump -n flag to suppress quotes around identifiers
disable system columns for views (Jan)
new INET and CIDR types for network addresses (TomH, Paul)
no more double quotes in psql output
pg_dump now dumps views (Terry)
new SET QUERY_LIMIT (Tatsuo, Jan)

Source Tree Changes
-------------------
/contrib cleanup (Jun)
Inline some small functions called for every row (Bruce)
Alpha/linux fixes
HP-UX cleanups (Tom)
Multibyte regression tests (Soonmyung.)
Remove --disabled options from configure
Define PGDOC to use POSTGRESDIR by default
Make regression optional
Remove extra braces code to pgindent (Bruce)
Add bsdsl shared library support (Bruce)
New --without-CXX support configure option (Brook)
New FAQ_CVS
Update backend flowchart in tools/backend (Bruce)
Change atttypmod from int16 to int32 (Bruce, Tom)
Getrusage() fix for platforms that do not have it (Tom)
Add PQconnectdb, PGUSER, PGPASSWORD to libpq man page
NS32K platform fixes (Phil Nelson, John Buller)
SCO 7/UnixWare 2.x fixes (Billy, others)
Sparc/Solaris 2.5 fixes (Ryan)
Pgbuildin.3 is obsolete, move to doc files (Thomas)
Even more documentation (Thomas)
Nextstep support (Jacek)
Aix support (David)
pginterface manual page (Bruce)
shared libraries all have version numbers
E.321. Release 6.3.2

**Release date:** 1998-04-07

This is a bug-fix release for 6.3.x. Refer to the release notes for version 6.3 for a more complete summary of new features.

**Summary:**

- Repairs automatic configuration support for some platforms, including Linux, from breakage inadvertently introduced in version 6.3.1.
- Correctly handles function calls on the left side of BETWEEN and LIKE clauses.

A dump/restore is NOT required for those running 6.3 or 6.3.1. A `make distclean`, `make`, and `make install` is all that is required. This last step should be performed while the postmaster is not running. You should re-link any custom applications that use PostgreSQL libraries.

For upgrades from pre-6.3 installations, refer to the installation and migration instructions for version 6.3.

### E.321.1. Changes

Configure detection improvements for tcl/tk (Brook Milligan, Alvin)
Manual page improvements (Bruce)
BETWEEN and LIKE fix (Thomas)
fix for psql \connect used by pg_dump (Oliver Elphick)
New odbc driver
pgaccess, version 0.86
qsort removed, now uses libc version, cleanups (Jeroen)
fix for buffer over-runs detected (Maurice Gittens)
fix for buffer overrun in libpgtcl (Randy Kunkee)
fix for UNION with DISTINCT or ORDER BY (Bruce)
gmtimeofday configure check (Doug Winterburn)
Fix "indexes not used" bug (Vadim)
docs additions (Thomas)
Fix for backend memory leak (Bruce)
libreadline cleanup (Erwan MAS)
Remove DISTDIR (Bruce)
Makefile dependency cleanup (Jeroen van Vianen)
ASSERT fixes (Bruce)
E.322. Release 6.3.1

Release date: 1998-03-23

Summary:

- Additional support for multibyte character sets.
- Repair byte ordering for mixed-endian clients and servers.
- Minor updates to allowed SQL syntax.
- Improvements to the configuration autodetection for installation.

A dump/restore is NOT required for those running 6.3. A `make distclean`, `make`, and `make install` is all that is required. This last step should be performed while the postmaster is not running. You should re-link any custom applications that use PostgreSQL libraries.

For upgrades from pre-6.3 installations, refer to the installation and migration instructions for version 6.3.

E.322.1. Changes

ecpg cleanup/fixed, now version 1.1 (Michael Meskes)
pagination cleanup (Bruce)
large object fix for pg_dump and tclsh (alvin)
LIKE fix for multiple adjacent underscores
fix for redefining built-in functions (Thomas)
ultrix4 cleanup
upgrade to pg_access 0.83
updated CLUSTER manual page
multibyte character set support, see doc/README.mb (Tatsuo)
configure --with-pgport fix
pg_ident fix
big-endian fix for backend communications (Kataoka)
SUBSTR() and substring() fix (Jan)
several jdbc fixes (Peter)
libpqtc1 improvements, see libpqtc1/README (Randy Kunkee)
Fix for "Datasize = 0" error (Vadim)
Prevent \do from wrapping (Bruce)
Remove duplicate Russian character set entries
Sunos4 cleanup
Allow optional TABLE key word in LOCK and SELECT INTO (Thomas)
CREATE SEQUENCE options to allow a negative integer (Thomas)
Add "PASSWORD" as an allowed column identifier (Thomas)
Add checks for UNION target fields (Bruce)
Fix Alpha port (Dwayne Bailey)
Fix for text arrays containing quotes (Doug Gibson)
Solaris compile fix (Albert Chin-A-Young)
Better identify tcl and tk libs and includes (Bruce)

E.323. Release 6.3

Release date: 1998-03-01

There are many new features and improvements in this release. Here is a brief, incomplete summary:

• Many new SQL features, including full SQL92 subselect capability (everything is here but target-list subselects).
• Support for client-side environment variables to specify time zone and date style.
• Socket interface for client/server connection. This is the default now so you might need to start postmaster with the -i flag.
• Better password authorization mechanisms. Default table privileges have changed.
• Old-style time travel has been removed. Performance has been improved.

Note: Bruce Momjian wrote the following notes to introduce the new release.

There are some general 6.3 issues that I want to mention. These are only the big items that cannot be described in one sentence. A review of the detailed changes list is still needed.

First, we now have subselects. Now that we have them, I would like to mention that without subselects, SQL is a very limited language. Subselects are a major feature, and you should review your code for places where subselects provide a better solution for your queries. I think you will find that there are more uses for subselects than you might think. Vadim has put us on the big SQL map with subselects, and fully functional ones too. The only thing you cannot do with subselects is to use them in the target list.

Second, 6.3 uses Unix domain sockets rather than TCP/IP by default. To enable connections from other machines, you have to use the new postmaster -i option, and of course edit pg_hba.conf. Also, for this reason, the format of pg_hba.conf has changed.

Third, char() fields will now allow faster access than varchar() or text. Specifically, the text and varchar() have a penalty for access to any columns after the first column of this type. char() used to also have this access penalty, but it no longer does. This might suggest that you redesign some of your tables, especially if you have short character columns that you have defined as varchar() or text. This and other changes make 6.3 even faster than earlier releases.

We now have passwords definable independent of any Unix file. There are new SQL USER commands. See the Administrator’s Guide for more information. There is a new table, pg_shadow, which is used to store user information and user passwords, and it by default only SELECT-able by the postgres super-user. pg_user is now a view of pg_shadow, and is SELECT-able by PUBLIC. You should keep using pg_user in your application without changes.
User-created tables now no longer have SELECT privilege to PUBLIC by default. This was done because
the ANSI standard requires it. You can of course GRANT any privileges you want after the table is created.
System tables continue to be SELECT-able by PUBLIC.

We also have real deadlock detection code. No more sixty-second timeouts. And the new locking code
implements a FIFO better, so there should be less resource starvation during heavy use.

Many complaints have been made about inadequate documentation in previous releases. Thomas has put
much effort into many new manuals for this release. Check out the doc/ directory.

For performance reasons, time travel is gone, but can be implemented using triggers (see
pgsql/contrib/spi/README). Please check out the new \d command for types, operators, etc. Also, views have their own privileges now, not based on the underlying tables, so privileges on them have to be set separately. Check /pgsql/interfaces for some new ways to talk to PostgreSQL.

This is the first release that really required an explanation for existing users. In many ways, this was necessary because the new release removes many limitations, and the work-arounds people were using are no longer needed.

E.323.1. Migration to Version 6.3

A dump/restore using pg_dump or pg_dumpall is required for those wishing to migrate data from any previous release of PostgreSQL.

E.323.2. Changes

Bug Fixes

-------
Fix binary cursors broken by MOVE implementation (Vadim)
Fix for tcl library crash (Jan)
Fix for array handling, from Gerhard Hintermayer
Fix acl error, and remove duplicate pqtrace (Bruce)
Fix psql \e for empty file (Bruce)
Fix for textcat on varchar() fields (Bruce)
Fix for DBT Sendproc (Zeugswetter Andres)
Fix vacuum analyze syntax problem (Bruce)
Fix for international identifiers (Tatsuo)
Fix for aggregates on inherited tables (Bruce)
Fix substr() for out-of-bounds data
Fix for select 1=1 or 2=2, select 1=1 and 2=2, and select sum(2+2) (Bruce)
Fix notty output to show status result. -q option still turns it off (Bruce)
Fix for count(*), aggs with views and multiple tables and sum(3) (Bruce)
Fix cluster (Bruce)
Fix for PQtrace start/stop several times (Bruce)
Fix a variety of locking problems like newer lock waiters getting
lock before older waiters, and having readlock people not share
locks if a writer is waiting for a lock, and waiting writers not
get priority over waiting readers (Bruce)
Fix crashes in psql when executing queries from external files (James)
Fix problem with multiple order by columns, with the first one having
Appendix E. Release Notes

NULL values (Jeroen)
Use correct hash table support functions for float8 and int4 (Thomas)
Re-enable JOIN= option in CREATE OPERATOR statement (Thomas)
Change precedence for boolean operators to match expected behavior (Thomas)
Generate elog(ERROR) on over-large integer (Bruce)
Allow multiple-argument functions in constraint clauses (Thomas)
Check boolean input literals for ’true’, ’false’, ’yes’, ’no’, ’1’, ’0’
and throw elog(ERROR) if unrecognized (Thomas)
Major large objects fix
Fix for GROUP BY showing duplicates (Vadim)
Fix for index scans in MergeJoin (Vadim)

Enhancements
-------------
Subselects with EXISTS, IN, ALL, ANY any keywords (Vadim, Bruce, Thomas)
New User Manual (Thomas, others)
Speedup by inlining some frequently-called functions
Real deadlock detection, no more timeouts (Bruce)
Add SQL92 "constants" CURRENT_DATE, CURRENT_TIME, CURRENT_TIMESTAMP, CURRENT_USER (Thomas)
Modify constraint syntax to be SQL92-compliant (Thomas)
Implement SQL92 PRIMARY KEY and UNIQUE clauses using indexes (Thomas)
Recognize SQL92 syntax for FOREIGN KEY. Throw elog notice (Thomas)
Allow NOT NULL UNIQUE constraint clause (each allowed separately before) (Thomas)
Allow PostgreSQL-style casting ("::") of non-constants (Thomas)
Add support for SQL3 TRUE and FALSE boolean constants (Thomas)
Support SQL92 syntax for IS TRUE/IS FALSE/IS NOT TRUE/IS NOT FALSE (Thomas)
Allow shorter strings for boolean literals (e.g. "t", "tr", "tru") (Thomas)
Allow SQL92 delimited identifiers (Thomas)
Implement SQL92 binary and hexadecimal string decoding (b’10’ and x’1F’) (Thomas)
Support SQL92 syntax for type coercion of literal strings
(e.g. "DATETIME ‘now’") (Thomas)
Add conversions for int2, int4, and OID types to and from text (Thomas)
Use shared lock when building indexes (Vadim)
Free memory allocated for a user query inside transaction block after
this query is done, was turned off in <= 6.2.1 (Vadim)
New SQL statement CREATE PROCEDURAL LANGUAGE (Jan)
New PostgreSQL Procedural Language (PL) backend interface (Jan)
Rename pg_dump -H option to -h (Bruce)
Add Java support for passwords, European dates (Peter)
Use indexes for LIKE and ~, !~ operations (Bruce)
Add hash functions for datetime and timespan (Thomas)
Time Travel removed (Vadim, Bruce)
Add paging for \d and \z, and fix \i (Bruce)
Add Unix domain socket support to backend and to frontend library (Goran)
Implement CREATE DATABASE/WITH LOCATION and initlocation utility (Thomas)
Allow more SQL92 and/or PostgreSQL reserved words as column identifiers (Thomas)
Augment support for SQL92 SET TIME ZONE... (Thomas)
SET/SHOW/RESET TIME ZONE uses TZ backend environment variable (Thomas)
Implement SET keyword = DEFAULT and SET TIME ZONE DEFAULT (Thomas)
Enable SET TIME ZONE using TZ environment variable (Thomas)
Add PGDATESTYLE environment variable to frontend and backend initialization (Thomas)
Add PGTZ, PGCO2983

2983
frontend library initialization environment variables (Thomas)
Regression tests time zone automatically set with "setenv PGTZ PST8PDT" (Thomas)
Add pg_description table for info on tables, columns, operators, types, and aggregates (Bruce)
Increase 16 char limit on system table/index names to 32 characters (Bruce)
Rename system indexes (Bruce)
Add 'GERMAN' option to SET DATESTYLE (Thomas)
Define an "ISO-style" timespan output format with "hh:mm:ss" fields (Thomas)
Allow fractional values for delta times (e.g. '2.5 days') (Thomas)
Validate numeric input more carefully for delta times (Thomas)
Implement day of year as possible input to date_part () (Thomas)
Define timespan_finite() and text_timespan() functions (Thomas)
Remove archive stuff (Bruce)
Allow for a pg_password authentication database that is separate from the system password file (Todd)
Dump ACLs, GRANT, REVOKE privileges (Matt)
Define text, varchar, and bpchar string length functions (Thomas)
Fix Query handling for inheritance, and cost computations (Bruce)
Implement CREATE TABLE/AS SELECT (alternative to SELECT/INTO) (Thomas)
Allow NOT, IS NULL, IS NOT NULL in constraints (Thomas)
Implement UNIONs for SELECT (Bruce)
Add UNION, GROUP, DISTINCT to INSERT (Bruce)
varchar() stores only necessary bytes on disk (Bruce)
Fix for BLOBs (Peter)
Mega-Patch for JDBC...see README_6.3 for list of changes (Peter)
Remove unused "option" from PQconnectdb ()
New LOCK command and lock manual page describing deadlocks (Bruce)
Add new psql \da, \dd, \df, \do, \ds, and \dT commands (Bruce)
Enhance psql \z to show sequences (Bruce)
Show NOT NULL and DEFAULT in psql \d table (Bruce)
New psql .psqlrc file start-up (Andrew)
Modify sample start-up script in contrib/linux to show syslog (Thomas)
New types for IP and MAC addresses in contrib/ip_and_mac (TomH)
Unix system time conversions with date/time types in contrib/unixdate (Thomas)
Update of contrib stuff (Massimo)
Add Unix socket support to DBD::Pg (Goran)
New python interface (PyGreSQL 2.0) (D'Arcy)
New frontend/backend protocol has a version number, network byte order (Phil)
Security features in pg_hba.conf enhanced and documented, many cleanups (Phil)
CHAR() now faster access than VARCHAR () or TEXT
ecpg embedded SQL preprocessor
Reduce system column overhead (Vadmin)
Remove pg_time table (Vadim)
Add pg_type attribute to identify types that need length (bpchar, varchar)
Add report of offending line when COPY command fails
Allow VIEW privileges to be set separately from the underlying tables.
For security, use GRANT/REVOKE on views as appropriate (Jan)
Tables now have no default GRANT SELECT TO PUBLIC. You must explicitly grant such privileges.
Clean up tutorial examples (Darren)

Source Tree Changes

-------------------

2984
Add new html development tools, and flow chart in /tools/backend
Fix for SCO compiles
Stratus computer port Robert Gillies
Added support for shlib for BSD44_derived & i386_solaris
Make configure more automated(Brook)
Add script to check regression test results
Break parser functions into smaller files, group together(Bruce)
Rename heap_create to heap_create_and_catalog, rename heap_creatr
to heap_create()(Bruce)
Sparc/Linux patch for locking(TomS)
Remove PORTNAME and reorganize port-specific stuff(Marc)
Add optimizer README file(Bruce)
Remove some recursion in optimizer and clean up some code there(Bruce)
Fix for NetBSD locking(Henry)
Fix for libptc1 make(Tatsuo)
AIX patch(Darren)
Change IS TRUE, IS FALSE, ... to expressions using "=" rather than
  function calls to istrue() or isfalse() to allow optimization(Thomas)
Various fixes NetBSD/Sparc related(TomR)
Alpha linux locking(Travis,Ryan)
Change elog(WARN) to elog(ERROR) (Bruce)
FAQ for FreeBSD(Marc)
Bring in the PostODBC source tree as part of our standard distribution(Marc)
A minor patch for HP/UX 10 vs 9(Stan)
New pg_attribute.atttypmod for type-specific info like varchar length(Bruce)
UnixWare patches(Billy)
New i386 ‘lock’ for spinlock asm(Billy)
Support for multiplexed backends is removed
Start an OpenBSD port
Start an AUX port
Start a Cygnus port
Add string functions to regression suite(Thomas)
Expand a few function names formerly truncated to 16 characters(Thomas)
Remove un-needed malloc() calls and replace with palloc()(Bruce)

E.324. Release 6.2.1

Release date: 1997-10-17

6.2.1 is a bug-fix and usability release on 6.2.

Summary:

- Allow strings to span lines, per SQL92.
- Include example trigger function for inserting user names on table updates.
This is a minor bug-fix release on 6.2. For upgrades from pre-6.2 systems, a full dump/reload is required. Refer to the 6.2 release notes for instructions.

E.324.1. Migration from version 6.2 to version 6.2.1

This is a minor bug-fix release. A dump/reload is not required from version 6.2, but is required from any release prior to 6.2.

In upgrading from version 6.2, if you choose to dump/reload you will find that \texttt{avg(money)} is now calculated correctly. All other bug fixes take effect upon updating the executables.

Another way to avoid dump/reload is to use the following SQL command from \texttt{psql} to update the existing system table:

\begin{verbatim}
update pg_aggregate set aggfinalfn = 'cash\_div\_flt8'
where aggname = 'avg' and aggbasetype = 790;
\end{verbatim}

This will need to be done to every existing database, including template1.

E.324.2. Changes

Allow \texttt{TIME} and \texttt{TYPE} column names (Thomas)
Allow larger range of true/false as boolean values (Thomas)
Support output of "now" and "current" (Thomas)
Handle DEFAULT with INSERT of NULL properly (Vadim)
Fix for relation reference counts problem in buffer manager (Vadim)
Allow strings to span lines, like ANSI (Thomas)
Fix for backward cursor with ORDER BY (Vadim)
Fix \texttt{avg(cash)} computation (Thomas)
Fix for specifying a column twice in ORDER/GROUP BY (Vadim)
Documented new \texttt{libpq} function to return affected rows, \texttt{PQcmdTuples} (Bruce)
Trigger function for inserting user names for INSERT/UPDATE (Brook Milligan)

E.325. Release 6.2

Release date: 1997-10-02

A dump/restore is required for those wishing to migrate data from previous releases of PostgreSQL.

E.325.1. Migration from version 6.1 to version 6.2

This migration requires a complete dump of the 6.1 database and a restore of the database in 6.2.
Note that the \texttt{pg\_dump} and \texttt{pg\_dumpall} utility from 6.2 should be used to dump the 6.1 database.
E.325.2. Migration from version 1.x to version 6.2

Those migrating from earlier 1.* releases should first upgrade to 1.09 because the COPY output format was improved from the 1.02 release.

E.325.3. Changes

Bug Fixes
--------
Fix problems with pg_dump for inheritance, sequences, archive tables (Bruce)
Fix compile errors on overflow due to shifts, unsigned, and bad prototypes from Solaris (Diab Jerius)
Fix bugs in geometric line arithmetic (bad intersection calculations) (Thomas)
Check for geometric intersections at endpoints to avoid rounding ugliness (Thomas)
Catch non-functional delete attempts (Vadim)
Change time function names to be more consistent (Michael Reifenberg)
Check for zero divides (Michael Reifenberg)
Fix very old bug which made rows changed/inserted by a command visible to the command itself (so we had multiple update of updated rows, etc.) (Vadim)
Fix for SELECT null, 'fail' FROM pg_am (Patrick)
SELECT NULL as EMPTY_FIELD now allowed (Patrick)
Remove un-needed signal stuff from contrib/pginterface
Fix OR (where x != 1 or x is null didn't return rows with x NULL) (Vadim)
Fix time_cmp function (Vadim)
Fix handling of functions with non-attribute first argument in WHERE clauses (Vadim)
Fix GROUP BY when order of entries is different from order in target list (Vadim)
Fix pg_dump for aggregates without sfunc1 (Vadim)

Enhancements
------------
Default genetic optimizer GEQO parameter is now 8 (Bruce)
Allow use parameters in target list having aggregates in functions (Vadim)
Added JDBC driver as an interface (Adrian & Peter)
pg_password utility
Return number of rows inserted/affected by INSERT/UPDATE/DELETE etc. (Vadim)
Triggers implemented with CREATE TRIGGER (SQL3) (Vadim)
SPI (Server Programming Interface) allows execution of queries inside C-functions (Vadim)
NOT NULL implemented (SQL92) (Robson Paniago de Miranda)
Include reserved words for string handling, outer joins, and unions (Thomas)
Implement extended comments ("/* ... */") using exclusive states (Thomas)
Add "/" single-line comments (Bruce)
Remove some restrictions on characters in operator names (Thomas)
DEFAULT and CONSTRAINT for tables implemented (SQL92) (Vadim & Thomas)
Add text concatenation operator and function (SQL92) (Thomas)
Support WITH TIME ZONE syntax (SQL92) (Thomas)
Support INTERVAL unit TO unit syntax (SQL92) (Thomas)
Define types DOUBLE PRECISION, INTERVAL, CHARACTER,
Appendix E. Release Notes

Define type \texttt{FLOAT(p)} and rudimentary \texttt{DECIMAL(p,s)} (SQL92) (Thomas)
Define \texttt{EXTRACT()}, \texttt{POSITION()}, \texttt{SUBSTRING()}, and \texttt{TRIM()} (SQL92) (Thomas)
Define \texttt{CURRENT_DATE}, \texttt{CURRENT_TIME}, \texttt{CURRENT_TIMESTAMP} (SQL92) (Thomas)
Add syntax and warnings for \texttt{UNION}, \texttt{HAVING}, \texttt{INNER} and \texttt{OUTER} \texttt{JOIN} (SQL92) (Thomas)
Add more reserved words, mostly for SQL92 compliance (Thomas)
Allow \texttt{hh:mm:ss} time entry for timespan/reltime types (Thomas)
Add \texttt{center()} routines for \texttt{lseg}, \texttt{path}, \texttt{polygon} (Thomas)
Add \texttt{distance()} routines for \texttt{circle-polygon}, \texttt{polygon-polygon} (Thomas)
Check explicitly for points and polygons contained within polygons using an axis-crossing algorithm (Thomas)
Add routine to convert \texttt{circle-box} (Thomas)
Merge conflicting operators for different geometric data types (Thomas)
Replace distance operator \texttt{"<==>"} with \texttt{"<->"} (Thomas)
Replace "above" operator \texttt{"!^"} with \texttt{"^\textgreater"} and "below" operator \texttt{"!|"} with \texttt{"^\less than"} (Thomas)
Add routines for text trimming on both ends, substring, and string position (Thomas)
Add conversion routines \texttt{circle(box)} and \texttt{poly(circle)} (Thomas)
Allow internal sorts to be stored in memory rather than in files (Bruce & Vadim)
Allow functions and operators on internally-identical types to succeed (Bruce)
Speed up backend start-up after profiling analysis (Bruce)
Inline frequently called functions for performance (Bruce)
Reduce open() calls (Bruce)
\texttt{psql}: Add \texttt{PAGER} for \texttt{\h} and \texttt{\?,\C} fix
Fix for \texttt{psql} pager when no tty (Bruce)
New entab utility (Bruce)
General trigger functions for referential integrity (Vadim)
General trigger functions for time travel (Vadim)
General trigger functions for AUTOINCREMENT/IDENTITY feature (Vadim)
MOVE implementation (Vadim)

Source Tree Changes
-------------------
HP-UX 10 patches (Vladimir Turin)
Added SCO support, (Daniel Harris)
MkLinux patches (Tatsuo Ishii)
Change geometric box terminology from "length" to "width" (Thomas)
Deprecate temporary unstored slope fields in geometric code (Thomas)
Remove restart instructions from INSTALL (Bruce)
Look in /usr/ucb first for install (Bruce)
Fix c++ copy example code (Thomas)
Add \texttt{-o} to \texttt{psql} manual page (Bruce)
Prevent rename unallocated string length from being copied into database (Bruce)
Cleanup for \texttt{NAMEDATALEN} use (Bruce)
Fix \texttt{pg_proc} names over 15 chars in output (Bruce)
Add \texttt{strNcpy()} function (Bruce)
remove some (void) casts that are unnecessary (Bruce)
new interfaces directory (Marc)
Replace \texttt{fopen()} calls with calls to \texttt{fd.c} functions (Bruce)
Make functions static where possible (Bruce)
enclose unused functions in \texttt{#ifdef NOT_USED} (Bruce)
Remove call to \texttt{difftime()} in timestamp support to fix SunOS (Bruce & Thomas)
Changes for Digital Unix
Portability fix for \texttt{pg_dumpall} (Bruce)
Appendix E. Release Notes

Rename pg_attribute.attnvals to attdispersion (Bruce)
"intro/unix" manual page now "pgintro" (Bruce)
"built-in" manual page now "pgbuiltin" (Bruce)
"drop" manual page now "drop_table" (Bruce)
Add "create_trigger", "drop_trigger" manual pages (Thomas)
Add constraints regression test (Vadim & Thomas)
Add comments syntax regression test (Thomas)
Add PGINDENT and support program (Bruce)
Massive commit to run PGINDENT on all *.c and *.h files (Bruce)
Files moved to /src/tools directory (Bruce)
SPI and Trigger programming guides (Vadim & D’Arcy)

E.326. Release 6.1.1

Release date: 1997-07-22

E.326.1. Migration from version 6.1 to version 6.1.1

This is a minor bug-fix release. A dump/reload is not required from version 6.1, but is required from any release prior to 6.1. Refer to the release notes for 6.1 for more details.

E.326.2. Changes

fix for SET with options (Thomas)
allow pg_dump/pg_dumpall to preserve ownership of all tables/objects (Bruce)
new psql \connect option allows changing usernames without changing databases
fix for initdb --debug option (Yoshihiko Ichikawa)
lextest cleanup (Bruce)
hash fixes (Vadim)
fix date/time month boundary arithmetic (Thomas)
fix timezone daylight handling for some ports (Thomas, Bruce, Tatsuo)
timestamp overhauled to use standard functions (Thomas)
other code cleanup in date/time routines (Thomas)
psql’s \d now case-insensitive (Bruce)
psql’s backslash commands can now have trailing semicolon (Bruce)
fix memory leak in psql when using \g (Bruce)
major fix for endian handling of communication to server (Thomas, Tatsuo)
Fix for Solaris assembler and include files (Yoshihiko Ichikawa)
allow underscores in usernames (Bruce)
pg_dumpall now returns proper status, portability fix (Bruce)
E.327. Release 6.1

Release date: 1997-06-08

The regression tests have been adapted and extensively modified for the 6.1 release of PostgreSQL.

Three new data types (datetime, timespan, and circle) have been added to the native set of PostgreSQL types. Points, boxes, paths, and polygons have had their output formats made consistent across the data types. The polygon output in misc.out has only been spot-checked for correctness relative to the original regression output.

PostgreSQL 6.1 introduces a new, alternate optimizer which uses genetic algorithms. These algorithms introduce a random behavior in the ordering of query results when the query contains multiple qualifications or multiple tables (giving the optimizer a choice on order of evaluation). Several regression tests have been modified to explicitly order the results, and hence are insensitive to optimizer choices. A few regression tests are for data types which are inherently unordered (e.g. points and time intervals) and tests involving those types are explicitly bracketed with set geqo to 'off' and reset geqo.

The interpretation of array specifiers (the curly braces around atomic values) appears to have changed sometime after the original regression tests were generated. The current ./expected/*.out files reflect this new interpretation, which might not be correct!

The float8 regression test fails on at least some platforms. This is due to differences in implementations of pow() and exp() and the signaling mechanisms used for overflow and underflow conditions.

The “random” results in the random test should cause the “random” test to be “failed”, since the regression tests are evaluated using a simple diff. However, “random” does not seem to produce random results on my test machine (Linux/gcc/i686).

E.327.1. Migration to Version 6.1

This migration requires a complete dump of the 6.0 database and a restore of the database in 6.1.

Those migrating from earlier 1.* releases should first upgrade to 1.09 because the COPY output format was improved from the 1.02 release.

E.327.2. Changes

Bug Fixes
-------
packet length checking in library routines
lock manager priority patch
check for under/over flow of float8(Bruce)
multitable join fix(Vadim)
SIGPIPE crash fix(Darren)
large object fixes(Sven)
allow btree indexes to handle NULLs(Vadim)
timezone fixes(D’Arcy)
select SUM(x) can return NULL on no rows(Thomas)
internal optimizer, executor bug fixes(Vadim)
fix problem where inner loop in < or <= has no rows(Vadim)
prevent re-commuting join index clauses (Vadim)
fix join clauses for multiple tables (Vadim)
fix hash, hashjoin for arrays (Vadim)
fix btree for abstime type (Vadim)
large object fixes (Raymond)
fix buffer leak in hash indexes (Vadim)
fix rtree for use in inner scan (Vadim)
fix gist for use in inner scan, cleanups (Vadim, Andrea)
avoid unnecessary local buffers allocation (Vadim, Massimo)
fix local buffers leak in transaction aborts (Vadim)
fix file manager memory leaks, cleanups (Vadim, Massimo)
fix storage manager memory leaks (Vadim)
fix btree duplicates handling (Vadim)
fix deleted rows reincarnation caused by vacuum (Vadim)
fix SELECT varchar() / char() INTO TABLE made zero-length fields (Bruce)
many psql, pg_dump, and libpq memory leaks fixed using Purify (Igor)

Enhancements
-------------
attribute optimization statistics (Bruce)
much faster new btree bulk load code (Paul)
BTREE UNIQUE added to bulk load code (Vadim)
new lock debug code (Massimo)
massive changes to libpg++ (Leo)
new GEQO optimizer speeds table multitable optimization (Martin)
new WARN message for non-unique insert into unique key (Marc)
update x=-3, no spaces, now valid (Bruce)
remove case-sensitive identifier handling (Bruce, Thomas, Dan)
debug backend now pretty-prints tree (Darren)
new Oracle character functions (Edmund)
new plaintext password functions (Dan)
no such class or insufficient privilege changed to distinct messages (Dan)
new ANSI timestamp function (Dan)
new ANSI Time and Date types (Thomas)
move large chunks of data in backend (Martin)
multicolumn btree indexes (Vadim)
new SET var TO value command (Martin)
update transaction status on reads (Dan)
new locale settings for character types (Oleg)
new SEQUENCE serial number generator (Vadim)
GROUP BY function now possible (Vadim)
re-organize regression test (Thomas, Marc)
new optimizer operation weights (Vadim)
new psql \z grant/permit option (Marc)
new MONEY data type (D’Arcy, Thomas)
tcp socket communication speed improved (Vadim)
new VACUUM option for attribute statistics, and for certain columns (Vadim)
many geometric type improvements (Thomas, Keith)
additional regression tests (Thomas)
new datestyle variable (Thomas, Vadim, Martin)
more comparison operators for sorting types (Thomas)
new conversion functions (Thomas)
new more compact btree format (Vadim)
allow pg_dumpall to preserve database ownership (Bruce)
new SET GEQO=# and R_PLANS variable (Vadim)
old (!GEQO) optimizer can use right-sided plans (Vadim)
typechecking improvement in SQL parser (Bruce)
new SET, SHOW, RESET commands (Thomas, Vadim)
new \connect database USER option
new destroydb -i option (Igor)
new \dt and \di psql commands (Darren)
SELECT "\n" now escapes newline (A. Duursma)
new geometry conversion functions from old format (Thomas)

Source tree changes
-------------------
new configuration script (Marc)
readline configuration option added (Marc)
OS-specific configuration options removed (Marc)
new OS-specific template files (Marc)
no more need to edit Makefile.global (Marc)
re-arrange include files (Marc)
neststep patches (Gregor Hoffleit)
removed Windows-specific code (Bruce)
removed postmaster -e option, now only postgres -e option (Bruce)
merge duplicate library code in front/backends (Martin)
now works with eBones, international Kerberos (Jun)
more shared library support
\+\ include file cleanup (Bruce)
warn about buggy flex (Bruce)
DG/UX, Ultrix, IRIX, AIX portability fixes

E.328. Release 6.0

Release date: 1997-01-29
A dump/restore is required for those wishing to migrate data from previous releases of PostgreSQL.

E.328.1. Migration from version 1.09 to version 6.0
This migration requires a complete dump of the 1.09 database and a restore of the database in 6.0.

E.328.2. Migration from pre-1.09 to version 6.0
Those migrating from earlier 1.* releases should first upgrade to 1.09 because the COPY output format was improved from the 1.02 release.
Appendix E. Release Notes

E.328.3. Changes

Bug Fixes
---------
ALTER TABLE bug - running postgres process needs to re-read table definition
Allow vacuum to be run on one table or entire database(Bruce)
Array fixes
Fix array over-runs of memory writes(Kurt)
Fix elusive btree range/non-range bug(Dan)
Fix for hash indexes on some types like time and date
Fix for pg_log size explosion
Fix permissions on lo_export() (Bruce)
Fix uninitialized reads of memory(Kurt)
Fixed ALTER TABLE ... char(3) bug(Bruce)
Fixed a few small memory leaks
Fixed EXPLAIN handling of options and changed full_path option name
Fixed output of group acl privileges
Memory leaks (hunt and destroy with tools like Purify(Kurt)
Minor improvements to rules system
NOTIFY fixes
New asserts for run-checking
Overhauled parser/analyze code to properly report errors and increase speed
Pg_dump -d now handles NULL’s properly(Bruce)
Prevent SELECT NULL from crashing server (Bruce)
Properly report errors when INSERT ... SELECT columns did not match
Properly report errors when insert column names were not correct
psql \g filename now works(Bruce)
psql fixed problem with multiple statements on one line with multiple outputs
Removed duplicate system OIDs
SELECT * INTO TABLE . GROUP/ORDER BY gives unlink error if table exists(Bruce)
Several fixes for queries that crashed the backend
Starting quote in insert string errors(Bruce)
Submitting an empty query now returns empty status, not just " " query(Bruce)

Enhancements
------------
Add EXPLAIN manual page(Bruce)
Add UNIQUE index capability(Dan)
Add hostname/user level access control rather than just hostname and user
Add synonym of != for <>(Bruce)
Allow "select oid,* from table"
Allow BY,ORDER BY to specify columns by number, or by non-alias table.column(Bruce)
Allow COPY from the frontend(Bryan)
Allow GROUP BY to use alias column name(Bruce)
Allow actual compression, not just reuse on the same page(Vadim)
Allow installation-configuration option to auto-add all local users(Bryan)
Allow libpq to distinguish between text value " and null(Bruce)
Allow non-postgres users with createdb privs toestroydb’s
Allow restriction on who can create C functions(Bryan)
Allow restriction on who can do backend COPY(Bryan)
Can shrink tables, pg_time and pg_log(Vadim & Erich)
Change debug level 2 to print queries only, changed debug heading layout(Bruce)
Appendix E. Release Notes

Change default decimal constant representation from float4 to float8 (Bruce)
European date format now set when postmaster is started
Execute lowercase function names if not found with exact case
Fixes for aggregate/GROUP processing, allow \( \text{\texttt{select sum(func(x),sum(x+y) from z}} \)
Gist now included in the distribution (Marc)
Ident authentication of local users (Bryan)
Implement BETWEEN qualifier (Bruce)
Implement IN qualifier (Bruce)
libpq has PQgetisnull() (Bruce)
libpq++ improvements
New options to initdb (Bryan)
Pg_dump allow dump of OIDs (Bruce)
Pg_dump create indexes after tables are loaded for speed (Bruce)
Pg_dumpall dumps all databases, and the user table
Pginterface additions for NULL values (Bruce)
Prevent postmaster from being run as root
psql \h and \? is now readable (Bruce)
psql allow backslashed, semicolons anywhere on the line (Bruce)
psql changed command prompt for lines in query or in quotes (Bruce)
psql char(3) now displays as (bp)char in \d output (Bruce)
psql return code now more accurate (Bryan?)
psql updated help syntax (Bruce)
Re-visit and fix vacuum (Vadim)
Reduce size of regression diffs, remove timezone name difference (Bruce)
Remove compile-time parameters to enable binary distributions (Bryan)
Reverse meaning of HBA masks (Bryan)
Secure Authentication of local users (Bryan)
Speed up vacuum (Vadim)
Vacuum now had VERBOSE option (Bruce)

Source tree changes
-------------------
All functions now have prototypes that are compared against the calls
Allow asserts to be disabled easily from Makefile.global (Bruce)
Change oid constants used in code to #define names
Decoupled sparc and solaris defines (Kurt)
Gcc -Wall compiles cleanly with warnings only from unfixable constructs
Major include file reorganization/reduction (Marc)
Make now stops on compile failure (Bryan)
Makefile restructuring (Bryan, Marc)
Merge bsdi_2_1 to bsdi (Bruce)
Monitor program removed
Name change from Postgres95 to PostgreSQL
New config.h file (Marc, Bryan)
PG_VERSION now set to 6.0 and used by postmaster
Portability additions, including Ultrix, DG/UX, AIX, and Solaris
Reduced the number of #define’s, centralized #define’s
Remove duplicate OIDS in system tables (Dan)
Remove duplicate system catalog info or report mismatches (Dan)
Removed many os-specific #define’s
Restructured object file generation/location (Bryan, Marc)
Restructured port-specific file locations (Bryan, Marc)
Unused/ uninitialized variables corrected
E.329. Release 1.09

Release date: 1996-11-04

Sorry, we didn’t keep track of changes from 1.02 to 1.09. Some of the changes listed in 6.0 were actually included in the 1.02.1 to 1.09 releases.

E.330. Release 1.02

Release date: 1996-08-01

E.330.1. Migration from version 1.02 to version 1.02.1

Here is a new migration file for 1.02.1. It includes the 'copy' change and a script to convert old ASCII files.

Note: The following notes are for the benefit of users who want to migrate databases from Postgres95 1.01 and 1.02 to Postgres95 1.02.1.

If you are starting afresh with Postgres95 1.02.1 and do not need to migrate old databases, you do not need to read any further.

In order to upgrade older Postgres95 version 1.01 or 1.02 databases to version 1.02.1, the following steps are required:

1. Start up a new 1.02.1 postmaster
2. Add the new built-in functions and operators of 1.02.1 to 1.01 or 1.02 databases. This is done by running the new 1.02.1 server against your own 1.01 or 1.02 database and applying the queries attached at the end of the file. This can be done easily through psql. If your 1.01 or 1.02 database is named testdb and you have cut the commands from the end of this file and saved them in addfunc.sql:

   % psql testdb -f addfunc.sql

Those upgrading 1.02 databases will get a warning when executing the last two statements in the file because they are already present in 1.02. This is not a cause for concern.

E.330.2. Dump/Reload Procedure

If you are trying to reload a pg_dump or text-mode, copy tablename to stdout generated with a previous version, you will need to run the attached sed script on the ASCII file before loading it into the
Appendix E. Release Notes

database. The old format used `.' as end-of-data, while `\.' is now the end-of-data marker. Also, empty strings are now loaded in as " rather than NULL. See the copy manual page for full details.

```
  sed 's/\^\.\$/\./g' <in_file >out_file
```

If you are loading an older binary copy or non-stdout copy, there is no end-of-data character, and hence no conversion necessary.

```
-- following lines added by agc to reflect the case-insensitive
-- regexp searching for varchar (in 1.02), and bpchar (in 1.02.1)
cREATE OPERATOR ~* (leftarg = varchar, rightarg = text, procedure = texticregexeq);
cREATE OPERATOR !~* (leftarg = varchar, rightarg = text, procedure = texticregexne);
cREATE OPERATOR ~* (leftarg = bpchar, rightarg = text, procedure = texticregexeq);
cREATE OPERATOR !~* (leftarg = bpchar, rightarg = text, procedure = texticregexne);
```

### E.330.3. Changes

Source code maintenance and development
* worldwide team of volunteers
* the source tree now in CVS at ftp.ki.net

Enhancements
* psql (and underlying libpq library) now has many more options for formatting output, including HTML
* `pg_dump` now output the schema and/or the data, with many fixes to enhance completeness.
* psql used in place of monitor in administration shell scripts. monitor to be deprecated in next release.
* date/time functions enhanced
* NULL insert/update/comparison fixed/enhanced
* TCL/TK lib and shell fixed to work with both tck7.4/tk4.0 and tcl7.5/tk4.1

Bug Fixes (almost too numerous to mention)
* indexes
* storage management
* check for NULL pointer before dereferencing
* Makefile fixes

New Ports
* added SolarisX86 port
* added BSD/OS 2.1 port
* added DG/UX port
E.331. Release 1.01

Release date: 1996-02-23

E.331.1. Migration from version 1.0 to version 1.01

The following notes are for the benefit of users who want to migrate databases from Postgres95 1.0 to Postgres95 1.01.

If you are starting afresh with Postgres95 1.01 and do not need to migrate old databases, you do not need to read any further.

In order to Postgres95 version 1.01 with databases created with Postgres95 version 1.0, the following steps are required:

1. Set the definition of NAMEDATALEN in src/Makefile.global to 16 and OIDNAMELEN to 20.
2. Decide whether you want to use Host based authentication.
   a. If you do, you must create a file name pg_hba in your top-level data directory (typically the value of your $PGDATA). src/libpq/pg_hba shows an example syntax.
   b. If you do not want host-based authentication, you can comment out the line:
      
      HBA = 1
      in src/Makefile.global

      Note that host-based authentication is turned on by default, and if you do not take steps A or B above, the out-of-the-box 1.01 will not allow you to connect to 1.0 databases.
3. Compile and install 1.01, but DO NOT do the initdb step.
4. Before doing anything else, terminate your 1.0 postmaster, and backup your existing $PGDATA directory.
5. Set your PGDATA environment variable to your 1.0 databases, but set up path up so that 1.01 binaries are being used.
6. Modify the file $PGDATA/PG_VERSION from 5.0 to 5.1
7. Start up a new 1.01 postmaster
8. Add the new built-in functions and operators of 1.01 to 1.0 databases. This is done by running the new 1.01 server against your own 1.0 database and applying the queries attached and saving in the file 1.0_to_1.01.sql. This can be done easily through psql. If your 1.0 database is name testdb:

   % psql testdb -f 1.0_to_1.01.sql
   and then execute the following commands (cut and paste from here):

   -- add builtin functions that are new to 1.01

   create function int4eqoid (int4, oid) returns bool as 'foo'
   language 'internal';
   create function oideqint4 (oid, int4) returns bool as 'foo'
   language 'internal';
   create function char2icregexeq (char2, text) returns bool as 'foo'
   language 'internal';
create function char2icregexne (char2, text) returns bool as 'foo'
language 'internal';
create function char4icregexeq (char4, text) returns bool as 'foo'
language 'internal';
create function char4icregexne (char4, text) returns bool as 'foo'
language 'internal';
create function char8icregexeq (char8, text) returns bool as 'foo'
language 'internal';
create function char8icregexne (char8, text) returns bool as 'foo'
language 'internal';
create function char16icregexeq (char16, text) returns bool as 'foo'
language 'internal';
create function char16icregexne (char16, text) returns bool as 'foo'
language 'internal';
create function texticregexeq (text, text) returns bool as 'foo'
language 'internal';
create function texticregexne (text, text) returns bool as 'foo'
language 'internal';

-- add builtin functions that are new to 1.01
create operator = (leftarg = int4, rightarg = oid, procedure = int4eqoid);
create operator = (leftarg = oid, rightarg = int4, procedure = oideqint4);
create operator ~* (leftarg = char2, rightarg = text, procedure = char2icregexeq);
create operator !~* (leftarg = char2, rightarg = text, procedure = char2icregexne);
create operator ~* (leftarg = char4, rightarg = text, procedure = char4icregexeq);
create operator !~* (leftarg = char4, rightarg = text, procedure = char4icregexne);
create operator ~* (leftarg = char8, rightarg = text, procedure = char8icregexeq);
create operator !~* (leftarg = char8, rightarg = text, procedure = char8icregexne);
create operator ~* (leftarg = char16, rightarg = text, procedure = char16icregexeq);
create operator !~* (leftarg = char16, rightarg = text, procedure = char16icregexne);
create operator ~* (leftarg = text, rightarg = text, procedure = texticregexeq);
create operator !~* (leftarg = text, rightarg = text, procedure = texticregexne);

E.331.2. Changes

Incompatibilities:
* 1.01 is backwards compatible with 1.0 database provided the user
  follow the steps outlined in the MIGRATION_from_1.0_to_1.01 file.
  If those steps are not taken, 1.01 is not compatible with 1.0 database.

Enhancements:
* added PQdisplayTuples() to libpq and changed monitor and psql to use it
* added NeXT port (requires SysVIPC implementation)
* added CAST .. AS ... syntax
* added ASC and DESC key words
* added 'internal' as a possible language for CREATE FUNCTION
  internal functions are C functions which have been statically linked
  into the postgres backend.
* a new type "name" has been added for system identifiers (table names,
attribute names, etc.) This replaces the old char16 type. The
name is set by the NAMEDATALEN #define in src/Makefile.global
* a readable reference manual that describes the query language.
* added host-based access control. A configuration file ($PGDATA/pg_hba)
is used to hold the configuration data. If host-based access control
is not desired, comment out HBA=1 in src/Makefile.global.
* changed regex handling to be uniform use of Henry Spencer’s regex code
regardless of platform. The regex code is included in the distribution
* added functions and operators for case-insensitive regular expressions.
The operators are ~* and !~*.
* pg_dump uses COPY instead of SELECT loop for better performance

Bug fixes:
* fixed an optimizer bug that was causing core dumps when
functions calls were used in comparisons in the WHERE clause
* changed all uses of getuid to geteuid so that effective uids are used
* psql now returns non-zero status on errors when using -c
* applied public patches 1-14

E.332. Release 1.0

Release date: 1995-09-05

E.332.1. Changes

Copyright change:
* The copyright of Postgres 1.0 has been loosened to be freely modifiable
  and modifiable for any purpose. Please read the COPYRIGHT file.
  Thanks to Professor Michael Stonebraker for making this possible.

Incompatibilities:
* date formats have to be MM-DD-YYYY (or DD-MM-YYYY if you’re using
  EUROPEAN STYLE). This follows SQL-92 specs.
  * "delimiters" is now a key word

Enhancements:
* sql LIKE syntax has been added
* copy command now takes an optional USING DELIMITER specification.
  delimiters can be any single-character string.
* IRIX 5.3 port has been added.
  Thanks to Paul Walmsley and others.
* updated pg_dump to work with new libpq
* \d has been added psql
  Thanks to Keith Parks
* regexp performance for architectures that use POSIX regex has been
  improved due to caching of precompiled patterns.
Appendix E. Release Notes

Thanks to Alistair Crooks
* a new version of libpq++
  Thanks to William Wanders

Bug fixes:
* arbitrary userids can be specified in the createuser script
* \c to connect to other databases in psql now works.
* bad pg_proc entry for float4inc() is fixed
* users with usecreatedb field set can now create databases without
  having to be usesuper
* remove access control entries when the entry no longer has any
  privileges
* fixed non-portable datetimes implementation
* added kerberos flags to the src/backend/Makefile
* libpq now works with kerberos
* typographic errors in the user manual have been corrected.
* btrees with multiple index never worked, now we tell you they don’t
  work when you try to use them

E.333. Postgres95 Release 0.03

Release date: 1995-07-21

E.333.1. Changes

Incompatible changes:
* BETA-0.3 IS INCOMPATIBLE WITH DATABASES CREATED WITH PREVIOUS VERSIONS
  (due to system catalog changes and indexing structure changes).
* double-quote ("") is deprecated as a quoting character for string literals;
  you need to convert them to single quotes (').
* name of aggregates (eg. int4sum) are renamed in accordance with the
  SQL standard (eg. sum).
* CHANGE ACL syntax is replaced by GRANT/REVOKE syntax.
* float literals (eg. 3.14) are now of type float4 (instead of float8 in
  previous releases); you might have to do typecasting if you depend on it
  being of type float8. If you neglect to do the typecasting and you assign
  a float literal to a field of type float8, you might get incorrect values
  stored!
* LIBPQ has been totally revamped so that frontend applications
  can connect to multiple backends
* the usesysid field in pg_user has been changed from int2 to int4 to
  allow wider range of Unix user ids.
* the netbsd/freebsd/bsd o/s ports have been consolidated into a
  single BSD44_derived port. (thanks to Alistair Crooks)

SQL standard-compliance (the following details changes that makes postgres95
Appendix E. Release Notes

more compliant to the SQL-92 standard):
  * the following SQL types are now built-in: smallint, int(eger), float, real, char(N), varchar(N), date and time.

  The following are aliases to existing postgres types:
  smallint -> int2
  integer, int -> int4
  float, real -> float4

  char(N) and varchar(N) are implemented as truncated text types. In addition, char(N) does blank-padding.
  * single-quote (') is used for quoting string literals; " (in addition to \') is supported as means of inserting a single quote in a string
  * SQL standard aggregate names (MAX, MIN, AVG, SUM, COUNT) are used
    (Also, aggregates can now be overloaded, i.e. you can define your own MAX aggregate to take in a user-defined type.)
  * CHANGE ACL removed. GRANT/REVOKE syntax added.
    - Privileges can be given to a group using the "GROUP" key word.
      For example:
      
      GRANT SELECT ON foobar TO GROUP my_group;
      
      The key word 'PUBLIC' is also supported to mean all users.
      Privileges can only be granted or revoked to one user or group at a time.
      "WITH GRANT OPTION" is not supported. Only class owners can change access control
    - The default access control is to grant users readonly access.
      You must explicitly grant insert/update access to users. To change this, modify the line in
      src/backend/utils/acl.h
      that defines ACL_WORLD_DEFAULT

Bug fixes:
  * the bug where aggregates of empty tables were not run has been fixed. Now, aggregates run on empty tables will return the initial conditions of the aggregates. Thus, COUNT of an empty table will now properly return 0.
  * allow the use of \; inside the monitor
  * the LISTEN/NOTIFY asynchronous notification mechanism now work
  * NOTIFY in rule action bodies now work
  * hash indexes work, and access methods in general should perform better. creation of large btree indexes should be much faster. (thanks to Paul Aoki)

Other changes and enhancements:
  * addition of an EXPLAIN statement used for explaining the query execution plan (eg. "EXPLAIN SELECT * FROM EMP" prints out the execution plan for the query).
  * WARN and NOTICE messages no longer have timestamps on them. To turn on timestamps of error messages, uncomment the line in
    src/backend/utils/elog.h:
    /* define ELOG_TIMESTAMPS */
  * On an access control violation, the message

3001
"Either no such class or insufficient privilege"
will be given. This is the same message that is returned when
a class is not found. This dissuades non-privileged users from
guessing the existence of privileged classes.

* some additional system catalog changes have been made that are not
visible to the user.

libpgtcl changes:
* The -oid option has been added to the "pg_result" tcl command.
  pg_result -oid returns oid of the last row inserted. If the
  last command was not an INSERT, then pg_result -oid returns "".
* the large object interface is available as pg_lo* tcl commands:
  pg_lo_open, pg_lo_close, pg_lo_creat, etc.

Portability enhancements and New Ports:
* flex/lex problems have been cleared up. Now, you should be able to use
  flex instead of lex on any platforms. We no longer make assumptions of
  what lexer you use based on the platform you use.
* The Linux-ELF port is now supported. Various configuration have been
tested: The following configuration is known to work:
  kernel 1.2.10, gcc 2.6.3, libc 4.7.2, flex 2.5.2, bison 1.24
  with everything in ELF format,

New utilities:
* ipcclean added to the distribution
  ipcclean usually does not need to be run, but if your backend crashes
  and leaves shared memory segments hanging around, ipcclean will
clean them up for you.

New documentation:
* the user manual has been revised and libpq documentation added.

E.334. Postgres95 Release 0.02

Release date: 1995-05-25

E.334.1. Changes

Incompatible changes:
* The SQL statement for creating a database is ‘CREATE DATABASE’ instead
  of ‘CREATEDB’. Similarly, dropping a database is ‘DROP DATABASE’ instead
  of ‘DESTROYDB’. However, the names of the executables ‘createdb’ and
  ‘destroydb’ remain the same.

New tools:
* pgperl - a Perl (4.036) interface to Postgres95
* pg_dump - a utility for dumping out a postgres database into a script file containing query commands. The script files are in an ASCII format and can be used to reconstruct the database, even on other machines and other architectures. (Also good for converting a Postgres 4.2 database to Postgres95 database.)

The following ports have been incorporated into postgres95-beta-0.02:
* the NetBSD port by Alistair Crooks
* the AIX port by Mike Tung
* the Windows NT port by Jon Forrest (more stuff but not done yet)
* the Linux ELF port by Brian Gallew

The following bugs have been fixed in postgres95-beta-0.02:
* new lines not escaped in COPY OUT and problem with COPY OUT when first attribute is a ‘.’
* cannot type return to use the default user id in createuser
* SELECT DISTINCT on big tables crashes
* Linux installation problems
* monitor doesn’t allow use of ‘localhost’ as PGHOST
* psql core dumps when doing \c or \l
* the "pgtclsh" target missing from src/bin/pgtclsh/Makefile
* libpgtcl has a hard-wired default port number
* SELECT DISTINCT INTO TABLE hangs
* CREATE TYPE doesn’t accept ‘variable’ as the internallength
* wrong result using more than 1 aggregate in a SELECT

E.335. Postgres95 Release 0.01

Release date: 1995-05-01
Initial release.
Appendix F. Additional Supplied Modules

This appendix and the next one contain information regarding the modules that can be found in the contrib directory of the PostgreSQL distribution. These include porting tools, analysis utilities, and plug-in features that are not part of the core PostgreSQL system, mainly because they address a limited audience or are too experimental to be part of the main source tree. This does not preclude their usefulness.

This appendix covers extensions and other server plug-in modules found in contrib. Appendix G covers utility programs.

When building from the source distribution, these components are not built automatically, unless you build the "world" target (see step 2). You can build and install all of them by running:

```
make
make install
```

in the contrib directory of a configured source tree; or to build and install just one selected module, do the same in that module’s subdirectory. Many of the modules have regression tests, which can be executed by running:

```
make check
```

before installation or

```
make installcheck
```

once you have a PostgreSQL server running.

If you are using a pre-packaged version of PostgreSQL, these modules are typically made available as a separate subpackage, such as postgresql-contrib.

Many modules supply new user-defined functions, operators, or types. To make use of one of these modules, after you have installed the code you need to register the new SQL objects in the database system. In PostgreSQL 9.1 and later, this is done by executing a CREATE EXTENSION command. In a fresh database, you can simply do

```
CREATE EXTENSION module_name;
```

This command must be run by a database superuser. This registers the new SQL objects in the current database only, so you need to run this command in each database that you want the module’s facilities to be available in. Alternatively, run it in database template1 so that the extension will be copied into subsequently-created databases by default.

Many modules allow you to install their objects in a schema of your choice. To do that, add SCHEMA schema_name to the CREATE EXTENSION command. By default, the objects will be placed in your current creation target schema, which in turn defaults to public.

If your database was brought forward by dump and reload from a pre-9.1 version of PostgreSQL, and you had been using the pre-9.1 version of the module in it, you should instead do

```
CREATE EXTENSION module_name FROM unpackaged;
```
This will update the pre-9.1 objects of the module into a proper extension object. Future updates to the module will be managed by ALTER EXTENSION. For more information about extension updates, see Section 35.15.

Note, however, that some of these modules are not “extensions” in this sense, but are loaded into the server in some other way, for instance by way of shared_preload_libraries. See the documentation of each module for details.

F.1. adminpack

adminpack provides a number of support functions which pgAdmin and other administration and management tools can use to provide additional functionality, such as remote management of server log files. Use of all these functions is restricted to superusers.

The functions shown in Table F-1 provide write access to files on the machine hosting the server. (See also the functions in Table 9-72, which provide read-only access.) Only files within the database cluster directory can be accessed, but either a relative or absolute path is allowable.

**Table F-1. adminpack Functions**

<table>
<thead>
<tr>
<th>Name</th>
<th>Return Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

<td><code>pg_catalog.pg_logdir_ls()</code></td>
<td>setof record</td>
<td>List the log files in the log_directory directory</td>
</tr>
</tbody>
</table>

`pg_file_write` writes the specified data into the file named by filename. If append is false, the file must not already exist. If append is true, the file can already exist, and will be appended to if so. Returns the number of bytes written.

`pg_file_rename` renames a file. If archivename is omitted or NULL, it simply renames oldname to newname (which must not already exist). If archivename is provided, it first renames newname to archivename (which must not already exist), and then renames oldname to newname. In event of failure of the second rename step, it will try to rename archivename back to newname before reporting the error. Returns true on success, false if the source file(s) are not present or not writable; other cases throw errors.

`pg_file_unlink` removes the specified file. Returns true on success, false if the specified file is not present or the unlink() call fails; other cases throw errors.

`pg_logdir_ls` returns the start timestamps and path names of all the log files in the log_directory directory. The log_filename parameter must have its default setting (postgresql-%Y-%m-%d_%H%M%S.log) to use this function.

The functions shown in Table F-2 are deprecated and should not be used in new applications; instead
use those shown in Table 9-64 and Table 9-72. These functions are provided in `adminpack` only for compatibility with old versions of pgAdmin.

Table F-2. Deprecated `adminpack` Functions

<table>
<thead>
<tr>

<td>Alternate name for <code>pg_rotate_logfile()</code>, but note that it returns integer 0 or 1 rather than boolean</td>
</tr>
</tbody>
</table>

F.2. auth_delay

auth_delay causes the server to pause briefly before reporting authentication failure, to make brute-force attacks on database passwords more difficult. Note that it does nothing to prevent denial-of-service attacks, and may even exacerbate them, since processes that are waiting before reporting authentication failure will still consume connection slots.

In order to function, this module must be loaded via `shared_preload_libraries` in `postgresql.conf`.

F.2.1. Configuration Parameters

`auth_delay.milliseconds (int)`

The number of milliseconds to wait before reporting an authentication failure. The default is 0.

These parameters must be set in `postgresql.conf`. Typical usage might be:

```
# postgresql.conf
shared_preload_libraries = 'auth_delay'
auth_delay.milliseconds = '500'
```

F.2.2. Author

KaiGai Kohei <kaigai@ak.jp.nec.com>
F.3. auto_explain

The `auto_explain` module provides a means for logging execution plans of slow statements automatically, without having to run EXPLAIN by hand. This is especially helpful for tracking down un-optimized queries in large applications.

The module provides no SQL-accessible functions. To use it, simply load it into the server. You can load it into an individual session:

```
LOAD 'auto_explain';
```

(You must be superuser to do that.) More typical usage is to preload it into some or all sessions by including `auto_explain` in `session_preload_libraries` or `shared_preload_libraries` in `postgresql.conf`. Then you can track unexpectedly slow queries no matter when they happen. Of course there is a price in overhead for that.

F.3.1. Configuration Parameters

There are several configuration parameters that control the behavior of `auto_explain`. Note that the default behavior is to do nothing, so you must set at least `auto_explain.log_min_duration` if you want any results.

`auto_explain.log_min_duration` (integer)

`auto_explain.log_min_duration` is the minimum statement execution time, in milliseconds, that will cause the statement’s plan to be logged. Setting this to zero logs all plans. Minus-one (the default) disables logging of plans. For example, if you set it to `250ms` then all statements that run 250ms or longer will be logged. Only superusers can change this setting.

`auto_explain.log_analyze` (boolean)

`auto_explain.log_analyze` causes EXPLAIN ANALYZE output, rather than just EXPLAIN output, to be printed when an execution plan is logged. This parameter is off by default. Only superusers can change this setting.

**Note:** When this parameter is on, per-plan-node timing occurs for all statements executed, whether or not they run long enough to actually get logged. This can have an extremely negative impact on performance. Turning off `auto_explain.log_timing` ameliorates the performance cost, at the price of obtaining less information.

`auto_explain.log_buffers` (boolean)

`auto_explain.log_buffers` controls whether buffer usage statistics are printed when an execution plan is logged; it’s equivalent to the `BUFFERS` option of EXPLAIN. This parameter has no effect unless `auto_explain.log_analyze` is enabled. This parameter is off by default. Only superusers can change this setting.

`auto_explain.log_timing` (boolean)

`auto_explain.log_timing` controls whether per-node timing information is printed when an execution plan is logged; it’s equivalent to the `TIMING` option of EXPLAIN. The overhead of repeatedly
reading the system clock can slow down queries significantly on some systems, so it may be useful to
set this parameter to off when only actual row counts, and not exact times, are needed. This parameter
has no effect unless auto_explain.log_analyze is enabled. This parameter is on by default.
Only superusers can change this setting.

\( \text{auto_explain.log_triggers (boolean)} \)

auto_explain.log_triggers causes trigger execution statistics to be included when an execution
plan is logged. This parameter has no effect unless auto_explain.log_analyze is enabled.
This parameter is off by default. Only superusers can change this setting.

\( \text{auto_explain.log_verbose (boolean)} \)

auto_explain.log_verbose controls whether verbose details are printed when an execution plan
is logged; it’s equivalent to the VERBOSE option of EXPLAIN. This parameter is off by default. Only
superusers can change this setting.

\( \text{auto_explain.log_format (enum)} \)

auto_explain.log_format selects the EXPLAIN output format to be used. The allowed values
are text, xml, json, and yaml. The default is text. Only superusers can change this setting.

\( \text{auto_explain.log_nested_statements (boolean)} \)

auto_explain.log_nested_statements causes nested statements (statements executed inside
a function) to be considered for logging. When it is off, only top-level query plans are logged. This
parameter is off by default. Only superusers can change this setting.

In ordinary usage, these parameters are set in postgresql.conf, although superusers can alter them
on-the-fly within their own sessions. Typical usage might be:

```
# postgresql.conf
session_preload_libraries = ‘auto_explain’
auto_explain.log_min_duration = ‘3s’
```

### F.3.2. Example

postgres=# LOAD ‘auto_explain’;
postgres=# SET auto_explain.log_min_duration = 0;
postgres=# SET auto_explain.log_analyze = true;
postgres=# SELECT count(*)
     FROM pg_class, pg_index
     WHERE oid = indrelid AND indisunique;

This might produce log output such as:

```
LOG: duration: 3.651 ms  plan:  
Query Text: SELECT count(*)
     FROM pg_class, pg_index
     WHERE oid = indrelid AND indisunique;
Aggregate  (cost=16.79..16.80 rows=1 width=0) (actual time=3.626..3.627 rows=1 loops=1)
    ->  Hash Join  (cost=4.17..16.55 rows=92 width=0) (actual time=3.349..3.594 rows=92 loops=1)
          Hash Cond: (pg_class.oid = pg_index.indrelid)
```
F.3.3. Author

Takahiro Itagaki <itagaki.takahiro@oss.ntt.co.jp>

F.4. btree_gin

btree_gin provides sample GIN operator classes that implement B-tree equivalent behavior for the data types int2, int4, int8, float4, float8, timestamp with time zone, timestamp without time zone, time with time zone, time without time zone, date, interval, oid, money, "char", varchar, text, bytea, bit, varbit, macaddr, inet, and cidr.

In general, these operator classes will not outperform the equivalent standard B-tree index methods, and they lack one major feature of the standard B-tree code: the ability to enforce uniqueness. However, they are useful for GIN testing and as a base for developing other GIN operator classes. Also, for queries that test both a GIN-indexable column and a B-tree-indexable column, it might be more efficient to create a multicoloumn GIN index that uses one of these operator classes than to create two separate indexes that would have to be combined via bitmap ANDing.

F.4.1. Example Usage

CREATE TABLE test (a int4);
-- create index
CREATE INDEX testidx ON test USING gin (a);
-- query
SELECT * FROM test WHERE a < 10;

F.4.2. Authors

Teodor Sigaev (<teodor@stack.net>) and Oleg Bartunov (<oleg@sai.msu.su>). See http://www.sai.msu.su/~megera/oddmuse/index.cgi/Gin for additional information.

F.5. btree_gist

btree_gist provides GiST index operator classes that implement B-tree equivalent behavior for the data types int2, int4, int8, float4, float8, numeric, timestamp with time zone, timestamp
without time zone, time with time zone, time without time zone, date, interval, oid, money, char, varchar, text, bytea, bit, varbit, macaddr, inet, and cidr.

In general, these operator classes will not outperform the equivalent standard B-tree index methods, and they lack one major feature of the standard B-tree code: the ability to enforce uniqueness. However, they provide some other features that are not available with a B-tree index, as described below. Also, these operator classes are useful when a multicolored GiST index is needed, wherein some of the columns are of data types that are only indexable with GiST but other columns are just simple data types. Lastly, these operator classes are useful for GiST testing and as a base for developing other GiST operator classes.

In addition to the typical B-tree search operators, btree_gist also provides index support for <> (”not equals”). This may be useful in combination with an exclusion constraint, as described below.

Also, for data types for which there is a natural distance metric, btree_gist defines a distance operator <-, and provides GiST index support for nearest-neighbor searches using this operator. Distance operators are provided for int2, int4, int8, float4, float8, timestamp with time zone, timestamp without time zone, time without time zone, date, interval, oid, and money.

F.5.1. Example Usage

Simple example using btree_gist instead of btree:

```
CREATE TABLE test (a int4);
-- create index
CREATE INDEX testidx ON test USING gist (a);
-- query
SELECT * FROM test WHERE a < 10;
-- nearest-neighbor search: find the ten entries closest to "42"
SELECT *, a <-> 42 AS dist FROM test ORDER BY a <-> 42 LIMIT 10;
```

Use an exclusion constraint to enforce the rule that a cage at a zoo can contain only one kind of animal:

```
=> CREATE TABLE zoo {
    cage INTEGER,
    animal TEXT,
    EXCLUDE USING gist (cage WITH =, animal WITH <>)
};

=> INSERT INTO zoo VALUES(123, 'zebra');
INSERT 0 1
=> INSERT INTO zoo VALUES(123, 'zebra');
INSERT 0 1
=> INSERT INTO zoo VALUES(123, 'lion');
ERROR: conflicting key value violates exclusion constraint "zoo_cage_animal_excl"
DETAIL: Key (cage, animal)=(123, lion) conflicts with existing key (cage, animal)=(123, zebra).
=> INSERT INTO zoo VALUES(124, 'lion');
INSERT 0 1
```
F.5.2. Authors

Teodor Sigaev (teodor@stack.net), Oleg Bartunov (oleg@sai.msu.su), and Janko Richter (jankorichter@yahoo.de). See http://www.sai.msu.su/~megera/postgres/gist/ for additional information.

F.6. chkpass

This module implements a data type chkpass that is designed for storing encrypted passwords. Each password is automatically converted to encrypted form upon entry, and is always stored encrypted. To compare, simply compare against a clear text password and the comparison function will encrypt it before comparing.

There are provisions in the code to report an error if the password is determined to be easily crackable. However, this is currently just a stub that does nothing.

If you precede an input string with a colon, it is assumed to be an already-encrypted password, and is stored without further encryption. This allows entry of previously-encrypted passwords.

On output, a colon is prepended. This makes it possible to dump and reload passwords without re-encrypting them. If you want the encrypted password without the colon then use the raw() function. This allows you to use the type with things like Apache’s Auth_PostgreSQL module.

The encryption uses the standard Unix function crypt(), and so it suffers from all the usual limitations of that function; notably that only the first eight characters of a password are considered.

Note that the chkpass data type is not indexable.

Sample usage:

```
CREATE TABLE test (p chkpass);
INSERT 0 1
SELECT * FROM test;
          p
----------------
:17hVp8kD5G3ko
(1 row)

SELECT raw(p) FROM test;
     raw
-------------
17hVp8kD5G3ko
(1 row)

SELECT p = 'hello' FROM test;
    ?column?
----------
     t
(1 row)
```
F.6.1. Author
D’Arcy J.M. Cain (<darcy@druid.net>)

F.7. citext

The citext module provides a case-insensitive character string type, citext. Essentially, it internally calls lower when comparing values. Otherwise, it behaves almost exactly like text.

F.7.1. Rationale

The standard approach to doing case-insensitive matches in PostgreSQL has been to use the lower function when comparing values, for example

```
SELECT * FROM tab WHERE lower(col) = LOWER(?);
```

This works reasonably well, but has a number of drawbacks:

- It makes your SQL statements verbose, and you always have to remember to use lower on both the column and the query value.
- It won’t use an index, unless you create a functional index using lower.
- If you declare a column as UNIQUE or PRIMARY KEY, the implicitly generated index is case-sensitive. So it’s useless for case-insensitive searches, and it won’t enforce uniqueness case-insensitively.

The citext data type allows you to eliminate calls to lower in SQL queries, and allows a primary key to be case-insensitive. citext is locale-aware, just like text, which means that the matching of upper case and lower case characters is dependent on the rules of the database’s LC_CTYPE setting. Again, this behavior is identical to the use of lower in queries. But because it’s done transparently by the data type, you don’t have to remember to do anything special in your queries.

F.7.2. How to Use It

Here’s a simple example of usage:

```
CREATE TABLE users (
    nick CITEXT PRIMARY KEY,
    pass TEXT NOT NULL
);```
SELECT * FROM users WHERE nick = 'Larry';

The SELECT statement will return one tuple, even though the nick column was set to larry and the query was for Larry.

F.7.3. String Comparison Behavior

citext performs comparisons by converting each string to lower case (as though lower were called) and then comparing the results normally. Thus, for example, two strings are considered equal if lower would produce identical results for them.

In order to emulate a case-insensitive collation as closely as possible, there are citext-specific versions of a number of string-processing operators and functions. So, for example, the regular expression operators ~ and ~* exhibit the same behavior when applied to citext: they both match case-insensitively. The same is true for !~ and !~*, as well as for the LIKE operators ~~ and ~~*, and !~~ and !~~*. If you’d like to match case-sensitively, you can cast the operator’s arguments to text.

Similarly, all of the following functions perform matching case-insensitively if their arguments are citext:

- regexp_matches()
- regexp_replace()
- regexp_split_to_array()
- regexp_split_to_table()
- replace()
- split_part()
- strpos()
- translate()

For the regexp functions, if you want to match case-sensitively, you can specify the “c” flag to force a case-sensitive match. Otherwise, you must cast to text before using one of these functions if you want case-sensitive behavior.

F.7.4. Limitations

- citext’s case-folding behavior depends on the LC_CTYPE setting of your database. How it compares values is therefore determined when the database is created. It is not truly case-insensitive in the terms
Appendix F. Additional Supplied Modules

defined by the Unicode standard. Effectively, what this means is that, as long as you're happy with your
collation, you should be happy with citext's comparisons. But if you have data in different languages
stored in your database, users of one language may find their query results are not as expected if the
collation is for another language.

- As of PostgreSQL 9.1, you can attach a COLLATE specification to citext columns or data values.
  Currently, citext operators will honor a non-default COLLATE specification while comparing case-
  folded strings, but the initial folding to lower case is always done according to the database’s LC_CTYPE
  setting (that is, as though COLLATE "default" were given). This may be changed in a future release
  so that both steps follow the input COLLATE specification.

- citext is not as efficient as text because the operator functions and the B-tree comparison functions
  must make copies of the data and convert it to lower case for comparisons. It is, however, slightly more
  efficient than using lower to get case-insensitive matching.

- citext doesn’t help much if you need data to compare case-sensitively in some contexts and case-
  insensitively in other contexts. The standard answer is to use the text type and manually use the
  lower function when you need to compare case-insensitively; this works all right if case-insensitive
  comparison is needed only infrequently. If you need case-insensitive behavior most of the time and
  case-sensitive infrequently, consider storing the data as citext and explicitly casting the column to
  text when you want case-sensitive comparison. In either situation, you will need two indexes if you
  want both types of searches to be fast.

- The schema containing the citext operators must be in the current search_path (typically public);
  if it is not, the normal case-sensitive text operators will be invoked instead.

F.7.5. Author

David E. Wheeler <david@kineticode.com>

Inspired by the original citext module by Donald Fraser.

F.8. cube

This module implements a data type cube for representing multidimensional cubes.

F.8.1. Syntax

Table F-3 shows the valid external representations for the cube type. x, y, etc. denote floating-point
numbers.

Table F-3. Cube External Representations

<table>
<thead>
<tr>
<th>x</th>
<th>A one-dimensional point (or, zero-length one-dimensional interval)</th>
</tr>
</thead>
<tbody>
<tr>
<td>(x)</td>
<td>Same as above</td>
</tr>
</tbody>
</table>
Appendix F. Additional Supplied Modules

\[ x_1, x_2, \ldots, x_n \]
A point in n-dimensional space, represented internally as a zero-volume cube

\[(x_1, x_2, \ldots, x_n)\]
Same as above

\((x), (y)\)
A one-dimensional interval starting at \(x\) and ending at \(y\) or vice versa; the order does not matter

\[\{ (x), (y) \}\]
Same as above

\[(x_1, \ldots, x_n), (y_1, \ldots, y_n)\]
An n-dimensional cube represented by a pair of its diagonally opposite corners

\[\{ (x_1, \ldots, x_n), (y_1, \ldots, y_n) \}\]
Same as above

It does not matter which order the opposite corners of a cube are entered in. The cube functions automatically swap values if needed to create a uniform “lower left — upper right” internal representation.

White space is ignored, so \[\{ (x), (y) \}\] is the same as \[\{ x \}, \{ y \}\].

F.8.2. Precision

Values are stored internally as 64-bit floating point numbers. This means that numbers with more than about 16 significant digits will be truncated.

F.8.3. Usage

The cube module includes a GiST index operator class for cube values. The operators supported by the GiST operator class are shown in Table F-4.

Table F-4. Cube GiST Operators

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(a = b)</td>
<td>The cubes (a) and (b) are identical.</td>
</tr>
<tr>
<td>(a &amp;&amp; b)</td>
<td>The cubes (a) and (b) overlap.</td>
</tr>
<tr>
<td>(a @&gt; b)</td>
<td>The cube (a) contains the cube (b).</td>
</tr>
<tr>
<td>(a &lt;@ b)</td>
<td>The cube (a) is contained in the cube (b).</td>
</tr>
</tbody>
</table>

(Before PostgreSQL 8.2, the containment operators \(>@\) and \(<@\) were respectively called \(@\) and \(\sim\). These names are still available, but are deprecated and will eventually be retired. Notice that the old names are reversed from the convention formerly followed by the core geometric data types!)

The standard B-tree operators are also provided, for example

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>([a, b] &lt; [c, d])</td>
<td>Less than</td>
</tr>
<tr>
<td>([a, b] &gt; [c, d])</td>
<td>Greater than</td>
</tr>
</tbody>
</table>
These operators do not make a lot of sense for any practical purpose but sorting. These operators first compare (a) to (c), and if these are equal, compare (b) to (d). That results in reasonably good sorting in most cases, which is useful if you want to use ORDER BY with this type.

Table F-5 shows the available functions.

**Table F-5. Cube Functions**

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cube(float8)</code> returns <code>cube</code></td>
<td>Makes a one dimensional cube with both coordinates the same. <code>cube(1) == '(1)'</code></td>
</tr>
<tr>
<td><code>cube(float8, float8)</code> returns <code>cube</code></td>
<td>Makes a one dimensional cube. <code>cube(1,2) == '(1),(2)'</code></td>
</tr>
<tr>
<td><code>cube(float8[])</code> returns <code>cube</code></td>
<td>Makes a zero-volume cube using the coordinates defined by the array. <code>cube(ARRAY[1,2]) == '(1,2)'</code></td>
</tr>
<tr>
<td><code>cube(float8[], float8[])</code> returns <code>cube</code></td>
<td>Makes a cube with upper right and lower left coordinates as defined by the two arrays, which must be of the same length. <code>cube('{1,2}'::float[], '{3,4}'::float[]) == '(1,2),(3,4)'</code></td>
</tr>
<tr>
<td><code>cube(cube, float8)</code> returns <code>cube</code></td>
<td>Makes a new cube by adding a dimension on to an existing cube with the same values for both parts of the new coordinate. This is useful for building cubes piece by piece from calculated values. <code>cube('(1)',2) == '(1,2),(1,2)'</code></td>
</tr>
<tr>
<td><code>cube(cube, float8, float8)</code> returns <code>cube</code></td>
<td>Makes a new cube by adding a dimension on to an existing cube. This is useful for building cubes piece by piece from calculated values. <code>cube('(1,2)',3,4) == '(1,3),(2,4)'</code></td>
</tr>
<tr>
<td><code>cube_dim(cube)</code> returns <code>int</code></td>
<td>Returns the number of dimensions of the cube</td>
</tr>
<tr>
<td><code>cube_ll_coord(cube, int)</code> returns <code>double</code></td>
<td>Returns the n’th coordinate value for the lower left corner of a cube</td>
</tr>
<tr>
<td><code>cube_ur_coord(cube, int)</code> returns <code>double</code></td>
<td>Returns the n’th coordinate value for the upper right corner of a cube</td>
</tr>
<tr>
<td><code>cube_is_point(cube)</code> returns <code>bool</code></td>
<td>Returns true if a cube is a point, that is, the two defining corners are the same.</td>
</tr>
<tr>
<td><code>cube_distance(cube, cube)</code> returns <code>double</code></td>
<td>Returns the distance between two cubes. If both cubes are points, this is the normal distance function.</td>
</tr>
</tbody>
</table>
Appendix F. Additional Supplied Modules

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cube_subset(cube, int[])</code> returns <code>cube</code></td>
<td>Makes a new cube from an existing cube, using a list of dimension indexes from an array. Can be used to find both the LL and UR coordinates of a single dimension, e.g. <code>cube_subset(cube('(1,3,5),(6,7,8)'), ARRAY[2]) = '(3),(7)'. Or can be used to drop dimensions, or reorder them as desired, e.g. </code>cube_subset(cube('(1,3,5),(6,7,8)'), ARRAY[3,2,1,1]) = '(5, 3, 1, 1),(8, 7, 6, 6)'.</td>
</tr>
<tr>
<td><code>cube_union(cube, cube)</code> returns <code>cube</code></td>
<td>Produces the union of two cubes</td>
</tr>
<tr>
<td><code>cube_inter(cube, cube)</code> returns <code>cube</code></td>
<td>Produces the intersection of two cubes</td>
</tr>
<tr>
<td><code>cube_enlarge(cube c, double r, int n)</code> returns <code>cube</code></td>
<td>Increases the size of a cube by a specified radius in at least n dimensions. If the radius is negative the cube is shrunk instead. This is useful for creating bounding boxes around a point for searching for nearby points. All defined dimensions are changed by the radius r. LL coordinates are decreased by r and UR coordinates are increased by r. If a LL coordinate is increased to larger than the corresponding UR coordinate (this can only happen when r &lt; 0) than both coordinates are set to their average. If n is greater than the number of defined dimensions and the cube is being increased (r &gt;= 0) then 0 is used as the base for the extra coordinates.</td>
</tr>
</tbody>
</table>

### F.8.4. Defaults

I believe this union:

```
select cube_union('0,5,2),(2,3,1)', '0');
cube_union
-------------------
(0, 0, 0),(2, 5, 2)
(1 row)
```

does not contradict common sense, neither does the intersection

```
select cube_inter('0,-1),(1,1)', '(-2),(2)');
cube_inter
------------
(0, 0),(1, 0)
(1 row)
```
In all binary operations on differently-dimensional cubes, I assume the lower-dimensional one to be a Cartesian projection, i.e., having zeroes in place of coordinates omitted in the string representation. The above examples are equivalent to:

```sql
cube_union(''(0,5,2),(2,3,1)'',''(0,0,0),(0,0,0)''');
cube_inter(''(0,-1),(1,1)'',''(-2,0),(2,0)''');
```

The following containment predicate uses the point syntax, while in fact the second argument is internally represented by a box. This syntax makes it unnecessary to define a separate point type and functions for (box,point) predicates.

```sql
select cube_contains(''(0,0),(1,1)'',''0.5,0.5'');
cube_contains
--------------
t
(1 row)
```

### F.8.5. Notes

For examples of usage, see the regression test `sql/cube.sql`.

To make it harder for people to break things, there is a limit of 100 on the number of dimensions of cubes. This is set in `cubedata.h` if you need something bigger.

### F.8.6. Credits

Original author: Gene Selkov, Jr. `<selkovjr@mcs.anl.gov>`, Mathematics and Computer Science Division, Argonne National Laboratory.

My thanks are primarily to Prof. Joe Hellerstein (http://db.cs.berkeley.edu/jmh/) for elucidating the gist of the GiST (http://gist.cs.berkeley.edu/), and to his former student, Andy Dong (http://best.me.berkeley.edu/~adong/), for his example written for Illustra, http://best.berkeley.edu/~adong/rtree/index.html. I am also grateful to all Postgres developers, present and past, for enabling myself to create my own world and live undisturbed in it. And I would like to acknowledge my gratitude to Argonne Lab and to the U.S. Department of Energy for the years of faithful support of my database research.

Minor updates to this package were made by Bruno Wolff III `<bruno@wolff.to>` in August/September of 2002. These include changing the precision from single precision to double precision and adding some new functions.

Additional updates were made by Joshua Reich `<josh@root.net>` in July 2006. These include `cube(float8[][], float8[][])` and cleaning up the code to use the V1 call protocol instead of the deprecated V0 protocol.
F.9. dblink

dblink is a module that supports connections to other PostgreSQL databases from within a database session.

See also postgres_fdw, which provides roughly the same functionality using a more modern and standards-compliant infrastructure.

dblink_connect

Name

dblink_connect — opens a persistent connection to a remote database

Synopsis

dblink_connect(text connstr) returns text

dblink_connect(text connname, text connstr) returns text

Description

dblink_connect() establishes a connection to a remote PostgreSQL database. The server and database to be contacted are identified through a standard libpq connection string. Optionally, a name can be assigned to the connection. Multiple named connections can be open at once, but only one unnamed connection is permitted at a time. The connection will persist until closed or until the database session is ended.

The connection string may also be the name of an existing foreign server. It is recommended to use the foreign-data wrapper dblink_fdw when defining the foreign server. See the example below, as well as CREATE SERVER and CREATE USER MAPPING.

Arguments

connname

The name to use for this connection; if omitted, an unnamed connection is opened, replacing any existing unnamed connection.

connstr

libpq-style connection info string, for example hostaddr=127.0.0.1 port=5432 dbname=mydb user=postgres password=mypassword options=-csearch_path=. For details see Section 31.1.1. Alternatively, the name of a foreign server.
Return Value

Returns status, which is always OK (since any error causes the function to throw an error instead of returning).

Notes

If untrusted users have access to a database that has not adopted a secure schema usage pattern, begin each session by removing publicly-writable schemas from search_path. One could, for example, add options=-csearch_path= to connstr. This consideration is not specific to dblink; it applies to every interface for executing arbitrary SQL commands.

Only superusers may use dblink_connect to create non-password-authenticated connections. If non-superusers need this capability, use dblink_connect_u instead.

It is unwise to choose connection names that contain equal signs, as this opens a risk of confusion with connection info strings in other dblink functions.

Examples

SELECT dblink_connect('dbname=postgres options=-csearch_path=');
  dblink_connect
-----------
  OK
(1 row)

SELECT dblink_connect('myconn', 'dbname=postgres options=-csearch_path=');
  dblink_connect
-----------
  OK
(1 row)

-- FOREIGN DATA WRAPPER functionality
-- Note: local connection must require password authentication for this to work properly
-- Otherwise, you will receive the following error from dblink_connect():
-- -----------------------------------------------
-- ERROR: password is required
-- DETAIL: Non-superuser cannot connect if the server does not request a password.
-- HINT: Target server’s authentication method must be changed.

CREATE SERVER fdtest FOREIGN DATA WRAPPER dblink_fdw OPTIONS (hostaddr '127.0.0.1', dbname

dblink_connect_u

Name

dblink_connect_u — opens a persistent connection to a remote database, insecurely

Synopsis

dblink_connect_u(text connstr) returns text
dblink_connect_u(text conname, text connstr) returns text

Description

dblink_connect_u() is identical to dblink_connect(), except that it will allow non-superusers to connect using any authentication method.

If the remote server selects an authentication method that does not involve a password, then impersonation and subsequent escalation of privileges can occur, because the session will appear to have originated from the user as which the local PostgreSQL server runs. Also, even if the remote server does demand a password, it is possible for the password to be supplied from the server environment, such as a ~/.pgpass file belonging to the server’s user. This opens not only a risk of impersonation, but the possibility of exposing a password to an untrustworthy remote server. Therefore, dblink_connect_u() is initially installed with all privileges revoked from PUBLIC, making it un-callable except by superusers. In some situations it may be appropriate to grant EXECUTE permission for dblink_connect_u() to specific users who are considered trustworthy, but this should be done with care. It is also recommended that any ~/.pgpass file belonging to the server’s user not contain any records specifying a wildcard host name.

For further details see dblink_connect().
dblink_disconnect

Name
dblink_disconnect — closes a persistent connection to a remote database

Synopsis
dblink_disconnect() returns text
dblink_disconnect(text connname) returns text

Description
dblink_disconnect() closes a connection previously opened by dblink_connect(). The form with no arguments closes an unnamed connection.

Arguments
connname

The name of a named connection to be closed.

Return Value
Returns status, which is always OK (since any error causes the function to throw an error instead of returning).

Examples
SELECT dblink_disconnect();
dblink_disconnect
-------------------
OK
(1 row)

SELECT dblink_disconnect('myconn');
dblink_disconnect
-------------------
OK
(1 row)
dblink

Name
dblink — executes a query in a remote database

Synopsis
dblink(text connname, text sql [, bool fail_on_error]) returns setof record
dblink(text connstr, text sql [, bool fail_on_error]) returns setof record
dblink(text sql [, bool fail_on_error]) returns setof record

Description
dblink executes a query (usually a SELECT, but it can be any SQL statement that returns rows) in a remote database.

When two text arguments are given, the first one is first looked up as a persistent connection’s name; if found, the command is executed on that connection. If not found, the first argument is treated as a connection info string as for dblink_connect, and the indicated connection is made just for the duration of this command.

Arguments
connname
Name of the connection to use; omit this parameter to use the unnamed connection.

connstr
A connection info string, as previously described for dblink_connect.

sql
The SQL query that you wish to execute in the remote database, for example select * from foo.

fail_on_error
If true (the default when omitted) then an error thrown on the remote side of the connection causes an error to also be thrown locally. If false, the remote error is locally reported as a NOTICE, and the function returns no rows.

Return Value
The function returns the row(s) produced by the query. Since dblink can be used with any query, it is declared to return record, rather than specifying any particular set of columns. This means that you must
specify the expected set of columns in the calling query — otherwise PostgreSQL would not know what to expect. Here is an example:

```sql
SELECT *
FROM dblink('dbname=mydb options=-csearch_path=’,
    'select proname, prosrc from pg_proc')
AS t1(proname name, prosrc text)
WHERE proname LIKE 'bytea%';
```

The “alias” part of the `FROM` clause must specify the column names and types that the function will return. (Specifying column names in an alias is actually standard SQL syntax, but specifying column types is a PostgreSQL extension.) This allows the system to understand what `*` should expand to, and what `proname` in the `WHERE` clause refers to, in advance of trying to execute the function. At run time, an error will be thrown if the actual query result from the remote database does not have the same number of columns shown in the `FROM` clause. The column names need not match, however, and `dblink` does not insist on exact type matches either. It will succeed so long as the returned data strings are valid input for the column type declared in the `FROM` clause.

**Notes**

A convenient way to use `dblink` with predetermined queries is to create a view. This allows the column type information to be buried in the view, instead of having to spell it out in every query. For example,

```sql
CREATE VIEW myremote_pg_proc AS
SELECT *
FROM dblink('dbname=postgres options=-csearch_path=’,
    'select proname, prosrc from pg_proc')
AS t1(proname name, prosrc text);

SELECT * FROM myremote_pg_proc WHERE proname LIKE 'bytea%';
```

**Examples**

```sql
SELECT * FROM dblink('dbname=postgres options=-csearch_path=’,
    'select proname, prosrc from pg_proc')
AS t1(proname name, prosrc text) WHERE proname LIKE 'bytea%';
```

**dblink_exec**

**Name**

dblink_exec — executes a command in a remote database

**Synopsis**

dblink_exec(text connname, text sql [, bool fail_on_error]) returns text
dblink_exec(text connstr, text sql [, bool fail_on_error]) returns text
dblink_exec(text sql [, bool fail_on_error]) returns text

**Description**

dblink_exec executes a command (that is, any SQL statement that doesn’t return rows) in a remote database.

When two text arguments are given, the first one is first looked up as a persistent connection’s name; if found, the command is executed on that connection. If not found, the first argument is treated as a connection info string as for dblink_connect, and the indicated connection is made just for the duration of this command.

**Arguments**

cconnname

Name of the connection to use; omit this parameter to use the unnamed connection.

cconnstr

A connection info string, as previously described for dblink_connect.

sql

The SQL command that you wish to execute in the remote database, for example insert into foo values(0,'a',"{a0","b0","c0"}").

fail_on_error

If true (the default when omitted) then an error thrown on the remote side of the connection causes an error to also be thrown locally. If false, the remote error is locally reported as a NOTICE, and the function’s return value is set to ERROR.

**Return Value**

Returns status, either the command’s status string or ERROR.
Examples

```sql
SELECT dblink_connect('dbname=dblink_test_standby');
   dblink_connect
--------------
   OK
(1 row)

SELECT dblink_exec('insert into foo values(21,"z","{"a0","b0","c0"}");');
   dblink_exec
-------------
   INSERT 943366 1
(1 row)

SELECT dblink_connect('myconn', 'dbname=regression');
   dblink_connect
--------------
   OK
(1 row)

SELECT dblink_exec('myconn', 'insert into foo values(21,"z","{"a0","b0","c0"}");');
   dblink_exec
-------------
   INSERT 6432584 1
(1 row)

SELECT dblink_exec('myconn', 'insert into pg_class values ("foo")',false);
NOTICE: sql error
DETAIL: ERROR: null value in column "relnamespace" violates not-null constraint

   dblink_exec
----------
   ERROR
(1 row)
```
**dblink_open**

**Name**

*dblink_open* — opens a cursor in a remote database

**Synopsis**

```plaintext
dblink_open(text cursorname, text sql [, bool fail_on_error]) returns text
dblink_open(text connname, text cursorname, text sql [, bool fail_on_error]) returns text
```

**Description**

*dblink_open()* opens a cursor in a remote database. The cursor can subsequently be manipulated with *dblink_fetch()* and *dblink_close()*.

**Arguments**

*connname*

Name of the connection to use; omit this parameter to use the unnamed connection.

*cursorname*

The name to assign to this cursor.

*sql*

The *SELECT* statement that you wish to execute in the remote database, for example *select * from pg_class.*

*fail_on_error*

If true (the default when omitted) then an error thrown on the remote side of the connection causes an error to also be thrown locally. If false, the remote error is locally reported as a NOTICE, and the function’s return value is set to *ERROR*.

**Return Value**

Returns status, either *OK* or *ERROR*.

**Notes**

Since a cursor can only persist within a transaction, *dblink_open* starts an explicit transaction block (*BEGIN*) on the remote side, if the remote side was not already within a transaction. This transaction will be closed again when the matching *dblink_close* is executed. Note that if you use *dblink_exec*
to change data between `dblink_open` and `dblink_close`, and then an error occurs or you use `dblink_disconnect` before `dblink_close`, your change will be lost because the transaction will be aborted.

Examples

```sql
SELECT dblink_connect('dbname=postgres options=-csearch_path=');
  dblink_connect
--------------
   OK
(1 row)

SELECT dblink_open('foo', 'select proname, prosrc from pg_proc');
  dblink_open
--------------
   OK
(1 row)
```
**dblink_fetch**

**Name**

dblink_fetch — returns rows from an open cursor in a remote database

**Synopsis**

dblink_fetch(text cursorname, int howmany [, bool fail_on_error]) returns setof record
dblink_fetch(text connname, text cursorname, int howmany [, bool fail_on_error]) returns setof record

**Description**

dblink_fetch fetches rows from a cursor previously established by dblink_open.

**Arguments**

connname

Name of the connection to use; omit this parameter to use the unnamed connection.

cursorname

The name of the cursor to fetch from.

howmany

The maximum number of rows to retrieve. The next howmany rows are fetched, starting at the current cursor position, moving forward. Once the cursor has reached its end, no more rows are produced.

fail_on_error

If true (the default when omitted) then an error thrown on the remote side of the connection causes an error to also be thrown locally. If false, the remote error is locally reported as a NOTICE, and the function returns no rows.

**Return Value**

The function returns the row(s) fetched from the cursor. To use this function, you will need to specify the expected set of columns, as previously discussed for dblink.

**Notes**

On a mismatch between the number of return columns specified in the FROM clause, and the actual number of columns returned by the remote cursor, an error will be thrown. In this event, the remote cursor is still
advanced by as many rows as it would have been if the error had not occurred. The same is true for any other error occurring in the local query after the remote FETCH has been done.

**Examples**

```sql
SELECT dblink_connect('dbname=postgres options=-csearch_path=');
-- dblink_connect
---------
     OK
(1 row)

SELECT dblink_open('foo', 'select proname, prosrc from pg_proc where proname like "bytea%"');
-- dblink_open
---------
     OK
(1 row)

SELECT * FROM dblink_fetch('foo', 5) AS (funcname name, source text);
  funcname | source
---------+---------
 byteacat | byteacat
 byteacmp | byteacmp
 byteaeq  | byteaeq
 byteage  | byteage
 byteagt  | byteagt
(5 rows)

SELECT * FROM dblink_fetch('foo', 5) AS (funcname name, source text);
  funcname | source
---------+---------
 byteain  | byteain
 byteale  | byteale
 bytealike | bytealike
 bytealt  | bytealt
 byteane  | byteane
(5 rows)

SELECT * FROM dblink_fetch('foo', 5) AS (funcname name, source text);
  funcname | source
---------+---------
 byteanlike | byteanlike
 byteaout  | byteaout
(2 rows)

SELECT * FROM dblink_fetch('foo', 5) AS (funcname name, source text);
  funcname | source
---------+---------
(0 rows)
```
**dblink_close**

**Name**

`dblink_close` — closes a cursor in a remote database

**Synopsis**

```
dblink_close(text cursorname [, bool fail_on_error]) returns text
dblink_close(text connname, text cursorname [, bool fail_on_error]) returns text
```

**Description**

`dblink_close` closes a cursor previously opened with `dblink_open`.

**Arguments**

- `connname`
  
  Name of the connection to use; omit this parameter to use the unnamed connection.

- `cursorname`
  
  The name of the cursor to close.

- `fail_on_error`
  
  If true (the default when omitted) then an error thrown on the remote side of the connection causes an error to also be thrown locally. If false, the remote error is locally reported as a NOTICE, and the function’s return value is set to `ERROR`.

**Return Value**

Returns status, either `OK` or `ERROR`.

**Notes**

If `dblink_open` started an explicit transaction block, and this is the last remaining open cursor in this connection, `dblink_close` will issue the matching `COMMIT`.

**Examples**

```
SELECT dblink_connect('dbname=postgres options=-csearch_path=');
dblink_connect
```

----------------
OK
(1 row)

SELECT dblink_open('foo', 'select proname, prosrc from pg_proc');
  dblink_open
----------------
OK
(1 row)

SELECT dblink_close('foo');
  dblink_close
----------------
OK
(1 row)
**dblink_get_connections**

**Name**

`dblink_get_connections` — returns the names of all open named `dblink` connections

**Synopsis**

`dblink_get_connections()` returns text[]

**Description**

`dblink_get_connections` returns an array of the names of all open named `dblink` connections.

**Return Value**

Returns a text array of connection names, or NULL if none.

**Examples**

```
SELECT dblink_get_connections();
```
**dblink_error_message**

**Name**

`dblink_error_message` — gets last error message on the named connection

**Synopsis**

`dblink_error_message(text connname) returns text`

**Description**

`dblink_error_message` fetches the most recent remote error message for a given connection.

**Arguments**

`connname`

Name of the connection to use.

**Return Value**

Returns last error message, or an empty string if there has been no error in this connection.

**Examples**

```sql
SELECT dblink_error_message('dtest1');
```
**dblink_send_query**

**Name**

dblink_send_query — sends an async query to a remote database

**Synopsis**

dblink_send_query(text connname, text sql) returns int

**Description**

dblink_send_query sends a query to be executed asynchronously, that is, without immediately waiting for the result. There must not be an async query already in progress on the connection.

After successfully dispatching an async query, completion status can be checked with dblink_is_busy, and the results are ultimately collected with dblink_get_result. It is also possible to attempt to cancel an active async query using dblink_cancel_query.

**Arguments**

connname

   Name of the connection to use.

sql

   The SQL statement that you wish to execute in the remote database, for example select * from pg_class.

**Return Value**

Returns 1 if the query was successfully dispatched, 0 otherwise.

**Examples**

SELECT dblink_send_query('dtest1', 'SELECT * FROM foo WHERE f1 < 3');
**dblink_is_busy**

**Name**

`dblink_is_busy` — checks if connection is busy with an async query

**Synopsis**

`dblink_is_busy(text conname) returns int`

**Description**

`dblink_is_busy` tests whether an async query is in progress.

**Arguments**

`conname`

Name of the connection to check.

**Return Value**

Returns 1 if connection is busy, 0 if it is not busy. If this function returns 0, it is guaranteed that `dblink_get_result` will not block.

**Examples**

```
SELECT dblink_is_busy('dtest1');
```
**dblink_get_notify**

**Name**

`dblink_get_notify` — retrieve async notifications on a connection

**Synopsis**

`dblink_get_notify()` returns `setof (notify_name text, be_pid int, extra text)`

`dblink_get_notify(text connname)` returns `setof (notify_name text, be_pid int, extra text)`

**Description**

`dblink_get_notify` retrieves notifications on either the unnamed connection, or on a named connection if specified. To receive notifications via dblink, `LISTEN` must first be issued, using `dblink_exec`. For details see `LISTEN` and `NOTIFY`.

**Arguments**

connname

The name of a named connection to get notifications on.

**Return Value**

Returns `setof (notify_name text, be_pid int, extra text)`, or an empty set if none.

**Examples**

```sql
SELECT dblink_exec('LISTEN virtual');
```

```
<table>
<thead>
<tr>
<th>notify_name</th>
<th>be_pid</th>
<th>extra</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```

(0 rows)

```sql
SELECT * FROM dblink_get_notify();
```

```
<table>
<thead>
<tr>
<th>notify_name</th>
<th>be_pid</th>
<th>extra</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```

(0 rows)

NOTIFY virtual;
NOTIFY
```sql
SELECT * FROM dblink_get_notify();

<table>
<thead>
<tr>
<th>notify_name</th>
<th>be_pid</th>
<th>extra</th>
</tr>
</thead>
<tbody>
<tr>
<td>virtual</td>
<td>1229</td>
<td></td>
</tr>
</tbody>
</table>

(1 row)
```
dblink_get_result

Name
dblink_get_result — gets an async query result

Synopsis
dblink_get_result(text connname [, bool fail_on_error]) returns setof record

Description
dblink_get_result collects the results of an asynchronous query previously sent with dblink_send_query. If the query is not already completed, dblink_get_result will wait until it is.

Arguments

connname
Name of the connection to use.

fail_on_error
If true (the default when omitted) then an error thrown on the remote side of the connection causes an error to also be thrown locally. If false, the remote error is locally reported as a NOTICE, and the function returns no rows.

Return Value
For an async query (that is, a SQL statement returning rows), the function returns the row(s) produced by the query. To use this function, you will need to specify the expected set of columns, as previously discussed for dblink.

For an async command (that is, a SQL statement not returning rows), the function returns a single row with a single text column containing the command’s status string. It is still necessary to specify that the result will have a single text column in the calling FROM clause.

Notes
This function must be called if dblink_send_query returned 1. It must be called once for each query sent, and one additional time to obtain an empty set result, before the connection can be used again.

When using dblink_send_query and dblink_get_result, dblink fetches the entire remote query result before returning any of it to the local query processor. If the query returns a large number of rows, this can result in transient memory bloat in the local session. It may be better to open such a query as a
cursor with `dblink_open` and then fetch a manageable number of rows at a time. Alternatively, use plain `dblink()`, which avoids memory bloat by spooling large result sets to disk.

## Examples

```sql
contrib_regression=# SELECT dblink_connect('dtest1', 'dbname=contrib_regression');
  dblink_connect
----------------
   OK
  (1 row)

contrib_regression=# SELECT * FROM contrib_regression-
contrib_regression=# dblink_send_query('dtest1', 'select * from foo where f1 < 3') AS t1;
  t1
----
1
  (1 row)

contrib_regression=# SELECT * FROM dblink_get_result('dtest1') AS t1(f1 int, f2 text, f3 text[]);
  f1 | f2 | f3
----+----+------------
  0 | a  | {a0,b0,c0}
  1 | b  | {a1,b1,c1}
  2 | c  | {a2,b2,c2}
(3 rows)

contrib_regression=# SELECT * FROM dblink_get_result('dtest1') AS t1(f1 int, f2 text, f3 text[]);
  f1 | f2 | f3
----+----+----
  0 | a  | {a0,b0,c0}
  1 | b  | {a1,b1,c1}
(3 rows)

contrib_regression=# SELECT * FROM dblink_get_result('dtest1') AS t1(f1 int, f2 text, f3 text[]);
  f1 | f2 | f3
----+----+---------------
  0 | a  | {a0,b0,c0}
  1 | b  | {a1,b1,c1}
  7 | h  | {a7,b7,c7}
  8 | i  | {a8,b8,c8}
(3 rows)
```
<table>
<thead>
<tr>
<th>f1</th>
<th>f2</th>
<th>f3</th>
</tr>
</thead>
<tbody>
<tr>
<td>9</td>
<td>j</td>
<td>{a9, b9, c9}</td>
</tr>
<tr>
<td>10</td>
<td>k</td>
<td>{a10, b10, c10}</td>
</tr>
</tbody>
</table>

(4 rows)

```sql
contrib_regression=# SELECT * FROM dblink_get_result('dtest1') AS t1(f1 int, f2 text, f3 text);
```

<table>
<thead>
<tr>
<th>f1</th>
<th>f2</th>
<th>f3</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

(0 rows)
dblink_cancel_query

Name
dblink_cancel_query — cancels any active query on the named connection

Synopsis
dblink_cancel_query(text connname) returns text

Description
dblink_cancel_query attempts to cancel any query that is in progress on the named connection. Note that this is not certain to succeed (since, for example, the remote query might already have finished). A cancel request simply improves the odds that the query will fail soon. You must still complete the normal query protocol, for example by calling dblink_get_result.

Arguments
cconnname

Name of the connection to use.

Return Value
Returns OK if the cancel request has been sent, or the text of an error message on failure.

Examples
SELECT dblink_cancel_query('dtest1');
dblink_get_pkey

Name

dblink_get_pkey — returns the positions and field names of a relation’s primary key fields

Synopsis

dblink_get_pkey(text relname) returns setof dblink_pkey_results

Description

dblink_get_pkey provides information about the primary key of a relation in the local database. This is sometimes useful in generating queries to be sent to remote databases.

Arguments

relname

Name of a local relation, for example foo or myschema.mytab. Include double quotes if the name is mixed-case or contains special characters, for example "FooBar"; without quotes, the string will be folded to lower case.

Return Value

Returns one row for each primary key field, or no rows if the relation has no primary key. The result row type is defined as

CREATE TYPE dblink_pkey_results AS (position int, colname text);

The position column simply runs from 1 to N; it is the number of the field within the primary key, not the number within the table’s columns.

Examples

CREATE TABLE foobar (  
    f1 int,  
    f2 int,  
    f3 int,  
    PRIMARY KEY (f1, f2, f3)  
);  
CREATE TABLE
SELECT * FROM dblink_get_pkey('foobar');

<table>
<thead>
<tr>
<th>position</th>
<th>colname</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>f1</td>
</tr>
<tr>
<td>2</td>
<td>f2</td>
</tr>
<tr>
<td>3</td>
<td>f3</td>
</tr>
</tbody>
</table>

(3 rows)
dblink_build_sql_insert

Name
dblink_build_sql_insert — builds an INSERT statement using a local tuple, replacing the primary key field values with alternative supplied values

Synopsis
dblink_build_sql_insert(text relname,
                   int2vector primary_key_attnums,
                   integer num_primary_key_atts,
                   text[] src_pk_att_vals_array,
                   text[] tgt_pk_att_vals_array) returns text

Description
dblink_build_sql_insert can be useful in doing selective replication of a local table to a remote database. It selects a row from the local table based on primary key, and then builds a SQL INSERT command that will duplicate that row, but with the primary key values replaced by the values in the last argument. (To make an exact copy of the row, just specify the same values for the last two arguments.)

Arguments

relname
Name of a local relation, for example foo or myschema.mytab. Include double quotes if the name is mixed-case or contains special characters, for example "FooBar"; without quotes, the string will be folded to lower case.

primary_key_attnums
Attribute numbers (1-based) of the primary key fields, for example 1 2.

num_primary_key_atts
The number of primary key fields.

src_pk_att_vals_array
Values of the primary key fields to be used to look up the local tuple. Each field is represented in text form. An error is thrown if there is no local row with these primary key values.

tgt_pk_att_vals_array
Values of the primary key fields to be placed in the resulting INSERT command. Each field is represented in text form.
Return Value

Returns the requested SQL statement as text.

Notes

As of PostgreSQL 9.0, the attribute numbers in primary_key_attnums are interpreted as logical column numbers, corresponding to the column’s position in SELECT * FROM relname. Previous versions interpreted the numbers as physical column positions. There is a difference if any column(s) to the left of the indicated column have been dropped during the lifetime of the table.

Examples

```
SELECT dblink_build_sql_insert('foo', '1 2', 2, 'l"a"', 'l"b"a"');

-------------
INSERT INTO foo(f1,f2,f3) VALUES('1','b"a",'1')
(1 row)
```
dblink_build_sql_delete

Name

dblink_build_sql_delete — builds a DELETE statement using supplied values for primary key field values

Synopsis

dblink_build_sql_delete(text relname,
                       int2vector primary_key_attnums,
                       integer num_primary_key_atts,
                       text[] tgt_pk_att_vals_array) returns text

Description

dblink_build_sql_delete can be useful in doing selective replication of a local table to a remote database. It builds a SQL DELETE command that will delete the row with the given primary key values.

Arguments

rename

Name of a local relation, for example foo or myschema.mytab. Include double quotes if the name is mixed-case or contains special characters, for example "FooBar"; without quotes, the string will be folded to lower case.

primary_key_attnums

Attribute numbers (1-based) of the primary key fields, for example 1 2.

num_primary_key_atts

The number of primary key fields.

tgt_pk_att_vals_array

Values of the primary key fields to be used in the resulting DELETE command. Each field is represented in text form.

Return Value

Returns the requested SQL statement as text.
Notes
As of PostgreSQL 9.0, the attribute numbers in `primary_key_attnums` are interpreted as logical column numbers, corresponding to the column’s position in `SELECT * FROM relname`. Previous versions interpreted the numbers as physical column positions. There is a difference if any column(s) to the left of the indicated column have been dropped during the lifetime of the table.

Examples

```
SELECT dblink_build_sql_delete("MyFoo", '1 2', 2, '{"1", "b"}');
```

```
-- dblink_build_sql_delete
DELETE FROM "MyFoo" WHERE f1='1' AND f2='b'
(1 row)
```
**dblink_build_sql_update**

**Name**

*dblink_build_sql_update* — builds an UPDATE statement using a local tuple, replacing the primary key field values with alternative supplied values.

**Synopsis**

```
dblink_build_sql_update(text relname,
                        int2vector primary_key_attnums,
                        integer num_primary_key_atts,
                        text[] src_pk_att_vals_array,
                        text[] tgt_pk_att_vals_array) returns text
```

**Description**

*dblink_build_sql_update* can be useful in doing selective replication of a local table to a remote database. It selects a row from the local table based on primary key, and then builds a SQL UPDATE command that will duplicate that row, but with the primary key values replaced by the values in the last argument. (To make an exact copy of the row, just specify the same values for the last two arguments.) The UPDATE command always assigns all fields of the row — the main difference between this and *dblink_build_sql_insert* is that it’s assumed that the target row already exists in the remote table.

**Arguments**

- **relname**
  
  Name of a local relation, for example *foo* or *myschema.mytab*. Include double quotes if the name is mixed-case or contains special characters, for example "FooBar"; without quotes, the string will be folded to lower case.

- **primary_key_attnums**
  
  Attribute numbers (1-based) of the primary key fields, for example 1 2.

- **num_primary_key_atts**
  
  The number of primary key fields.

- **src_pk_att_vals_array**
  
  Values of the primary key fields to be used to look up the local tuple. Each field is represented in text form. An error is thrown if there is no local row with these primary key values.

- **tgt_pk_att_vals_array**
  
  Values of the primary key fields to be placed in the resulting UPDATE command. Each field is represented in text form.
Return Value

Returns the requested SQL statement as text.

Notes

As of PostgreSQL 9.0, the attribute numbers in primary_key_attnums are interpreted as logical column numbers, corresponding to the column’s position in SELECT * FROM relname. Previous versions interpreted the numbers as physical column positions. There is a difference if any column(s) to the left of the indicated column have been dropped during the lifetime of the table.

Examples

```
SELECT dblink_build_sql_update('foo', '1 2', 2, '{"1", "a"}', '{"1", "b"}');
  dblink_build_sql_update
____________________________________________________
  UPDATE foo SET f1='1',f2='b',f3='1' WHERE f1='1' AND f2='b'
(1 row)
```
Appendix F. Additional Supplied Modules

F.10. dict_int

dict_int is an example of an add-on dictionary template for full-text search. The motivation for this example dictionary is to control the indexing of integers (signed and unsigned), allowing such numbers to be indexed while preventing excessive growth in the number of unique words, which greatly affects the performance of searching.

F.10.1. Configuration

The dictionary accepts two options:

- The `maxlen` parameter specifies the maximum number of digits allowed in an integer word. The default value is 6.
- The `rejectlong` parameter specifies whether an overlength integer should be truncated or ignored. If `rejectlong` is `false` (the default), the dictionary returns the first `maxlen` digits of the integer. If `rejectlong` is `true`, the dictionary treats an overlength integer as a stop word, so that it will not be indexed. Note that this also means that such an integer cannot be searched for.

F.10.2. Usage

Installing the `dict_int` extension creates a text search template `intdict_template` and a dictionary `intdict` based on it, with the default parameters. You can alter the parameters, for example

```sql
mydb# ALTER TEXT SEARCH DICTIONARY intdict (MAXLEN = 4, REJECTLONG = true);
```

or create new dictionaries based on the template.

To test the dictionary, you can try

```sql
mydb# select ts_lexize('intdict', '12345678');
```

```
{123456}
```

but real-world usage will involve including it in a text search configuration as described in Chapter 12. That might look like this:

```sql
ALTER TEXT SEARCH CONFIGURATION english
    ALTER MAPPING FOR int, uint WITH intdict;
```
F.11. dict_xsyn

dict_xsyn (Extended Synonym Dictionary) is an example of an add-on dictionary template for full-text search. This dictionary type replaces words with groups of their synonyms, and so makes it possible to search for a word using any of its synonyms.

F.11.1. Configuration

A dict_xsyn dictionary accepts the following options:

- `matchorig` controls whether the original word is accepted by the dictionary. Default is `true`.
- `matchsynonyms` controls whether the synonyms are accepted by the dictionary. Default is `false`.
- `keeporig` controls whether the original word is included in the dictionary’s output. Default is `true`.
- `keepsynonyms` controls whether the synonyms are included in the dictionary’s output. Default is `true`.
- `rules` is the base name of the file containing the list of synonyms. This file must be stored in `$SHAREDIR/tsearch_data/` (where `$SHAREDIR` means the PostgreSQL installation’s shared-data directory). Its name must end in `.rules` (which is not to be included in the `rules` parameter).

The rules file has the following format:

- Each line represents a group of synonyms for a single word, which is given first on the line. Synonyms are separated by whitespace, thus:
  
  `word syn1 syn2 syn3`
  
- The sharp (`#`) sign is a comment delimiter. It may appear at any position in a line. The rest of the line will be skipped.

Look at `xsyn_sample.rules`, which is installed in `$SHAREDIR/tsearch_data/`, for an example.

F.11.2. Usage

Installing the dict_xsyn extension creates a text search template `xsyn_template` and a dictionary `xsyn` based on it, with default parameters. You can alter the parameters, for example

```
mydb# ALTER TEXT SEARCH DICTIONARY xsyn (RULES='my_rules', KEEPORIG=false);
```

or create new dictionaries based on the template.

To test the dictionary, you can try

```
mydb# SELECT ts_lexize('xsyn', 'word');
```

```
[ syn1, syn2, syn3 ]
```

```
mydb# ALTER TEXT SEARCH DICTIONARY xsyn (RULES='my_rules', KEEPORIG=true);
```

```
ALTER TEXT SEARCH DICTIONARY
```

3055
mydb=# SELECT ts_lexize('xsyn', 'word');
  ts_lexize
--------------
  {word, syn1, syn2, syn3}

mydb# ALTER TEXT SEARCH DICTIONARY xsyn (RULES='my_rules', KEEPORIG=false, MATCHSYNONYMS=true);
 ALTER TEXT SEARCH DICTIONARY

mydb=# SELECT ts_lexize('xsyn', 'syn1');
  ts_lexize
--------------
  {syn1, syn2, syn3}

mydb# ALTER TEXT SEARCH DICTIONARY xsyn (RULES='my_rules', KEEPORIG=true, MATCHORIG=false, KEEPSYNONYMS=false);
 ALTER TEXT SEARCH DICTIONARY

mydb=# SELECT ts_lexize('xsyn', 'syn1');
  ts_lexize
--------------
  {word}

Real-world usage will involve including it in a text search configuration as described in Chapter 12. That might look like this:

ALTER TEXT SEARCH CONFIGURATION english
  ALTER MAPPING FOR word, asciiword WITH xsyn, english_stem;

F.12. dummy_seclabel

The dummy_seclabel module exists only to support regression testing of the SECURITY LABEL statement. It is not intended to be used in production.

F.12.1. Rationale

The SECURITY LABEL statement allows the user to assign security labels to database objects; however, security labels can only be assigned when specifically allowed by a loadable module, so this module is provided to allow proper regression testing.

Security label providers intended to be used in production will typically be dependent on a platform-specific feature such as SE-Linux. This module is platform-independent, and therefore better-suited to regression testing.
F.12.2. Usage

Here's a simple example of usage:

```sql
# postgresql.conf
shared_preload_libraries = 'dummy_seclabel'

postgres=# CREATE TABLE t (a int, b text);
CREATE TABLE

postgres=# SECURITY LABEL ON TABLE t IS 'classified';
SECURITY LABEL
```

The `dummy_seclabel` module provides only four hardcoded labels: `unclassified`, `classified`, `secret`, and `top secret`. It does not allow any other strings as security labels. These labels are not used to enforce access controls. They are only used to check whether the `SECURITY LABEL` statement works as expected, or not.

F.12.3. Author

KaiGai Kohei <kaigai@ak.jp.nec.com>

F.13. earthdistance

The `earthdistance` module provides two different approaches to calculating great circle distances on the surface of the Earth. The one described first depends on the `cube` module (which must be installed before `earthdistance` can be installed). The second one is based on the built-in `point` data type, using longitude and latitude for the coordinates.

In this module, the Earth is assumed to be perfectly spherical. (If that's too inaccurate for you, you might want to look at the PostGIS¹ project.)

F.13.1. Cube-based Earth Distances

Data is stored in cubes that are points (both corners are the same) using 3 coordinates representing the x, y, and z distance from the center of the Earth. A domain `earth` over `cube` is provided, which includes constraint checks that the value meets these restrictions and is reasonably close to the actual surface of the Earth.

The radius of the Earth is obtained from the `earth()` function. It is given in meters. But by changing this one function you can change the module to use some other units, or to use a different value of the radius that you feel is more appropriate.

This package has applications to astronomical databases as well. Astronomers will probably want to change `earth()` to return a radius of `180/pi()` so that distances are in degrees.

¹. http://postgis.net/
Appendix F. Additional Supplied Modules

Functions are provided to support input in latitude and longitude (in degrees), to support output of latitude and longitude, to calculate the great circle distance between two points and to easily specify a bounding box usable for index searches.

The provided functions are shown in Table F-6.

### Table F-6. Cube-based Earthdistance Functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Returns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>earth()</td>
<td>float8</td>
<td>Returns the assumed radius of the Earth.</td>
</tr>
<tr>
<td>sec_to_gc(float8)</td>
<td>float8</td>
<td>Converts the normal straight line (secant) distance between two points on the surface of the Earth to the great circle distance between them.</td>
</tr>
<tr>
<td>gc_to_sec(float8)</td>
<td>float8</td>
<td>Converts the great circle distance between two points on the surface of the Earth to the normal straight line (secant) distance between them.</td>
</tr>
<tr>
<td>ll_to_earth(float8, float8)</td>
<td>earth</td>
<td>Returns the location of a point on the surface of the Earth given its latitude (argument 1) and longitude (argument 2) in degrees.</td>
</tr>
<tr>
<td>latitude(earth)</td>
<td>float8</td>
<td>Returns the latitude in degrees of a point on the surface of the Earth.</td>
</tr>
<tr>
<td>longitude(earth)</td>
<td>float8</td>
<td>Returns the longitude in degrees of a point on the surface of the Earth.</td>
</tr>
<tr>
<td>earth_distance(earth, earth)</td>
<td>float8</td>
<td>Returns the great circle distance between two points on the surface of the Earth.</td>
</tr>
<tr>
<td>earth_box(earth, float8)</td>
<td>cube</td>
<td>Returns a box suitable for an indexed search using the cube @&gt; operator for points within a given great circle distance of a location. Some points in this box are further than the specified great circle distance from the location, so a second check using earth_distance should be included in the query.</td>
</tr>
</tbody>
</table>
F.13.2. Point-based Earth Distances

The second part of the module relies on representing Earth locations as values of type `point`, in which the first component is taken to represent longitude in degrees, and the second component is taken to represent latitude in degrees. Points are taken as (longitude, latitude) and not vice versa because longitude is closer to the intuitive idea of x-axis and latitude to y-axis.

A single operator is provided, shown in Table F-7.

<table>
<thead>
<tr>
<th>Operator</th>
<th>Returns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>point &lt;@&gt; point</code></td>
<td>float8</td>
<td>Gives the distance in statute miles between two points on the Earth’s surface.</td>
</tr>
</tbody>
</table>

Note that unlike the `cube`-based part of the module, units are hardwired here: changing the `earth()` function will not affect the results of this operator.

One disadvantage of the longitude/latitude representation is that you need to be careful about the edge conditions near the poles and near +/- 180 degrees of longitude. The `cube`-based representation avoids these discontinuities.

F.14. file_fdw

The `file_fdw` module provides the foreign-data wrapper `file_fdw`, which can be used to access data files in the server’s file system. Data files must be in a format that can be read by `COPY FROM`; see `COPY` for details. Access to such data files is currently read-only.

A foreign table created using this wrapper can have the following options:

- **filename**
  - Specifies the file to be read. Required. Must be an absolute path name.
- **format**
  - Specifies the file’s format, the same as `COPY`’s `FORMAT` option.
- **header**
  - Specifies whether the file has a header line, the same as `COPY`’s `HEADER` option.
- **delimiter**
  - Specifies the file’s delimiter character, the same as `COPY`’s `DELIMITER` option.
- **quote**
  - Specifies the file’s quote character, the same as `COPY`’s `QUOTE` option.
- **escape**
  - Specifies the file’s escape character, the same as `COPY`’s `ESCAPE` option.
null

Specifies the file’s null string, the same as COPY’s NULL option.

encoding

Specifies the file’s encoding, the same as COPY’s ENCODING option.

Note that while COPY allows options such as OIDS and HEADER to be specified without a corresponding value, the foreign data wrapper syntax requires a value to be present in all cases. To activate COPY options normally supplied without a value, you can instead pass the value TRUE.

A column of a foreign table created using this wrapper can have the following options:

force_not_null

This is a Boolean option. If true, it specifies that values of the column should not be matched against the null string (that is, the file-level null option). This has the same effect as listing the column in COPY’s FORCE_NOT_NULL option.

force_null

This is a Boolean option. If true, it specifies that values of the column which match the null string are returned as NULL even if the value is quoted. Without this option, only unquoted values matching the null string are returned as NULL. This has the same effect as listing the column in COPY’s FORCE_NULL option.

COPY’s OIDS and FORCE_QUOTE options are currently not supported by file_fdw.

These options can only be specified for a foreign table or its columns, not in the options of the file_fdw foreign-data wrapper, nor in the options of a server or user mapping using the wrapper.

Changing table-level options requires superuser privileges, for security reasons: only a superuser should be able to determine which file is read. In principle non-superusers could be allowed to change the other options, but that’s not supported at present.

For a foreign table using file_fdw, EXPLAIN shows the name of the file to be read. Unless COSTS OFF is specified, the file size (in bytes) is shown as well.

Example F-1. Create a Foreign Table for PostgreSQL CSV Logs

One of the obvious uses for the file_fdw is to make the PostgreSQL activity log available as a table for querying. To do this, first you must be logging to a CSV file, which here we will call pglog.csv. First, install file_fdw as an extension:

CREATE EXTENSION file_fdw;

Then create a foreign server:

CREATE SERVER pglog FOREIGN DATA WRAPPER file_fdw;

Now you are ready to create the foreign data table. Using the CREATE FOREIGN TABLE command, you will need to define the columns for the table, the CSV file name, and its format:

CREATE FOREIGN TABLE pglog (  
    log_time timestamp(3) with time zone,  
    user_name text,  
    database_name text,  
    process_id integer,  
    connection_from text,  
)
session_id text,
session_line_num bigint,
command_tag text,
session_start_time timestamp with time zone,
virtual_transaction_id text,
transaction_id bigint,
error_severity text,
sql_state_code text,
message text,
detail text,
hint text,
normal_query text,
normal_query_pos integer,
context text,
query text,
query_pos integer,
location text,
application_name text
) SERVER pglog
OPTIONS ( filename '/home/josh/9.1/data/pg_log/pglog.csv', format 'csv' );

That’s it — now you can query your log directly. In production, of course, you would need to define some way to deal with log rotation.

### F.15. fuzzystrmatch

The `fuzzystrmatch` module provides several functions to determine similarities and distance between strings.

<table>
<thead>
<tr>
<th>Caution</th>
</tr>
</thead>
<tbody>
<tr>
<td>At present, the <code>soundex</code>, <code>metaphone</code>, <code>dmetaphone</code>, and <code>dmetaphone_alt</code> functions do not work well with multibyte encodings (such as UTF-8).</td>
</tr>
</tbody>
</table>

#### F.15.1. Soundex

The Soundex system is a method of matching similar-sounding names by converting them to the same code. It was initially used by the United States Census in 1880, 1900, and 1910. Note that Soundex is not very useful for non-English names.

The `fuzzystrmatch` module provides two functions for working with Soundex codes:

- `soundex(text) returns text`
- `difference(text, text) returns int`

The `soundex` function converts a string to its Soundex code. The `difference` function converts two strings to their Soundex codes and then reports the number of matching code positions. Since Soundex
Appendix F. Additional Supplied Modules

codes have four characters, the result ranges from zero to four, with zero being no match and four being an exact match. (Thus, the function is misnamed — similarity would have been a better name.)

Here are some usage examples:

```
SELECT soundex('hello world!');

SELECT soundex('Anne'), soundex('Ann'), difference('Anne', 'Ann');
SELECT soundex('Anne'), soundex('Andrew'), difference('Anne', 'Andrew');
SELECT soundex('Anne'), soundex('Margaret'), difference('Anne', 'Margaret');

CREATE TABLE s (nm text);

INSERT INTO s VALUES ('john');
INSERT INTO s VALUES ('joan');
INSERT INTO s VALUES ('wobbly');
INSERT INTO s VALUES ('jack');

SELECT * FROM s WHERE soundex(nm) = soundex('john');
SELECT * FROM s WHERE difference(s.nm, 'john') > 2;

F.15.2. Levenshtein

This function calculates the Levenshtein distance between two strings:

```
levenshtein(text source, text target, int ins_cost, int del_cost, int sub_cost) returns int
levenshtein(text source, text target) returns int
levenshtein_less_equal(text source, text target, int ins_cost, int del_cost, int sub_cost, int max_d) returns int
levenshtein_less_equal(text source, text target, int max_d) returns int
```

Both source and target can be any non-null string, with a maximum of 255 bytes. The cost parameters specify how much to charge for a character insertion, deletion, or substitution, respectively. You can omit the cost parameters, as in the second version of the function; in that case they all default to 1. `levenshtein_less_equal` is accelerated version of levenshtein function for low values of distance. If actual distance is less or equal then max_d, then levenshtein_less_equal returns accurate value of it. Otherwise this function returns value which is greater than max_d.

Examples:

```
test=# SELECT levenshtein('GUMBO', 'GAMBOL');
  levenshtein
-----------------
     2
(1 row)

test=# SELECT levenshtein('GUMBO', 'GAMBOL', 2,1,1);
  levenshtein
-----------------
     3
(1 row)
```
Appendix F. Additional Supplied Modules

Example:

test=# SELECT levenshtein_less_equal('extensive', 'exhaustive', 2);
levenshtein_less_equal
------------------------
            3
   (1 row)

test=# SELECT levenshtein_less_equal('extensive', 'exhaustive', 4);
levenshtein_less_equal
------------------------
            4
   (1 row)

F.15.3. Metaphone

Metaphone, like Soundex, is based on the idea of constructing a representative code for an input string. Two strings are then deemed similar if they have the same codes.

This function calculates the metaphone code of an input string:

metaphone(text source, int max_output_length) returns text

source has to be a non-null string with a maximum of 255 characters. max_output_length sets the maximum length of the output metaphone code; if longer, the output is truncated to this length.

Example:

test=# SELECT metaphone('GUMBO', 4);
metaphone
-----------
           KM
   (1 row)

F.15.4. Double Metaphone

The Double Metaphone system computes two “sounds like” strings for a given input string — a “primary” and an “alternate”. In most cases they are the same, but for non-English names especially they can be a bit different, depending on pronunciation. These functions compute the primary and alternate codes:

dmetaphone(text source) returns text
dmetaphone_alt(text source) returns text

There is no length limit on the input strings.

Example:

test=# select dmetaphone('gumbo');
   dmetaphone
-----------
           KMP
   (1 row)
F.16. hstore

This module implements the hstore data type for storing sets of key/value pairs within a single PostgreSQL value. This can be useful in various scenarios, such as rows with many attributes that are rarely examined, or semi-structured data. Keys and values are simply text strings.

F.16.1. hstore External Representation

The text representation of an hstore, used for input and output, includes zero or more key => value pairs separated by commas. Some examples:

\[
\begin{aligned}
 k & => v \\
 foo & => bar, baz & => whatever \\
 "1-a" & => "anything at all"
\end{aligned}
\]

The order of the pairs is not significant (and may not be reproduced on output). Whitespace between pairs or around the => sign is ignored. Double-quote keys and values that include whitespace, commas, =s or >s. To include a double quote or a backslash in a key or value, escape it with a backslash.

Each key in an hstore is unique. If you declare an hstore with duplicate keys, only one will be stored in the hstore and there is no guarantee as to which will be kept:

```
SELECT 'a=>1,a=>2 '::hstore;
 hstore
----------
 "a"=>"1"
```

A value (but not a key) can be an SQL NULL. For example:

```
key => NULL
```

The NULL keyword is case-insensitive. Double-quote the NULL to treat it as the ordinary string “NULL”.

**Note:** Keep in mind that the hstore text format, when used for input, applies before any required quoting or escaping. If you are passing an hstore literal via a parameter, then no additional processing is needed. But if you’re passing it as a quoted literal constant, then any single-quote characters and (depending on the setting of the standard_conforming_strings configuration parameter) backslash characters need to be escaped correctly. See Section 4.1.2.1 for more on the handling of string constants.

On output, double quotes always surround keys and values, even when it’s not strictly necessary.

F.16.2. hstore Operators and Functions

The operators provided by the hstore module are shown in Table F-8, the functions in Table F-9.
<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
<th>Example</th>
<th>Result</th>
</tr>

</tbody>
</table>
### Function Table

<table>
<thead>
<tr>
<th>Function</th>
<th>Return Type</th>
<th>Description</th>
<th>Example</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>delete(hstore, text)</td>
<td>hstore</td>
<td>delete pair with matching key</td>
<td>delete('a=&gt;1,b=&gt;2','b')</td>
<td>&quot;a&quot;=&gt;'1'</td>
</tr>
<tr>
<td>delete(hstore, text[])</td>
<td>hstore</td>
<td>delete pairs with matching keys</td>
<td>delete('a=&gt;1,b=&gt;2,c=&gt;3',ARRAY['a','b'])</td>
<td>&quot;c&quot;=&gt;'3'</td>
</tr>
<tr>
<td>delete(hstore, hstore)</td>
<td>hstore</td>
<td>delete pairs matching those in the second argument</td>
<td>delete('a=&gt;1,b=&gt;2','a=&gt;4,b=&gt;2'::hstore)</td>
<td>&quot;a&quot;=&gt;'1'</td>
</tr>
<tr>
<td>populate_record(record, hstore)</td>
<td>record</td>
<td>replace fields in record with matching values from hstore</td>
<td>see Examples section</td>
<td></td>
</tr>
</tbody>
</table>

**Note:** The function `hstore_to_json` is used when an hstore value is cast to json. Likewise, `hstore_to_jsonb` is used when an hstore value is cast to jsonb.

**Note:** The function `populate_record` is actually declared with `anyelement`, not `record`, as its first argument, but it will reject non-record types with a run-time error.

### F.16.3. Indexes

hstore has GiST and GIN index support for the @>, ?, ?& and ?| operators. For example:

```sql
CREATE INDEX hidx ON testhstore USING GIST (h);
CREATE INDEX hidx ON testhstore USING GIN (h);
```

hstore also supports btree or hash indexes for the = operator. This allows hstore columns to be declared UNIQUE, or to be used in GROUP BY, ORDER BY or DISTINCT expressions. The sort ordering for hstore values is not particularly useful, but these indexes may be useful for equivalence lookups. Create indexes for = comparisons as follows:

```sql
CREATE INDEX hidx ON testhstore USING BTREE (h);
CREATE INDEX hidx ON testhstore USING HASH (h);
```

### F.16.4. Examples

Add a key, or update an existing key with a new value:

```sql
UPDATE tab SET h = h || hstore('c', '3');
```
Appendix F. Additional Supplied Modules

Delete a key:

UPDATE tab SET h = delete(h, 'k1');

**Convert a record to an hstore:**

CREATE TABLE test (col1 integer, col2 text, col3 text);
INSERT INTO test VALUES (123, 'foo', 'bar');

SELECT hstore(t) FROM test AS t;

<table>
<thead>
<tr>
<th>hstore</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;col1&quot;=&gt;&quot;123&quot;, &quot;col2&quot;=&gt;&quot;foo&quot;, &quot;col3&quot;=&gt;&quot;bar&quot;</td>
</tr>
</tbody>
</table>

(1 row)

**Convert an hstore to a predefined record type:**

CREATE TABLE test (col1 integer, col2 text, col3 text);

SELECT * FROM populate_record(null::test, "col1"=>"456", "col2"=>"zzz");

<table>
<thead>
<tr>
<th>col1</th>
<th>col2</th>
<th>col3</th>
</tr>
</thead>
<tbody>
<tr>
<td>456</td>
<td>zzz</td>
<td></td>
</tr>
</tbody>
</table>

(1 row)

**Modify an existing record using the values from an hstore:**

CREATE TABLE test (col1 integer, col2 text, col3 text);
INSERT INTO test VALUES (123, 'foo', 'bar');

SELECT (r).* FROM (SELECT t #= "col3"=>"baz" AS r FROM test t) s;

<table>
<thead>
<tr>
<th>col1</th>
<th>col2</th>
<th>col3</th>
</tr>
</thead>
<tbody>
<tr>
<td>123</td>
<td>foo</td>
<td>baz</td>
</tr>
</tbody>
</table>

(1 row)

---

**F.16.5. Statistics**

The hstore type, because of its intrinsic liberality, could contain a lot of different keys. Checking for valid keys is the task of the application. The following examples demonstrate several techniques for checking keys and obtaining statistics.

Simple example:
SELECT * FROM each('aaa=>bq, b=>NULL, ""=>l');

Using a table:

SELECT (each(h)).key, (each(h)).value INTO stat FROM testhstore;

Online statistics:

SELECT key, count(*) FROM (SELECT (each(h)).key FROM testhstore) AS stat GROUP BY key ORDER BY count DESC, key;

<table>
<thead>
<tr>
<th>key</th>
<th>count</th>
</tr>
</thead>
<tbody>
<tr>
<td>line</td>
<td>883</td>
</tr>
<tr>
<td>query</td>
<td>207</td>
</tr>
<tr>
<td>pos</td>
<td>203</td>
</tr>
<tr>
<td>node</td>
<td>202</td>
</tr>
<tr>
<td>space</td>
<td>197</td>
</tr>
<tr>
<td>status</td>
<td>195</td>
</tr>
<tr>
<td>public</td>
<td>194</td>
</tr>
<tr>
<td>title</td>
<td>190</td>
</tr>
<tr>
<td>org</td>
<td>189</td>
</tr>
</tbody>
</table>

F.16.6. Compatibility

As of PostgreSQL 9.0, hstore uses a different internal representation than previous versions. This presents no obstacle for dump/restore upgrades since the text representation (used in the dump) is unchanged.

In the event of a binary upgrade, upward compatibility is maintained by having the new code recognize old-format data. This will entail a slight performance penalty when processing data that has not yet been modified by the new code. It is possible to force an upgrade of all values in a table column by doing an UPDATE statement as follows:

UPDATE tablename SET hstorecol = hstorecol || "";

Another way to do it is:

ALTER TABLE tablename ALTER hstorecol TYPE hstore USING hstorecol || "";

The ALTER TABLE method requires an exclusive lock on the table, but does not result in bloating the table with old row versions.
F.16.7. Authors

Oleg Bartunov <oleg@sai.msu.su>, Moscow, Moscow University, Russia
Teodor Sigaev <teodor@sigaev.ru>, Moscow, Delta-Soft Ltd., Russia
Additional enhancements by Andrew Gierth <andrew@taoli11.riddles.org.uk>, United Kingdom

F.17. intagg

The intagg module provides an integer aggregator and an enumerator. intagg is now obsolete, because there are built-in functions that provide a superset of its capabilities. However, the module is still provided as a compatibility wrapper around the built-in functions.

F.17.1. Functions

The aggregator is an aggregate function int_array_aggregate(integer) that produces an integer array containing exactly the integers it is fed. This is a wrapper around array_agg, which does the same thing for any array type.

The enumerator is a function int_array_enum(integer[]) that returns setof integer. It is essentially the reverse operation of the aggregator: given an array of integers, expand it into a set of rows. This is a wrapper around unnest, which does the same thing for any array type.

F.17.2. Sample Uses

Many database systems have the notion of a one to many table. Such a table usually sits between two indexed tables, for example:

CREATE TABLE left (id INT PRIMARY KEY, ...);
CREATE TABLE right (id INT PRIMARY KEY, ...);
CREATE TABLE one_to_many(left INT REFERENCES left, right INT REFERENCES right);

It is typically used like this:

SELECT right.*, from right JOIN one_to_many ON (right.id = one_to_many.right)
   WHERE one_to_many.left = item;

This will return all the items in the right hand table for an entry in the left hand table. This is a very common construct in SQL.

Now, this methodology can be cumbersome with a very large number of entries in the one_to_many table. Often, a join like this would result in an index scan and a fetch for each right hand entry in the table for a particular left hand entry. If you have a very dynamic system, there is not much you can do. However, if you have some data which is fairly static, you can create a summary table with the aggregator.

CREATE TABLE summary AS
   SELECT left, int_array_aggregate(right) AS right
   FROM one_to_many
GROUP BY left;

This will create a table with one row per left item, and an array of right items. Now this is pretty useless
without some way of using the array; that’s why there is an array enumerator. You can do

```sql
SELECT left, int_array_enum(right) FROM summary WHERE left = item;
```

The above query using `int_array_enum` produces the same results as

```sql
SELECT left, right FROM one_to_many WHERE left = item;
```

The difference is that the query against the summary table has to get only one row from the table, whereas
the direct query against `one_to_many` must index scan and fetch a row for each entry.

On one system, an `EXPLAIN` showed a query with a cost of 8488 was reduced to a cost of 329. The original
query was a join involving the `one_to_many` table, which was replaced by:

```sql
SELECT right, count(right) FROM
  ( SELECT left, int_array_enum(right) AS right
    FROM summary JOIN (SELECT left FROM left_table WHERE left = item) AS lefts
    ON (summary.left = lefts.left)
  ) AS list
GROUP BY right
ORDER BY count DESC;
```

### F.18. intarray

The `intarray` module provides a number of useful functions and operators for manipulating null-free
arrays of integers. There is also support for indexed searches using some of the operators.

All of these operations will throw an error if a supplied array contains any NULL elements.

Many of these operations are only sensible for one-dimensional arrays. Although they will accept input
arrays of more dimensions, the data is treated as though it were a linear array in storage order.

#### F.18.1. intarray Functions and Operators

The functions provided by the `intarray` module are shown in Table F-10, the operators in Table F-11.

**Table F-10. intarray Functions**

</tbody>
</table>

(Before PostgreSQL 8.2, the containment operators `@>` and `<@` were respectively called `@` and `~`. These names are still available, but are deprecated and will eventually be retired. Notice that the old names are reversed from the convention formerly followed by the core geometric data types!) The operators `&&`, `@>`, and `<@` are equivalent to PostgreSQL’s built-in operators of the same names, except that they work only on integer arrays that do not contain nulls, while the built-in operators work for any array type. This restriction makes them faster than the built-in operators in many cases. The `@@` and ~~ operators test whether an array satisfies a query, which is expressed as a value of a specialized data type `query_int`. A query consists of integer values that are checked against the elements of the array, possibly combined using the operators `&` (AND), `|` (OR), and `!` (NOT). Parentheses can be used as needed. For example, the query `1&(2|3)` matches arrays that contain 1 and also contain either 2 or 3.

### F.18.2. Index Support

`intarray` provides index support for the `&&`, `@>`, `<@`, and `@@` operators, as well as regular array equality. Two GiST index operator classes are provided: `gist__int_ops` (used by default) is suitable for small- to medium-size data sets, while `gist__intbig_ops` uses a larger signature and is more suitable for indexing large data sets (i.e., columns containing a large number of distinct array values). The implementation uses an RD-tree data structure with built-in lossy compression.

There is also a non-default GIN operator class `gin__int_ops` supporting the same operators. The choice between GiST and GIN indexing depends on the relative performance characteristics of GiST and GIN, which are discussed elsewhere. As a rule of thumb, a GIN index is faster to search than a GiST index, but slower to build or update; so GIN is better suited for static data and GiST for often-updated data.

### F.18.3. Example

-- a message can be in one or more “sections”
CREATE TABLE message (mid INT PRIMARY KEY, sections INT[], ...);
-- create specialized index
CREATE INDEX message_rdtree_idx ON message USING GIST (sections gist__int_ops);
-- select messages in section 1 OR 2 - OVERLAP operator
SELECT message.mid FROM message WHERE message.sections && '{1,2}';
-- select messages in sections 1 AND 2 - CONTAINS operator
SELECT message.mid FROM message WHERE message.sections @> '(1,2)';

-- the same, using QUERY operator
SELECT message.mid FROM message WHERE message.sections @@ '1&2::query_int;

F.18.4. Benchmark

The source directory contrib/intarray/bench contains a benchmark test suite. To run:

    cd .../bench
    createdb TEST
    psql TEST < ../_int.sql
    ./create_test.pl | psql TEST
    ./bench.pl

The bench.pl script has numerous options, which are displayed when it is run without any arguments.

F.18.5. Authors

All work was done by Teodor Sigaev (<teodor@sigaev.ru>) and Oleg Bartunov (<oleg@sai.msu.su>). See http://www.sai.msu.su/~megera/postgres/gist/ for additional information. Andrey Oktyabrski did a great work on adding new functions and operations.

F.19. isn

The isn module provides data types for the following international product numbering standards: EAN13, UPC, ISBN (books), ISMN (music), and ISSN (serials). Numbers are validated on input according to a hard-coded list of prefixes; this list of prefixes is also used to hyphenate numbers on output. Since new prefixes are assigned from time to time, the list of prefixes may be out of date. It is hoped that a future version of this module will obtained the prefix list from one or more tables that can be easily updated by users as needed; however, at present, the list can only be updated by modifying the source code and recompiling. Alternatively, prefix validation and hyphenation support may be dropped from a future version of this module.

F.19.1. Data Types

Table F-12 shows the data types provided by the isn module.

Table F-12. isn Data Types

<table>
<thead>
<tr>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EAN13</td>
<td>European Article Numbers, always displayed in the EAN13 display format</td>
</tr>
</tbody>
</table>
### Data Type

<table>

Some notes:

1. ISBN13, ISMN13, ISSN13 numbers are all EAN13 numbers.
2. EAN13 numbers aren’t always ISBN13, ISMN13 or ISSN13 (some are).
3. Some ISBN13 numbers can be displayed as ISBN.
4. Some ISMN13 numbers can be displayed as ISMN.
5. Some ISSN13 numbers can be displayed as ISSN.
6. UPC numbers are a subset of the EAN13 numbers (they are basically EAN13 without the first digit).
7. All UPC, ISBN, ISMN and ISSN numbers can be represented as EAN13 numbers.

Internally, all these types use the same representation (a 64-bit integer), and all are interchangeable. Multiple types are provided to control display formatting and to permit tighter validity checking of input that is supposed to denote one particular type of number.

The ISBN, ISMN, and ISSN types will display the short version of the number (ISxN 10) whenever it’s possible, and will show ISxN 13 format for numbers that do not fit in the short version. The EAN13, ISBN13, ISMN13 and ISSN13 types will always display the long version of the ISxN (EAN13).

### F.19.2. Casts

The isn module provides the following pairs of type casts:

- ISBN13 <=> EAN13
- ISMN13 <=> EAN13
- ISSN13 <=> EAN13
- ISBN <=> EAN13
Appendix F. Additional Supplied Modules

- ISMN <=> EAN13
- ISSN <=> EAN13
- UPC <=> EAN13
- ISMN <=> ISMN13
- ISSN <=> ISSN13

When casting from EAN13 to another type, there is a run-time check that the value is within the domain of the other type, and an error is thrown if not. The other casts are simply relabelings that will always succeed.

F.19.3. Functions and Operators

The isn module provides the standard comparison operators, plus B-tree and hash indexing support for all these data types. In addition there are several specialized functions; shown in Table F-13. In this table, isn means any one of the module’s data types.

Table F-13. isn Functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Returns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>isn_weak(boolean)</td>
<td>boolean</td>
<td>Sets the weak input mode (returns new setting)</td>
</tr>
<tr>
<td>isn_weak()</td>
<td>boolean</td>
<td>Gets the current status of the weak mode</td>
</tr>
<tr>
<td>make_valid(isn)</td>
<td>isn</td>
<td>Validates an invalid number (clears the invalid flag)</td>
</tr>
<tr>
<td>is_valid(isn)</td>
<td>boolean</td>
<td>Checks for the presence of the invalid flag</td>
</tr>
</tbody>
</table>

Weak mode is used to be able to insert invalid data into a table. Invalid means the check digit is wrong, not that there are missing numbers.

Why would you want to use the weak mode? Well, it could be that you have a huge collection of ISBN numbers, and that there are so many of them that for weird reasons some have the wrong check digit (perhaps the numbers were scanned from a printed list and the OCR got the numbers wrong, perhaps the numbers were manually captured... who knows). Anyway, the point is you might want to clean the mess up, but you still want to be able to have all the numbers in your database and maybe use an external tool to locate the invalid numbers in the database so you can verify the information and validate it more easily; so for example you’d want to select all the invalid numbers in the table.

When you insert invalid numbers in a table using the weak mode, the number will be inserted with the corrected check digit, but it will be displayed with an exclamation mark (!) at the end, for example 0-11-000322-5!. This invalid marker can be checked with the is_valid function and cleared with the make_valid function.

You can also force the insertion of invalid numbers even when not in the weak mode, by appending the ! character at the end of the number.
Another special feature is that during input, you can write ? in place of the check digit, and the correct check digit will be inserted automatically.

F.19.4. Examples

--Using the types directly:
SELECT isbn('978-0-393-04002-9');
SELECT isbn13('0901690546');
SELECT issn('1436-4522');

--Casting types:
-- note that you can only cast from ean13 to another type when the
-- number would be valid in the realm of the target type;
-- thus, the following will NOT work: select isbn(ean13('0220356483481'));
-- but these will:
SELECT upc(ean13('0220356483481'));
SELECT ean13(upc('220356483481'));

--Create a table with a single column to hold ISBN numbers:
CREATE TABLE test (id isbn);
INSERT INTO test VALUES('9780393040029');

--Automatically calculate check digits (observe the ‘?’):
INSERT INTO test VALUES('220500896?');
INSERT INTO test VALUES('978055215372?');

SELECT issn('3251231?');
SELECT ismn('979047213542?');

--Using the weak mode:
SELECT isn_weak(true);
INSERT INTO test VALUES('978-0-11-000533-4');
INSERT INTO test VALUES('9780141219307');
INSERT INTO test VALUES('2-205-00876-X');
SELECT isn_weak(false);

SELECT id FROM test WHERE NOT is_valid(id);
UPDATE test SET id = make_valid(id) WHERE id = '2-205-00876-X!';

SELECT * FROM test;
SELECT isbn13(id) FROM test;

F.19.5. Bibliography

The information to implement this module was collected from several sites, including:

- http://www.isbn-international.org/
Appendix F. Additional Supplied Modules

- http://www.issn.org/
- http://www.ismn-international.org/
- http://www.wikipedia.org/

The prefixes used for hyphenation were also compiled from:

- http://www.gs1.org/productssolutions/idkeys/support/prefix_list.html
- https://www.isbn-international.org/content/isbn-users-manual
- http://www.ismn-international.org/ranges.html

Care was taken during the creation of the algorithms and they were meticulously verified against the suggested algorithms in the official ISBN, ISMN, ISSN User Manuals.

F.19.6. Author

Germán Méndez Bravo (Kronuz), 2004 - 2006

This module was inspired by Garrett A. Wollman’s isbn_isssn code.

F.20. lo

The lo module provides support for managing Large Objects (also called LOs or BLOBs). This includes a data type lo and a trigger lo_manage.

F.20.1. Rationale

One of the problems with the JDBC driver (and this affects the ODBC driver also), is that the specification assumes that references to BLOBs (Binary Large OBjects) are stored within a table, and if that entry is changed, the associated BLOB is deleted from the database.

As PostgreSQL stands, this doesn’t occur. Large objects are treated as objects in their own right; a table entry can reference a large object by OID, but there can be multiple table entries referencing the same large object OID, so the system doesn’t delete the large object just because you change or remove one such entry.

Now this is fine for PostgreSQL-specific applications, but standard code using JDBC or ODBC won’t delete the objects, resulting in orphan objects — objects that are not referenced by anything, and simply occupy disk space.

The lo module allows fixing this by attaching a trigger to tables that contain LO reference columns. The trigger essentially just does a lo_unlink whenever you delete or modify a value referencing a large object. When you use this trigger, you are assuming that there is only one database reference to any large object that is referenced in a trigger-controlled column!
The module also provides a data type `lo`, which is really just a domain of the `oid` type. This is useful for differentiating database columns that hold large object references from those that are OIDs of other things. You don’t have to use the `lo` type to use the trigger, but it may be convenient to use it to keep track of which columns in your database represent large objects that you are managing with the trigger. It is also rumored that the ODBC driver gets confused if you don’t use `lo` for BLOB columns.

**F.20.2. How to Use It**

Here’s a simple example of usage:

```sql
CREATE TABLE image (title TEXT, raster lo);
CREATE TRIGGER t_raster BEFORE UPDATE OR DELETE ON image
    FOR EACH ROW EXECUTE PROCEDURE lo_manage(raster);
```

For each column that will contain unique references to large objects, create a `BEFORE UPDATE OR DELETE` trigger, and give the column name as the sole trigger argument. You can also restrict the trigger to only execute on updates to the column by using `BEFORE UPDATE OF column_name`. If you need multiple `lo` columns in the same table, create a separate trigger for each one, remembering to give a different name to each trigger on the same table.

**F.20.3. Limitations**

- Dropping a table will still orphan any objects it contains, as the trigger is not executed. You can avoid this by preceding the `DROP TABLE` with `DELETE FROM table`. `TRUNCATE` has the same hazard.
  - If you already have, or suspect you have, orphaned large objects, see the vacuumlo module to help you clean them up. It’s a good idea to run vacuumlo occasionally as a back-stop to the `lo_manage` trigger.
- Some frontends may create their own tables, and will not create the associated trigger(s). Also, users may not remember (or know) to create the triggers.

**F.20.4. Author**

Peter Mount <peter@retep.org.uk>

**F.21. ltree**

This module implements a data type `ltree` for representing labels of data stored in a hierarchical tree-like structure. Extensive facilities for searching through label trees are provided.
F.21.1. Definitions

A label is a sequence of alphanumeric characters and underscores (for example, in C locale the characters A-Za-z0-9_ are allowed). Labels must be less than 256 bytes long.

Examples: 42, Personal_Services

A label path is a sequence of zero or more labels separated by dots, for example L1.L2.L3, representing a path from the root of a hierarchical tree to a particular node. The length of a label path must be less than 65Kb, but keeping it under 2Kb is preferable.

Example: Top.Countries.Europe.Russia

The ltree module provides several data types:

- ltree stores a label path.
- lquery represents a regular-expression-like pattern for matching ltree values. A simple word matches that label within a path. A star symbol (*) matches zero or more labels. For example:

  ```
  foo Match the exact label path foo
  *.foo.* Match any label path containing the label foo
  *.foo Match any label path whose last label is foo
  ```

Star symbols can also be quantified to restrict how many labels they can match:

- `{n}` Match exactly n labels
- `{n}` Match at least n labels
- `{n,m}` Match at least n but not more than m labels
- `{,m}` Match at most m labels -- same as `{0,m}

There are several modifiers that can be put at the end of a non-star label in lquery to make it match more than just the exact match:

- `@` Match case-insensitively, for example a@ matches A
- `*` Match any label with this prefix, for example foo* matches foobar
- `%` Match initial underscore-separated words

The behavior of % is a bit complicated. It tries to match words rather than the entire label. For example foo_bar% matches foo_bar_baz but not foo_barbaz. If combined with *, prefix matching applies to each word separately, for example foo_bar%* matches fool_bar2_baz but not fool_br2_baz.

Also, you can write several possibly-modified labels separated with | (OR) to match any of those labels, and you can put ! (NOT) at the start to match any label that doesn’t match any of the alternatives.

Here’s an annotated example of lquery:

```
Top.}*{0,2}.sport@!.*football|tennis.Russ*|Spain
```

a. b. c. d. e.

This query will match any label path that:

a. begins with the label Top
b. and next has zero to two labels before
c. a label beginning with the case-insensitive prefix sport
d. then a label not matching football nor tennis
e. and then ends with a label beginning with Russ or exactly matching Spain.
Appendix F. Additional Supplied Modules

- **ltxtquery** represents a full-text-search-like pattern for matching ltree values. An ltxtquery value contains words, possibly with the modifiers @, *, % at the end; the modifiers have the same meanings as in lquery. Words can be combined with & (AND), | (OR), ! (NOT), and parentheses. The key difference from lquery is that ltxtquery matches words without regard to their position in the label path.

  Here's an example ltxtquery:

  Europe & Russia*% & !Transportation

  This will match paths that contain the label Europe and any label beginning with Russia (case-insensitive), but not paths containing the label Transportation. The location of these words within the path is not important. Also, when % is used, the word can be matched to any underscore-separated word within a label, regardless of position.

  Note: ltxtquery allows whitespace between symbols, but ltree and lquery do not.

F.21.2. Operators and Functions

Type ltree has the usual comparison operators =, <>, <, >, <=, >=. Comparison sorts in the order of a tree traversal, with the children of a node sorted by label text. In addition, the specialized operators shown in Table F-14 are available.

Table F-14. ltree Operators

<table>
<thead>
<tr>
<th>Operator</th>
<th>Returns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ltree @ ltree</td>
<td>boolean</td>
<td>is left argument an ancestor of right (or equal)?</td>
</tr>
<tr>
<td>ltree &lt;@ ltree</td>
<td>boolean</td>
<td>is left argument a descendant of right (or equal)?</td>
</tr>
<tr>
<td>ltree ~ lquery</td>
<td>boolean</td>
<td>does ltree match lquery?</td>
</tr>
<tr>
<td>lquery ~ ltree</td>
<td>boolean</td>
<td>does ltree match lquery?</td>
</tr>
<tr>
<td>ltree ? lquery[]</td>
<td>boolean</td>
<td>does ltree match any lquery in array?</td>
</tr>
<tr>
<td>lquery[] ? ltree</td>
<td>boolean</td>
<td>does ltree match any lquery in array?</td>
</tr>
<tr>
<td>ltree @ lttxquery</td>
<td>boolean</td>
<td>does ltree match lttxquery?</td>
</tr>
<tr>
<td>lttxquery @ ltree</td>
<td>boolean</td>
<td>does ltree match lttxquery?</td>
</tr>
<tr>
<td>ltree</td>
<td></td>
<td>ltree</td>
</tr>
<tr>
<td>ltree</td>
<td></td>
<td>text</td>
</tr>
<tr>
<td>text</td>
<td></td>
<td>ltree</td>
</tr>
<tr>
<td>ltree[] @&gt; ltree</td>
<td>boolean</td>
<td>does array contain an ancestor of ltree?</td>
</tr>
<tr>
<td>ltree &lt;@ ltree[]</td>
<td>boolean</td>
<td>does array contain an ancestor of ltree?</td>
</tr>
</tbody>
</table>
Appendix F. Additional Supplied Modules

The operators `<@, @>, @ and ~ have analogues `^<@, ^@>, ^@, ^~`, which are the same except they do not use indexes. These are useful only for testing purposes.

The available functions are shown in Table F-15.

### Table F-15. ltree Functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Return Type</th>
<th>Description</th>
<th>Example</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>subtree(ltree, int start, int end)</td>
<td>ltree</td>
<td>subpath of ltree from position start to position end-1 (counting from 0)</td>
<td>subtree('Top.Child1.Child2',1,2)</td>
<td></td>
</tr>
</tbody>
</table>
### Appendix F. Additional Supplied Modules

<table>
<thead>
<tr>
<th>Function</th>
<th>Return Type</th>
<th>Description</th>
<th>Example</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>subpath(ltree, int offset, int len)</td>
<td>ltree</td>
<td>subpath of ltree starting at position offset, length len. If offset is negative, subpath starts that far from the end of the path. If len is negative, leaves that many labels off the end of the path.</td>
<td>subpath(’Top.Child1.Child2’,0,2)</td>
<td></td>
</tr>
<tr>
<td>subpath(ltree, int offset)</td>
<td>ltree</td>
<td>subpath of ltree starting at position offset, extending to end of path. If offset is negative, subpath starts that far from the end of the path.</td>
<td>subpath(’Top.Child1.Child2’,4)</td>
<td></td>
</tr>
<tr>
<td>nlevel(ltree)</td>
<td>integer</td>
<td>number of labels in path</td>
<td>nlevel(’Top.Child1.Child2’)</td>
<td></td>
</tr>
<tr>
<td>index(ltree a, ltree b)</td>
<td>integer</td>
<td>position of first occurrence of b in a; -1 if not found</td>
<td>index(’0.1.2.3.5.4.5.6.8.5.6.8’,’5.6’)</td>
<td></td>
</tr>
<tr>
<td>index(ltree a, ltree b, int offset)</td>
<td>integer</td>
<td>position of first occurrence of b in a, searching starting at offset; negative offset means start -offset labels from the end of the path</td>
<td>index(’0.1.2.3.5.4.5.6.8.5.6.8’,’5.6’,-4)</td>
<td></td>
</tr>
<tr>
<td>text2ltree(text)</td>
<td>ltree</td>
<td>cast text to ltree</td>
<td></td>
<td></td>
</tr>
<tr>
<td>ltree2text(ltree)</td>
<td>text</td>
<td>cast ltree to text</td>
<td></td>
<td></td>
</tr>
<tr>
<td>lca(ltree, ltree, ...)</td>
<td>ltree</td>
<td>longest common ancestor of paths (up to 8 arguments supported)</td>
<td>lca(’1.2.3’,’1.2.3.4.5.6’)</td>
<td></td>
</tr>
</tbody>
</table>
Appendix F. Additional Supplied Modules

<table>
<thead>
<tr>
<th>Function</th>
<th>Return Type</th>
<th>Description</th>
<th>Example</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>lca(ltree[])</td>
<td>ltree</td>
<td>longest common ancestor of paths in array</td>
<td>lca(array['1.2.3', '1.2.3.4'])</td>
<td></td>
</tr>
</tbody>
</table>

F.21.3. Indexes

ltree supports several types of indexes that can speed up the indicated operators:

- B-tree index over ltree: <, <=, =, >, >=

- GiST index over ltree: <, <=, =, >, @, <@, @>, <@, @, ~, ?

Example of creating such an index:

```
CREATE INDEX path_gist_idx ON test USING GIST (path);
```

- GiST index over ltree[]: ltree[] <@ ltree, ltree @> ltree[], @, ~, ?

Example of creating such an index:

```
CREATE INDEX path_gist_idx ON test USING GIST (array_path);
```

Note: This index type is lossy.

F.21.4. Example

This example uses the following data (also available in file contrib/ltree/ltreetest.sql in the source distribution):

```
CREATE TABLE test (path ltree);
INSERT INTO test VALUES ('Top');
INSERT INTO test VALUES ('Top.Science');
INSERT INTO test VALUES ('Top.Science.Astronomy');
INSERT INTO test VALUES ('Top.Science.Astronomy.Astrophysics');
INSERT INTO test VALUES ('Top.Science.Astronomy.Cosmology');
INSERT INTO test VALUES ('Top.Hobbies');
INSERT INTO test VALUES ('Top.Hobbies.Amateurs_Astronomy');
INSERT INTO test VALUES ('Top.Collections');
INSERT INTO test VALUES ('Top.Collections.Pictures');
INSERT INTO test VALUES ('Top.Collections.Pictures.Astronomy');
INSERT INTO test VALUES ('Top.Collections.Pictures.Astronomy.Astronauts');
CREATE INDEX path_gist_idx ON test USING gist(path);
CREATE INDEX path_idx ON test USING btree(path);
```

Now, we have a table test populated with data describing the hierarchy shown below:

```
   Top
     / | \
    Science Hobbies Collections
```
We can do inheritance:

```
ltree=test=> SELECT path FROM test WHERE path <@ 'Top.Science';
```
```
<table>
<thead>
<tr>
<th>path</th>
</tr>
</thead>
<tbody>
<tr>
<td>Top.Science</td>
</tr>
<tr>
<td>Top.Science.Astronomy</td>
</tr>
<tr>
<td>Top.Science.AstronomyAstrophysics</td>
</tr>
</tbody>
</table>
```
(4 rows)

Here are some examples of path matching:

```
ltree=test=> SELECT path FROM test WHERE path ~ '*.Astronomy.*';
```
```
<table>
<thead>
<tr>
<th>path</th>
</tr>
</thead>
<tbody>
<tr>
<td>Top.Science.Astronomy</td>
</tr>
<tr>
<td>Top.Science.AstronomyAstrophysics</td>
</tr>
<tr>
<td>Top.Collections.Pictures.Astronomy</td>
</tr>
</tbody>
</table>
```
(7 rows)

```
ltree=test=> SELECT path FROM test WHERE path ~ '*.!pictures@.*.Astronomy.*';
```
```
<table>
<thead>
<tr>
<th>path</th>
</tr>
</thead>
<tbody>
<tr>
<td>Top.Science.Astronomy</td>
</tr>
<tr>
<td>Top.Science.AstronomyAstrophysics</td>
</tr>
</tbody>
</table>
```
(3 rows)

Here are some examples of full text search:

```
ltree=test=> SELECT path FROM test WHERE path @ 'Astro*% & !pictures@';
```
```
<table>
<thead>
<tr>
<th>path</th>
</tr>
</thead>
<tbody>
<tr>
<td>Top.Science.Astronomy</td>
</tr>
<tr>
<td>Top.Science.AstronomyAstrophysics</td>
</tr>
<tr>
<td>Top.Hobbies.Amaters_Astronomy</td>
</tr>
</tbody>
</table>
```
(4 rows)
Appendix F. Additional Supplied Modules

```sql
l Buffett => SELECT path FROM test WHERE path @ 'Astro* & !pictures@';
  path
  -------------------------------------
  Top.Science.Astronomy
  Top.Science.Astronomy.Astrophysics
  (3 rows)
```

Path construction using functions:

```sql
l Buffett => SELECT subpath(path,0,2)||'Space'||subpath(path,2) FROM test WHERE path <@ 'Top.Science.Astronomy';
  ?column?
  ------------------------------------------
  Top.Science.Space.Astronomy
  (3 rows)
```

We could simplify this by creating a SQL function that inserts a label at a specified position in a path:

```sql
CREATE FUNCTION ins_label(ltree, int, text) RETURNS ltree
      AS 'select subpath($1,0,$2) || $3 || subpath($1,$2);'
      LANGUAGE SQL IMMUTABLE;
```

```sql
l Buffett => SELECT ins_label(path,2,'Space') FROM test WHERE path <@ 'Top.Science.Astronomy';
  ins_label
  ------------------------------------------
  Top.Science.Space.Astronomy
  (3 rows)
```

F.21.5. Authors

All work was done by Teodor Sigaev (<teodor@stack.net>) and Oleg Bartunov (<oleg@sai.msu.su>). See http://www.sai.msu.su/~megera/postgres/gist/ for additional information. Authors would like to thank Eugeny Rodichev for helpful discussions. Comments and bug reports are welcome.
Appendix F. Additional Supplied Modules

F.22. pageinspect

The pageinspect module provides functions that allow you to inspect the contents of database pages at a low level, which is useful for debugging purposes. All of these functions may be used only by superusers.

F.22.1. Functions

get_raw_page(relname text, fork text, blkno int) returns bytea

get_raw_page reads the specified block of the named relation and returns a copy as a bytea value. This allows a single time-consistent copy of the block to be obtained. fork should be 'main' for the main data fork, 'fsm' for the free space map, 'vm' for the visibility map, or 'init' for the initialization fork.

get_raw_page(relname text, blkno int) returns bytea

A shorthand version of get_raw_page, for reading from the main fork. Equivalent to get_raw_page(relname, 'main', blkno)

page_header(page bytea) returns record

page_header shows fields that are common to all PostgreSQL heap and index pages. A page image obtained with get_raw_page should be passed as argument. For example:

test=# SELECT * FROM page_header(get_raw_page('pg_class', 0));

<table>
<thead>
<tr>
<th>lsn</th>
<th>checksum</th>
<th>flags</th>
<th>lower</th>
<th>upper</th>
<th>special</th>
<th>pagesize</th>
<th>version</th>
<th>prune_xid</th>
</tr>
</thead>
<tbody>
<tr>
<td>0/24A1B50</td>
<td>1</td>
<td>1</td>
<td>232</td>
<td>368</td>
<td>8192</td>
<td>8192</td>
<td>4</td>
<td>0</td>
</tr>
</tbody>
</table>

The returned columns correspond to the fields in the PageHeaderData struct. See src/include/storage/bufpage.h for details.

heap_page_items(page bytea) returns setof record

heap_page_items shows all line pointers on a heap page. For those line pointers that are in use, tuple headers are also shown. All tuples are shown, whether or not the tuples were visible to an MVCC snapshot at the time the raw page was copied.

A heap page image obtained with get_raw_page should be passed as argument. For example:

test=# SELECT * FROM heap_page_items(get_raw_page('pg_class', 0));

See src/include/storage/itemid.h and src/include/access/htup_details.h for explanations of the fields returned.

bt_metap(relname text) returns record

bt_metap returns information about a B-tree index’s metapage. For example:

test=# SELECT * FROM bt_metap('pg_cast_oid_index');

<table>
<thead>
<tr>
<th>magic</th>
<th>version</th>
<th>root</th>
<th>level</th>
<th>fastroot</th>
<th>fastlevel</th>
</tr>
</thead>
<tbody>
<tr>
<td>340322</td>
<td>2</td>
<td>1</td>
<td>0</td>
<td>1</td>
<td>0</td>
</tr>
</tbody>
</table>
bt_page_stats(relname text, blkno int) returns record

bt_page_stats returns summary information about single pages of B-tree indexes. For example:

test=# SELECT * FROM bt_page_stats('pg_cast_oid_index', 1);
- [ RECORD 1 ] --
  blkno | 1
  type  | l
  live_items | 256
  dead_items | 0
  avg_item_size | 12
  page_size | 8192
  free_size | 4056
  btpo_prev | 0
  btpo_next | 0
  btpo   | 0
  btpo_flags | 3

bt_page_items(relname text, blkno int) returns setof record

bt_page_items returns detailed information about all of the items on a B-tree index page. For example:

test=# SELECT * FROM bt_page_items('pg_cast_oid_index', 1);
  itemoffset | ctid | itemlen | nulls | vars | data
-------------+-------+---------+-------+------+--------------
   1 | (0,1) | 12 | f | f | 23 27 00 00
   2 | (0,2) | 12 | f | f | 24 27 00 00
   3 | (0,3) | 12 | f | f | 25 27 00 00
   4 | (0,4) | 12 | f | f | 26 27 00 00
   5 | (0,5) | 12 | f | f | 27 27 00 00
   6 | (0,6) | 12 | f | f | 28 27 00 00
   7 | (0,7) | 12 | f | f | 29 27 00 00
   8 | (0,8) | 12 | f | f | 2a 27 00 00

fsm_page_contents(page bytea) returns text

fsm_page_contents shows the internal node structure of a FSM page. The output is a multiline string, with one line per node in the binary tree within the page. Only those nodes that are not zero are printed. The so-called "next" pointer, which points to the next slot to be returned from the page, is also printed.

See src/backend/storage/freespace/README for more information on the structure of an FSM page.

F.23. passwordcheck

The passwordcheck module checks users’ passwords whenever they are set with CREATE ROLE or ALTER ROLE. If a password is considered too weak, it will be rejected and the command will terminate with an error.

To enable this module, add ‘$libdir/passwordcheck’ to shared_preload_libraries in postgresql.conf, then restart the server.
You can adapt this module to your needs by changing the source code. For example, you can use CrackLib to check passwords — this only requires uncommenting two lines in the Makefile and rebuilding the module. (We cannot include CrackLib by default for license reasons.) Without CrackLib, the module enforces a few simple rules for password strength, which you can modify or extend as you see fit.

---

Caution

To prevent unencrypted passwords from being sent across the network, written to the server log or otherwise stolen by a database administrator, PostgreSQL allows the user to supply pre-encrypted passwords. Many client programs make use of this functionality and encrypt the password before sending it to the server.

This limits the usefulness of the passwordcheck module, because in that case it can only try to guess the password. For this reason, passwordcheck is not recommended if your security requirements are high. It is more secure to use an external authentication method such as GSSAPI (see Chapter 19) than to rely on passwords within the database.

Alternatively, you could modify passwordcheck to reject pre-encrypted passwords, but forcing users to set their passwords in clear text carries its own security risks.

---

F.24. pg_buffercache

The pg_buffercache module provides a means for examining what’s happening in the shared buffer cache in real time.

The module provides a C function pg_buffercache_pages that returns a set of records, plus a view pg_buffercache that wraps the function for convenient use.

By default public access is revoked from both of these, just in case there are security issues lurking.

F.24.1. The pg_buffercache View

The definitions of the columns exposed by the view are shown in Table F-16.

Table F-16. pg_buffercache Columns

<table>

</tbody>
</table>

There is one row for each buffer in the shared cache. Unused buffers are shown with all fields null except bufferid. Shared system catalogs are shown as belonging to database zero.

Because the cache is shared by all the databases, there will normally be pages from relations not belonging to the current database. This means that there may not be matching join rows in `pg_class` for some rows, or that there could even be incorrect joins. If you are trying to join against `pg_class`, it’s a good idea to restrict the join to rows having `reldatabase` equal to the current database’s OID or zero.

When the `pg_buffercache` view is accessed, internal buffer manager locks are taken for long enough to copy all the buffer state data that the view will display. This ensures that the view produces a consistent set of results, while not blocking normal buffer activity longer than necessary. Nonetheless there could be some impact on database performance if this view is read often.

### F.24.2. Sample Output

```sql
regression=# SELECT c.relname, count(*) AS buffers
            FROM pg_buffercache b INNER JOIN pg_class c
            ON b.relfilenode = pg_relation_filenode(c.oid) AND
               b.reldatabase IN (0, (SELECT oid FROM pg_database
                                      WHERE datname = current_database()))
            GROUP BY c.relname
            ORDER BY 2 DESC
            LIMIT 10;
```

Debugging advice: Tom Lane <tgl@sss.pgh.pa.us>

F.25. pgcrypto

The pgcrypto module provides cryptographic functions for PostgreSQL.

F.25.1. General Hashing Functions

F.25.1.1. digest()

digest(data text, type text) returns bytea
digest(data bytea, type text) returns bytea

Computes a binary hash of the given data. type is the algorithm to use. Standard algorithms are md5, sha1, sha224, sha256, sha384 and sha512. If pgcrypto was built with OpenSSL, more algorithms are available, as detailed in Table F-20.

If you want the digest as a hexadecimal string, use encode() on the result. For example:

```sql
CREATE OR REPLACE FUNCTION sha1(bytea) returns text AS $$
    SELECT encode(digest($1, 'sha1'), 'hex')
$$ LANGUAGE SQL STRICT IMMUTABLE;
```

F.25.1.2. hmac()

hmac(data text, key text, type text) returns bytea
hmac(data bytea, key bytea, type text) returns bytea

Calculates hashed MAC for data with key. type is the same as in digest().

This is similar to digest() but the hash can only be recalculated knowing the key. This prevents the scenario of someone altering data and also changing the hash to match.

If the key is larger than the hash block size it will first be hashed and the result will be used as key.
F.25.2. Password Hashing Functions

The functions `crypt()` and `gen_salt()` are specifically designed for hashing passwords. `crypt()` does the hashing and `gen_salt()` prepares algorithm parameters for it.

The algorithms in `crypt()` differ from the usual MD5 or SHA1 hashing algorithms in the following respects:

1. They are slow. As the amount of data is so small, this is the only way to make brute-forcing passwords hard.
2. They use a random value, called the `salt`, so that users having the same password will have different encrypted passwords. This is also an additional defense against reversing the algorithm.
3. They include the algorithm type in the result, so passwords hashed with different algorithms can co-exist.
4. Some of them are adaptive — that means when computers get faster, you can tune the algorithm to be slower, without introducing incompatibility with existing passwords.

Table F-17 lists the algorithms supported by the `crypt()` function.

<table>
<thead>
<tr>
<th>Algorithm</th>
<th>Max Password Length</th>
<th>Adaptive?</th>
<th>Salt Bits</th>
<th>Output Length</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bf</td>
<td>72</td>
<td>yes</td>
<td>128</td>
<td>60</td>
<td>Blowfish-based, variant 2a</td>
</tr>
<tr>
<td>md5</td>
<td>unlimited</td>
<td>no</td>
<td>48</td>
<td>34</td>
<td>MD5-based crypt</td>
</tr>
<tr>
<td>xdes</td>
<td>8</td>
<td>yes</td>
<td>24</td>
<td>20</td>
<td>Extended DES</td>
</tr>
<tr>
<td>des</td>
<td>8</td>
<td>no</td>
<td>12</td>
<td>13</td>
<td>Original UNIX crypt</td>
</tr>
</tbody>
</table>

F.25.2.1. `crypt()`

`crypt(password text, salt text) returns text`

Calculates a crypt(3)-style hash of `password`. When storing a new password, you need to use `gen_salt()` to generate a new `salt` value. To check a password, pass the stored hash value as `salt`, and test whether the result matches the stored value.

Example of setting a new password:

```
UPDATE ... SET pswhash = crypt('new password', gen_salt('md5'));
```

Example of authentication:
SELECT (pswhash = crypt('entered password', pswhash)) AS pswmatch FROM ... ;

This returns true if the entered password is correct.

**F.25.2.2. gen_salt()**

gen_salt(type text [, iter_count integer ]) returns text

Generates a new random salt string for use in crypt(). The salt string also tells crypt() which algorithm to use.

The type parameter specifies the hashing algorithm. The accepted types are: des, xdes, md5 and bf.

The iter_count parameter lets the user specify the iteration count, for algorithms that have one. The higher the count, the more time it takes to hash the password and therefore the more time to break it. Although with too high a count the time to calculate a hash may be several years — which is somewhat impractical. If the iter_count parameter is omitted, the default iteration count is used. Allowed values for iter_count depend on the algorithm and are shown in Table F-18.

**Table F-18. Iteration Counts for crypt()**

<table>
<thead>
<tr>
<th>Algorithm</th>
<th>Default</th>
<th>Min</th>
<th>Max</th>
</tr>
</thead>
<tbody>
<tr>
<td>xdes</td>
<td>725</td>
<td>1</td>
<td>16777215</td>
</tr>
<tr>
<td>bf</td>
<td>6</td>
<td>4</td>
<td>31</td>
</tr>
</tbody>
</table>

For xdes there is an additional limitation that the iteration count must be an odd number.

To pick an appropriate iteration count, consider that the original DES crypt was designed to have the speed of 4 hashes per second on the hardware of that time. Slower than 4 hashes per second would probably dampen usability. Faster than 100 hashes per second is probably too fast.

Table F-19 gives an overview of the relative slowness of different hashing algorithms. The table shows how much time it would take to try all combinations of characters in an 8-character password, assuming that the password contains either only lower case letters, or upper- and lower-case letters and numbers. In the crypt-bf entries, the number after a slash is the iter_count parameter of gen_salt.

**Table F-19. Hash Algorithm Speeds**

<th>Hashes/sec</th>
<th>For [a–z]</th>
<th>For [A–Za–z0–9]</th>
<th>Duration relative to md5 hash</th>
</tr>
</thead>
<tbody>
<tr>
<td>md5 (hash)</td>
<td>150085504</td>
<td>22.5 minutes</td>
<td>17 days</td>
<td>1</td>
</tr>
</tbody>
</table>

**Notes:**

- The machine used is an Intel Mobile Core i3.
- crypt-des and crypt-md5 algorithm numbers are taken from John the Ripper v1.6.38 -test output.
- md5 hash numbers are from mdcrack 1.2.
- sha1 numbers are from lcrack-20031130-beta.
- crypt-bf numbers are taken using a simple program that loops over 1000 8-character passwords. That way I can show the speed with different numbers of iterations. For reference: john -test shows 213 loops/sec for crypt-bf/5. (The very small difference in results is in accordance with the fact that the crypt-bf implementation in pgcrypto is the same one used in John the Ripper.)

Note that “try all combinations” is not a realistic exercise. Usually password cracking is done with the help of dictionaries, which contain both regular words and various mutations of them. So, even somewhat word-like passwords could be cracked much faster than the above numbers suggest, while a 6-character non-word-like password may escape cracking. Or not.

### F.25.3. PGP Encryption Functions

The functions here implement the encryption part of the OpenPGP (RFC 4880) standard. Supported are both symmetric-key and public-key encryption.

An encrypted PGP message consists of 2 parts, or packets:

- Packet containing a session key — either symmetric-key or public-key encrypted.
- Packet containing data encrypted with the session key.

When encrypting with a symmetric key (i.e., a password):

1. The given password is hashed using a String2Key (S2K) algorithm. This is rather similar to crypt() algorithms — purposefully slow and with random salt — but it produces a full-length binary key.
2. If a separate session key is requested, a new random key will be generated. Otherwise the S2K key will be used directly as the session key.
3. If the S2K key is to be used directly, then only S2K settings will be put into the session key packet. Otherwise the session key will be encrypted with the S2K key and put into the session key packet.

When encrypting with a public key:

1. A new random session key is generated.
2. It is encrypted using the public key and put into the session key packet.
Appendix F. Additional Supplied Modules

In either case the data to be encrypted is processed as follows:

1. Optional data-manipulation: compression, conversion to UTF-8, and/or conversion of line-endings.
2. The data is prefixed with a block of random bytes. This is equivalent to using a random IV.
3. An SHA1 hash of the random prefix and data is appended.
4. All this is encrypted with the session key and placed in the data packet.

**F.25.3.1. pgp_sym_encrypt()**

```plaintext
pgp_sym_encrypt(data text, psw text [, options text ]) returns bytea
pgp_sym_encrypt_bytea(data bytea, psw text [, options text ]) returns bytea
```

Encrypt data with a symmetric PGP key psw. The options parameter can contain option settings, as described below.

**F.25.3.2. pgp_sym_decrypt()**

```plaintext
pgp_sym_decrypt(msg bytea, psw text [, options text ]) returns text
pgp_sym_decrypt_bytea(msg bytea, psw text [, options text ]) returns bytea
```

Decrypt a symmetric-key-encrypted PGP message.

Decrypting bytea data with pgp_sym_decrypt is disallowed. This is to avoid outputting invalid character data. Decrypting originally textual data with pgp_sym_decrypt_bytea is fine.

The options parameter can contain option settings, as described below.

**F.25.3.3. pgp_pub_encrypt()**

```plaintext
pgp_pub_encrypt(data text, key bytea [, options text ]) returns bytea
pgp_pub_encrypt_bytea(data bytea, key bytea [, options text ]) returns bytea
```

Encrypt data with a public PGP key key. Giving this function a secret key will produce an error.

The options parameter can contain option settings, as described below.

**F.25.3.4. pgp_pub_decrypt()**

```plaintext
pgp_pub_decrypt(msg bytea, key bytea [, psw text [, options text ]]) returns text
pgp_pub_decrypt_bytea(msg bytea, key bytea [, psw text [, options text ]]) returns bytea
```

Decrypt a public-key-encrypted message. key must be the secret key corresponding to the public key that was used to encrypt. If the secret key is password-protected, you must give the password in psw. If there is no password, but you want to specify options, you need to give an empty password.

Decrypting bytea data with pgp_pub_decrypt is disallowed. This is to avoid outputting invalid character data. Decrypting originally textual data with pgp_pub_decrypt_bytea is fine.
The `options` parameter can contain option settings, as described below.

### F.25.3.5. pgp_key_id()

`pgp_key_id(bytea) returns text`

`pgp_key_id` extracts the key ID of a PGP public or secret key. Or it gives the key ID that was used for encrypting the data, if given an encrypted message.

It can return 2 special key IDs:

- **SYMKEY**
  
  The message is encrypted with a symmetric key.

- **ANYKEY**

  The message is public-key encrypted, but the key ID has been removed. That means you will need to try all your secret keys on it to see which one decrypts it. `pgcrypto` itself does not produce such messages.

Note that different keys may have the same ID. This is rare but a normal event. The client application should then try to decrypt with each one, to see which fits — like handling ANYKEY.

### F.25.3.6. armor(), dearmor()

`armor(data bytea) returns text`

`dearmor(data text) returns bytea`

These functions wrap/unwrap binary data into PGP ASCII-armor format, which is basically Base64 with CRC and additional formatting.

### F.25.3.7. Options for PGP Functions

Options are named to be similar to GnuPG. An option’s value should be given after an equal sign; separate options from each other with commas. For example:

```
pgp_sym_encrypt(data, psw, 'compress-algo=1, cipher-algo=aes256')
```

All of the options except `convert-crlf` apply only to encrypt functions. Decrypt functions get the parameters from the PGP data.

The most interesting options are probably `compress-algo` and `unicode-mode`. The rest should have reasonable defaults.

#### F.25.3.7.1. cipher-algo

Which cipher algorithm to use.

Values: bf, aes128, aes192, aes256 (OpenSSL-only: 3des, cast5)
Appendix F. Additional Supplied Modules

Default: aes128
Applies to: pgp_sym_encrypt, pgp_pub_encrypt

F.25.3.7.2. compress-algo
Which compression algorithm to use. Only available if PostgreSQL was built with zlib.

Values:
0 - no compression
1 - ZIP compression
2 - ZLIB compression (= ZIP plus meta-data and block CRCs)
Default: 0
Applies to: pgp_sym_encrypt, pgp_pub_encrypt

F.25.3.7.3. compress-level
How much to compress. Higher levels compress smaller but are slower. 0 disables compression.

Values: 0, 1-9
Default: 6
Applies to: pgp_sym_encrypt, pgp_pub_encrypt

F.25.3.7.4. convert-crlf
Whether to convert \n into \r\n when encrypting and \r\n to \n when decrypting. RFC 4880 specifies that text data should be stored using \r\n line-feeds. Use this to get fully RFC-compliant behavior.

Values: 0, 1
Default: 0
Applies to: pgp_sym_encrypt, pgp_pub_encrypt, pgp_sym_decrypt, pgp_pub_decrypt

F.25.3.7.5. disable-mdc
Do not protect data with SHA-1. The only good reason to use this option is to achieve compatibility with ancient PGP products, predating the addition of SHA-1 protected packets to RFC 4880. Recent gnupg.org and pgp.com software supports it fine.

Values: 0, 1
Default: 0
Applies to: pgp_sym_encrypt, pgp_pub_encrypt
**F.25.3.7.6. sess-key**

Use separate session key. Public-key encryption always uses a separate session key; this option is for symmetric-key encryption, which by default uses the S2K key directly.

Values: 0, 1  
Default: 0  
Applies to: pgp_sym_encrypt

**F.25.3.7.7. s2k-mode**

Which S2K algorithm to use.

Values:  
0 - Without salt. Dangerous!  
1 - With salt but with fixed iteration count.  
3 - Variable iteration count.  
Default: 3  
Applies to: pgp_sym_encrypt

**F.25.3.7.8. s2k-digest-algo**

Which digest algorithm to use in S2K calculation.

Values: md5, sha1  
Default: sha1  
Applies to: pgp_sym_encrypt

**F.25.3.7.9. s2k-cipher-algo**

Which cipher to use for encrypting separate session key.

Values: bf, aes, aes128, aes192, aes256  
Default: use cipher-algo  
Applies to: pgp_sym_encrypt

**F.25.3.7.10. unicode-mode**

Whether to convert textual data from database internal encoding to UTF-8 and back. If your database already is UTF-8, no conversion will be done, but the message will be tagged as UTF-8. Without this option it will not be.

Values: 0, 1  
Default: 0  
Applies to: pgp_sym_encrypt, pgp_pub_encrypt
F.25.3.8. Generating PGP Keys with GnuPG

To generate a new key:

gpg --gen-key

The preferred key type is “DSA and Elgamal”.
For RSA encryption you must create either DSA or RSA sign-only key as master and then add an RSA encryption subkey with gpg --edit-key.
To list keys:

gpg --list-secret-keys

To export a public key in ASCII-armor format:

gpg -a --export KEYID > public.key

To export a secret key in ASCII-armor format:

gpg -a --export-secret-keys KEYID > secret.key

You need to use dearmor() on these keys before giving them to the PGP functions. Or if you can handle binary data, you can drop -a from the command.

F.25.3.9. Limitations of PGP Code

• No support for signing. That also means that it is not checked whether the encryption subkey belongs to the master key.

• No support for encryption key as master key. As such practice is generally discouraged, this should not be a problem.

• No support for several subkeys. This may seem like a problem, as this is common practice. On the other hand, you should not use your regular GPG/PGP keys with pgcrypto, but create new ones, as the usage scenario is rather different.

F.25.4. Raw Encryption Functions

These functions only run a cipher over data; they don’t have any advanced features of PGP encryption. Therefore they have some major problems:

1. They use user key directly as cipher key.
2. They don’t provide any integrity checking, to see if the encrypted data was modified.
3. They expect that users manage all encryption parameters themselves, even IV.
4. They don’t handle text.

So, with the introduction of PGP encryption, usage of raw encryption functions is discouraged.

```sql
encrypt(data bytea, key bytea, type text) returns bytea
decrypt(data bytea, key bytea, type text) returns bytea

encrypt_iv(data bytea, key bytea, iv bytea, type text) returns bytea
decrypt_iv(data bytea, key bytea, iv bytea, type text) returns bytea
```

Encrypt/decrypt data using the cipher method specified by `type`. The syntax of the `type` string is:

```
algorithm [ - mode ] [ /pad: padding ]
```

where `algorithm` is one of:

- `bf` — Blowfish
- `aes` — AES (Rijndael-128, -192 or -256)

and `mode` is one of:

- `cbc` — next block depends on previous (default)
- `ecb` — each block is encrypted separately (for testing only)

and `padding` is one of:

- `pkcs` — data may be any length (default)
- `none` — data must be multiple of cipher block size

So, for example, these are equivalent:

```sql
encrypt(data, 'fooz', 'bf')
encrypt(data, 'fooz', 'bf-cbc/pad:pkcs')
```

In `encrypt_iv` and `decrypt_iv`, the `iv` parameter is the initial value for the CBC mode; it is ignored for ECB. It is clipped or padded with zeroes if not exactly block size. It defaults to all zeroes in the functions without this parameter.
Appendix F. Additional Supplied Modules

F.25.5. Random-Data Functions

`gen_random_bytes(count integer) returns bytea`

Returns `count` cryptographically strong random bytes. At most 1024 bytes can be extracted at a time. This is to avoid draining the randomness generator pool.

`gen_random_uuid() returns uuid`

Returns a version 4 (random) UUID.

F.25.6. Notes

F.25.6.1. Configuration

`pgcrypto` configures itself according to the findings of the main PostgreSQL configure script. The options that affect it are `--with-zlib` and `--with-openssl`.

When compiled with zlib, PGP encryption functions are able to compress data before encrypting.

When compiled with OpenSSL, there will be more algorithms available. Also public-key encryption functions will be faster as OpenSSL has more optimized BIGNUM functions.

Table F-20. Summary of Functionality with and without OpenSSL

<table>
<thead>
<tr>
<th>Functionality</th>
<th>Built-in</th>
<th>With OpenSSL</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>

Notes:

1. SHA2 algorithms were added to OpenSSL in version 0.9.8. For older versions, `pgcrypto` will use built-in code.

2. Any digest algorithm OpenSSL supports is automatically picked up. This is not possible with ciphers, which need to be supported explicitly.

3. AES is included in OpenSSL since version 0.9.7. For older versions, `pgcrypto` will use built-in code.
F.25.6.2. NULL Handling

As is standard in SQL, all functions return NULL, if any of the arguments are NULL. This may create security risks on careless usage.

F.25.6.3. Security Limitations

All pgcrypto functions run inside the database server. That means that all the data and passwords move between pgcrypto and client applications in clear text. Thus you must:

1. Connect locally or use SSL connections.
2. Trust both system and database administrator.

If you cannot, then better do crypto inside client application.

The implementation does not resist side-channel attacks\(^4\). For example, the time required for a pgcrypto decryption function to complete varies among ciphertexts of a given size.

F.25.6.4. Useful Reading

  The GNU Privacy Handbook.

F.26. pg_freespacemap

The pg_freespacemap module provides a means for examining the free space map (FSM). It provides a function called pg_freespace, or two overloaded functions, to be precise. The functions show the value recorded in the free space map for a given page, or for all pages in the relation.

By default public access is revoked from the functions, just in case there are security issues lurking.

F.26.1. Functions

pg_freespace(rel regclass IN, blkno bigint IN) returns int2

Returns the amount of free space on the page of the relation, specified by blkno, according to the FSM.
Appendix F. Additional Supplied Modules

pg_freespace(rel regclass IN, blkno OUT bigint, avail OUT int2)

Displays the amount of free space on each page of the relation, according to the FSM. A set of (blkno bigint, avail int2) tuples is returned, one tuple for each page in the relation.

The values stored in the free space map are not exact. They’re rounded to precision of \( \frac{1}{256} \)th of \( BLCKSZ \) (32 bytes with default \( BLCKSZ \)), and they’re not kept fully up-to-date as tuples are inserted and updated.

For indexes, what is tracked is entirely-unused pages, rather than free space within pages. Therefore, the values are not meaningful, just whether a page is full or empty.

**Note:** The interface was changed in version 8.4, to reflect the new FSM implementation introduced in the same version.

F.26.2. Sample Output

```sql
postgres=# SELECT * FROM pg_freespace('foo');
blkno | avail
-------+-------
 0     |   0   
 1     |   0   
 2     |   0   
 3     |   32  
 4     |   704 
 5     |   704 
 6     |   704 
 7     |  1216 
 8     |   704 
 9     |   704 
10    |   704 
11    |   704 
12    |   704 
13    |   704 
14    |   704 
15    |   704 
16    |   704 
17    |   704 
18    |   704 
19    | 3648  
(20 rows)
```

```sql
postgres=# SELECT * FROM pg_freespace('foo', 7);
pg_freespace
------------
     1216
(1 row)
```

F.26.3. Author

Original version by Mark Kirkwood <markir@paradise.net.nz>. Rewritten in version 8.4 to suit new FSM implementation by Heikki Linnakangas <heikki@enterprisedb.com>

F.27. pg_prewarm

The pg_prewarm module provides a convenient way to load relation data into either the operating system buffer cache or the PostgreSQL buffer cache.

F.27.1. Functions

```sql
pg_prewarm(regclass, mode text default 'buffer', fork text default 'main',
            first_block int8 default null,
            last_block int8 default null) RETURNS int8
```

The first argument is the relation to be prewarmed. The second argument is the prewarming method to be used, as further discussed below; the third is the relation fork to be prewarmed, usually `main`. The fourth argument is the first block number to prewarm (NULL is accepted as a synonym for zero). The fifth argument is the last block number to prewarm (NULL means prewarm through the last block in the relation). The return value is the number of blocks prewarmed.

There are three available prewarming methods. `prefetch` issues asynchronous prefetch requests to the operating system, if this is supported, or throws an error otherwise. `read` reads the requested range of blocks; unlike `prefetch`, this is synchronous and supported on all platforms and builds, but may be slower. `buffer` reads the requested range of blocks into the database buffer cache.

Note that with any of these methods, attempting to prewarm more blocks than can be cached — by the OS when using `prefetch` or `read`, or by PostgreSQL when using `buffer` — will likely result in lower-numbered blocks being evicted as higher numbered blocks are read in. Prewarmed data also enjoys no special protection from cache evictions, so it is possible for other system activity may evict the newly prewarmed blocks shortly after they are read; conversely, prewarming may also evict other data from cache. For these reasons, prewarming is typically most useful at startup, when caches are largely empty.

F.27.2. Author

Robert Haas <rhaas@postgresql.org>

F.28. pgrowlocks

The pgrowlocks module provides a function to show row locking information for a specified table.
F.28.1. Overview

`pgrowlocks(text)` returns `setof record`

The parameter is the name of a table. The result is a set of records, with one row for each locked row within the table. The output columns are shown in Table F-21.

**Table F-21. pgrowlocks Output Columns**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>locked_row</td>
<td>tid</td>
<td>Tuple ID (TID) of locked row</td>
</tr>
<tr>
<td>locker</td>
<td>xid</td>
<td>Transaction ID of locker, or multixact ID if multitransaction</td>
</tr>
<tr>
<td>multi</td>
<td>boolean</td>
<td>True if locker is a multitransaction</td>
</tr>
<tr>
<td>xids</td>
<td>xid[]</td>
<td>Transaction IDs of lockers (more than one if multitransaction)</td>
</tr>
<tr>
<td>modes</td>
<td>text[]</td>
<td>Lock mode of lockers (more than one if multitransaction), an array of Key Share, Share, For No Key Update, No Key Update, For Update, Update.</td>
</tr>
<tr>
<td>pids</td>
<td>integer[]</td>
<td>Process IDs of locking backends (more than one if multitransaction)</td>
</tr>
</tbody>
</table>

`pgrowlocks` takes `AccessShareLock` for the target table and reads each row one by one to collect the row locking information. This is not very speedy for a large table. Note that:

1. If the table as a whole is exclusive-locked by someone else, `pgrowlocks` will be blocked.

2. `pgrowlocks` is not guaranteed to produce a self-consistent snapshot. It is possible that a new row lock is taken, or an old lock is freed, during its execution.

`pgrowlocks` does not show the contents of locked rows. If you want to take a look at the row contents at the same time, you could do something like this:

```sql
SELECT * FROM accounts AS a, pgrowlocks('accounts') AS p
WHERE p.locked_row = a.ctid;
```

Be aware however that such a query will be very inefficient.

F.28.2. Sample Output

```sql
=# SELECT * FROM pgrowlocks('t1');
 locked_row | locker | multi | xids | modes | pids
-----------------|--------|-------|------|-------|------
(0,1) | 609 | f | {609} | {"For Share"} | {3161}
```
F.28.3. Author

Tatsuo Ishii

F.29. pg_stat_statements

The pg_stat_statements module provides a means for tracking execution statistics of all SQL statements executed by a server.

The module must be loaded by adding pg_stat_statements to shared_preload_libraries in postgresql.conf, because it requires additional shared memory. This means that a server restart is needed to add or remove the module.

F.29.1. The pg_stat_statements View

The statistics gathered by the module are made available via a system view named pg_stat_statements. This view contains one row for each distinct database ID, user ID and query ID (up to the maximum number of distinct statements that the module can track). The columns of the view are shown in Table F-22.

Table F-22. pg_stat_statements Columns

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>References</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>userid</td>
<td>oid</td>
<td>pg_authid.oid</td>
<td>OID of user who executed the statement</td>
</tr>
<tr>

<td>blk_write_time</td>
<td>double precision</td>
<td></td>
<td>Total time the statement spent writing blocks, in milliseconds (if track_io_timing is enabled, otherwise zero)</td>
</tr>
</tbody>
</table>

This view, and the functions pg_stat_statements_reset and pg_stat_statements, are available only in databases they have been specifically installed into by installing the pg_stat_statements extension. However, statistics are tracked across all databases of the server whenever the pg_stat_statements module is loaded into the server, regardless of presence of the view.

For security reasons, non-superusers are not allowed to see the SQL text or queryid of queries executed by other users. They can see the statistics, however, if the view has been installed in their database.

Plannable queries (that is, SELECT, INSERT, UPDATE, and DELETE) are combined into a single pg_stat_statements entry whenever they have identical query structures according to an internal hash calculation. Typically, two queries will be considered the same for this purpose if they are semantically equivalent except for the values of literal constants appearing in the query. Utility commands (that is, all other commands) are compared strictly on the basis of their textual query strings, however.

When a constant’s value has been ignored for purposes of matching the query to other queries, the constant is replaced by ? in the pg_stat_statements display. The rest of the query text is that of the first query that had the particular queryid hash value associated with the pg_stat_statements entry.

In some cases, queries with visibly different texts might get merged into a single pg_stat_statements entry. Normally this will happen only for semantically equivalent queries, but there is a small chance of hash collisions causing unrelated queries to be merged into one entry. (This cannot happen for queries belonging to different users or databases, however.)

Since the queryid hash value is computed on the post-parse-analysis representation of the queries, the opposite is also possible: queries with identical texts might appear as separate entries, if they have different meanings as a result of factors such as different search_path settings.

Consumers of pg_stat_statements may wish to use queryid (perhaps in combination with dbid and userid) as a more stable and reliable identifier for each entry than its query text. However, it is important to understand that there are only limited guarantees around the stability of the queryid hash value. Since the identifier is derived from the post-parse-analysis tree, its value is a function of, among other things, the internal object identifiers appearing in this representation. This has some counterintuitive implications. For example, pg_stat_statements will consider two apparently-identical queries to be distinct, if they reference a table that was dropped and recreated between the executions of the two queries. The hashing process is also sensitive to differences in machine architecture and other facets of the platform. Furthermore, it is not safe to assume that queryid will be stable across major versions of PostgreSQL.

As a rule of thumb, queryid values can be assumed to be stable and comparable only so long as the underlying server version and catalog metadata details stay exactly the same. Two servers participating in replication based on physical WAL replay can be expected to have identical queryid values for the same query. However, logical replication schemes do not promise to keep replicas identical in all relevant details, so queryid will not be a useful identifier for accumulating costs across a set of logical replicas. If in doubt, direct testing is recommended.
The representative query texts are kept in an external disk file, and do not consume shared memory. Therefore, even very lengthy query texts can be stored successfully. However, if many long query texts are accumulated, the external file might grow unmanageably large. As a recovery method if that happens, \texttt{pg_stat_statements} may choose to discard the query texts, whereupon all existing entries in the \texttt{pg_stat_statements} view will show null query fields, though the statistics associated with each \texttt{queryid} are preserved. If this happens, consider reducing \texttt{pg_stat_statements.max} to prevent recurrences.

\textbf{F.29.2. Functions}

\texttt{pg_stat_statements_reset()} returns void

\texttt{pg_stat_statements_reset} discards all statistics gathered so far by \texttt{pg_stat_statements}. By default, this function can only be executed by superusers.

\texttt{pg_stat_statements(showtext boolean)} returns setof record

The \texttt{pg_stat_statements} view is defined in terms of a function also named \texttt{pg_stat_statements}. It is possible for clients to call the \texttt{pg_stat_statements} function directly, and by specifying \texttt{showtext := false} have query text be omitted (that is, the OUT argument that corresponds to the view’s \texttt{query} column will return nulls). This feature is intended to support external tools that might wish to avoid the overhead of repeatedly retrieving query texts of indeterminate length. Such tools can instead cache the first query text observed for each entry themselves, since that is all \texttt{pg_stat_statements} itself does, and then retrieve query texts only as needed. Since the server stores query texts in a file, this approach may reduce physical I/O for repeated examination of the \texttt{pg_stat_statements} data.

\textbf{F.29.3. Configuration Parameters}

\texttt{pg_stat_statements.max(integer)}

\texttt{pg_stat_statements.max} is the maximum number of statements tracked by the module (i.e., the maximum number of rows in the \texttt{pg_stat_statements} view). If more distinct statements than that are observed, information about the least-executed statements is discarded. The default value is 5000. This parameter can only be set at server start.

\texttt{pg_stat_statements.track (enum)}

\texttt{pg_stat_statements.track} controls which statements are counted by the module. Specify \texttt{top} to track top-level statements (those issued directly by clients), \texttt{all} to also track nested statements (such as statements invoked within functions), or \texttt{none} to disable statement statistics collection. The default value is \texttt{top}. Only superusers can change this setting.

\texttt{pg_stat_statements.track_utility(boolean)}

\texttt{pg_stat_statements.track_utility} controls whether utility commands are tracked by the module. Utility commands are all those other than \texttt{SELECT}, \texttt{INSERT}, \texttt{UPDATE} and \texttt{DELETE}. The default value is \texttt{on}. Only superusers can change this setting.
pg_stat_statements.save(boolean)

pg_stat_statements.save specifies whether to save statement statistics across server shutdowns. If it is off then statistics are not saved at shutdown nor reloaded at server start. The default value is on. This parameter can only be set in the postgresql.conf file or on the server command line.

The module requires additional shared memory proportional to pg_stat_statements.max. Note that this memory is consumed whenever the module is loaded, even if pg_stat_statements.track is set to none.

These parameters must be set in postgresql.conf. Typical usage might be:

```
# postgresql.conf
shared_preload_libraries = 'pg_stat_statements'

pg_stat_statements.max = 10000
pg_stat_statements.track = all
```

### F.29.4. Sample Output

```
bench=# SELECT pg_stat_statements_reset();

$ pgbench -i bench
$ pgbench -c10 -t300 bench

bench=# \x
bench=# SELECT query, calls, total_time, rows, 100.0 * shared_blks_hit / nullif(shared_blks_hit + shared_blks_read, 0) AS hit_percent
   FROM pg_stat_statements ORDER BY total_time DESC LIMIT 5;

F.29.5. Authors

Takahiro Itagaki <itagaki.takahiro@oss.ntt.co.jp>. Query normalization added by Peter Geoghegan <peter@2ndquadrant.com>.

F.30. pgstattuple

The pgstattuple module provides various functions to obtain tuple-level statistics.

F.30.1. Functions

pgstattuple(regclass) returns record

pgstattuple returns a relation’s physical length, percentage of “dead” tuples, and other info. This may help users to determine whether vacuum is necessary or not. The argument is the target relation’s name (optionally schema-qualified) or OID. For example:

test=> SELECT * FROM pgstattuple('pg_catalog.pg_proc');
- [ RECORD 1 ]---------------------
  table_len      | 458752
  tuple_count    | 1470
  tuple_len      | 438896
  tuple_percent  | 95.67
  dead_tuple_count | 11
  dead_tuple_len | 3157
  dead_tuple_percent | 0.69
  free_space    | 8932
  free_percent  | 1.95

The output columns are described in Table F-23.

Table F-23. pgstattuple Output Columns

<table>
<thead>
<tr>
<th>Column</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_len</td>
<td>bigint</td>
<td>Physical relation length in bytes</td>
</tr>
</tbody>
</table>
### Appendix F. Additional Supplied Modules

<table>
<thead>
<tr>
<th>Column</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tuple_count</td>
<td>bigint</td>
<td>Number of live tuples</td>
</tr>
<tr>
<td>tuple_len</td>
<td>bigint</td>
<td>Total length of live tuples in bytes</td>
</tr>
<tr>
<td>tuple_percent</td>
<td>float8</td>
<td>Percentage of live tuples</td>
</tr>
<tr>
<td>dead_tuple_count</td>
<td>bigint</td>
<td>Number of dead tuples</td>
</tr>
<tr>
<td>dead_tuple_len</td>
<td>bigint</td>
<td>Total length of dead tuples in bytes</td>
</tr>
<tr>
<td>dead_tuple_percent</td>
<td>float8</td>
<td>Percentage of dead tuples</td>
</tr>
<tr>
<td>free_space</td>
<td>bigint</td>
<td>Total free space in bytes</td>
</tr>
<tr>
<td>free_percent</td>
<td>float8</td>
<td>Percentage of free space</td>
</tr>
</tbody>
</table>

**Note:** The `table_len` will always be greater than the sum of the `tuple_len`, `dead_tuple_len` and `free_space`. The difference is accounted for by fixed page overhead, the per-page table of pointers to tuples, and padding to ensure that tuples are correctly aligned.

`pgstattuple` acquires only a read lock on the relation. So the results do not reflect an instantaneous snapshot; concurrent updates will affect them.

`pgstattuple` judges a tuple is “dead” if `HeapTupleSatisfiesDirty` returns false.

`pgstattuple(text)` returns record

This is the same as `pgstattuple(regclass)`, except that the target relation is specified as TEXT. This function is kept because of backward-compatibility so far, and will be deprecated in some future release.

`pgstatindex(regclass)` returns record

`pgstatindex` returns a record showing information about a B-tree index. For example:

```
test=> SELECT * FROM pgstatindex('pg_cast_oid_index');
-[ RECORD 1 ]-------
version      | 2
tree_level   | 0
index_size   | 16384
root_block_no| 1
internal_pages| 0
leaf_pages   | 1
empty_pages  | 0
deleted_pages| 0
avg_leaf_density | 54.27
leaf_fragmentation | 0
```

The output columns are:

<table>
<thead>
<tr>
<th>Column</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>version</td>
<td>integer</td>
<td>B-tree version number</td>
</tr>
<tr>
<td>tree_level</td>
<td>integer</td>
<td>Tree level of the root page</td>
</tr>
</tbody>
</table>
Appendix F. Additional Supplied Modules

<table>
<thead>
<tr>
<th>Column</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>index_size</td>
<td>bigint</td>
<td>Total index size in bytes</td>
</tr>
<tr>
<td>root_block_no</td>
<td>bigint</td>
<td>Location of root page (zero if none)</td>
</tr>
<tr>
<td>internal_pages</td>
<td>bigint</td>
<td>Number of “internal” (upper-level) pages</td>
</tr>
<tr>
<td>leaf_pages</td>
<td>bigint</td>
<td>Number of leaf pages</td>
</tr>
<tr>
<td>empty_pages</td>
<td>bigint</td>
<td>Number of empty pages</td>
</tr>
<tr>
<td>deleted_pages</td>
<td>bigint</td>
<td>Number of deleted pages</td>
</tr>
<tr>
<td>avg_leaf_density</td>
<td>float8</td>
<td>Average density of leaf pages</td>
</tr>
<tr>
<td>leaf_fragmentation</td>
<td>float8</td>
<td>Leaf page fragmentation</td>
</tr>
</tbody>
</table>

The reported `index_size` will normally correspond to one more page than is accounted for by `internal_pages + leaf_pages + empty_pages + deleted_pages`, because it also includes the index’s metapage.

As with `pgstattuple`, the results are accumulated page-by-page, and should not be expected to represent an instantaneous snapshot of the whole index.

`pgstatindex(text)` returns record

This is the same as `pgstatindex(regclass)`, except that the target index is specified as TEXT. This function is kept because of backward-compatibility so far, and will be deprecated in some future release.

`pgstatginindex(regclass)` returns record

`pgstatginindex` returns a record showing information about a GIN index. For example:

```
test=> SELECT * FROM pgstatginindex('test_gin_index');
- [ RECORD 1 ]-+-+
  version | 1
  pending_pages | 0
  pending_tuples | 0
```

The output columns are:

<table>
<thead>
<tr>
<th>Column</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>version</td>
<td>integer</td>
<td>GIN version number</td>
</tr>
<tr>
<td>pending_pages</td>
<td>integer</td>
<td>Number of pages in the pending list</td>
</tr>
<tr>
<td>pending_tuples</td>
<td>bigint</td>
<td>Number of tuples in the pending list</td>
</tr>
</tbody>
</table>

`pg_relpages(regclass)` returns bigint

`pg_relpages` returns the number of pages in the relation.
pg_relpages(text) returns bigint

This is the same as pg_relpages(regclass), except that the target relation is specified as TEXT. This function is kept because of backward-compatibility so far, and will be deprecated in some future release.

F.30.2. Authors
Tatsuo Ishii and Satoshi Nagayasu

F.31. pg_trgm

The pg_trgm module provides functions and operators for determining the similarity of alphanumeric text based on trigram matching, as well as index operator classes that support fast searching for similar strings.

F.31.1. Trigram (or Trigraph) Concepts

A trigram is a group of three consecutive characters taken from a string. We can measure the similarity of two strings by counting the number of trigrams they share. This simple idea turns out to be very effective for measuring the similarity of words in many natural languages.

Note: pg_trgm ignores non-word characters (non-alphanumerics) when extracting trigrams from a string. Each word is considered to have two spaces prefixed and one space suffixed when determining the set of trigrams contained in the string. For example, the set of trigrams in the string "cat" is " c", " ca", "cat", and "at ". The set of trigrams in the string "foo|bar" is " f", " fo", "foo", "oo ", " b", " ba", "bar", and "ar ".

F.31.2. Functions and Operators

The functions provided by the pg_trgm module are shown in Table F-24, the operators in Table F-25.

Table F-24. pg_trgm Functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Returns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>similarity(text, text)</td>
<td>real</td>
<td>Returns a number that indicates how similar the two arguments are. The range of the result is zero (indicating that the two strings are completely dissimilar) to one (indicating that the two strings are identical).</td>
</tr>
</tbody>
</table>
Appendix F. Additional Supplied Modules

<table>
<thead>
<tr>
<th>Function</th>
<th>Returns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show_trgm(text)</code></td>
<td><code>text[]</code></td>
<td>Returns an array of all the trigrams in the given string. (In practice this is seldom useful except for debugging.)</td>
</tr>
<tr>
<td><code>show_limit()</code></td>
<td><code>real</code></td>
<td>Returns the current similarity threshold used by the <code>%</code> operator. This sets the minimum similarity between two words for them to be considered similar enough to be misspellings of each other, for example.</td>
</tr>
<tr>
<td><code>set_limit(real)</code></td>
<td><code>real</code></td>
<td>Sets the current similarity threshold that is used by the <code>%</code> operator. The threshold must be between 0 and 1 (default is 0.3). Returns the same value passed in.</td>
</tr>
</tbody>
</table>

Table F-25. pg_trgm Operators

<table>
<thead>
<tr>
<th>Operator</th>
<th>Returns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>text % text</code></td>
<td><code>boolean</code></td>
<td>Returns true if its arguments have a similarity that is greater than the current similarity threshold set by <code>set_limit</code>.</td>
</tr>
<tr>
<td><code>text &lt;-&gt; text</code></td>
<td><code>real</code></td>
<td>Returns the “distance” between the arguments, that is one minus the <code>similarity()</code> value.</td>
</tr>
</tbody>
</table>

F.31.3. Index Support

The pg_trgm module provides GiST and GIN index operator classes that allow you to create an index over a text column for the purpose of very fast similarity searches. These index types support the above-described similarity operators, and additionally support trigram-based index searches for `LIKE`, `ILIKE`, `~` and `~*` queries. (These indexes do not support equality nor simple comparison operators, so you may need a regular B-tree index too.)

Example:

```sql
CREATE TABLE test_trgm (t text);
CREATE INDEX trgm_idx ON test_trgm USING gist (t gist_trgm_ops);
```

or

```sql
CREATE INDEX trgm_idx ON test_trgm USING gin (t gin_trgm_ops);
```
At this point, you will have an index on the \( t \) column that you can use for similarity searching. A typical query is

```sql
SELECT t, similarity(t, 'word') AS sml
FROM test_trgm
WHERE t % 'word'
ORDER BY sml DESC, t;
```

This will return all values in the text column that are sufficiently similar to \( \text{word} \), sorted from best match to worst. The index will be used to make this a fast operation even over very large data sets.

A variant of the above query is

```sql
SELECT t, t <-> 'word' AS dist
FROM test_trgm
ORDER BY dist LIMIT 10;
```

This can be implemented quite efficiently by GiST indexes, but not by GIN indexes. It will usually beat the first formulation when only a small number of the closest matches is wanted.

Beginning in PostgreSQL 9.1, these index types also support index searches for LIKE and ILIKE, for example

```sql
SELECT * FROM test_trgm WHERE t LIKE '%foo%bar';
```

The index search works by extracting trigrams from the search string and then looking these up in the index. The more trigrams in the search string, the more effective the index search is. Unlike B-tree based searches, the search string need not be left-anchored.

Beginning in PostgreSQL 9.3, these index types also support index searches for regular-expression matches (~ and ~* operators), for example

```sql
SELECT * FROM test_trgm WHERE t ~ '(foo|bar)';
```

The index search works by extracting trigrams from the regular expression and then looking these up in the index. The more trigrams that can be extracted from the regular expression, the more effective the index search is. Unlike B-tree based searches, the search string need not be left-anchored.

For both LIKE and regular-expression searches, keep in mind that a pattern with no extractable trigrams will degenerate to a full-index scan.

The choice between GiST and GIN indexing depends on the relative performance characteristics of GiST and GIN, which are discussed elsewhere. As a rule of thumb, a GIN index is faster to search than a GiST index, but slower to build or update; so GIN is better suited for static data and GiST for often-updated data.

### F.31.4. Text Search Integration

Trigram matching is a very useful tool when used in conjunction with a full text index. In particular it can help to recognize misspelled input words that will not be matched directly by the full text search mechanism.
The first step is to generate an auxiliary table containing all the unique words in the documents:

```sql
CREATE TABLE words AS SELECT word FROM ts_stat('SELECT to_tsvector("simple", bodytext) FROM documents');
```

where `documents` is a table that has a text field `bodytext` that we wish to search. The reason for using the `simple` configuration with the `to_tsvector` function, instead of using a language-specific configuration, is that we want a list of the original (unstemmed) words.

Next, create a trigram index on the word column:

```sql
CREATE INDEX words_idx ON words USING gin(word gin_trgm_ops);
```

Now, a `SELECT` query similar to the previous example can be used to suggest spellings for misspelled words in user search terms. A useful extra test is to require that the selected words are also of similar length to the misspelled word.

**Note:** Since the `words` table has been generated as a separate, static table, it will need to be periodically regenerated so that it remains reasonably up-to-date with the document collection. Keeping it exactly current is usually unnecessary.

### F.32. postgres_fdw

The `postgres_fdw` module provides the foreign-data wrapper `postgres_fdw`, which can be used to access data stored in external PostgreSQL servers.

The functionality provided by this module overlaps substantially with the functionality of the older `dblink` module. But `postgres_fdw` provides more transparent and standards-compliant syntax for accessing remote tables, and can give better performance in many cases.

To prepare for remote access using `postgres_fdw`:
Appendix F. Additional Supplied Modules

1. Install the postgres_fdw extension using CREATE EXTENSION.
2. Create a foreign server object, using CREATE SERVER, to represent each remote database you want to connect to. Specify connection information, except user and password, as options of the server object.
3. Create a user mapping, using CREATE USER MAPPING, for each database user you want to allow to access each foreign server. Specify the remote user name and password to use as user and password options of the user mapping.
4. Create a foreign table, using CREATE FOREIGN TABLE, for each remote table you want to access. The columns of the foreign table must match the referenced remote table. You can, however, use table and/or column names different from the remote table’s, if you specify the correct remote names as options of the foreign table object.

Now you need only SELECT from a foreign table to access the data stored in its underlying remote table. You can also modify the remote table using INSERT, UPDATE, or DELETE. (Of course, the remote user you have specified in your user mapping must have privileges to do these things.)

It is generally recommended that the columns of a foreign table be declared with exactly the same data types, and collations if applicable, as the referenced columns of the remote table. Although postgres_fdw is currently rather forgiving about performing data type conversions at need, surprising semantic anomalies may arise when types or collations do not match, due to the remote server interpreting WHERE clauses slightly differently from the local server.

Note that a foreign table can be declared with fewer columns, or with a different column order, than its underlying remote table has. Matching of columns to the remote table is by name, not position.

F.32.1. FDW Options of postgres_fdw

F.32.1.1. Connection Options

A foreign server using the postgres_fdw foreign data wrapper can have the same options that libpq accepts in connection strings, as described in Section 31.1.2, except that these options are not allowed:

- user and password (specify these for a user mapping, instead)
- client_encoding (this is automatically set from the local server encoding)
- fallback_application_name (always set to postgres_fdw)

Only superusers may connect to foreign servers without password authentication, so always specify the password option for user mappings belonging to non-superusers.

F.32.1.2. Object Name Options

These options can be used to control the names used in SQL statements sent to the remote PostgreSQL server. These options are needed when a foreign table is created with names different from the underlying remote table’s names.
schema_name

This option, which can be specified for a foreign table, gives the schema name to use for the foreign table on the remote server. If this option is omitted, the name of the foreign table’s schema is used.

table_name

This option, which can be specified for a foreign table, gives the table name to use for the foreign table on the remote server. If this option is omitted, the foreign table’s name is used.

column_name

This option, which can be specified for a column of a foreign table, gives the column name to use for the column on the remote server. If this option is omitted, the column’s name is used.

F.32.1.3. Cost Estimation Options

postgres_fdw retrieves remote data by executing queries against remote servers, so ideally the estimated cost of scanning a foreign table should be whatever it costs to be done on the remote server, plus some overhead for communication. The most reliable way to get such an estimate is to ask the remote server and then add something for overhead — but for simple queries, it may not be worth the cost of an additional remote query to get a cost estimate. So postgres_fdw provides the following options to control how cost estimation is done:

use_remote_estimate

This option, which can be specified for a foreign table or a foreign server, controls whether postgres_fdw issues remote EXPLAIN commands to obtain cost estimates. A setting for a foreign table overrides any setting for its server, but only for that table. The default is false.

fdw_startup_cost

This option, which can be specified for a foreign server, is a numeric value that is added to the estimated startup cost of any foreign-table scan on that server. This represents the additional overhead of establishing a connection, parsing and planning the query on the remote side, etc. The default value is 100.

fdw_tuple_cost

This option, which can be specified for a foreign server, is a numeric value that is used as extra cost per-tuple for foreign-table scans on that server. This represents the additional overhead of data transfer between servers. You might increase or decrease this number to reflect higher or lower network delay to the remote server. The default value is 0.01.

When use_remote_estimate is true, postgres_fdw obtains row count and cost estimates from the remote server and then adds fdw_startup_cost and fdw_tuple_cost to the cost estimates. When use_remote_estimate is false, postgres_fdw performs local row count and cost estimation and then adds fdw_startup_cost and fdw_tuple_cost to the cost estimates. This local estimation is unlikely to be very accurate unless local copies of the remote table’s statistics are available. Running ANALYZE on the foreign table is the way to update the local statistics; this will perform a scan of the remote table and then calculate and store statistics just as though the table were local. Keeping local statistics can be a useful way to reduce per-query planning overhead for a remote table — but if the remote table is frequently updated, the local statistics will soon be obsolete.
F.32.1.4. Updatability Options

By default all foreign tables using `postgres_fdw` are assumed to be updatable. This may be overridden using the following option:

```plaintext
updatable
```

This option controls whether `postgres_fdw` allows foreign tables to be modified using `INSERT`, `UPDATE` and `DELETE` commands. It can be specified for a foreign table or a foreign server. A table-level option overrides a server-level option. The default is `true`.

Of course, if the remote table is not in fact updatable, an error would occur anyway. Use of this option primarily allows the error to be thrown locally without querying the remote server. Note however that the `information_schema` views will report a `postgres_fdw` foreign table to be updatable (or not) according to the setting of this option, without any check of the remote server.

F.32.2. Connection Management

`postgres_fdw` establishes a connection to a foreign server during the first query that uses a foreign table associated with the foreign server. This connection is kept and re-used for subsequent queries in the same session. However, if multiple user identities (user mappings) are used to access the foreign server, a connection is established for each user mapping.

F.32.3. Transaction Management

During a query that references any remote tables on a foreign server, `postgres_fdw` opens a transaction on the remote server if one is not already open corresponding to the current local transaction. The remote transaction is committed or aborted when the local transaction commits or aborts. Savepoints are similarly managed by creating corresponding remote savepoints.

The remote transaction uses `SERIALIZABLE` isolation level when the local transaction has `SERIALIZABLE` isolation level; otherwise it uses `REPEATABLE READ` isolation level. This choice ensures that if a query performs multiple table scans on the remote server, it will get snapshot-consistent results for all the scans. A consequence is that successive queries within a single transaction will see the same data from the remote server, even if concurrent updates are occurring on the remote server due to other activities. That behavior would be expected anyway if the local transaction uses `SERIALIZABLE` or `REPEATABLE READ` isolation level, but it might be surprising for a `READ COMMITTED` local transaction. A future PostgreSQL release might modify these rules.

F.32.4. Remote Query Optimization

`postgres_fdw` attempts to optimize remote queries to reduce the amount of data transferred from foreign servers. This is done by sending query `WHERE` clauses to the remote server for execution, and by not retrieving table columns that are not needed for the current query. To reduce the risk of misexecution of queries, `WHERE` clauses are not sent to the remote server unless they use only built-in data types, operators, and functions. Operators and functions in the clauses must be `IMMUTABLE` as well.
The query that is actually sent to the remote server for execution can be examined using `EXPLAIN VERBOSE`.

### F.32.5. Remote Query Execution Environment

In the remote sessions opened by `postgres_fdw`, the `search_path` parameter is set to just `pg_catalog`, so that only built-in objects are visible without schema qualification. This is not an issue for queries generated by `postgres_fdw` itself, because it always supplies such qualification. However, this can pose a hazard for functions that are executed on the remote server via triggers or rules on remote tables. For example, if a remote table is actually a view, any functions used in that view will be executed with the restricted search path. It is recommended to schema-qualify all names in such functions, or else attach `SET search_path` options (see CREATE FUNCTION) to such functions to establish their expected search path environment.

`postgres_fdw` likewise establishes remote session settings for the parameters `TimeZone`, `DateStyle`, `IntervalStyle`, and `extra_float_digits`. These are less likely to be problematic than `search_path`, but can be handled with function `SET` options if the need arises.

It is not recommended that you override this behavior by changing the session-level settings of these parameters; that is likely to cause `postgres_fdw` to malfunction.

### F.32.6. Cross-Version Compatibility

`postgres_fdw` can be used with remote servers dating back to PostgreSQL 8.3. Read-only capability is available back to 8.1. A limitation however is that `postgres_fdw` generally assumes that immutable built-in functions and operators are safe to send to the remote server for execution, if they appear in a `WHERE` clause for a foreign table. Thus, a built-in function that was added since the remote server’s release might be sent to it for execution, resulting in “function does not exist” or a similar error. This type of failure can be worked around by rewriting the query, for example by embedding the foreign table reference in a `sub-SELECT` with `OFFSET 0` as an optimization fence, and placing the problematic function or operator outside the `sub-SELECT`.

### F.32.7. Examples

Here is an example of creating a foreign table with `postgres_fdw`. First install the extension:

```sql
CREATE EXTENSION postgres_fdw;
```

Then create a foreign server using `CREATE SERVER`. In this example we wish to connect to a PostgreSQL server on host `192.83.123.89` listening on port `5432`. The database to which the connection is made is named `foreign_db` on the remote server:

```sql
CREATE SERVER foreign_server
    FOREIGN DATA WRAPPER postgres_fdw
    OPTIONS (host '192.83.123.89', port '5432', dbname 'foreign_db');
```
A user mapping, defined with CREATE USER MAPPING, is needed as well to identify the role that will be used on the remote server:

```
CREATE USER MAPPING FOR local_user
  SERVER foreign_server
  OPTIONS (user 'foreign_user', password 'password');
```

Now it is possible to create a foreign table with CREATE FOREIGN TABLE. In this example we wish to access the table named `some_schema.some_table` on the remote server. The local name for it will be `foreign_table`:

```
CREATE FOREIGN TABLE foreign_table (
  id serial NOT NULL,
  data text
)
  SERVER foreign_server
  OPTIONS (schema_name 'some_schema', table_name 'some_table');
```

It’s essential that the data types and other properties of the columns declared in CREATE FOREIGN TABLE match the actual remote table. Column names must match as well, unless you attach column_name options to the individual columns to show how they are named in the remote table.

Shigeru Hanada <shigeru.hanada@gmail.com>

### F.33. seg

This module implements a data type `seg` for representing line segments, or floating point intervals. `seg` can represent uncertainty in the interval endpoints, making it especially useful for representing laboratory measurements.

#### F.33.1. Rationale

The geometry of measurements is usually more complex than that of a point in a numeric continuum. A measurement is usually a segment of that continuum with somewhat fuzzy limits. The measurements come out as intervals because of uncertainty and randomness, as well as because the value being measured may naturally be an interval indicating some condition, such as the temperature range of stability of a protein.

Using just common sense, it appears more convenient to store such data as intervals, rather than pairs of numbers. In practice, it even turns out more efficient in most applications.

Further along the line of common sense, the fuzziness of the limits suggests that the use of traditional numeric data types leads to a certain loss of information. Consider this: your instrument reads 6.50, and you input this reading into the database. What do you get when you fetch it? Watch:
Appendix F. Additional Supplied Modules

test=> select 6.50 :: float8 as "pH";
pH
---
6.5
(1 row)

In the world of measurements, 6.50 is not the same as 6.5. It may sometimes be critically different. The experimenters usually write down (and publish) the digits they trust. 6.50 is actually a fuzzy interval contained within a bigger and even fuzzier interval, 6.5, with their center points being (probably) the only common feature they share. We definitely do not want such different data items to appear the same.

Conclusion? It is nice to have a special data type that can record the limits of an interval with arbitrarily variable precision. Variable in the sense that each data element records its own precision.

Check this out:

test=> select '6.25 .. 6.50'::seg as "pH";
pH
------------
6.25 .. 6.50
(1 row)

F.33.2. Syntax

The external representation of an interval is formed using one or two floating-point numbers joined by the range operator (.. or ...). Alternatively, it can be specified as a center point plus or minus a deviation. Optional certainty indicators (<, > or ~) can be stored as well. (Certainty indicators are ignored by all the built-in operators, however.) Table F-26 gives an overview of allowed representations; Table F-27 shows some examples.

In Table F-26, x, y, and delta denote floating-point numbers. x and y, but not delta, can be preceded by a certainty indicator.

Table F-26. seg External Representations

<table>
<thead>
<tr>
<th>Representation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x</td>
<td>Single value (zero-length interval)</td>
</tr>
<tr>
<td>x .. y</td>
<td>Interval from x to y</td>
</tr>
<tr>
<td>x (+-) delta</td>
<td>Interval from x - delta to x + delta</td>
</tr>
<tr>
<td>x ..</td>
<td>Open interval with lower bound x</td>
</tr>
<tr>
<td>.. x</td>
<td>Open interval with upper bound x</td>
</tr>
</tbody>
</table>

Table F-27. Examples of Valid seg Input

<table>
<thead>
<tr>
<th>Example</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.0</td>
<td>Creates a zero-length segment (a point, if you will)</td>
</tr>
</tbody>
</table>
Appendix F. Additional Supplied Modules

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>~5.0</td>
<td>Creates a zero-length segment and records ~ in the data. ~ is ignored by \texttt{seg} operations, but is preserved as a comment.</td>
</tr>
<tr>
<td>&lt;5.0</td>
<td>Creates a point at 5.0. &lt; is ignored but is preserved as a comment.</td>
</tr>
<tr>
<td>&gt;5.0</td>
<td>Creates a point at 5.0. &gt; is ignored but is preserved as a comment.</td>
</tr>
<tr>
<td>5(+-)0.3</td>
<td>Creates an interval 4.7 .. 5.3. Note that the (+-) notation isn’t preserved.</td>
</tr>
<tr>
<td>50 ..</td>
<td>Everything that is greater than or equal to 50</td>
</tr>
<tr>
<td>.. 0</td>
<td>Everything that is less than or equal to 0</td>
</tr>
<tr>
<td>1.5e-2 .. 2E-2</td>
<td>Creates an interval 0.015 .. 0.02</td>
</tr>
<tr>
<td>1 ... 2</td>
<td>The same as 1..2, or 1 .. 2, or 1..2 (spaces around the range operator are ignored)</td>
</tr>
</tbody>
</table>

Because \ldots is widely used in data sources, it is allowed as an alternative spelling of \ldots. Unfortunately, this creates a parsing ambiguity: it is not clear whether the upper bound in 0..23 is meant to be 23 or 0.23. This is resolved by requiring at least one digit before the decimal point in all numbers in \texttt{seg} input.

As a sanity check, \texttt{seg} rejects intervals with the lower bound greater than the upper, for example 5 .. 2.

F.33.3. Precision

\texttt{seg} values are stored internally as pairs of 32-bit floating point numbers. This means that numbers with more than 7 significant digits will be truncated.

Numbers with 7 or fewer significant digits retain their original precision. That is, if your query returns 0.00, you will be sure that the trailing zeroes are not the artifacts of formatting: they reflect the precision of the original data. The number of leading zeroes does not affect precision: the value 0.0067 is considered to have just 2 significant digits.

F.33.4. Usage

The \texttt{seg} module includes a GiST index operator class for \texttt{seg} values. The operators supported by the GiST operator class are shown in Table F-28.

Table F-28. Seg GiST Operators

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[a, b] &lt;&lt; [c, d]</td>
<td>[a, b] is entirely to the left of [c, d]. That is, [a, b] &lt;&lt; [c, d] is true if b &lt; c and false otherwise.</td>
</tr>
<tr>
<td>[a, b] &gt;&gt; [c, d]</td>
<td>[a, b] is entirely to the right of [c, d]. That is, [a, b] &gt;&gt; [c, d] is true if a &gt; d and false otherwise.</td>
</tr>
</tbody>
</table>
Appendix F. Additional Supplied Modules

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[a, b] &amp;&lt; [c, d]</td>
<td>Overlaps or is left of — This might be better read as “does not extend to right of”. It is true when b &lt;= d.</td>
</tr>
<tr>
<td>[a, b] &amp;&gt; [c, d]</td>
<td>Overlaps or is right of — This might be better read as “does not extend to left of”. It is true when a &gt;= c.</td>
</tr>
<tr>
<td>[a, b] = [c, d]</td>
<td>Same as — The segments [a, b] and [c, d] are identical, that is, a = c and b = d.</td>
</tr>
<tr>
<td>[a, b] &amp;&amp; [c, d]</td>
<td>The segments [a, b] and [c, d] overlap.</td>
</tr>
<tr>
<td>[a, b] @&gt; [c, d]</td>
<td>The segment [a, b] contains the segment [c, d], that is, a &lt;= c and b &gt;= d.</td>
</tr>
<tr>
<td>[a, b] &lt;@ [c, d]</td>
<td>The segment [a, b] is contained in [c, d], that is, a &gt;= c and b &lt;= d.</td>
</tr>
</tbody>
</table>

(Before PostgreSQL 8.2, the containment operators @> and <@ were respectively called @ and ~. These names are still available, but are deprecated and will eventually be retired. Notice that the old names are reversed from the convention formerly followed by the core geometric data types!)

The standard B-tree operators are also provided, for example

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[a, b] &lt; [c, d]</td>
<td>Less than</td>
</tr>
<tr>
<td>[a, b] &gt; [c, d]</td>
<td>Greater than</td>
</tr>
</tbody>
</table>

These operators do not make a lot of sense for any practical purpose but sorting. These operators first compare (a) to (c), and if these are equal, compare (b) to (d). That results in reasonably good sorting in most cases, which is useful if you want to use ORDER BY with this type.

**F.33.5. Notes**

For examples of usage, see the regression test sql/seg.sql.

The mechanism that converts (+-) to regular ranges isn’t completely accurate in determining the number of significant digits for the boundaries. For example, it adds an extra digit to the lower boundary if the resulting interval includes a power of ten:

```sql
postgres=> select '10(+)-1'::seg as seg;
seg
-------
9.0 .. 11 -- should be: 9 .. 11
```

The performance of an R-tree index can largely depend on the initial order of input values. It may be very helpful to sort the input table on the seg column; see the script sort-segments.pl for an example.
Appendix F. Additional Supplied Modules

F.33.6. Credits

Original author: Gene Selkov, Jr. <selkovjr@mcs.anl.gov>, Mathematics and Computer Science Division, Argonne National Laboratory.

My thanks are primarily to Prof. Joe Hellerstein (http://db.cs.berkeley.edu/jmh/) for elucidating the gist of the GiST (http://gist.cs.berkeley.edu/). I am also grateful to all Postgres developers, present and past, for enabling myself to create my own world and live undisturbed in it. And I would like to acknowledge my gratitude to Argonne Lab and to the U.S. Department of Energy for the years of faithful support of my database research.

F.34. sepgsql

sepgsql is a loadable module that supports label-based mandatory access control (MAC) based on SELinux security policy.

Warning

The current implementation has significant limitations, and does not enforce mandatory access control for all actions. See Section F.34.7.

F.34.1. Overview

This module integrates with SELinux to provide an additional layer of security checking above and beyond what is normally provided by PostgreSQL. From the perspective of SELinux, this module allows PostgreSQL to function as a user-space object manager. Each table or function access initiated by a DML query will be checked against the system security policy. This check is in addition to the usual SQL permissions checking performed by PostgreSQL.

SELinux access control decisions are made using security labels, which are represented by strings such as `system_u:object_r:sepgsql_table_t:s0`. Each access control decision involves two labels: the label of the subject attempting to perform the action, and the label of the object on which the operation is to be performed. Since these labels can be applied to any sort of object, access control decisions for objects stored within the database can be (and, with this module, are) subjected to the same general criteria used for objects of any other type, such as files. This design is intended to allow a centralized security policy to protect information assets independent of the particulars of how those assets are stored.

The SECURITY LABEL statement allows assignment of a security label to a database object.

F.34.2. Installation

sepgsql can only be used on Linux 2.6.28 or higher with SELinux enabled. It is not available on any other platform. You will also need libselinux 2.1.10 or higher and selinux-policy 3.9.13 or higher (although some distributions may backport the necessary rules into older policy versions).

The `sestatus` command allows you to check the status of SELinux. A typical display is:
Appendix F. Additional Supplied Modules

$ sestatus
SELinux status: enabled
SELinuxfs mount: /selinux
Current mode: enforcing
Mode from config file: enforcing
Policy version: 24
Policy from config file: targeted

If SELinux is disabled or not installed, you must set that product up first before installing this module.

To build this module, include the option `--with-selinux` in your PostgreSQL configure command. Be sure that the `libselinux-devel` RPM is installed at build time.

To use this module, you must include `sepgsql` in the `shared_preload_libraries` parameter in `postgresql.conf`. The module will not function correctly if loaded in any other manner. Once the module is loaded, you should execute `sepgsql.sql` in each database. This will install functions needed for security label management, and assign initial security labels.

Here is an example showing how to initialize a fresh database cluster with `sepgsql` functions and security labels installed. Adjust the paths shown as appropriate for your installation:

```
$ export PGDATA=/path/to/data/directory
$ initdb
$ vi $PGDATA/postgresql.conf
change
  #shared_preload_libraries = "$" # (change requires restart)
to
  shared_preload_libraries = 'sepgsql' # (change requires restart)
$ for DBNAME in template0 template1 postgres; do
  postgres --single -F -c exit_on_error=true $DBNAME \
    </usr/local/pgsql/share/contrib/sepgsql.sql >/dev/null
done
```

Please note that you may see some or all of the following notifications depending on the particular versions you have of libselinux and selinux-policy:

```
/etc/selinux/targeted/contexts/sepgsql_contexts: line 33 has invalid object type db_blobs
/etc/selinux/targeted/contexts/sepgsql_contexts: line 36 has invalid object type db_language
/etc/selinux/targeted/contexts/sepgsql_contexts: line 37 has invalid object type db_language
/etc/selinux/targeted/contexts/sepgsql_contexts: line 38 has invalid object type db_language
/etc/selinux/targeted/contexts/sepgsql_contexts: line 39 has invalid object type db_language
/etc/selinux/targeted/contexts/sepgsql_contexts: line 40 has invalid object type db_language
```

These messages are harmless and should be ignored.

If the installation process completes without error, you can now start the server normally.

F.34.3. Regression Tests

Due to the nature of SELinux, running the regression tests for `sepgsql` requires several extra configuration steps, some of which must be done as root. The regression tests will not be run by an ordinary `make check` or `make installcheck` command; you must set up the configuration and then invoke the test script manually. The tests must be run in the `contrib/sepgsql` directory of a configured PostgreSQL
Appendix F. Additional Supplied Modules

build tree. Although they require a build tree, the tests are designed to be executed against an installed server, that is they are comparable to *make installcheck* not *make check.*

First, set up *sepgsql* in a working database according to the instructions in Section F.34.2. Note that the current operating system user must be able to connect to the database as superuser without password authentication.

Second, build and install the policy package for the regression test. The *sepgsql-regtest* policy is a special purpose policy package which provides a set of rules to be allowed during the regression tests. It should be built from the policy source file *sepgsql-regtest.te*, which is done using *make* with a Makefile supplied by SELinux. You will need to locate the appropriate Makefile on your system; the path shown below is only an example. Once built, install this policy package using the *semodule* command, which loads supplied policy packages into the kernel. If the package is correctly installed, *semodule -l* should list *sepgsql-regtest* as an available policy package:

```
$ cd .../contrib/sepgsql
$ make -f /usr/share/selinux/devel/Makefile
$ sudo semodule -u sepgsql-regtest.pp
$ sudo semodule -l | grep sepgsql
sepgsql-regtest 1.07
```

Third, turn on *sepgsql_regression_test_mode*. For security reasons, the rules in *sepgsql-regtest* are not enabled by default; the *sepgsql_regression_test_mode* parameter enables the rules needed to launch the regression tests. It can be turned on using the *setsebool* command:

```
$ sudo setsebool sepgsql_regression_test_mode on
$ getsebool sepgsql_regression_test_mode
sepgsql_regression_test_mode --> on
```

Fourth, verify your shell is operating in the *unconfined_t* domain:

```
$ id -Z
unconfined_u:unconfined_r:unconfined_t:s0-s0:c0.c1023
```

See Section F.34.8 for details on adjusting your working domain, if necessary.

Finally, run the regression test script:

```
$ ./test_sepgsql
```

This script will attempt to verify that you have done all the configuration steps correctly, and then it will run the regression tests for the *sepgsql* module.

After completing the tests, it’s recommended you disable the *sepgsql_regression_test_mode* parameter:

```
$ sudo setsebool sepgsql_regression_test_mode off
```

You might prefer to remove the *sepgsql-regtest* policy entirely:

```
$ sudo semodule -r sepgsql-regtest
```
F.34.4. GUC Parameters

sepgsq1.permissive (boolean)

This parameter enables sepgsql to function in permissive mode, regardless of the system setting. The default is off. This parameter can only be set in the postgresql.conf file or on the server command line.

When this parameter is on, sepgsql functions in permissive mode, even if SELinux in general is working in enforcing mode. This parameter is primarily useful for testing purposes.

sepgsq1.debug_audit (boolean)

This parameter enables the printing of audit messages regardless of the system policy settings. The default is off, which means that messages will be printed according to the system settings.

The security policy of SELinux also has rules to control whether or not particular accesses are logged. By default, access violations are logged, but allowed accesses are not.

This parameter forces all possible logging to be turned on, regardless of the system policy.

F.34.5. Features

F.34.5.1. Controlled Object Classes

The security model of SELinux describes all the access control rules as relationships between a subject entity (typically, a client of the database) and an object entity (such as a database object), each of which is identified by a security label. If access to an unlabeled object is attempted, the object is treated as if it were assigned the label unlabeled_t.

Currently, sepgsql allows security labels to be assigned to schemas, tables, columns, sequences, views, and functions. When sepgsql is in use, security labels are automatically assigned to supported database objects at creation time. This label is called a default security label, and is decided according to the system security policy, which takes as input the creator’s label, the label assigned to the new object’s parent object and optionally name of the constructed object.

A new database object basically inherits the security label of the parent object, except when the security policy has special rules known as type-transition rules, in which case a different label may be applied. For schemas, the parent object is the current database; for tables, sequences, views, and functions, it is the containing schema; for columns, it is the containing table.

F.34.5.2. DML Permissions

For tables, db_table:select, db_table:insert, db_table:update or db_table:delete are checked for all the referenced target tables depending on the kind of statement; in addition, db_table:select is also checked for all the tables that contain columns referenced in the WHERE or RETURNING clause, as a data source for UPDATE, and so on.

Column-level permissions will also be checked for each referenced column. db_column:select is checked on not only the columns being read using SELECT, but those being referenced in other DML
statements; \texttt{db\_column:update} or \texttt{db\_column:insert} will also be checked for columns being modified by \texttt{UPDATE} or \texttt{INSERT}.

For example, consider:

\begin{verbatim}
UPDATE t1 SET x = 2, y = md5sum(y) WHERE z = 100;
\end{verbatim}

Here, \texttt{db\_column:update} will be checked for \texttt{t1.x}, since it is being updated, \texttt{db\_column:{select update}} will be checked for \texttt{t1.y}, since it is both updated and referenced, and \texttt{db\_column:select} will be checked for \texttt{t1.z}, since it is only referenced. \texttt{db\_table:{select update}} will also be checked at the table level.

For sequences, \texttt{db\_sequence:get\_value} is checked when we reference a sequence object using \texttt{SELECT}; however, note that we do not currently check permissions on execution of corresponding functions such as \texttt{lastval()}.

For views, \texttt{db\_view:expand} will be checked, then any other required permissions will be checked on the objects being expanded from the view, individually.

For functions, \texttt{db\_procedure:{execute}} will be checked when user tries to execute a function as a part of query, or using fast-path invocation. If this function is a trusted procedure, it also checks \texttt{db\_procedure:{entrypoint}} permission to check whether it can perform as entry point of trusted procedure.

In order to access any schema object, \texttt{db\_schema:search} permission is required on the containing schema. When an object is referenced without schema qualification, schemas on which this permission is not present will not be searched (just as if the user did not have \texttt{USAGE} privilege on the schema). If an explicit schema qualification is present, an error will occur if the user does not have the requisite permission on the named schema.

The client must be allowed to access all referenced tables and columns, even if they originated from views which were then expanded, so that we apply consistent access control rules independent of the manner in which the table contents are referenced.

The default database privilege system allows database superusers to modify system catalogs using DML commands, and reference or modify toast tables. These operations are prohibited when \texttt{sepgsql} is enabled.

\subsection{F.34.5.3. DDL Permissions}

\texttt{SELinux} defines several permissions to control common operations for each object type; such as creation, alter, drop and relabel of security label. In addition, several object types have special permissions to control their characteristic operations; such as addition or deletion of name entries within a particular schema.

Creating a new database object requires \texttt{create} permission. \texttt{SELinux} will grant or deny this permission based on the client’s security label and the proposed security label for the new object. In some cases, additional privileges are required:

- \texttt{CREATE DATABASE} additionally requires \texttt{getattr} permission for the source or template database.
- Creating a schema object additionally requires \texttt{add\_name} permission on the parent schema.
- Creating a table additionally requires permission to create each individual table column, just as if each table column were a separate top-level object.
• Creating a function marked as LEAKPROOF additionally requires install permission. (This permission is also checked when LEAKPROOF is set for an existing function.)

When DROP command is executed, drop will be checked on the object being removed. Permissions will be also checked for objects dropped indirectly via CASCADE. Deletion of objects contained within a particular schema (tables, views, sequences and procedures) additionally requires remove_name on the schema.

When ALTER command is executed, setattr will be checked on the object being modified for each object types, except for subsidiary objects such as the indexes or triggers of a table, where permissions are instead checked on the parent object. In some cases, additional permissions are required:

• Moving an object to a new schema additionally requires remove_name permission on the old schema and add_name permission on the new one.

• Setting the LEAKPROOF attribute on a function requires install permission.

• Using SECURITY LABEL on an object additionally requires relabelfrom permission for the object in conjunction with its old security label and relabelto permission for the object in conjunction with its new security label. (In cases where multiple label providers are installed and the user tries to set a security label, but it is not managed by SELinux, only setattr should be checked here. This is currently not done due to implementation restrictions.)

F.34.5.4. Trusted Procedures

Trusted procedures are similar to security definer functions or setuid commands. SELinux provides a feature to allow trusted code to run using a security label different from that of the client, generally for the purpose of providing highly controlled access to sensitive data (e.g. rows might be omitted, or the precision of stored values might be reduced). Whether or not a function acts as a trusted procedure is controlled by its security label and the operating system security policy. For example:

```
postgres=# CREATE TABLE customer (  
    cid        int primary key,  
    cname      text,  
    credit     text  
  );
CREATE TABLE
postgres=# SECURITY LABEL ON COLUMN customer.credit  
           IS 'system_u:object_r:sepgsql_secret_table_t:s0';
SECURITY LABEL
postgres=# CREATE FUNCTION show_credit(int) RETURNS text  
AS 'SELECT regexp_replace(credit, "-[0-9]+$", "-xxxx", "g")  
FROM customer WHERE cid = $1'  
LANGUAGE sql;
CREATE FUNCTION
postgres=# SECURITY LABEL ON FUNCTION show_credit(int)  
           IS 'system_u:object_r:sepgsql_trusted_proc_exec_t:s0';
SECURITY LABEL
```

The above operations should be performed by an administrative user.

```
postgres=# SELECT * FROM customer;
ERROR: SELinux: security policy violation
```
In this case, a regular user cannot reference `customer.credit` directly, but a trusted procedure `show_credit` allows him to print the credit card numbers of customers with some of the digits masked out.

**F.34.5.5. Dynamic Domain Transitions**

It is possible to use SELinux's dynamic domain transition feature to switch the security label of the client process, the client domain, to a new context, if that is allowed by the security policy. The client domain needs the `setcurrent` permission and also `dyntransition` from the old to the new domain.

Dynamic domain transitions should be considered carefully, because they allow users to switch their label, and therefore their privileges, at their option, rather than (as in the case of a trusted procedure) as mandated by the system. Thus, the `dyntransition` permission is only considered safe when used to switch to a domain with a smaller set of privileges than the original one. For example:

```
regression=# select sepgsql_getcon();
sepgsql_getcon
-------------------------------------------------------
unconfined_u:unconfined_r:unconfined_t:s0-s0:c0.c1023
(1 row)

regression=# SELECT sepgsql_setcon('unconfined_u:unconfined_r:unconfined_t:s0-s0:c1.c4');
sepgsql_setcon
----------------
t
(1 row)

regression=# SELECT sepgsql_setcon('unconfined_u:unconfined_r:unconfined_t:s0-s0:c1.c1023');
ERROR: SELinux: security policy violation
```

In this example above we were allowed to switch from the larger MCS range `c1.c1023` to the smaller range `c1.c4`, but switching back was denied.

A combination of dynamic domain transition and trusted procedure enables an interesting use case that fits the typical process life-cycle of connection pooling software. Even if your connection pooling software is not allowed to run most of SQL commands, you can allow it to switch the security label of the client using the `sepgsql_setcon()` function from within a trusted procedure; that should take some credential to authorize the request to switch the client label. After that, this session will have the privileges of the target user, rather than the connection pooler. The connection pooler can later revert the security label change by again using `sepgsql_setcon()` with NULL argument, again invoked from within a trusted procedure with appropriate permissions checks. The point here is that only the trusted procedure actually has permission to change the effective security label, and only does so when given proper credentials. Of course, for secure operation, the credential store (table, procedure definition, or whatever) must be protected from unauthorized access.
F.34.5.6. Miscellaneous

We reject the LOAD command across the board, because any module loaded could easily circumvent security policy enforcement.

F.34.6. Sepgsql Functions

Table F-29 shows the available functions.

Table F-29. Sepgsql Functions

<table>
<thead>
<tr>
<th>Function Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sepgsql_getcon() returns text</td>
<td>Returns the client domain, the current security label of the client.</td>
</tr>
<tr>
<td>sepgsql_setcon(text) returns bool</td>
<td>Switches the client domain of the current session to the new domain, if allowed by the security policy. It also accepts NULL input as a request to transition to the client’s original domain.</td>
</tr>
<tr>
<td>sepgsql_mcstrans_in(text) returns text</td>
<td>Translates the given qualified MLS/MCS range into raw format if the mcstrans daemon is running.</td>
</tr>
<tr>
<td>sepgsql_mcstrans_out(text) returns text</td>
<td>Translates the given raw MLS/MCS range into qualified format if the mcstrans daemon is running.</td>
</tr>
<tr>
<td>sepgsql_restorecon(text) returns bool</td>
<td>Sets up initial security labels for all objects within the current database. The argument may be NULL, or the name of a specfile to be used as alternative of the system default.</td>
</tr>
</tbody>
</table>

F.34.7. Limitations

Data Definition Language (DDL) Permissions

Due to implementation restrictions, some DDL operations do not check permissions.

Data Control Language (DCL) Permissions

Due to implementation restrictions, DCL operations do not check permissions.

Row-level access control

PostgreSQL does not support row-level access; therefore, sepgsql does not support it either.

Covert channels

sepgsql does not try to hide the existence of a certain object, even if the user is not allowed to reference it. For example, we can infer the existence of an invisible object as a result of primary key conflicts, foreign key violations, and so on, even if we cannot obtain the contents of the object. The existence of a top secret table cannot be hidden; we only hope to conceal its contents.

KaiGai Kohei <kaigai@ak.jp.nec.com>

F.35. spi

The spi module provides several workable examples of using the Server Programming Interface (SPI) and triggers. While these functions are of some value in their own right, they are even more useful as examples to modify for your own purposes. The functions are general enough to be used with any table, but you have to specify table and field names (as described below) while creating a trigger.

Each of the groups of functions described below is provided as a separately-installable extension.

F.35.1. refint — Functions for Implementing Referential Integrity

check_primary_key() and check_foreign_key() are used to check foreign key constraints. (This functionality is long since superseded by the built-in foreign key mechanism, of course, but the module is still useful as an example.)

check_primary_key() checks the referencing table. To use, create a BEFORE INSERT OR UPDATE trigger using this function on a table referencing another table. Specify as the trigger arguments: the referencing table’s column name(s) which form the foreign key, the referenced table name, and the column names in the referenced table which form the primary/unique key. To handle multiple foreign keys, create a trigger for each reference.

check_foreign_key() checks the referenced table. To use, create a BEFORE DELETE OR UPDATE trigger using this function on a table referenced by other table(s). Specify as the trigger arguments: the

7. http://docs.fedoraproject.org/selinux-faq
number of referencing tables for which the function has to perform checking, the action if a referencing key is found (cascade — to delete the referencing row, restrict — to abort transaction if referencing keys exist, setnull — to set referencing key fields to null), the triggered table’s column names which form the primary/unique key, then the referencing table name and column names (repeated for as many referencing tables as were specified by first argument). Note that the primary/unique key columns should be marked NOT NULL and should have a unique index.

There are examples in refint.example.

**F.35.2. timetravel — Functions for Implementing Time Travel**

Long ago, PostgreSQL had a built-in time travel feature that kept the insert and delete times for each tuple. This can be emulated using these functions. To use these functions, you must add to a table two columns of abstime type to store the date when a tuple was inserted (start_date) and changed/deleted (stop_date):

```
CREATE TABLE mytab (...
    start_date abstime,
    stop_date abstime
...);
```

The columns can be named whatever you like, but in this discussion we’ll call them start_date and stop_date.

When a new row is inserted, start_date should normally be set to current time, and stop_date to infinity. The trigger will automatically substitute these values if the inserted data contains nulls in these columns. Generally, inserting explicit non-null data in these columns should only be done when re-loading dumped data.

Tuples with stop_date equal to infinity are “valid now”, and can be modified. Tuples with a finite stop_date cannot be modified anymore — the trigger will prevent it. (If you need to do that, you can turn off time travel as shown below.)

For a modifiable row, on update only the stop_date in the tuple being updated will be changed (to current time) and a new tuple with the modified data will be inserted. Start_date in this new tuple will be set to current time and stop_date to infinity.

A delete does not actually remove the tuple but only sets its stop_date to current time.

To query for tuples “valid now”, include stop_date = ‘infinity’ in the query’s WHERE condition. (You might wish to incorporate that in a view.) Similarly, you can query for tuples valid at any past time with suitable conditions on start_date and stop_date.

`timetravel()` is the general trigger function that supports this behavior. Create a BEFORE INSERT OR UPDATE OR DELETE trigger using this function on each time-traveled table. Specify two trigger arguments: the actual names of the start_date and stop_date columns. Optionally, you can specify one to three more arguments, which must refer to columns of type text. The trigger will store the name of the current user into the first of these columns during INSERT, the second column during UPDATE, and the third during DELETE.

`set_timetravel()` allows you to turn time-travel on or off for a table. `set_timetravel('mytab', 1)` will turn TT ON for table mytab. `set_timetravel('mytab', 0)` will turn TT OFF for table
Appendix F. Additional Supplied Modules

mytab. In both cases the old status is reported. While TT is off, you can modify the start_date and stop_date columns freely. Note that the on/off status is local to the current database session — fresh sessions will always start out with TT ON for all tables.

get_timetravel() returns the TT state for a table without changing it.

There is an example in timetravel.example.

F.35.3. autoinc — Functions for Autoincrementing Fields

autoinc() is a trigger that stores the next value of a sequence into an integer field. This has some overlap with the built-in “serial column” feature, but it is not the same: autoinc() will override attempts to substitute a different field value during inserts, and optionally it can be used to increment the field during updates, too.

To use, create a BEFORE INSERT (or optionally BEFORE INSERT OR UPDATE) trigger using this function. Specify two trigger arguments: the name of the integer column to be modified, and the name of the sequence object that will supply values. (Actually, you can specify any number of pairs of such names, if you’d like to update more than one autoincrementing column.)

There is an example in autoinc.example.

F.35.4. insert_username — Functions for Tracking Who Changed a Table

insert_username() is a trigger that stores the current user’s name into a text field. This can be useful for tracking who last modified a particular row within a table.

To use, create a BEFORE INSERT and/or UPDATE trigger using this function. Specify a single trigger argument: the name of the text column to be modified.

There is an example in insert_username.example.

F.35.5. moddatetime — Functions for Tracking Last Modification Time

moddatetime() is a trigger that stores the current time into a timestamp field. This can be useful for tracking the last modification time of a particular row within a table.

To use, create a BEFORE UPDATE trigger using this function. Specify a single trigger argument: the name of the column to be modified. The column must be of type timestamp or timestamp with time zone.

There is an example in moddatetime.example.
Appendix F. Additional Supplied Modules

F.36. sslinfo

The sslinfo module provides information about the SSL certificate that the current client provided when connecting to PostgreSQL. The module is useless (most functions will return NULL) if the current connection does not use SSL.

This extension won’t build at all unless the installation was configured with --with-openssl.

F.36.1. Functions Provided

ssl_is_used() returns boolean

Returns TRUE if current connection to server uses SSL, and FALSE otherwise.

ssl_version() returns text

Returns the name of the protocol used for the SSL connection (e.g. SSLv2, SSLv3, or TLSv1).

ssl_cipher() returns text

Returns the name of the cipher used for the SSL connection (e.g. DHE-RSA-AES256-SHA).

ssl_client_cert_present() returns boolean

Returns TRUE if current client has presented a valid SSL client certificate to the server, and FALSE otherwise. (The server might or might not be configured to require a client certificate.)

ssl_client_serial() returns numeric

Returns serial number of current client certificate. The combination of certificate serial number and certificate issuer is guaranteed to uniquely identify a certificate (but not its owner — the owner ought to regularly change his keys, and get new certificates from the issuer).

So, if you run your own CA and allow only certificates from this CA to be accepted by the server, the serial number is the most reliable (albeit not very mnemonic) means to identify a user.

ssl_client_dn() returns text

Returns the full subject of the current client certificate, converting character data into the current database encoding. It is assumed that if you use non-ASCII characters in the certificate names, your database is able to represent these characters, too. If your database uses the SQL.ASCII encoding, non-ASCII characters in the name will be represented as UTF-8 sequences.

The result looks like /CN=Somebody /C=Some country/O=Some organization.

ssl_issuer_dn() returns text

Returns the full issuer name of the current client certificate, converting character data into the current database encoding. Encoding conversions are handled the same as for ssl_client_dn.

The combination of the return value of this function with the certificate serial number uniquely identifies the certificate.

This function is really useful only if you have more than one trusted CA certificate in your server’s root.crt file, or if this CA has issued some intermediate certificate authority certificates.
ssl_client_dn_field(fieldname text) returns text

This function returns the value of the specified field in the certificate subject, or NULL if the field is not present. Field names are string constants that are converted into ASN1 object identifiers using the OpenSSL object database. The following values are acceptable:

- commonName (alias CN)
- surname (alias SN)
- name
- givenName (alias GN)
- countryName (alias C)
- localityName (alias L)
- stateOrProvinceName (alias ST)
- organizationName (alias O)
- organizationUnitName (alias OU)
- title
- description
- initials
- postalCode
- streetAddress
- generationQualifier
- description
- dnQualifier
- x500UniqueIdentifier
- pseudonym
- role
- emailAddress

All of these fields are optional, except commonName. It depends entirely on your CA’s policy which of them would be included and which wouldn’t. The meaning of these fields, however, is strictly defined by the X.500 and X.509 standards, so you cannot just assign arbitrary meaning to them.

ssl_issuer_field(fieldname text) returns text

Same as ssl_client_dn_field, but for the certificate issuer rather than the certificate subject.

F.37. tablefunc

The tablefunc module includes various functions that return tables (that is, multiple rows). These functions are useful both in their own right and as examples of how to write C functions that return multiple rows.
Appendix F. Additional Supplied Modules

F.37.1. Functions Provided

Table F-30 shows the functions provided by the `tablefunc` module.

<table>
<thead>
<tr>
<th>Function</th>
<th>Returns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>normal_rand(int numvals, float8 mean, float8 stddev)</td>
<td>setof float8</td>
<td>Produces a set of normally distributed random values</td>
</tr>
<tr>
<td>crosstab(text sql)</td>
<td>setof record</td>
<td>Produces a “pivot table” containing row names plus ( N ) value columns, where ( N ) is determined by the row type specified in the calling query</td>
</tr>
<tr>
<td>crosstabN(text sql)</td>
<td>setof table_crosstab_N</td>
<td>Produces a “pivot table” containing row names plus ( N ) value columns. <code>crosstab2</code>, <code>crosstab3</code>, and <code>crosstab4</code> are predefined, but you can create additional <code>crosstabN</code> functions as described below</td>
</tr>
<tr>
<td>crosstab(text source_sql, text category_sql)</td>
<td>setof record</td>
<td>Produces a “pivot table” with the value columns specified by a second query</td>
</tr>
<tr>
<td>crosstab(text sql, int N)</td>
<td>setof record</td>
<td>Obsolete version of <code>crosstab(text)</code>. The parameter ( N ) is now ignored, since the number of value columns is always determined by the calling query</td>
</tr>
<tr>
<td>connectby(text relname, text keyid_fld, text parent_keyid_fld [, text orderby_fld ], text start_with, int max_depth [, text branch_delim ]})</td>
<td>setof record</td>
<td>Produces a representation of a hierarchical tree structure</td>
</tr>
</tbody>
</table>

F.37.1.1. `normal_rand`

`normal_rand(int numvals, float8 mean, float8 stddev) returns setof float8`

`normal_rand` produces a set of normally distributed random values (Gaussian distribution).

`numvals` is the number of values to be returned from the function. `mean` is the mean of the normal distribution of values and `stddev` is the standard deviation of the normal distribution of values.
For example, this call requests 1000 values with a mean of 5 and a standard deviation of 3:

```sql
test=# SELECT * FROM normal_rand(1000, 5, 3);
```

```sql
<table>
<thead>
<tr>
<th>normal_rand</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.56556322244898</td>
</tr>
<tr>
<td>9.10040991424657</td>
</tr>
<tr>
<td>5.36957140345079</td>
</tr>
<tr>
<td>-0.369151492880995</td>
</tr>
<tr>
<td>0.283600703686639</td>
</tr>
<tr>
<td>.</td>
</tr>
<tr>
<td>.</td>
</tr>
<tr>
<td>4.82992125404908</td>
</tr>
<tr>
<td>9.71308014517282</td>
</tr>
<tr>
<td>2.49639286969028</td>
</tr>
</tbody>
</table>
```

(1000 rows)

F.37.1.2. crosstab(text)

crosstab(text sql)
crosstab(text sql, int N)

The `crosstab` function is used to produce “pivot” displays, wherein data is listed across the page rather than down. For example, we might have data like

```
row1  val11
row1  val12
row1  val13
...
row2  val21
row2  val22
row2  val23
...
```

which we wish to display like

```
row1  val11  val12  val13  ...
row2  val21  val22  val23  ...
...
```

The `crosstab` function takes a text parameter that is a SQL query producing raw data formatted in the first way, and produces a table formatted in the second way.

The `sql` parameter is a SQL statement that produces the source set of data. This statement must return one `row_name` column, one `category` column, and one `value` column. `N` is an obsolete parameter, ignored if supplied (formerly this had to match the number of output value columns, but now that is determined by the calling query).

For example, the provided query might produce a set something like:

```
row_name  cat  value
```
Appendix F. Additional Supplied Modules

---
row1  cat1  val1
row1  cat2  val2
row1  cat3  val3
row1  cat4  val4
row2  cat1  val5
row2  cat2  val6
row2  cat3  val7
row2  cat4  val8
---

The `crosstab` function is declared to return `setof record`, so the actual names and types of the output columns must be defined in the `FROM` clause of the calling `SELECT` statement, for example:

```sql
SELECT * FROM crosstab('...' AS ct(row_name text, category_1 text, category_2 text);
```

This example produces a set something like:

```plaintext
<< value columns >>
row_name  category_1  category_2
----------  ------------  ------------
row1       val1        val2
row2       val5        val6
```

The `FROM` clause must define the output as one `row_name` column (of the same data type as the first result column of the SQL query) followed by N `value` columns (all of the same data type as the third result column of the SQL query). You can set up as many output value columns as you wish. The names of the output columns are up to you.

The `crosstab` function produces one output row for each consecutive group of input rows with the same `row_name` value. It fills the output `value` columns, left to right, with the `value` fields from these rows. If there are fewer rows in a group than there are output `value` columns, the extra output columns are filled with nulls; if there are more rows, the extra input rows are skipped.

In practice the SQL query should always specify `ORDER BY 1,2` to ensure that the input rows are properly ordered, that is, values with the same `row_name` are brought together and correctly ordered within the row. Notice that `crosstab` itself does not pay any attention to the second column of the query result; it’s just there to be ordered by, to control the order in which the third-column values appear across the page.

Here is a complete example:

```sql
CREATE TABLE ct(id SERIAL, rowid TEXT, attribute TEXT, value TEXT);
INSERT INTO ct(rowid, attribute, value) VALUES('test1','att1','val1');
INSERT INTO ct(rowid, attribute, value) VALUES('test1','att2','val2');
INSERT INTO ct(rowid, attribute, value) VALUES('test1','att3','val3');
INSERT INTO ct(rowid, attribute, value) VALUES('test1','att4','val4');
INSERT INTO ct(rowid, attribute, value) VALUES('test2','att1','val5');
INSERT INTO ct(rowid, attribute, value) VALUES('test2','att2','val6');
INSERT INTO ct(rowid, attribute, value) VALUES('test2','att3','val7');
SELECT *
```

3143
FROM crosstab(
  'select rowid, attribute, value
from ct
  where attribute = "att2" or attribute = "att3"
order by 1,2')
AS ct(row_name text, category_1 text, category_2 text, category_3 text);

row_name | category_1 | category_2 | category_3
----------+------------+------------+------------
test1     | val2       | val3       |
test2     | val6       | val7       |
(2 rows)

You can avoid always having to write out a FROM clause to define the output columns, by setting up a custom crosstab function that has the desired output row type wired into its definition. This is described in the next section. Another possibility is to embed the required FROM clause in a view definition.

F.37.1.3. crosstabN (text)

crosstabN(text sql)

The crosstabN functions are examples of how to set up custom wrappers for the general crosstab function, so that you need not write out column names and types in the calling SELECT query. The tablefunc module includes crosstab2, crosstab3, and crosstab4, whose output row types are defined as

CREATE TYPE tablefunc_crosstab_N AS (  
  row_name TEXT,
  category_1 TEXT,
  category_2 TEXT,
  .
  .
  .
  category_N TEXT
);

Thus, these functions can be used directly when the input query produces row_name and value columns of type text, and you want 2, 3, or 4 output values columns. In all other ways they behave exactly as described above for the general crosstab function.

For instance, the example given in the previous section would also work as

SELECT *
FROM crosstab3(
  'select rowid, attribute, value
from ct
  where attribute = "att2" or attribute = "att3"
order by 1,2');
These functions are provided mostly for illustration purposes. You can create your own return types and functions based on the underlying `crosstab()` function. There are two ways to do it:

- Create a composite type describing the desired output columns, similar to the examples in `contrib/tablefunc/tablefunc--1.0.sql`. Then define a unique function name accepting one `text` parameter and returning `setof your_type_name`, but linking to the same underlying `crosstab` C function. For example, if your source data produces row names that are `text`, and values that are `float8`, and you want 5 value columns:

  ```sql
  CREATE TYPE my_crosstab_float8_5_cols AS (
    my_row_name text,
    my_category_1 float8,
    my_category_2 float8,
    my_category_3 float8,
    my_category_4 float8,
    my_category_5 float8
  );
  CREATE OR REPLACE FUNCTION crosstab_float8_5_cols(text)
  RETURNS setof my_crosstab_float8_5_cols
  AS '$libdir/tablefunc','crosstab' LANGUAGE C STABLE STRICT;
  ```

- Use `OUT` parameters to define the return type implicitly. The same example could also be done this way:

  ```sql
  CREATE OR REPLACE FUNCTION crosstab_float8_5_cols(
    IN text,
    OUT my_row_name text,
    OUT my_category_1 float8,
    OUT my_category_2 float8,
    OUT my_category_3 float8,
    OUT my_category_4 float8,
    OUT my_category_5 float8
  )
  RETURNS setof record
  AS '$libdir/tablefunc','crosstab' LANGUAGE C STABLE STRICT;
  ```

### F.37.1.4. crosstab(text, text)

`crosstab(text source_sql, text category_sql)`

The main limitation of the single-parameter form of `crosstab` is that it treats all values in a group alike, inserting each value into the first available column. If you want the value columns to correspond to specific categories of data, and some groups might not have data for some of the categories, that doesn’t work well. The two-parameter form of `crosstab` handles this case by providing an explicit list of the categories corresponding to the output columns.

`source_sql` is a SQL statement that produces the source set of data. This statement must return one `row_name` column, one `category` column, and one `value` column. It may also have one or more “extra” columns. The `row_name` column must be first. The `category` and `value` columns must be the last two columns, in that order. Any columns between `row_name` and `category` are treated as “extra”. The “extra” columns are expected to be the same for all rows with the same `row_name` value.
Appendix F. Additional Supplied Modules

For example, `source_sql` might produce a set something like:

```sql
SELECT row_name, extra_col, cat, value FROM foo ORDER BY 1;
```

<table>
<thead>
<tr>
<th>row_name</th>
<th>extra_col</th>
<th>cat</th>
<th>value</th>
</tr>
</thead>
<tbody>
<tr>
<td>row1</td>
<td>extra1</td>
<td>cat1</td>
<td>val1</td>
</tr>
<tr>
<td>row1</td>
<td>extra1</td>
<td>cat2</td>
<td>val2</td>
</tr>
<tr>
<td>row1</td>
<td>extra1</td>
<td>cat4</td>
<td>val4</td>
</tr>
<tr>
<td>row2</td>
<td>extra2</td>
<td>cat1</td>
<td>val5</td>
</tr>
<tr>
<td>row2</td>
<td>extra2</td>
<td>cat2</td>
<td>val6</td>
</tr>
<tr>
<td>row2</td>
<td>extra2</td>
<td>cat3</td>
<td>val7</td>
</tr>
<tr>
<td>row2</td>
<td>extra2</td>
<td>cat4</td>
<td>val8</td>
</tr>
</tbody>
</table>

`category_sql` is a SQL statement that produces the set of categories. This statement must return only one column. It must produce at least one row, or an error will be generated. Also, it must not produce duplicate values, or an error will be generated. `category_sql` might be something like:

```sql
SELECT DISTINCT cat FROM foo ORDER BY 1;
```

<table>
<thead>
<tr>
<th>cat</th>
</tr>
</thead>
<tbody>
<tr>
<td>cat1</td>
</tr>
<tr>
<td>cat2</td>
</tr>
<tr>
<td>cat3</td>
</tr>
<tr>
<td>cat4</td>
</tr>
</tbody>
</table>

The `crosstab` function is declared to return `setof record`, so the actual names and types of the output columns must be defined in the `FROM` clause of the calling `SELECT` statement, for example:

```sql
SELECT * FROM crosstab(‘...’, ‘...’) AS ct(row_name text, extra text, cat1 text, cat2 text, cat3 text, cat4 text);
```

This will produce a result something like:

```
<== value columns ==>  
row_name  extra     cat1  cat2  cat3  cat4
-------------------------+---------+---------+---------+---------+
row1        extra1    val1   val2   val4
row2        extra2    val5   val6   val7   val8
```

The `FROM` clause must define the proper number of output columns of the proper data types. If there are \( N \) columns in the `source_sql` query’s result, the first \( N-2 \) of them must match up with the first \( N-2 \) output columns. The remaining output columns must have the type of the last column of the `source_sql` query’s result, and there must be exactly as many of them as there are rows in the `category_sql` query’s result.

The `crosstab` function produces one output row for each consecutive group of input rows with the same `row_name` value. The output `row_name` column, plus any “extra” columns, are copied from the first row.
of the group. The output value columns are filled with the value fields from rows having matching category values. If a row’s category does not match any output of the category_sql query, its value is ignored. Output columns whose matching category is not present in any input row of the group are filled with nulls.

In practice the source_sql query should always specify ORDER BY 1 to ensure that values with the same row_name are brought together. However, ordering of the categories within a group is not important. Also, it is essential to be sure that the order of the category_sql query’s output matches the specified output column order.

Here are two complete examples:

```sql
cREATE TABLE sales(year int, month int, qty int);
INSERT INTO sales VALUES(2007, 1, 1000);
INSERT INTO sales VALUES(2007, 2, 1500);
INSERT INTO sales VALUES(2007, 7, 500);
INSERT INTO sales VALUES(2007, 11, 1500);
INSERT INTO sales VALUES(2007, 12, 2000);
INSERT INTO sales VALUES(2008, 1, 1000);

SELECT * FROM crosstab(
    'select year, month, qty from sales order by 1',
    'select m from generate_series(1,12) m'
) as {
    year int,
    "Jan" int,
    "Feb" int,
    "Mar" int,
    "Apr" int,
    "May" int,
    "Jun" int,
    "Jul" int,
    "Aug" int,
    "Sep" int,
    "Oct" int,
    "Nov" int,
    "Dec" int
};
```

<table>
<thead>
<tr>
<th>year</th>
<th>Jan</th>
<th>Feb</th>
<th>Mar</th>
<th>Apr</th>
<th>May</th>
<th>Jun</th>
<th>Jul</th>
<th>Aug</th>
<th>Sep</th>
<th>Oct</th>
<th>Nov</th>
<th>Dec</th>
</tr>
</thead>
<tbody>
<tr>
<td>2007</td>
<td>1000</td>
<td>1500</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>2008</td>
<td>1000</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

(2 rows)

```sql
CREATE TABLE cth(rowid text, rowdt timestamp, attribute text, val text);
INSERT INTO cth VALUES('test1','01 March 2003','temperature','42');
INSERT INTO cth VALUES('test1','01 March 2003','test_result','PASS');
INSERT INTO cth VALUES('test1','01 March 2003','volts','2.6987');
INSERT INTO cth VALUES('test2','02 March 2003','temperature','53');
INSERT INTO cth VALUES('test2','02 March 2003','test_result','FAIL');
INSERT INTO cth VALUES('test2','02 March 2003','test_startdate','01 March 2003');
INSERT INTO cth VALUES('test2','02 March 2003','volts','3.1234');

SELECT * FROM crosstab
```

(2 rows)
Appendix F. Additional Supplied Modules

```sql
( 'SELECT rowid, rowdt, attribute, val FROM cth ORDER BY 1', 'SELECT DISTINCT attribute FROM cth ORDER BY 1'
)
AS
(
  rowid text,
  rowdt timestamp,
  temperature int4,
  test_result text,
  test_startdate timestamp,
  volts float8
);
```

You can create predefined functions to avoid having to write out the result column names and types in each query. See the examples in the previous section. The underlying C function for this form of `crosstab` is named `crosstab_hash`.

### F.37.1.5. `connectby`

`connectby(text relname, text keyid_fld, text parent_keyid_fld [, text orderby_fld ], text start_with, int max_depth [, text branch_delim ])`

The `connectby` function produces a display of hierarchical data that is stored in a table. The table must have a key field that uniquely identifies rows, and a parent-key field that references the parent (if any) of each row. `connectby` can display the sub-tree descending from any row.

Table F-31 explains the parameters.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>relname</td>
<td>Name of the source relation</td>
</tr>
<tr>
<td>keyid_fld</td>
<td>Name of the key field</td>
</tr>
<tr>
<td>parent_keyid_fld</td>
<td>Name of the parent-key field</td>
</tr>
<tr>
<td>orderby_fld</td>
<td>Name of the field to order siblings by (optional)</td>
</tr>
<tr>
<td>start_with</td>
<td>Key value of the row to start at</td>
</tr>
<tr>
<td>max_depth</td>
<td>Maximum depth to descend to, or zero for unlimited depth</td>
</tr>
<tr>
<td>branch_delim</td>
<td>String to separate keys with in branch output (optional)</td>
</tr>
</tbody>
</table>
The key and parent-key fields can be any data type, but they must be the same type. Note that the `start_with` value must be entered as a text string, regardless of the type of the key field.

The `connectby` function is declared to return `setof record`, so the actual names and types of the output columns must be defined in the `FROM` clause of the calling `SELECT` statement, for example:

```sql
SELECT * FROM connectby('connectby_tree', 'keyid', 'parent_keyid', 'pos', 'row2', 0, '~')
  AS t(keyid text, parent_keyid text, level int, branch text, pos int);
```

The first two output columns are used for the current row’s key and its parent row’s key; they must match the type of the table’s key field. The third output column is the depth in the tree and must be of type `integer`. If a `branch_delim` parameter was given, the next output column is the branch display and must be of type `text`. Finally, if an `orderby_fld` parameter was given, the last output column is a serial number, and must be of type `integer`.

The “branch” output column shows the path of keys taken to reach the current row. The keys are separated by the specified `branch_delim` string. If no branch display is wanted, omit both the `branch_delim` parameter and the branch column in the output column list.

If the ordering of siblings of the same parent is important, include the `orderby_fld` parameter to specify which field to order siblings by. This field can be of any sortable data type. The output column list must include a final integer serial-number column, if and only if `orderby_fld` is specified.

The parameters representing table and field names are copied as-is into the SQL queries that `connectby` generates internally. Therefore, include double quotes if the names are mixed-case or contain special characters. You may also need to schema-qualify the table name.

In large tables, performance will be poor unless there is an index on the parent-key field.

It is important that the `branch_delim` string not appear in any key values, else `connectby` may incorrectly report an infinite-recursion error. Note that if `branch_delim` is not provided, a default value of `~` is used for recursion detection purposes.

Here is an example:

```sql
CREATE TABLE connectby_tree(keyid text, parent_keyid text, pos int);

INSERT INTO connectby_tree VALUES('row1', NULL, 0);
INSERT INTO connectby_tree VALUES('row2', 'row1', 0);
INSERT INTO connectby_tree VALUES('row3', 'row1', 0);
INSERT INTO connectby_tree VALUES('row4', 'row2', 1);
INSERT INTO connectby_tree VALUES('row5', 'row2', 0);
INSERT INTO connectby_tree VALUES('row6', 'row4', 0);
INSERT INTO connectby_tree VALUES('row7', 'row3', 0);
INSERT INTO connectby_tree VALUES('row8', 'row6', 0);
INSERT INTO connectby_tree VALUES('row9', 'row5', 0);

-- with branch, without orderby_fld (order of results is not guaranteed)
SELECT * FROM connectby('connectby_tree', 'keyid', 'parent_keyid', 'row2', 0, '~')
  AS t(keyid text, parent_keyid text, level int, branch text);
```

<table>
<thead>
<tr>
<th>keyid</th>
<th>parent_keyid</th>
<th>level</th>
<th>branch</th>
</tr>
</thead>
<tbody>
<tr>
<td>row2</td>
<td></td>
<td>0</td>
<td>row2</td>
</tr>
<tr>
<td>row4</td>
<td>row2</td>
<td>1</td>
<td>row2~row4</td>
</tr>
<tr>
<td>row6</td>
<td>row4</td>
<td>2</td>
<td>row2<del>row4</del>row6</td>
</tr>
</tbody>
</table>

3149
## Appendix F: Additional Supplied Modules

### Without branch, without orderby_fld (order of results is not guaranteed)

```
SELECT * FROM connectby('connectby_tree', 'keyid', 'parent_keyid', 'row2', 0)
AS t(keyid text, parent_keyid text, level int);
```

<table>
<thead>
<tr>
<th>keyid</th>
<th>parent_keyid</th>
<th>level</th>
</tr>
</thead>
<tbody>
<tr>
<td>row2</td>
<td></td>
<td>0</td>
</tr>
<tr>
<td>row4</td>
<td>row2</td>
<td>1</td>
</tr>
<tr>
<td>row6</td>
<td>row4</td>
<td>2</td>
</tr>
<tr>
<td>row8</td>
<td>row6</td>
<td>3</td>
</tr>
<tr>
<td>row5</td>
<td>row2</td>
<td>1</td>
</tr>
<tr>
<td>row9</td>
<td>row5</td>
<td>2</td>
</tr>
</tbody>
</table>

(6 rows)

### With branch, with orderby_fld (notice that row5 comes before row4)

```
SELECT * FROM connectby('connectby_tree', 'keyid', 'parent_keyid', 'pos', 'row2', 0, '~')
AS t(keyid text, parent_keyid text, level int, branch text, pos int);
```

<table>
<thead>
<tr>
<th>keyid</th>
<th>parent_keyid</th>
<th>level</th>
<th>branch</th>
<th>pos</th>

<tr>
<td>row9</td>
<td>row5</td>
<td>2</td>
<td>row2<del>row5</del>row9</td>
<td>3</td>
</tr>
<tr>
<td>row4</td>
<td>row2</td>
<td>1</td>
<td>row2~row4</td>
<td>4</td>
</tr>
<tr>
<td>row6</td>
<td>row4</td>
<td>2</td>
<td>row2<del>row4</del>row6</td>
<td>5</td>
</tr>
<tr>
<td>row8</td>
<td>row6</td>
<td>3</td>
<td>row2<del>row4</del>row6~row8</td>
<td>6</td>
</tr>
</tbody>
</table>

(6 rows)

### Without branch, with orderby_fld (notice that row5 comes before row4)

```
SELECT * FROM connectby('connectby_tree', 'keyid', 'parent_keyid', 'pos', 'row2', 0)
AS t(keyid text, parent_keyid text, level int, pos int);
```

<table>
<thead>
<tr>
<th>keyid</th>
<th>parent_keyid</th>
<th>level</th>
<th>pos</th>
</tr>
</thead>
<tbody>
<tr>
<td>row2</td>
<td></td>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>row5</td>
<td>row2</td>
<td>1</td>
<td>2</td>
</tr>
<tr>
<td>row9</td>
<td>row5</td>
<td>2</td>
<td>3</td>
</tr>
<tr>
<td>row4</td>
<td>row2</td>
<td>1</td>
<td>4</td>
</tr>
<tr>
<td>row6</td>
<td>row4</td>
<td>2</td>
<td>5</td>
</tr>
<tr>
<td>row8</td>
<td>row6</td>
<td>3</td>
<td>6</td>
</tr>
</tbody>
</table>

Appendix F. Additional Supplied Modules

F.37.2. Author

Joe Conway

F.38. tcn

The tcn module provides a trigger function that notifies listeners of changes to any table on which it is attached. It must be used as an **AFTER trigger FOR EACH ROW**.

Only one parameter may be supplied to the function in a `CREATE TRIGGER` statement, and that is optional. If supplied it will be used for the channel name for the notifications. If omitted `tcn` will be used for the channel name.

The payload of the notifications consists of the table name, a letter to indicate which type of operation was performed, and column name/value pairs for primary key columns. Each part is separated from the next by a comma. For ease of parsing using regular expressions, table and column names are always wrapped in double quotes, and data values are always wrapped in single quotes. Embedded quotes are doubled.

A brief example of using the extension follows.

```sql
test=# create table tcndata
(test=# (a int not null,
(test=# b date not null,
(test=# c text,
(test=# primary key (a, b)
(test=# );
CREATE TABLE

CREATE TABLE

CREATE TRIGGER

LISTEN

INSERT 0 3
Asynchronous notification "tcn" with payload ""tcndata",I,"a"='1','b'=2012-12-22" received.
Asynchronous notification "tcn" with payload ""tcndata",I,"a"='1','b'=2012-12-23" received.
Asynchronous notification "tcn" with payload ""tcndata",I,"a"='2','b'=2012-12-23" received.

UPDATE 2
Asynchronous notification "tcn" with payload ""tcndata",U,"a"='1','b'=2012-12-22" received.
Asynchronous notification "tcn" with payload ""tcndata",U,"a"='1','b'=2012-12-23" received.

DELETE 1
Asynchronous notification "tcn" with payload ""tcndata",D,"a"='1','b'=2012-12-22" received.
```

3151
F.39. test_decoding

test_decoding is an example of a logical decoding output plugin. It doesn’t do anything especially useful, but can serve as a starting point for developing your own output plugin.

**test_decoding** receives WAL through the logical decoding mechanism and decodes it into text representations of the operations performed.

Typical output from this plugin, used over the SQL logical decoding interface, might be:

```sql
postgres=# SELECT * FROM pg_logical_slot_get_changes('test_slot', NULL, NULL, 'include-xids', '0');

<table>
<thead>
<tr>
<th>location</th>
<th>xid</th>
<th>data</th>
</tr>
</thead>
<tbody>
<tr>
<td>0/16D30F8</td>
<td>691</td>
<td>BEGIN</td>
</tr>
<tr>
<td>0/16D32A0</td>
<td>691</td>
<td>table public.data: INSERT: id[int4]:2 data[text]:'arg'</td>
</tr>
<tr>
<td>0/16D32A0</td>
<td>691</td>
<td>table public.data: INSERT: id[int4]:3 data[text]:'demo'</td>
</tr>
<tr>
<td>0/16D32A0</td>
<td>691</td>
<td>COMMIT</td>
</tr>
<tr>
<td>0/16D32B8</td>
<td>692</td>
<td>BEGIN</td>
</tr>
<tr>
<td>0/16D3398</td>
<td>692</td>
<td>table public.data: DELETE: id[int4]:2</td>
</tr>
<tr>
<td>0/16D3398</td>
<td>692</td>
<td>table public.data: DELETE: id[int4]:3</td>
</tr>
</tbody>
</table>

(8 rows)
```

F.40. test_parser

test_parser is an example of a custom parser for full-text search. It doesn’t do anything especially useful, but can serve as a starting point for developing your own parser.

**test_parser** recognizes words separated by white space, and returns just two token types:

```sql
mydb=# SELECT * FROM ts_token_type('testparser');

<table>
<thead>
<tr>
<th>tokid</th>
<th>alias</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>word</td>
<td>Word</td>
</tr>
<tr>
<td>12</td>
<td>blank</td>
<td>Space symbols</td>
</tr>
</tbody>
</table>

(2 rows)
```

These token numbers have been chosen to be compatible with the default parser’s numbering. This allows us to use its `headline()` function, thus keeping the example simple.

F.40.1. Usage

Installing the **test_parser** extension creates a text search parser **testparser**. It has no user-configurable parameters.

You can test the parser with, for example,

```sql
mydb=# SELECT * FROM ts_parse('testparser', 'That”s my first own parser');
```

(1 row)
Real-world use requires setting up a text search configuration that uses the parser. For example,

```sql
mydb=# CREATE TEXT SEARCH CONFIGURATION testcfg ( PARSER = testparser );
CREATE TEXT SEARCH CONFIGURATION

mydb=# ALTER TEXT SEARCH CONFIGURATION testcfg
mydb=#   ADD MAPPING FOR word WITH english_stem;
ALTER TEXT SEARCH CONFIGURATION

mydb=# SELECT to_tsvector('testcfg', 'That”s my first own parser');
 to_tsvector
-------------------------------
 ’that’:1 ’first’:3 ’parser’:5
(1 row)

mydb=# SELECT ts_headline('testcfg', 'Supernovae stars are the brightest phenomena in galaxies',
 mydb(# to_tsquery('testcfg', 'star')));
 ts_headline
-----------------------------------------------------
 Supernovae <b>stars</b> are the brightest phenomena in galaxies
(1 row)
```

### F.41. test_shm_mq

test_shm_mq is an example of how to use dynamic shared memory and the shared memory message queue facilities to coordinate a user backend with the efforts of one or more background workers. It is not intended to do anything useful on its own; rather, it is a demonstration of how these facilities can be used, and a unit test of those facilities.

The function in this extension sends the same message repeatedly through a loop of processes. The message payload, the size of the message queue through which it is sent, and the number of processes in the loop are configurable. At the end, the message may be verified to ensure that it has not been corrupted in transmission.
F.41.1. Functions

```
test_shm_mq(queue_size int8, message text,
     repeat_count int4 default 1, num_workers int4 default 1)
     RETURNS void
```

This function sends and receives messages synchronously. The user backend sends the provided message to the first background worker using a message queue of the given size. The first background worker sends the message to the second background worker, if the number of workers is greater than one, and so forth. Eventually, the last background worker sends the message back to the user backend. If the repeat count is greater than one, the user backend then sends the message back to the first worker. Once the message has been sent and received by all the coordinating processes a number of times equal to the repeat count, the user backend verifies that the message finally received matches the one originally sent and throws an error if not.

```
test_shm_mq_pipelined(queue_size int8, message text,
     repeat_count int4 default 1, num_workers int4 default 1,
     verify bool default true)
     RETURNS void
```

This function sends the same message multiple times, as specified by the repeat count, to the first background worker using a queue of the given size. These messages are then forwarded to each background worker in turn, in each case using a queue of the given size. Finally, the last background worker sends the messages back to the user backend. The user backend uses non-blocking sends and receives, so that it may begin receiving copies of the message before it has finished sending all copies of the message. The verify argument controls whether or not the received copies are checked against the message that was sent. (This takes nontrivial time so it may be useful to disable it for benchmarking purposes.)

F.42. tsearch2

The tsearch2 module provides backwards-compatible text search functionality for applications that used tsearch2 before text searching was integrated into core PostgreSQL in release 8.3.

F.42.1. Portability Issues

Although the built-in text search features were based on tsearch2 and are largely similar to it, there are numerous small differences that will create portability issues for existing applications:

- Some functions’ names were changed, for example rank to ts_rank. The replacement tsearch2 module provides aliases having the old names.
- The built-in text search data types and functions all exist within the system schema pg_catalog. In an installation using tsearch2, these objects would usually have been in the public schema, though some users chose to place them in a separate schema of their own. Explicitly schema-qualified references to the objects will therefore fail in either case. The replacement tsearch2 module provides alias objects that are stored in public (or another schema if necessary) so that such references will still work.
Appendix F. Additional Supplied Modules

• There is no concept of a “current parser” or “current dictionary” in the built-in text search features, only of a current search configuration (set by the default_text_search_config parameter). While the current parser and current dictionary were used only by functions intended for debugging, this might still pose a porting obstacle in some cases. The replacement tsearch2 module emulates these additional state variables and provides backwards-compatible functions for setting and retrieving them.

There are some issues that are not addressed by the replacement tsearch2 module, and will therefore require application code changes in any case:

• The old tsearch2 trigger function allowed items in its argument list to be names of functions to be invoked on the text data before it was converted to tsvector format. This was removed as being a security hole, since it was not possible to guarantee that the function invoked was the one intended. The recommended approach if the data must be massaged before being indexed is to write a custom trigger that does the work for itself.

• Text search configuration information has been moved into core system catalogs that are noticeably different from the tables used by tsearch2. Any applications that examined or modified those tables will need adjustment.

• If an application used any custom text search configurations, those will need to be set up in the core catalogs using the new text search configuration SQL commands. The replacement tsearch2 module offers a little bit of support for this by making it possible to load an old set of tsearch2 configuration tables into PostgreSQL 8.3. (Without the module, it is not possible to load the configuration data because values in the regprocedure columns cannot be resolved to functions.) While those configuration tables won’t actually do anything, at least their contents will be available to be consulted while setting up an equivalent custom configuration in 8.3.

• The old reset_tsearch() and get_covers() functions are not supported.

• The replacement tsearch2 module does not define any alias operators, relying entirely on the built-in ones. This would only pose an issue if an application used explicitly schema-qualified operator names, which is very uncommon.

F.42.2. Converting a pre-8.3 Installation

The recommended way to update a pre-8.3 installation that uses tsearch2 is:

1. Make a dump from the old installation in the usual way, but be sure not to use -c (--clean) option of pg_dump or pg_dumphall.

2. In the new installation, create empty database(s) and install the replacement tsearch2 module into each database that will use text search. This must be done before loading the dump data! If your old installation had the tsearch2 objects in a schema other than public, be sure to adjust the CREATE EXTENSION command so that the replacement objects are created in that same schema.

3. Load the dump data. There will be quite a few errors reported due to failure to recreate the original tsearch2 objects. These errors can be ignored, but this means you cannot restore the dump in a single transaction (eg, you cannot use pg_restore’s --switch).
Appendix F. Additional Supplied Modules

4. Examine the contents of the restored tsearch2 configuration tables (pg_ts_cfg and so on), and create equivalent built-in text search configurations as needed. You may drop the old configuration tables once you’ve extracted all the useful information from them.

5. Test your application.

At a later time you may wish to rename application references to the alias text search objects, so that you can eventually uninstall the replacement tsearch2 module.

F.42.3. References

Tsearch2 Development Site http://www.sai.msu.su/~megera/postgres/gist/tsearch/V2/

F.43. unaccent

unaccent is a text search dictionary that removes accents (diacritic signs) from lexemes. It’s a filtering dictionary, which means its output is always passed to the next dictionary (if any), unlike the normal behavior of dictionaries. This allows accent-insensitive processing for full text search.

The current implementation of unaccent cannot be used as a normalizing dictionary for the thesaurus dictionary.

F.43.1. Configuration

An unaccent dictionary accepts the following options:

- RULES is the base name of the file containing the list of translation rules. This file must be stored in $SHAREDIR/tsearch_data/ (where $SHAREDIR means the PostgreSQL installation’s shared-data directory). Its name must end in .rules (which is not to be included in the RULES parameter).

The rules file has the following format:

- Each line represents a pair, consisting of a character with accent followed by a character without accent. The first is translated into the second. For example,

<table>
<thead>
<tr>
<th>Å</th>
<th>A</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ä</td>
<td>A</td>
</tr>
<tr>
<td>Æ</td>
<td>A</td>
</tr>
<tr>
<td>Å</td>
<td>A</td>
</tr>
<tr>
<td>Æ</td>
<td>A</td>
</tr>
<tr>
<td>Å</td>
<td>A</td>
</tr>
<tr>
<td>Å</td>
<td>A</td>
</tr>
<tr>
<td>E</td>
<td>A</td>
</tr>
</tbody>
</table>

A more complete example, which is directly useful for most European languages, can be found in unaccent.rules, which is installed in $SHAREDIR/tsearch_data/ when the unaccent module is installed.
F.43.2. Usage

Installing the `unaccent` extension creates a text search template `unaccent` and a dictionary `unaccent` based on it. The `unaccent` dictionary has the default parameter setting `RULES='unaccent'`, which makes it immediately usable with the standard `unaccent.rules` file. If you wish, you can alter the parameter, for example

```
mydb=# ALTER TEXT SEARCH DICTIONARY unaccent (RULES='my_rules');
```

or create new dictionaries based on the template.

To test the dictionary, you can try:

```
mydb=# select ts_lexize('unaccent','Hôtel');
   ts_lexize
-----------
   {Hotel}
   (1 row)
```

Here is an example showing how to insert the `unaccent` dictionary into a text search configuration:

```
mydb=# CREATE TEXT SEARCH CONFIGURATION fr ( COPY = french );
mydb=# ALTER TEXT SEARCH CONFIGURATION fr
ALTER MAPPING FOR hword, hword_part, word
   WITH unaccent, french_stem;
mydb=# select to_tsvector('fr','Hôtels de la Mer');
   to_tsvector
-------------------
 'hotel':1 'mer':4
   (1 row)

mydb=# select to_tsvector('fr','Hôtel de la Mer') @@ to_tsquery('fr','Hotels');
   ?column?
----------
   t
   (1 row)

mydb=# select ts_headline('fr','Hôtel de la Mer',to_tsquery('fr','Hotels'));
   ts_headline
------------------------
 <b>Hôtel</b> de la Mer
   (1 row)
```

F.43.3. Functions

The `unaccent()` function removes accents (diacritic signs) from a given string. Basically, it’s a wrapper around the `unaccent` dictionary, but it can be used outside normal text search contexts.

```
unaccent([dictionary regdictionary, ] string text) returns text
```
If the *dictionary* argument is omitted, the text search dictionary named *unaccent* and appearing in the same schema as the *unaccent()* function itself is used.

For example:

```sql
SELECT unaccent('unaccent', 'Hôtel');
SELECT unaccent('Hôtel');
```

## F.44. uuid-ossp

The *uuid-ossp* module provides functions to generate universally unique identifiers (UUIDs) using one of several standard algorithms. There are also functions to produce certain special UUID constants.

### F.44.1. uuid-ossp Functions

Table F-32 shows the functions available to generate UUIDs. The relevant standards ITU-T Rec. X.667, ISO/IEC 9834-8:2005, and RFC 4122 specify four algorithms for generating UUIDs, identified by the version numbers 1, 3, 4, and 5. (There is no version 2 algorithm.) Each of these algorithms could be suitable for a different set of applications.

**Table F-32. Functions for UUID Generation**

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>uuid_generate_v1()</code></td>
<td>This function generates a version 1 UUID. This involves the MAC address of the computer and a time stamp. Note that UUIDs of this kind reveal the identity of the computer that created the identifier and the time at which it did so, which might make it unsuitable for certain security-sensitive applications.</td>
</tr>
<tr>
<td><code>uuid_generate_v1mc()</code></td>
<td>This function generates a version 1 UUID but uses a random multicast MAC address instead of the real MAC address of the computer.</td>
</tr>
</tbody>
</table>
Appendix F. Additional Supplied Modules

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uuid_generate_v3(namespace uuid, name text)</td>
<td>This function generates a version 3 UUID in the given namespace using the specified input name. The namespace should be one of the special constants produced by the uuid_ns_*() functions shown in Table F-33. (It could be any UUID in theory.) The name is an identifier in the selected namespace. For example: SELECT uuid_generate_v3(uuid_ns_url(), '<a href="http://www.postgresql.org">http://www.postgresql.org</a>'); The name parameter will be MD5-hashed, so the cleartext cannot be derived from the generated UUID. The generation of UUIDs by this method has no random or environment-dependent element and is therefore reproducible.</td>
</tr>
<tr>
<td>uuid_generate_v4()</td>
<td>This function generates a version 4 UUID, which is derived entirely from random numbers.</td>
</tr>
<tr>
<td>uuid_generate_v5(namespace uuid, name text)</td>
<td>This function generates a version 5 UUID, which works like a version 3 UUID except that SHA-1 is used as a hashing method. Version 5 should be preferred over version 3 because SHA-1 is thought to be more secure than MD5.</td>
</tr>
</tbody>
</table>

Table F-33. Functions Returning UUID Constants

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uuid_nil()</td>
<td>A “nil” UUID constant, which does not occur as a real UUID.</td>
</tr>
<tr>
<td>uuid_ns_dns()</td>
<td>Constant designating the DNS namespace for UUIDs.</td>
</tr>
<tr>
<td>uuid_ns_url()</td>
<td>Constant designating the URL namespace for UUIDs.</td>
</tr>
<tr>
<td>uuid_ns_oid()</td>
<td>Constant designating the ISO object identifier (OID) namespace for UUIDs. (This pertains to ASN.1 OIDs, which are unrelated to the OIDs used in PostgreSQL.)</td>
</tr>
<tr>
<td>uuid_ns_x500()</td>
<td>Constant designating the X.500 distinguished name (DN) namespace for UUIDs.</td>
</tr>
</tbody>
</table>

F.44.2. Building uuid-ossp

Historically this module depended on the OSSP UUID library, which accounts for the module’s name.
While the OSSP UUID library can still be found at http://www.ossp.org/pkg/lib/uuid/, it is not well main-
tained, and is becoming increasingly difficult to port to newer platforms. uuid-ossp can now be built
without the OSSP library on some platforms. On FreeBSD, NetBSD, and some other BSD-derived plat-
forms, suitable UUID creation functions are included in the core libc library. On Linux, OS X, and some
other platforms, suitable functions are provided in the libuuid library, which originally came from the
e2fsprogs project (though on modern Linux it is considered part of util-linux-ng). When invok-
ing configure, specify --with-uuid=bsd to use the BSD functions, or --with-uuid=e2fs to use
e2fsprogs' libuuid, or --with-uuid=ossp to use the OSSP UUID library. More than one of these
libraries might be available on a particular machine, so configure does not automatically choose one.

**Note:** If you only need randomly-generated (version 4) UUIDs, consider using the
`gen_random_uuid()` function from the pgcrypto module instead.

### F.44.3. Author

Peter Eisentraut <peter_e@gmx.net>

### F.45. xml2

The xml2 module provides XPath querying and XSLT functionality.

#### F.45.1. Deprecation Notice

From PostgreSQL 8.3 on, there is XML-related functionality based on the SQL/XML standard in the core
server. That functionality covers XML syntax checking and XPath queries, which is what this module
does, and more, but the API is not at all compatible. It is planned that this module will be removed in a
future version of PostgreSQL in favor of the newer standard API, so you are encouraged to try converting
your applications. If you find that some of the functionality of this module is not available in an adequate
form with the newer API, please explain your issue to <pgsql-hackers@postgresql.org> so that the
deficiency can be addressed.

#### F.45.2. Description of Functions

Table F-34 shows the functions provided by this module. These functions provide straightforward XML
parsing and XPath queries. All arguments are of type text, so for brevity that is not shown.

<table>
<thead>
<tr>
<th>Function</th>
<th>Returns</th>
<th>Description</th>
</tr>
</thead>
</table>

3160
<table>
<thead>
<tr>
<th>Function</th>
<th>Returns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>xml_is_well_formed(document)</code></td>
<td>bool</td>
<td>This parses the document text in its parameter and returns true if the document is well-formed XML. (Note: before PostgreSQL 8.2, this function was called <code>xml_valid()</code>. That is the wrong name since validity and well-formedness have different meanings in XML. The old name is still available, but is deprecated.)</td>
</tr>
<tr>
<td><code>xpath_string(document, query)</code></td>
<td>text</td>
<td>These functions evaluate the XPath query on the supplied document, and cast the result to the specified type.</td>
</tr>
<tr>
<td><code>xpath_number(document, query)</code></td>
<td>float4</td>
<td></td>
</tr>
<tr>
<td><code>xpath_bool(document, query)</code></td>
<td>bool</td>
<td></td>
</tr>
<tr>
<td><code>xpath_nodeset(document, query, toptag, itemtag)</code></td>
<td>text</td>
<td>This evaluates query on document and wraps the result in XML tags. If the result is multivalued, the output will look like: <code>&lt;toptag&gt;&lt;itemtag&gt;Value 1 which could be an XML fragment&lt;/itemtag&gt;&lt;itemtag&gt;Value 2....&lt;/itemtag&gt;&lt;/toptag&gt;</code> If either <code>toptag</code> or <code>itemtag</code> is an empty string, the relevant tag is omitted.</td>
</tr>
<tr>
<td><code>xpath_nodeset(document, query)</code></td>
<td>text</td>
<td>Like <code>xpath_nodeset(document, query, toptag, itemtag)</code> but result omits both tags.</td>
</tr>
<tr>
<td><code>xpath_nodeset(document, query, itemtag)</code></td>
<td>text</td>
<td>Like <code>xpath_nodeset(document, query, toptag, itemtag)</code> but result omits <code>toptag</code>.</td>
</tr>
<tr>
<td><code>xpath_list(document, query, separator)</code></td>
<td>text</td>
<td>This function returns multiple values separated by the specified separator, for example <code>Value 1,Value 2,Value 3</code> if separator is <code>,</code>.</td>
</tr>
</tbody>
</table>
Appendix F. Additional Supplied Modules

<table>
<thead>
<tr>
<th>Function</th>
<th>Returns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xpath_list(document, query)</td>
<td>text</td>
<td>This is a wrapper for the above function that uses , as the separator.</td>
</tr>
</tbody>
</table>

F.45.3. xpath_table

xpath_table(text key, text document, text relation, text xpaths, text criteria) returns setof record

xpath_table is a table function that evaluates a set of XPath queries on each of a set of documents and returns the results as a table. The primary key field from the original document table is returned as the first column of the result so that the result set can readily be used in joins. The parameters are described in Table F-35.

Table F-35. xpath_table Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>key</td>
<td>the name of the “key” field — this is just a field to be used as the first column of the output table, i.e., it identifies the record from which each output row came (see note below about multiple values)</td>
</tr>
<tr>
<td>document</td>
<td>the name of the field containing the XML document</td>
</tr>
<tr>
<td>relation</td>
<td>the name of the table or view containing the documents</td>
</tr>
<tr>
<td>xpaths</td>
<td>one or more XPath expressions, separated by</td>
</tr>
<tr>
<td>criteria</td>
<td>the contents of the WHERE clause. This cannot be omitted, so use true or 1=1 if you want to process all the rows in the relation</td>
</tr>
</tbody>
</table>

These parameters (except the XPath strings) are just substituted into a plain SQL SELECT statement, so you have some flexibility — the statement is

SELECT <key>, <document> FROM <relation> WHERE <criteria>

so those parameters can be anything valid in those particular locations. The result from this SELECT needs to return exactly two columns (which it will unless you try to list multiple fields for key or document). Beware that this simplistic approach requires that you validate any user-supplied values to avoid SQL injection attacks.

The function has to be used in a FROM expression, with an AS clause to specify the output columns; for example

SELECT * FROM
xpath_table(‘article_id’,
  ‘article_xml’,
  ‘articles’,
  ‘/article/author|/article/pages|/article/title’,
  3162
Appendix F. Additional Supplied Modules

'date_entered > "2003-01-01" ')
AS t(article_id integer, author text, page_count integer, title text);

The AS clause defines the names and types of the columns in the output table. The first is the “key” field
and the rest correspond to the XPath queries. If there are more XPath queries than result columns, the
extra queries will be ignored. If there are more result columns than XPath queries, the extra columns will
be NULL.

Notice that this example defines the page_count result column as an integer. The function deals inter-
ationally with string representations, so when you say you want an integer in the output, it will take the string
representation of the XPath result and use PostgreSQL input functions to transform it into an integer (or
whatever type the AS clause requests). An error will result if it can’t do this — for example if the result
is empty — so you may wish to just stick to text as the column type if you think your data has any
problems.

The calling SELECT statement doesn’t necessarily have be just SELECT * — it can reference the output
columns by name or join them to other tables. The function produces a virtual table with which you can
perform any operation you wish (e.g. aggregation, joining, sorting etc). So we could also have:

SELECT t.title, p.fullname, p.email
FROM xpath_table('article_id', 'article_xml', 'articles',
    '/article/title|/article/author/@id',
    'xpath_string(article_xml,"/article/@date") > "2003-03-20" ')
AS t(article_id integer, title text, author_id integer),
    tblPeopleInfo AS p
WHERE t.author_id = p.person_id;

as a more complicated example. Of course, you could wrap all of this in a view for convenience.

F.45.3.1. Multivalued Results

The xpath_table function assumes that the results of each XPath query might be multivalued, so the
number of rows returned by the function may not be the same as the number of input documents. The first
row returned contains the first result from each query, the second row the second result from each query.
If one of the queries has fewer values than the others, null values will be returned instead.

In some cases, a user will know that a given XPath query will return only a single result (perhaps a unique
document identifier) — if used alongside an XPath query returning multiple results, the single-valued
result will appear only on the first row of the result. The solution to this is to use the key field as part of a
join against a simpler XPath query. As an example:

CREATE TABLE test ( id int PRIMARY KEY,
    xml text );

INSERT INTO test VALUES (1, '<doc num="C1">
<line num="L1"><a>1</a><b>2</b><c>3</c></line>
<line num="L2"><a>11</a><b>22</b><c>33</c></line>
</doc>');

INSERT INTO test VALUES (2, '<doc num="C2">

Appendix F. Additional Supplied Modules

SELECT * FROM
  xpath_table('id', 'xml', 'test',
              '/doc/@num|/doc/line/@num|/doc/line/a|/doc/line/b|/doc/line/c',
              'true')
AS t(id int, doc_num varchar(10), line_num varchar(10), val1 int, val2 int, val3 int)
WHERE id = 1 ORDER BY doc_num, line_num

id | doc_num | line_num | val1 | val2 | val3
----+---------+----------+------+------+------
1 | C1 | L1 | 1 | 2 | 3
1 | | L2 | 11 | 22 | 33

To get doc_num on every line, the solution is to use two invocations of xpath_table and join the results:

SELECT t.*, i.doc_num FROM
  xpath_table('id', 'xml', 'test',
              '/doc/line/@num|/doc/line/a|/doc/line/b|/doc/line/c',
              'true')
AS t(id int, line_num varchar(10), val1 int, val2 int, val3 int),
  xpath_table('id', 'xml', 'test', '/doc/@num', 'true')
AS i(id int, doc_num varchar(10))
WHERE i.id = t.id AND i.id = 1
ORDER BY doc_num, line_num;

id | line_num | val1 | val2 | val3 | doc_num
----+----------+------+------+------+---------
1 | L1 | 1 | 2 | 3 | C1
1 | L2 | 11 | 22 | 33 | C1
(2 rows)

F.45.4. XSLT Functions

The following functions are available if libxml2 is installed:

F.45.4.1. xslt_process

xslt_process(text document, text stylesheet, text paramlist) returns text

This function applies the XSL stylesheet to the document and returns the transformed result. The paramlist is a list of parameter assignments to be used in the transformation, specified in the form a=1,b=2. Note that the parameter parsing is very simple-minded: parameter values cannot contain commas!
There is also a two-parameter version of `xslt_process` which does not pass any parameters to the transformation.

**F.45.5. Author**

John Gray `<jgray@azuli.co.uk>`

Development of this module was sponsored by Torchbox Ltd. (www.torchbox.com). It has the same BSD license as PostgreSQL.
Appendix G. Additional Supplied Programs

This appendix and the previous one contain information regarding the modules that can be found in the contrib directory of the PostgreSQL distribution. See Appendix F for more information about the contrib section in general and server extensions and plug-ins found in contrib specifically.

This appendix covers utility programs found in contrib. Once installed, either from source or a packaging system, they are found in the bin directory of the PostgreSQL installation and can be used like any other program.

G.1. Client Applications

This section covers PostgreSQL client applications in contrib. They can be run from anywhere, independent of where the database server resides. See also Reference II, PostgreSQL Client Applications for information about client applications that part of the core PostgreSQL distribution.

oid2name

Name

oid2name — resolve OIDs and file nodes in a PostgreSQL data directory

Synopsis

oid2name[option...]

Description

oid2name is a utility program that helps administrators to examine the file structure used by PostgreSQL. To make use of it, you need to be familiar with the database file structure, which is described in Chapter 59.

Note: The name “oid2name” is historical, and is actually rather misleading, since most of the time when you use it, you will really be concerned with tables’ filenode numbers (which are the file names visible in the database directories). Be sure you understand the difference between table OIDs and table filenodes!
oid2name connects to a target database and extracts OID, filenode, and/or table name information. You can also have it show database OIDs or tablespace OIDs.

**Options**

oid2name accepts the following command-line arguments:

- `f filenode`
  show info for table with filenode `filenode`

- `i`
  include indexes and sequences in the listing

- `o oid`
  show info for table with OID `oid`

- `q`
  omit headers (useful for scripting)

- `s`
  show tablespace OIDs

- `S`
  include system objects (those in `information_schema`, `pg_toast` and `pg_catalog` schemas)

- `t tablename_pattern`
  show info for table(s) matching `tablename_pattern`

- `V`  
  --version
  Print the oid2name version and exit.

- `x`
  display more information about each object shown: tablespace name, schema name, and OID

- `?`
  --help
  Show help about oid2name command line arguments, and exit.

oid2name also accepts the following command-line arguments for connection parameters:

- `d database`
  database to connect to

- `H host`
  database server’s host
-p port
  database server’s port

-U username
  user name to connect as

-P password
  password (deprecated — putting this on the command line is a security hazard)

To display specific tables, select which tables to show by using -o, -f and/or -t. -o takes an OID, -f takes a filenode, and -t takes a table name (actually, it’s a LIKE pattern, so you can use things like foo%). You can use as many of these options as you like, and the listing will include all objects matched by any of the options. But note that these options can only show objects in the database given by -d.

If you don’t give any of -o, -f or -t, but do give -d, it will list all tables in the database named by -d. In this mode, the -S and -i options control what gets listed.

If you don’t give -d either, it will show a listing of database OIDs. Alternatively you can give -s to get a tablespace listing.

Notes
oid2name requires a running database server with non-corrupt system catalogs. It is therefore of only limited use for recovering from catastrophic database corruption situations.

Examples

$ # what’s in this database server, anyway?
$ oid2name
All databases:
  Oid       Database Name   Tablespace
-------------
  17228     alvherre         pg_default
  17255     regression       pg_default
  17227     template0        pg_default
         1                 template1 pg_default

$ oid2name -s
All tablespaces:
  Oid     Tablespace Name
-----------
   1663    pg_default
   1664    pg_global
  155151   fastdisk
  155152   bigdisk

$ # OK, let’s look into database alvherre
$ cd $PGDATA/base/17228
$ # get top 10 db objects in the default tablespace, ordered by size
$ ls -ls * | head -10

pgbench

Name

pgbench — run a benchmark test on PostgreSQL

Synopsis

pgbench -i [option...] [dbname]

pgbench [option...] [dbname]

Description

pgbench is a simple program for running benchmark tests on PostgreSQL. It runs the same sequence of SQL commands over and over, possibly in multiple concurrent database sessions, and then calculates the average transaction rate (transactions per second). By default, pgbench tests a scenario that is loosely based on TPC-B, involving five SELECT, UPDATE, and INSERT commands per transaction. However, it is easy to test other cases by writing your own transaction script files.

Typical output from pgbench looks like:

transaction type: TPC-B (sort of)
scaling factor: 10
query mode: simple
number of clients: 10
number of threads: 1
number of transactions per client: 1000
number of transactions actually processed: 10000/10000
tps = 85.184871 (including connections establishing)
tps = 85.296346 (excluding connections establishing)

The first six lines report some of the most important parameter settings. The next line reports the number of transactions completed and intended (the latter being just the product of number of clients and number of transactions per client); these will be equal unless the run failed before completion. (In -T mode, only the actual number of transactions is printed.) The last two lines report the number of transactions per second, figured with and without counting the time to start database sessions.

The default TPC-B-like transaction test requires specific tables to be set up beforehand. pgbench should be invoked with the -i (initialize) option to create and populate these tables. (When you are testing a custom script, you don’t need this step, but will instead need to do whatever setup your test needs.) Initialization looks like:

pgbench -i [ other-options ] dbname

where dbname is the name of the already-created database to test in. (You may also need -h, -p, and/or -U options to specify how to connect to the database server.)
Caution

pgbench -i creates four tables pgbench_accounts, pgbench_branches, pgbench_history, and pgbench_tellers, destroying any existing tables of these names. Be very careful to use another database if you have tables having these names!

At the default “scale factor” of 1, the tables initially contain this many rows:

<table>
<thead>
<tr>
<th>table</th>
<th># of rows</th>
</tr>
</thead>
<tbody>
<tr>
<td>pgbench_branches</td>
<td>1</td>
</tr>
<tr>
<td>pgbench_tellers</td>
<td>10</td>
</tr>
<tr>
<td>pgbench_accounts</td>
<td>100000</td>
</tr>
<tr>
<td>pgbench_history</td>
<td>0</td>
</tr>
</tbody>
</table>

You can (and, for most purposes, probably should) increase the number of rows by using the -s (scale factor) option. The -F (fillfactor) option might also be used at this point.

Once you have done the necessary setup, you can run your benchmark with a command that doesn’t include -i, that is

pgbench [ options ] dbname

In nearly all cases, you’ll need some options to make a useful test. The most important options are -c (number of clients), -t (number of transactions), -T (time limit), and -f (specify a custom script file). See below for a full list.

Options

The following is divided into three subsections: Different options are used during database initialization and while running benchmarks, some options are useful in both cases.

Initialization Options

pgbench accepts the following command-line initialization arguments:

-i
   --initialize

   Required to invoke initialization mode.

-F fillfactor
   --fillfactor=fillfactor

   Create the pgbench_accounts, pgbench_tellers and pgbench_branches tables with the given fillfactor. Default is 100.

-n
   --no-vacuum

   Perform no vacuuming after initialization.
-q
--quiet

Switch logging to quiet mode, producing only one progress message per 5 seconds. The default logging prints one message each 100000 rows, which often outputs many lines per second (especially on good hardware).

-s scale_factor
--scale=scale_factor

Multiply the number of rows generated by the scale factor. For example, -s 100 will create 10,000,000 rows in the pgbench_accounts table. Default is 1. When the scale is 20,000 or larger, the columns used to hold account identifiers (aid columns) will switch to using larger integers (bigint), in order to be big enough to hold the range of account identifiers.

--foreign-keys

Create foreign key constraints between the standard tables.

--index-tablespace=index_tablespace

Create indexes in the specified tablespace, rather than the default tablespace.

--tablespace=tablespace

Create tables in the specified tablespace, rather than the default tablespace.

--unlogged-tables

Create all tables as unlogged tables, rather than permanent tables.

### Benchmarking Options

pgbench accepts the following command-line benchmarking arguments:

-c clients
--client=clients

Number of clients simulated, that is, number of concurrent database sessions. Default is 1.

-C
--connect

Establish a new connection for each transaction, rather than doing it just once per client session. This is useful to measure the connection overhead.

-d
--debug

Print debugging output.

-D varname=value
--define=varname=value

Define a variable for use by a custom script (see below). Multiple --define options are allowed.
pgbench

-f filename
--file=filename

Read transaction script from filename. See below for details. \(-N, -S,\) and \(-f\) are mutually exclusive.

-j threads
--jobs=threads

Number of worker threads within pgbench. Using more than one thread can be helpful on multi-CPU machines. The number of clients must be a multiple of the number of threads, since each thread is given the same number of client sessions to manage. Default is 1.

-l
--log

Write the time taken by each transaction to a log file. See below for details.

-M querymode
--protocol=querymode

Protocol to use for submitting queries to the server:
• simple: use simple query protocol.
• extended: use extended query protocol.
• prepared: use extended query protocol with prepared statements.

The default is simple query protocol. (See Chapter 49 for more information.)

-n
--no-vacuum

Perform no vacuuming before running the test. This option is necessary if you are running a custom test scenario that does not include the standard tables pgbench_accounts, pgbench_branches, pgbench_history, and pgbench_tellers.

-N
--skip-some-updates

Do not update pgbench_tellers and pgbench_branches. This will avoid update contention on these tables, but it makes the test case even less like TPC-B.

-P sec
--progress=sec

Show progress report every sec seconds. The report includes the time since the beginning of the run, the tps since the last report, and the transaction latency average and standard deviation since the last report. Under throttling (-R), the latency is computed with respect to the transaction scheduled start time, not the actual transaction beginning time, thus it also includes the average schedule lag time.

-r
--report-latencies

Report the average per-statement latency (execution time from the perspective of the client) of each command after the benchmark finishes. See below for details.
-R rate
--rate=rate

Execute transactions targeting the specified rate instead of running as fast as possible (the default). The rate is given in transactions per second. If the targeted rate is above the maximum possible rate, the rate limit won’t impact the results.

The rate is targeted by starting transactions along a Poisson-distributed schedule time line. The expected start time schedule moves forward based on when the client first started, not when the previous transaction ended. That approach means that when transactions go past their original scheduled end time, it is possible for later ones to catch up again.

When throttling is active, the transaction latency reported at the end of the run is calculated from the scheduled start times, so it includes the time each transaction had to wait for the previous transaction to finish. The wait time is called the schedule lag time, and its average and maximum are also reported separately. The transaction latency with respect to the actual transaction start time, i.e. the time spent executing the transaction in the database, can be computed by subtracting the schedule lag time from the reported latency.

A high schedule lag time is an indication that the system cannot process transactions at the specified rate, with the chosen number of clients and threads. When the average transaction execution time is longer than the scheduled interval between each transaction, each successive transaction will fall further behind, and the schedule lag time will keep increasing the longer the test run is. When that happens, you will have to reduce the specified transaction rate.

-s scale_factor
--scale=scale_factor

Report the specified scale factor in pgbench’s output. With the built-in tests, this is not necessary; the correct scale factor will be detected by counting the number of rows in the pgbench_branches table. However, when testing custom benchmarks (-f option), the scale factor will be reported as 1 unless this option is used.

-S
--select-only

Perform select-only transactions instead of TPC-B-like test.

-t transactions
--transactions=transactions

Number of transactions each client runs. Default is 10.

-T seconds
--time=seconds

Run the test for this many seconds, rather than a fixed number of transactions per client. -t and -T are mutually exclusive.

-v
--vacuum-all

Vacuum all four standard tables before running the test. With neither -n nor -v, pgbench will vacuum the pgbench_tellers and pgbench_branches tables, and will truncate pgbench_history.
--aggregate-interval=seconds

Length of aggregation interval (in seconds). May be used only together with -l - with this option, the log contains per-interval summary (number of transactions, min/max latency and two additional fields useful for variance estimation).

This option is not currently supported on Windows.

--sampling-rate=rate

Sampling rate, used when writing data into the log, to reduce the amount of log generated. If this option is given, only the specified fraction of transactions are logged. 1.0 means all transactions will be logged, 0.05 means only 5% of the transactions will be logged.

Remember to take the sampling rate into account when processing the log file. For example, when computing tps values, you need to multiply the numbers accordingly (e.g. with 0.01 sample rate, you’ll only get 1/100 of the actual tps).

**Common Options**

pgbench accepts the following command-line common arguments:

- `--host=hostname`
  The database server’s host name

- `--port=port`
  The database server’s port number

- `--username=login`
  The user name to connect as

- `--version`
  Print the pgbench version and exit.

- `--help`
  Show help about pgbench command line arguments, and exit.
Notes

What is the “Transaction” Actually Performed in pgbench?

The default transaction script issues seven commands per transaction:

1. BEGIN;
2. UPDATE pgbench_accounts SET abalance = abalance + :delta WHERE aid = :aid;
3. SELECT abalance FROM pgbench_accounts WHERE aid = :aid;
4. UPDATE pgbench_tellers SET tbalance = tbalance + :delta WHERE tid = :tid;
5. UPDATE pgbench_branches SET bbalance = bbalance + :delta WHERE bid = :bid;
6. INSERT INTO pgbench_history (tid, bid, aid, delta, mtime) VALUES (:tid, :bid, :aid, :delta, CURRENT_TIMESTAMP);
7. END;

If you specify `-N`, steps 4 and 5 aren’t included in the transaction. If you specify `-S`, only the SELECT is issued.

Custom Scripts

pgbench has support for running custom benchmark scenarios by replacing the default transaction script (described above) with a transaction script read from a file (`-f` option). In this case a “transaction” counts as one execution of a script file. You can even specify multiple scripts (multiple `-f` options), in which case a random one of the scripts is chosen each time a client session starts a new transaction.

The format of a script file is one SQL command per line; multiline SQL commands are not supported. Empty lines and lines beginning with `--` are ignored. Script file lines can also be “meta commands”, which are interpreted by pgbench itself, as described below.

There is a simple variable-substitution facility for script files. Variables can be set by the command-line `-D` option, explained above, or by the meta commands explained below. In addition to any variables preset by `-D` command-line options, there are a few variables that are preset automatically, listed in Table G-1. A value specified for these variables using `-D` takes precedence over the automatic presets. Once set, a variable’s value can be inserted into a SQL command by writing `:variable_name`. When running more than one client session, each session has its own set of variables.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>scale</td>
<td>current scale factor</td>
</tr>
<tr>
<td>client_id</td>
<td>unique number identifying the client session (starts from zero)</td>
</tr>
</tbody>
</table>

Table G-1. Automatic variables

Script file meta commands begin with a backslash (`\`). Arguments to a meta command are separated by white space. These meta commands are supported:

- \BEGIN
- \END
- \UPDATE <table_name> SET <column_name> = <expression>
- \SELECT <column_name> FROM <table_name>
- \INSERT INTO <table_name> (<column1>, <column2>, ..., <columnN>) VALUES (<value1>, <value2>, ..., <valueN>)
- \SELECT <column_name> FROM <table_name> WHERE <condition>
- \UPDATE <table_name> SET <column_name> = <expression> WHERE <condition>
- \DELETE FROM <table_name> WHERE <condition>
- \COMMENT ON <object> IS '<comment>'
\set varname operand1 [ operator operand2 ]

Sets variable \textit{varname} to a calculated integer value. Each \textit{operand} is either an integer constant or a \textit{:variablename} reference to a variable having an integer value. The \textit{operator} can be \(+\), \(-\), \(*\), or \(/\).

Example:
\set ntellers 10 * :scale

\setrandom varname min max

Sets variable \textit{varname} to a random integer value between the limits \textit{min} and \textit{max} inclusive. Each limit can be either an integer constant or a \textit{:variablename} reference to a variable having an integer value.

Example:
\setrandom aid 1 :naccounts

\sleep number [ \textit{us} | \textit{ms} | \textit{s} ]

Causes script execution to sleep for the specified duration in microseconds (\textit{us}), milliseconds (\textit{ms}) or seconds (\textit{s}). If the unit is omitted then seconds are the default. \textit{number} can be either an integer constant or a \textit{:variablename} reference to a variable having an integer value.

Example:
\sleep 10 ms

\setshell varname command [ argument ... ]

Sets variable \textit{varname} to the result of the shell command \textit{command}. The command must return an integer value through its standard output.

\textit{argument} can be either a text constant or a \textit{:variablename} reference to a variable of any types. If you want to use \textit{argument} starting with colons, you need to add an additional colon at the beginning of \textit{argument}.

Example:
\setshell variable_to_be_assigned command literal_argument :variable ::literal_starting_with_colon

\shell command [ argument ... ]

Same as \setshell, but the result is ignored.

Example:
\shell command literal_argument :variable ::literal_starting_with_colon

As an example, the full definition of the built-in TPC-B-like transaction is:

\set nbranches :scale
\set ntellers 10 * :scale
\set naccaccounts 100000 * :scale
\setrandom aid 1 :naccaccounts
\setrandom bid 1 :nbranches
\setrandom tid 1 :ntellers
\setrandom delta -5000 5000
BEGIN;
UPDATE pgbench_accounts SET abalance = abalance + :delta WHERE aid = :aid;
SELECT abalance FROM pgbench_accounts WHERE aid = :aid;
UPDATE pgbench_tellers SET tbalance = tbalance + :delta WHERE tid = :tid;
UPDATE pgbench_branches SET bbalance = bbalance + :delta WHERE bid = :bid;
INSERT INTO pgbench_history (tid, bid, aid, delta, mtime) VALUES (:tid, :bid, :aid, :delta, CURRENT_TIMESTAMP);
END;

This script allows each iteration of the transaction to reference different, randomly-chosen rows. (This example also shows why it’s important for each client session to have its own variables — otherwise they’d not be independently touching different rows.)

Per-Transaction Logging

With the -l option but without the --aggregate-interval, pgbench writes the time taken by each transaction to a log file. The log file will be named pgbench_log.nnn, where nnn is the PID of the pgbench process. If the -j option is 2 or higher, creating multiple worker threads, each will have its own log file. The first worker will use the same name for its log file as in the standard single worker case. The additional log files for the other workers will be named pgbench_log.nnn.mmm, where mmm is a sequential number for each worker starting with 1.

The format of the log is:

client_id transaction_no time file_no time_epoch time_us [schedule_lag]

where time is the total elapsed transaction time in microseconds, file_no identifies which script file was used (useful when multiple scripts were specified with -f), and time_epoch/time_us are a UNIX epoch format timestamp and an offset in microseconds (suitable for creating an ISO 8601 timestamp with fractional seconds) showing when the transaction completed. The last field, schedule_lag, is the difference between the transaction’s scheduled start time, and the time it actually started, in microseconds. It is only present when the --rate option is used.

Here are example outputs:

0 199 2241 0 1175850568 995598
0 200 2465 0 1175850568 998079
0 201 2513 0 1175850569 608
0 202 2038 0 1175850569 2663

When running a long test on hardware that can handle a lot of transactions, the log files can become very large. The --sampling-rate option can be used to log only a random sample of transactions.

Aggregated Logging

With the --aggregate-interval option, the logs use a bit different format:

interval_start num_of_transactions latency_sum latency_2_sum min_latency max_latency [lag_sum lag_2_sum]

where interval_start is the start of the interval (UNIX epoch format timestamp), num_of_transactions is the number of transactions within the interval, latency_sum is a sum of latencies (so you can compute average latency easily). The following two fields are useful for
variance estimation - \textit{latency\_sum} is a sum of latencies and \textit{latency\_2\_sum} is a sum of 2nd powers of latencies. The next two fields are \textit{min\_latency} - a minimum latency within the interval, and \textit{max\_latency} - maximum latency within the interval. A transaction is counted into the interval when it was committed. The last four fields, \textit{lag\_sum}, \textit{lag\_2\_sum}, \textit{min\_lag}, and \textit{max\_lag}, are only present if the \texttt{--rate} option is used. They are calculated from the time each transaction had to wait for the previous one to finish, i.e. the difference between each transaction’s scheduled start time and the time it actually started.

Here is example output:

```
1345828501 5601 1542744 483552416 61 2573
1345828503 7884 1979812 565806736 60 1479
1345828505 7208 1979422 567277552 59 1391
1345828507 7685 1980268 569784714 60 1398
1345828509 7073 1979779 573489941 236 1411
```

Notice that while the plain (unaggregated) log file contains a reference to the custom script files, the aggregated log does not. Therefore if you need per script data, you need to aggregate the data on your own.

**Per-Statement Latencies**

With the \texttt{--r} option, \texttt{pgbench} collects the elapsed transaction time of each statement executed by every client. It then reports an average of those values, referred to as the latency for each statement, after the benchmark has finished.

For the default script, the output will look similar to this:

```
starting vacuum...end.
transaction type: TPC-B (sort of)
scaling factor: 1
query mode: simple
number of clients: 10
number of threads: 1
number of transactions per client: 1000
number of transactions actually processed: 10000/10000
tps = 618.764555 (including connections establishing)
tps = 622.977698 (excluding connections establishing)
statement latencies in milliseconds:
  0.004386 \set nbranches 1 * :scale
  0.001343 \set ntellers 10 * :scale
  0.001212 \set naccounts 100000 * :scale
  0.001310 \setrandom aid 1 :naccounts
  0.001073 \setrandom bid 1 :nbranches
  0.001005 \setrandom tid 1 :ntellers
  0.001078 \setrandom delta -5000 5000
  0.326152 BEGIN;
  0.603376 UPDATE pgbench_accounts SET abalance = abalance + :delta WHERE aid = :aid;
  0.454643 SELECT abalance FROM pgbench_accounts WHERE aid = :aid;
  5.528491 UPDATE pgbench_tellers SET tbalance = tbalance + :delta WHERE tid =
```
If multiple script files are specified, the averages are reported separately for each script file.

Note that collecting the additional timing information needed for per-statement latency computation adds some overhead. This will slow average execution speed and lower the computed TPS. The amount of slowdown varies significantly depending on platform and hardware. Comparing average TPS values with and without latency reporting enabled is a good way to measure if the timing overhead is significant.

**Good Practices**

It is very easy to use pgbench to produce completely meaningless numbers. Here are some guidelines to help you get useful results.

In the first place, *never* believe any test that runs for only a few seconds. Use the `-t` or `-T` option to make the run last at least a few minutes, so as to average out noise. In some cases you could need hours to get numbers that are reproducible. It’s a good idea to try the test run a few times, to find out if your numbers are reproducible or not.

For the default TPC-B-like test scenario, the initialization scale factor (`-s`) should be at least as large as the largest number of clients you intend to test (`-c`); else you’ll mostly be measuring update contention. There are only `-s` rows in the `pgbench_branches` table, and every transaction wants to update one of them, so `-c` values in excess of `-s` will undoubtedly result in lots of transactions blocked waiting for other transactions.

The default test scenario is also quite sensitive to how long it's been since the tables were initialized: accumulation of dead rows and dead space in the tables changes the results. To understand the results you must keep track of the total number of updates and when vacuuming happens. If autovacuum is enabled it can result in unpredictable changes in measured performance.

A limitation of pgbench is that it can itself become the bottleneck when trying to test a large number of client sessions. This can be alleviated by running pgbench on a different machine from the database server, although low network latency will be essential. It might even be useful to run several pgbench instances concurrently, on several client machines, against the same database server.

**Security**

If untrusted users have access to a database that has not adopted a secure schema usage pattern, do not run pgbench in that database. pgbench uses unqualified names and does not manipulate the search path.
vacuumlo

Name
vacuumlo — remove orphaned large objects from a PostgreSQL database

Synopsis
vacuumlo [option...] dbname...

Description
vacuumlo is a simple utility program that will remove any “orphaned” large objects from a PostgreSQL database. An orphaned large object (LO) is considered to be any LO whose OID does not appear in any oid or lo data column of the database.

If you use this, you may also be interested in the lo_manage trigger in the lo module. lo_manage is useful to try to avoid creating orphaned LOs in the first place.

All databases named on the command line are processed.

Options
vacuumlo accepts the following command-line arguments:

-\l limit
  Remove no more than limit large objects per transaction (default 1000). Since the server acquires a lock per LO removed, removing too many LOs in one transaction risks exceeding max_locks_per_transaction. Set the limit to zero if you want all removals done in a single transaction.

-\n
  Don’t remove anything, just show what would be done.

-\v
  Write a lot of progress messages.

-\V
  --version
  Print the vacuumlo version and exit.

-?  --help
  Show help about vacuumlo command line arguments, and exit.
vacuumlo also accepts the following command-line arguments for connection parameters:

- `h hostname`
  Database server’s host.

- `p port`
  Database server’s port.

- `U username`
  User name to connect as.

- `w`
  --no-password
  Never issue a password prompt. If the server requires password authentication and a password is not available by other means such as a .pgpass file, the connection attempt will fail. This option can be useful in batch jobs and scripts where no user is present to enter a password.

- `W`
  Force vacuumlo to prompt for a password before connecting to a database.
  This option is never essential, since vacuumlo will automatically prompt for a password if the server demands password authentication. However, vacuumlo will waste a connection attempt finding out that the server wants a password. In some cases it is worth typing `W` to avoid the extra connection attempt.

**Notes**

vacuumlo works by the following method: First, vacuumlo builds a temporary table which contains all of the OIDs of the large objects in the selected database. It then scans through all columns in the database that are of type `oid` or `lo`, and removes matching entries from the temporary table. (Note: Only types with these names are considered; in particular, domains over them are not considered.) The remaining entries in the temporary table identify orphaned LOs. These are removed.

**Author**

Peter Mount <peter@retep.org.uk>
G.2. Server Applications

This section covers PostgreSQL server-related applications in contrib. They are typically run on the host where the database server resides. See also Reference III, PostgreSQL Server Applications for information about server applications that part of the core PostgreSQL distribution.

pg_archivecleanup

Name

pg_archivecleanup — clean up PostgreSQL WAL archive files

Synopsis

pg_archivecleanup [option...] archivelocation oldestkeptwalfile

Description

pg_archivecleanup is designed to be used as an archive_cleanup_command to clean up WAL file archives when running as a standby server (see Section 25.2). pg_archivecleanup can also be used as a standalone program to clean WAL file archives.

To configure a standby server to use pg_archivecleanup, put this into its recovery.conf configuration file:

archive_cleanup_command = 'pg_archivecleanup archivelocation %r'

where archivelocation is the directory from which WAL segment files should be removed.

When used within archive_cleanup_command, all WAL files logically preceding the value of the %r argument will be removed from archivelocation. This minimizes the number of files that need to be retained, while preserving crash-restart capability. Use of this parameter is appropriate if the archivelocation is a transient staging area for this particular standby server, but not when the archivelocation is intended as a long-term WAL archive area, or when multiple standby servers are recovering from the same archive location.

When used as a standalone program all WAL files logically preceding the oldestkeptwalfile will be removed from archivelocation. In this mode, if you specify a .backup file name, then only the file prefix will be used as the oldestkeptwalfile. This allows you to remove all WAL files archived prior to a specific base backup without error. For example, the following example will remove all files older than WAL file name 00000010000003700000010:

pg_archivecleanup -d archive 00000010000003700000010.00000020.backup

pg_archivecleanup: keep WAL file "archive/000000010000003700000010" and later
pg_archivecleanup: removing file "archive/000000010000003700000010F"
*pg_archivecleanup*

pg_archivecleanup: removing file "archive/00000001000000370000000E"

pg_archivecleanup assumes that *archivelocation* is a directory readable and writable by the server-owning user.

**Options**

pg_archivecleanup accepts the following command-line arguments:

- `-d`
  - Print lots of debug logging output on stderr.

- `-n`
  - Print the names of the files that would have been removed on stdout (performs a dry run).

- `-V`  
  --version
  - Print the pg_archivecleanup version and exit.

- `-x extension`
  - When using the program as a standalone utility, provide an extension that will be stripped from all file names before deciding if they should be deleted. This is typically useful for cleaning up archives that have been compressed during storage, and therefore have had an extension added by the compression program. For example: `-x .gz`.

- `--help`
  - Show help about pg_archivecleanup command line arguments, and exit.

**Notes**

pg_archivecleanup is designed to work with PostgreSQL 8.0 and later when used as a standalone utility, or with PostgreSQL 9.0 and later when used as an archive cleanup command.

pg_archivecleanup is written in C and has an easy-to-modify source code, with specifically designated sections to modify for your own needs.

**Examples**

On Linux or Unix systems, you might use:

```
archive_cleanup_command = 'pg_archivecleanup -d /mnt/standby/archive %r 2>>cleanup.log'
```
where the archive directory is physically located on the standby server, so that the `archive_command` is accessing it across NFS, but the files are local to the standby. This will:

- produce debugging output in `cleanup.log`
- remove no-longer-needed files from the archive directory

`pg_standby`
**pg_standby**

**Name**

pg_standby — supports the creation of a PostgreSQL warm standby server

**Synopsis**

pg_standby [option...] archivelocation nextwalfile xlogfilepath [restartwalfile]

**Description**

pg_standby supports creation of a “warm standby” database server. It is designed to be a production-ready program, as well as a customizable template should you require specific modifications.

pg_standby is designed to be a waiting `restore_command`, which is needed to turn a standard archive recovery into a warm standby operation. Other configuration is required as well, all of which is described in the main server manual (see Section 25.2).

To configure a standby server to use pg_standby, put this into its `recovery.conf` configuration file:

```
restore_command = 'pg_standby archiveDir %f %p %r'
```

where `archiveDir` is the directory from which WAL segment files should be restored.

If `restartwalfile` is specified, normally by using the `%r` macro, then all WAL files logically preceding this file will be removed from `archivelocation`. This minimizes the number of files that need to be retained, while preserving crash-restart capability. Use of this parameter is appropriate if the `archivelocation` is a transient staging area for this particular standby server, but not when the `archivelocation` is intended as a long-term WAL archive area.

pg_standby assumes that `archivelocation` is a directory readable by the server-owning user. If `restartwalfile` (or `-k`) is specified, the `archivelocation` directory must be writable too.

There are two ways to fail over to a “warm standby” database server when the master server fails:

**Smart Failover**

In smart failover, the server is brought up after applying all WAL files available in the archive. This results in zero data loss, even if the standby server has fallen behind, but if there is a lot of unapplied WAL it can be a long time before the standby server becomes ready. To trigger a smart failover, create a trigger file containing the word `smart`, or just create it and leave it empty.

**Fast Failover**

In fast failover, the server is brought up immediately. Any WAL files in the archive that have not yet been applied will be ignored, and all transactions in those files are lost. To trigger a fast failover, create a trigger file and write the word `fast` into it. pg_standby can also be configured to execute a fast failover automatically if no new WAL file appears within a defined interval.
Options

pg_standby accepts the following command-line arguments:

- **c**
  Use `cp` or `copy` command to restore WAL files from archive. This is the only supported behavior so this option is useless.

- **d**
  Print lots of debug logging output on `stderr`.

- **k**
  Remove files from `archivelocation` so that no more than this many WAL files before the current one are kept in the archive. Zero (the default) means not to remove any files from `archivelocation`. This parameter will be silently ignored if `restartwalfile` is specified, since that specification method is more accurate in determining the correct archive cut-off point. Use of this parameter is *deprecated* as of PostgreSQL 8.3; it is safer and more efficient to specify a `restartwalfile` parameter. A too small setting could result in removal of files that are still needed for a restart of the standby server, while a too large setting wastes archive space.

- **r maxretries**
  Set the maximum number of times to retry the copy command if it fails (default 3). After each failure, we wait for `sleeptime* num_retries` so that the wait time increases progressively. So by default, we will wait 5 secs, 10 secs, then 15 secs before reporting the failure back to the standby server. This will be interpreted as end of recovery and the standby will come up fully as a result.

- **s sleeptime**
  Set the number of seconds (up to 60, default 5) to sleep between tests to see if the WAL file to be restored is available in the archive yet. The default setting is not necessarily recommended; consult Section 25.2 for discussion.

- **t triggerfile**
  Specify a trigger file whose presence should cause failover. It is recommended that you use a struc-tured file name to avoid confusion as to which server is being triggered when multiple servers exist on the same system; for example `/tmp/pgsql.trigger.5432`.

- **V**
  --version
  Print the `pg_standby` version and exit.

- **w maxwaittime**
  Set the maximum number of seconds to wait for the next WAL file, after which a fast failover will be performed. A setting of zero (the default) means wait forever. The default setting is not necessarily recommended; consult Section 25.2 for discussion.

- **?**
  --help
  Show help about `pg_standby` command line arguments, and exit.
Notes

pg_standby is designed to work with PostgreSQL 8.2 and later.

PostgreSQL 8.3 provides the %r macro, which is designed to let pg_standby know the last file it needs to keep. With PostgreSQL 8.2, the -k option must be used if archive cleanup is required. This option remains available in 8.3, but its use is deprecated.

PostgreSQL 8.4 provides the recovery_end_command option. Without this option a leftover trigger file can be hazardous.

pg_standby is written in C and has an easy-to-modify source code, with specifically designated sections to modify for your own needs

Examples

On Linux or Unix systems, you might use:

archive_command = ‘cp %p .../archive/%f’

restore_command = ‘pg_standby -d -s 2 -t /tmp/pgsql.trigger.5442 .../archive %f %p %r 2>>standby.log’

recovery_end_command = ‘rm -f /tmp/pgsql.trigger.5442’

where the archive directory is physically located on the standby server, so that the archive_command is accessing it across NFS, but the files are local to the standby (enabling use of ln). This will:

• produce debugging output in standby.log
• sleep for 2 seconds between checks for next WAL file availability
• stop waiting only when a trigger file called /tmp/pgsql.trigger.5442 appears, and perform failover according to its content
• remove the trigger file when recovery ends
• remove no-longer-needed files from the archive directory

On Windows, you might use:

archive_command = ‘copy %p ...\archive\%f’

restore_command = ‘pg_standby -d -s 5 -t \pgsql.trigger.5442 ...\archive %f %p %r 2>>standby.log’

recovery_end_command = ‘del \pgsql.trigger.5442’

Note that backslashes need to be doubled in the archive_command, but not in the restore_command or recovery_end_command. This will:

• use the copy command to restore WAL files from archive
• produce debugging output in `standby.log`
• sleep for 5 seconds between checks for next WAL file availability
• stop waiting only when a trigger file called `C:\pgsql.trigger.5442` appears, and perform failover according to its content
• remove the trigger file when recovery ends
• remove no-longer-needed files from the archive directory

The `copy` command on Windows sets the final file size before the file is completely copied, which would ordinarily confuse `pg_standby`. Therefore `pg_standby` waits `sleeptime` seconds once it sees the proper file size. GNUWin32’s `cp` sets the file size only after the file copy is complete.

Since the Windows example uses `copy` at both ends, either or both servers might be accessing the archive directory across the network.

`pg_archivecleanup`
**pg_test_fsync**

**Name**

`pg_test_fsync` — determine fastest `wal_sync_method` for PostgreSQL

**Synopsis**

`pg_test_fsync [option...]`

**Description**

`pg_test_fsync` is intended to give you a reasonable idea of what the fastest `wal_sync_method` is on your specific system, as well as supplying diagnostic information in the event of an identified I/O problem. However, differences shown by `pg_test_fsync` might not make any significant difference in real database throughput, especially since many database servers are not speed-limited by their transaction logs. `pg_test_fsync` reports average file sync operation time in microseconds for each `wal_sync_method`, which can also be used to inform efforts to optimize the value of `commit_delay`.

**Options**

`pg_test_fsync` accepts the following command-line options:

- `-f`
  --filename
  Specifies the file name to write test data in. This file should be in the same file system that the `pg_xlog` directory is or will be placed in. (`pg_xlog` contains the WAL files.) The default is `pg_test_fsync.out` in the current directory.

- `-s`
  --secs-per-test
  Specifies the number of seconds for each test. The more time per test, the greater the test’s accuracy, but the longer it takes to run. The default is 5 seconds, which allows the program to complete in under 2 minutes.

- `-V`
  --version
  Print the `pg_test_fsync` version and exit.

- `?`
  --help
  Show help about `pg_test_fsync` command line arguments, and exit.

pg_test_timing

Name
pg_test_timing — measure timing overhead

Synopsis
pg_test_timing [option...]

Description
pg_test_timing is a tool to measure the timing overhead on your system and confirm that the system time never moves backwards. Systems that are slow to collect timing data can give less accurate EXPLAIN ANALYZE results.

Options
pg_test_timing accepts the following command-line options:

- \( \text{--duration} = \text{duration} \)
  - Specifies the test duration, in seconds. Longer durations give slightly better accuracy, and are more likely to discover problems with the system clock moving backwards. The default test duration is 3 seconds.

- \( \text{--version} \)
  - Print the pg_test_timing version and exit.

- \( \text{--help} \)
  - Show help about pg_test_timing command line arguments, and exit.

Usage

Interpreting results
Good results will show most (>90%) individual timing calls take less than one microsecond. Average per loop overhead will be even lower, below 100 nanoseconds. This example from an Intel i7-860 system
using a TSC clock source shows excellent performance:

Testing timing overhead for 3 seconds.
Per loop time including overhead: 35.96 nsec
Histogram of timing durations:

<table>
<thead>
<tr>
<th>&lt; usec</th>
<th>% of total</th>
<th>count</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>96.40465</td>
<td>80435604</td>
</tr>
<tr>
<td>2</td>
<td>3.59518</td>
<td>2999652</td>
</tr>
<tr>
<td>4</td>
<td>0.00015</td>
<td>126</td>
</tr>
<tr>
<td>8</td>
<td>0.00002</td>
<td>13</td>
</tr>
<tr>
<td>16</td>
<td>0.00000</td>
<td>2</td>
</tr>
</tbody>
</table>

Note that different units are used for the per loop time than the histogram. The loop can have resolution within a few nanoseconds (nsec), while the individual timing calls can only resolve down to one microsecond (usec).

**Measuring executor timing overhead**

When the query executor is running a statement using `EXPLAIN ANALYZE`, individual operations are timed as well as showing a summary. The overhead of your system can be checked by counting rows with the psql program:

```
CREATE TABLE t AS SELECT * FROM generate_series(1,100000);
\timing
SELECT COUNT(*) FROM t;
EXPLAIN ANALYZE SELECT COUNT(*) FROM t;
```

The i7-860 system measured runs the count query in 9.8 ms while the `EXPLAIN ANALYZE` version takes 16.6 ms, each processing just over 100,000 rows. That 6.8 ms difference means the timing overhead per row is 68 ns, about twice what `pg_test_timing` estimated it would be. Even that relatively small amount of overhead is making the fully timed count statement take almost 70% longer. On more substantial queries, the timing overhead would be less problematic.

**Changing time sources**

On some newer Linux systems, it’s possible to change the clock source used to collect timing data at any time. A second example shows the slowdown possible from switching to the slower acpi_pm time source, on the same system used for the fast results above:

```bash
# cat /sys/devices/system/clocksource/clocksource0/available_clocksource
tsc hpct acpi_pm
# echo acpi_pm > /sys/devices/system/clocksource/clocksource0/current_clocksource
# pg_test_timing
Per loop time including overhead: 722.92 nsec
Histogram of timing durations:

<table>
<thead>
<tr>
<th>&lt; usec</th>
<th>% of total</th>
<th>count</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>27.84870</td>
<td>1155682</td>
</tr>
</tbody>
</table>
```
In this configuration, the sample `EXPLAIN ANALYZE` above takes 115.9 ms. That’s 1061 nsec of timing overhead, again a small multiple of what’s measured directly by this utility. That much timing overhead means the actual query itself is only taking a tiny fraction of the accounted for time, most of it is being consumed in overhead instead. In this configuration, any `EXPLAIN ANALYZE` totals involving many timed operations would be inflated significantly by timing overhead.

FreeBSD also allows changing the time source on the fly, and it logs information about the timer selected during boot:

```bash
# dmesg | grep "Timecounter"
Timecounter "ACPI-fast" frequency 3579545 Hz quality 900
Timecounter "i8254" frequency 1193182 Hz quality 0
Timecounters tick every 10.000 msec
Timecounter "TSC" frequency 2531787134 Hz quality 800
# sysctl kern.timecounter.hardware=TSC
kern.timecounter.hardware: ACPI-fast -> TSC
```

Other systems may only allow setting the time source on boot. On older Linux systems the "clock" kernel setting is the only way to make this sort of change. And even on some more recent ones, the only option you’ll see for a clock source is "jiffies". Jiffies are the older Linux software clock implementation, which can have good resolution when it’s backed by fast enough timing hardware, as in this example:

```bash
$ cat /sys/devices/system/clocksource/clocksource0/available_clocksource
jiffies
$ dmesg | grep time.c
time.c: Using 3.579545 MHz WALL PM GTOD PIT/TSC timer.
time.c: Detected 2400.153 MHz processor.
$ pg_test_timing
Testing timing overhead for 3 seconds.
Per timing duration including loop overhead: 97.75 ns
Histogram of timing durations:
< usec  % of total  count
  1  90.23734  27694571
  2  9.75277  2993204
  4  0.00981  3010
  8  0.00007  22
 16  0.00000  1
 32  0.00000  1
```
Clock hardware and timing accuracy

Collecting accurate timing information is normally done on computers using hardware clocks with various levels of accuracy. With some hardware the operating systems can pass the system clock time almost directly to programs. A system clock can also be derived from a chip that simply provides timing interrupts, periodic ticks at some known time interval. In either case, operating system kernels provide a clock source that hides these details. But the accuracy of that clock source and how quickly it can return results varies based on the underlying hardware.

Inaccurate time keeping can result in system instability. Test any change to the clock source very carefully. Operating system defaults are sometimes made to favor reliability over best accuracy. And if you are using a virtual machine, look into the recommended time sources compatible with it. Virtual hardware faces additional difficulties when emulating timers, and there are often per operating system settings suggested by vendors.

The Time Stamp Counter (TSC) clock source is the most accurate one available on current generation CPUs. It's the preferred way to track the system time when it's supported by the operating system and the TSC clock is reliable. There are several ways that TSC can fail to provide an accurate timing source, making it unreliable. Older systems can have a TSC clock that varies based on the CPU temperature, making it unusable for timing. Trying to use TSC on some older multicore CPUs can give a reported time that’s inconsistent among multiple cores. This can result in the time going backwards, a problem this program checks for. And even the newest systems can fail to provide accurate TSC timing with very aggressive power saving configurations.

Newer operating systems may check for the known TSC problems and switch to a slower, more stable clock source when they are seen. If your system supports TSC time but doesn’t default to that, it may be disabled for a good reason. And some operating systems may not detect all the possible problems correctly, or will allow using TSC even in situations where it’s known to be inaccurate.

The High Precision Event Timer (HPET) is the preferred timer on systems where it’s available and TSC is not accurate. The timer chip itself is programmable to allow up to 100 nanosecond resolution, but you may not see that much accuracy in your system clock.

Advanced Configuration and Power Interface (ACPI) provides a Power Management (PM) Timer, which Linux refers to as the acpi_pm. The clock derived from acpi_pm will at best provide 300 nanosecond resolution.

Timers used on older PC hardware include the 8254 Programmable Interval Timer (PIT), the real-time clock (RTC), the Advanced Programmable Interrupt Controller (APIC) timer, and the Cyclone timer. These timers aim for millisecond resolution.

EXPLAIN
**pg_upgrade**

**Name**

pg_upgrade — upgrade a PostgreSQL server instance

**Synopsis**

```
pg_upgrade -b oldbindir -B newbindir -d olddatadir -D newdatadir [option...]
```

**Description**

pg_upgrade (formerly called pg_migrator) allows data stored in PostgreSQL data files to be upgraded to a later PostgreSQL major version without the data dump/reload typically required for major version upgrades, e.g. from 8.4.7 to the current major release of PostgreSQL. It is not required for minor version upgrades, e.g. from 9.0.1 to 9.0.4.

Major PostgreSQL releases regularly add new features that often change the layout of the system tables, but the internal data storage format rarely changes. pg_upgrade uses this fact to perform rapid upgrades by creating new system tables and simply reusing the old user data files. If a future major release ever changes the data storage format in a way that makes the old data format unreadable, pg_upgrade will not be usable for such upgrades. (The community will attempt to avoid such situations.)

pg_upgrade does its best to make sure the old and new clusters are binary-compatible, e.g. by checking for compatible compile-time settings, including 32/64-bit binaries. It is important that any external modules are also binary compatible, though this cannot be checked by pg_upgrade.

pg_upgrade supports upgrades from 8.3.X and later to the current major release of PostgreSQL, including snapshot and alpha releases.

**Options**

pg_upgrade accepts the following command-line arguments:

- `-b bindir`
  `--old-bindir=bindir`
  the old PostgreSQL executable directory; environment variable PGBINOLD

- `-B bindir`
  `--new-bindir=bindir`
  the new PostgreSQL executable directory; environment variable PGBINNEW

- `-c`
  `--check`
  check clusters only, don’t change any data
pg_upgrade

-d datadir
--old-datadir=datadir

the old cluster data directory; environment variable PGDATAOLD

-D datadir
--new-datadir=datadir

the new cluster data directory; environment variable PGDATANEW

-j
--jobs

number of simultaneous processes or threads to use

-k
--link

use hard links instead of copying files to the new cluster

-o options
--old-options options

options to be passed directly to the old postgres command

-O options
--new-options options

options to be passed directly to the new postgres command

-p port
--old-port=port

the old cluster port number; environment variable PGPORTOLD

-P port
--new-port=port

the new cluster port number; environment variable PGPORTNEW

-r
--retain

retain SQL and log files even after successful completion

-U username
--username=username

cluster’s super user name; environment variable PGUSER

-v
--verbose

enable verbose internal logging

-V
--version

display version information, then exit
Usage

These are the steps to perform an upgrade with pg_upgrade:

1. Optionally move the old cluster
   - If you are using a version-specific installation directory, e.g. /opt/PostgreSQL/9.1, you do not need to move the old cluster. The graphical installers all use version-specific installation directories.
   - If your installation directory is not version-specific, e.g. /usr/local/pgsql, it is necessary to move the current PostgreSQL install directory so it does not interfere with the new PostgreSQL installation. Once the current PostgreSQL server is shut down, it is safe to rename the PostgreSQL installation directory; assuming the old directory is /usr/local/pgsql, you can do:
     ```bash
     mv /usr/local/pgsql /usr/local/pgsql.old
     ```
     to rename the directory.

2. For source installs, build the new version
   - Build the new PostgreSQL source with configure flags that are compatible with the old cluster. pg_upgrade will check pg_controldata to make sure all settings are compatible before starting the upgrade.

3. Install the new PostgreSQL binaries
   - Install the new server’s binaries and support files.
     - For source installs, if you wish to install the new server in a custom location, use the prefix variable:
       ```make
       make prefix=/usr/local/pgsql.new install
       ```

4. Install pg_upgrade and pg_upgrade_support
   - Install the pg_upgrade binary and pg_upgrade_support library in the new PostgreSQL installation.

5. Initialize the new PostgreSQL cluster
   - Initialize the new cluster using initdb. Again, use compatible initdb flags that match the old cluster. Many prebuilt installers do this step automatically. There is no need to start the new cluster.

6. Install custom shared object files
   - Install any custom shared object files (or DLLs) used by the old cluster into the new cluster, e.g. pgcrypto.so, whether they are from contrib or some other source. Do not install the schema definitions, e.g. CREATE EXTENSION pgcrypto, because these will be upgraded from the old cluster. Also, any custom full text search files (dictionary, synonym, thesaurus, stop words) must also be copied to the new cluster.

7. Adjust authentication
pg_upgrade will connect to the old and new servers several times, so you might want to set authentication to peer in pg_hba.conf or use a ~/.pgpass file (see Section 31.15).

8. Stop both servers

Make sure both database servers are stopped using, on Unix, e.g.:

```bash
pg_ctl -D /opt/PostgreSQL/8.4 stop
pg_ctl -D /opt/PostgreSQL/9.0 stop
```

or on Windows, using the proper service names:

```cmd
NET STOP postgresql-8.4
NET STOP postgresql-9.0
```

or

```cmd
NET STOP psql-8.3 (PostgreSQL 8.3 and older used a different service name)
```

9. Run pg_upgrade

Always run the pg_upgrade binary of the new server, not the old one. pg_upgrade requires the specification of the old and new cluster’s data and executable (bin) directories. You can also specify user and port values, and whether you want the data linked instead of copied (the default).

If you use link mode, the upgrade will be much faster (no file copying) and use less disk space, but you will not be able to access your old cluster once you start the new cluster after the upgrade. Link mode also requires that the old and new cluster data directories be in the same file system. (Tablespaces and pg_xlog can be on different file systems.) See pg_upgrade --help for a full list of options.

The --jobs option allows multiple CPU cores to be used for copying/linking of files and to dump and reload database schemas in parallel; a good place to start is the maximum of the number of CPU cores and tablespaces. This option can dramatically reduce the time to upgrade a multi-database server running on a multiprocessor machine.

For Windows users, you must be logged into an administrative account, and then start a shell as the postgres user and set the proper path:

```cmd
RUNAS /USER:postgres "CMD.EXE"
SET PATH=%PATH%;C:\Program Files\PostgreSQL\9.0\bin;
```

and then run pg_upgrade with quoted directories, e.g.:

```cmd
pg_upgrade.exe
   --old-datadir "C:/Program Files/PostgreSQL/8.4/data"
   --new-datadir "C:/Program Files/PostgreSQL/9.0/data"
   --old-bindir "C:/Program Files/PostgreSQL/8.4/bin"
   --new-bindir "C:/Program Files/PostgreSQL/9.0/bin"
```

Once started, pg_upgrade will verify the two clusters are compatible and then do the upgrade. You can use pg_upgrade --check to perform only the checks, even if the old server is still running. pg_upgrade --check will also outline any manual adjustments you will need to make after the upgrade. If you are going to be using link mode, you should use the --link option with --check to enable link-mode-specific checks. pg_upgrade requires write permission in the current directory.

Obviously, no one should be accessing the clusters during the upgrade. pg_upgrade defaults to running servers on port 50432 to avoid unintended client connections. You can use the same port number for both clusters when doing an upgrade because the old and new clusters will not be running at the same time. However, when checking an old running server, the old and new port numbers must be different.
If an error occurs while restoring the database schema, \texttt{pg\_upgrade} will exit and you will have to revert to the old cluster as outlined in step 14 below. To try \texttt{pg\_upgrade} again, you will need to modify the old cluster so the \texttt{pg\_upgrade} schema restore succeeds. If the problem is a contrib module, you might need to uninstall the contrib module from the old cluster and install it in the new cluster after the upgrade, assuming the module is not being used to store user data.

10. Restore \texttt{pg\_hba\_conf}

If you modified \texttt{pg\_hba\_conf}, restore its original settings. It might also be necessary to adjust other configuration files in the new cluster to match the old cluster, e.g. \texttt{postgresql.conf}.

11. Post-Upgrade processing

If any post-upgrade processing is required, \texttt{pg\_upgrade} will issue warnings as it completes. It will also generate script files that must be run by the administrator. The script files will connect to each database that needs post-upgrade processing. Each script should be run using:

\begin{verbatim}
psql --username postgres --file script.sql postgres
\end{verbatim}

The scripts can be run in any order and can be deleted once they have been run.

\begin{center}
\textbf{Caution}
\end{center}

In general it is unsafe to access tables referenced in rebuild scripts until the rebuild scripts have run to completion; doing so could yield incorrect results or poor performance. Tables not referenced in rebuild scripts can be accessed immediately.

12. Statistics

Because optimizer statistics are not transferred by \texttt{pg\_upgrade}, you will be instructed to run a command to regenerate that information at the end of the upgrade. You might need to set connection parameters to match your new cluster.

13. Delete old cluster

Once you are satisfied with the upgrade, you can delete the old cluster’s data directories by running the script mentioned when \texttt{pg\_upgrade} completes. (Automatic deletion is not possible if you have user-defined tablespaces inside the old data directory.) You can also delete the old installation directories (e.g. bin, share).

14. Reverting to old cluster

If, after running \texttt{pg\_upgrade}, you wish to revert to the old cluster, there are several options:

- If you ran \texttt{pg\_upgrade} with --check, no modifications were made to the old cluster and you can re-use it anytime.

- If you ran \texttt{pg\_upgrade} with --link, the data files are shared between the old and new cluster. If you started the new cluster, the new server has written to those shared files and it is unsafe to use the old cluster.

- If you ran \texttt{pg\_upgrade} without --link or did not start the new server, the old cluster was not modified except that, if linking started, a .old suffix was appended to $PGDATA/global/pg_control. To reuse the old cluster, possibly remove the .old suffix from $PGDATA/global/pg_control; you can then restart the old cluster.
Notes

pg_upgrade does not support upgrading of databases containing these `reg*` OID-referencing system data types: `regproc`, `regprocedure`, `regoper`, `regoperator`, `regconfig`, and `regdictionary`. (regtype can be upgraded.)

All failure, rebuild, and reindex cases will be reported by pg_upgrade if they affect your installation; post-upgrade scripts to rebuild tables and indexes will be generated automatically. If you are trying to automate the upgrade of many clusters, you should find that clusters with identical database schemas require the same post-upgrade steps for all cluster upgrades; this is because the post-upgrade steps are based on the database schemas, and not user data.

For deployment testing, create a schema-only copy of the old cluster, insert dummy data, and upgrade that.

If you are upgrading a pre-PostgreSQL 9.2 cluster that uses a configuration-file-only directory, you must pass the real data directory location to pg_upgrade, and pass the configuration directory location to the server, e.g. `-d /real-data-directory -o '-D /configuration-directory'`.

If using a pre-9.1 old server that is using a non-default Unix-domain socket directory or a default that differs from the default of the new cluster, set `PGHOST` to point to the old server's socket location. (This is not relevant on Windows.)

A Log-Shipping Standby Server (Section 25.2) cannot be upgraded because the server must allow writes. The simplest way is to upgrade the primary and use `rsync` to rebuild the standbys. You can run `rsync` while the primary is down, or as part of a base backup (Section 24.3.2) which overwrites the old standby cluster.

If you want to use link mode and you do not want your old cluster to be modified when the new cluster is started, make a copy of the old cluster and upgrade that in link mode. To make a valid copy of the old cluster, use `rsync` to create a dirty copy of the old cluster while the server is running, then shut down the old server and run `rsync` again to update the copy with any changes to make it consistent. You might want to exclude some files, e.g. `postmaster.pid`, as documented in Section 24.3.3. If your file system supports file system snapshots or copy-on-write file copies, you can use that to make a backup of the old cluster and tablespaces, though the snapshot and copies must be created simultaneously or while the database server is down.

Limitations in Upgrading from PostgreSQL 8.3

Upgrading from PostgreSQL 8.3 has additional restrictions not present when upgrading from later PostgreSQL releases. For example, pg_upgrade will not work for upgrading from 8.3 if a user column is defined as:

- `tsquery` data type
- data type name and is not the first column

You must drop any such columns and upgrade them manually.

pg升级 will not work if the `ltree` contrib module is installed in a database.

pg_upgrade will require a table rebuild if:
pg_upgrade will require a reindex if:

- a user column is of data type `tsvector`

- an index is of type hash or GIN

- an index uses `bpchar_pattern_ops`

Also, the default datetime storage format changed to integer after PostgreSQL 8.3. `pg_upgrade` will check that the datetime storage format used by the old and new clusters match. Make sure your new cluster is built with the configure flag `--disable-integer-datetimes`.

For Windows users, note that due to different integer datetimes settings used by the graphical installer and the MSI installer, it is only possible to upgrade from version 8.3 of the installer distribution to version 8.4 or later of the installer distribution. It is not possible to upgrade from the MSI installer to the new graphical installer.

**See Also**

`initdb`, `pg_ctl`, `pg_dump`, `postgres`
**pg_xlogdump**

**Name**

*pg_xlogdump* — display a human-readable rendering of the write-ahead log of a PostgreSQL database cluster

**Synopsis**

*pg_xlogdump [option...] [startseg [endseg]]*

**Description**

*pg_xlogdump* displays the write-ahead log (WAL) and is mainly useful for debugging or educational purposes.

This utility can only be run by the user who installed the server, because it requires read-only access to the data directory.

**Options**

The following command-line options control the location and format of the output:

*startseg*

Start reading at the specified log segment file. This implicitly determines the path in which files will be searched for, and the timeline to use.

*endseg*

Stop after reading the specified log segment file.

- **-b --bkp-details**
  Output detailed information about backup blocks.

- **-e end --end=end**
  Stop reading at the specified log position, instead of reading to the end of the log stream.

- **-f --follow**
  After reaching the end of valid WAL, keep polling once per second for new WAL to appear.

- **-n limit --limit=limit**
  Display the specified number of records, then stop.
pg_xlogdump

-p path
--path=path

Directory in which to find log segment files. The default is to search for them in the pg_xlog subdirectory of the current directory.

-r rmgr
--rmgr=rmgr

Only display records generated by the specified resource manager. If list is passed as name, print a list of valid resource manager names, and exit.

-s start
--start=start

Log position at which to start reading. The default is to start reading the first valid log record found in the earliest file found.

-t timeline
--timeline=timeline

Timeline from which to read log records. The default is to use the value in startseg, if that is specified; otherwise, the default is 1.

-V
--version

Print the pg_xlogdump version and exit.

-x xid
--xid=xid

Only display records marked with the given TransactionId.

-?
--help

Show help about pg_xlogdump command line arguments, and exit.

Notes

Can give wrong results when the server is running.

Only the specified timeline is displayed (or the default, if none is specified). Records in other timelines are ignored.

Appendix H. External Projects

PostgreSQL is a complex software project, and managing the project is difficult. We have found that many enhancements to PostgreSQL can be more efficiently developed separately from the core project.

H.1. Client Interfaces

There are only two client interfaces included in the base PostgreSQL distribution:

- libpq is included because it is the primary C language interface, and because many other client interfaces are built on top of it.
- ECPG is included because it depends on the server-side SQL grammar, and is therefore sensitive to changes in PostgreSQL itself.

All other language interfaces are external projects and are distributed separately. Table H-1 includes a list of some of these projects. Note that some of these packages might not be released under the same license as PostgreSQL. For more information on each language interface, including licensing terms, refer to its website and documentation.

H.2. Administration Tools

There are several administration tools available for PostgreSQL. The most popular is pgAdmin\(^1\), and there are several commercially available ones as well.

H.3. Procedural Languages

PostgreSQL includes several procedural languages with the base distribution: PL/pgSQL, PL/Tcl, PL/Perl, and PL/Python.

In addition, there are a number of procedural languages that are developed and maintained outside the core PostgreSQL distribution. Table H-2 lists some of these packages. Note that some of these projects might not be released under the same license as PostgreSQL. For more information on each procedural language, including licensing information, refer to its website and documentation.

H.4. Extensions

PostgreSQL is designed to be easily extensible. For this reason, extensions loaded into the database can function just like features that are built in. The contrib/ directory shipped with the source code contains several extensions, which are described in Appendix F. Other extensions are developed independently, like PostGIS\(^2\). Even PostgreSQL replication solutions can be developed externally. For example, Slony-I\(^3\) is a popular master/standby replication solution that is developed independently from the core project.

---

2. http://postgis.net/
Appendix I. The Source Code Repository

The PostgreSQL source code is stored and managed using the Git version control system. A public mirror of the master repository is available; it is updated within a minute of any change to the master repository. Our wiki, https://wiki.postgresql.org/wiki/Working_with_Git, has some discussion on working with Git.

Note that building PostgreSQL from the source repository requires reasonably up-to-date versions of bison, flex, and Perl. These tools are not needed to build from a distribution tarball, because the files that these tools are used to build are included in the tarball. Other tool requirements are the same as shown in Section 15.2.

I.1. Getting The Source via Git

With Git you will make a copy of the entire code repository on your local machine, so you will have access to all history and branches offline. This is the fastest and most flexible way to develop or test patches.

Git

1. You will need an installed version of Git, which you can get from https://git-scm.com. Many systems already have a recent version of Git installed by default, or available in their package distribution system.

2. To begin using the Git repository, make a clone of the official mirror:

   git clone https://git.postgresql.org/git/postgresql.git

   This will copy the full repository to your local machine, so it may take a while to complete, especially if you have a slow Internet connection. The files will be placed in a new subdirectory postgresql of your current directory.

   The Git mirror can also be reached via the Git protocol. Just change the URL prefix to git, as in:

   git clone git://git.postgresql.org/git/postgresql.git

3. Whenever you want to get the latest updates in the system, cd into the repository, and run:

   git fetch

   Git can do a lot more things than just fetch the source. For more information, consult the Git man pages, or see the website at https://git-scm.com.
Appendix J. Documentation

PostgreSQL has four primary documentation formats:

- Plain text, for pre-installation information
- HTML, for on-line browsing and reference
- PDF or PostScript, for printing
- man pages, for quick reference.

Additionally, a number of plain-text README files can be found throughout the PostgreSQL source tree, documenting various implementation issues.

HTML documentation and man pages are part of a standard distribution and are installed by default. PDF and PostScript format documentation is available separately for download.

J.1. DocBook

The documentation sources are written in DocBook, which is a markup language superficially similar to HTML. Both of these languages are applications of the Standard Generalized Markup Language, SGML, which is essentially a language for describing other languages. In what follows, the terms DocBook and SGML are both used, but technically they are not interchangeable.

DocBook allows an author to specify the structure and content of a technical document without worrying about presentation details. A document style defines how that content is rendered into one of several final forms. DocBook is maintained by the OASIS group¹. The official DocBook site² has good introductory and reference documentation and a complete O'Reilly book for your online reading pleasure. The NewbieDoc Docbook Guide³ is very helpful for beginners. The FreeBSD Documentation Project⁴ also uses DocBook and has some good information, including a number of style guidelines that might be worth considering.

J.2. Tool Sets

The following tools are used to process the documentation. Some might be optional, as noted.

DocBook DTD⁵

This is the definition of DocBook itself. We currently use version 4.2; you cannot use later or earlier

¹. http://www.oasis-open.org
versions. You need the SGML variant of the DocBook DTD, but to build man pages you also need the XML variant of the same version.

ISO 8879 character entities
These are required by DocBook but are distributed separately because they are maintained by ISO.

DocBook DSSSL Stylesheets
These contain the processing instructions for converting the DocBook sources to other formats, such as HTML.

DocBook XSL Stylesheets
This is another stylesheet for converting DocBook to other formats. We currently use this to produce man pages and optionally HTMLHelp. You can also use this toolchain to produce HTML or PDF output, but official PostgreSQL releases use the DSSSL stylesheets for that.

The minimum required version is currently 1.74.0.

OpenJade
This is the base package of SGML processing. It contains an SGML parser, a DSSSL processor (that is, a program to convert SGML to other formats using DSSSL stylesheets), as well as a number of related tools. Jade is now being maintained by the OpenJade group, no longer by James Clark.

Libxslt for xsltproc
This is the processing tool to use with the XSLT stylesheets (like jade is the processing tool for DSSSL stylesheets).

JadeTeX
If you want to, you can also install JadeTeX to use TeX as a formatting backend for Jade. JadeTeX can create PostScript or PDF files (the latter with bookmarks).

However, the output from JadeTeX is inferior to what you get from the RTF backend. Particular problem areas are tables and various artifacts of vertical and horizontal spacing. Also, there is no opportunity to manually polish the results.

We have documented experience with several installation methods for the various tools that are needed to process the documentation. These will be described below. There might be some other packaged distributions for these tools. Please report package status to the documentation mailing list, and we will include that information here.

J.2.1. Linux RPM Installation
Most vendors provide a complete RPM set for DocBook processing in their distribution. Look for an “SGML” option while installing, or the following packages:

openjade (or jade). You may also need sgml-tools and either xsltproc or libxslt. If your dis-
tributor does not provide these then you should be able to make use of the packages from some other, reasonably compatible vendor.

J.2.2. FreeBSD Installation

The FreeBSD Documentation Project is itself a heavy user of DocBook, so it comes as no surprise that there is a full set of “ports” of the documentation tools available on FreeBSD. The following ports need to be installed to build the documentation on FreeBSD.

• textproc/sp
• textproc/openjade
• textproc/iso8879
• textproc/dsssl-docbook-modular
• textproc/docbook-420

A number of things from /usr/ports/print (tex, jadetex) might also be of interest.

It’s possible that the ports do not update the main catalog file in /usr/local/share/sgml/catalog.ports or that the order isn’t proper. Be sure to have the following lines in the beginning of the file:

CATALOG "openjade/catalog"
CATALOG "iso8879/catalog"
CATALOG "docbook/dsssl/modular/catalog"
CATALOG "docbook/4.2/catalog"

If you do not want to edit the file you can also set the environment variable SGML_CATALOG_FILES to a colon-separated list of catalog files (such as the one above).

More information about the FreeBSD documentation tools can be found in the FreeBSD Documentation Project’s instructions\(^\text{12}\).

J.2.3. Debian Packages

There is a full set of packages of the documentation tools available for Debian GNU/Linux. To install, simply use:

apt-get install docbook docbook-dsssl docbook-xsl openjade1.3 opensp xsltproc

Appendix J. Documentation

J.2.4. OS X

If you use MacPorts, the following will get you set up:

```bash
sudo port install docbook-dsssl docbook-sgml-4.2 docbook-xml-4.2 docbook-xsl libxslt openjade opensp
```

J.2.5. Manual Installation from Source

The manual installation process of the DocBook tools is somewhat complex, so if you have pre-built packages available, use them. We describe here only a standard setup, with reasonably standard installation paths, and no “fancy” features. For details, you should study the documentation of the respective package, and read SGML introductory material.

J.2.5.1. Installing OpenJade

1. The installation of OpenJade offers a GNU-style `./configure; make; make install` build process. Details can be found in the OpenJade source distribution. In a nutshell:

   ```bash
   ./configure --enable-default-catalog=/usr/local/share/sgml/catalog
   make
   make install
   ```

   Be sure to remember where you put the “default catalog”; you will need it below. You can also leave it off, but then you will have to set the environment variable `SGML_CATALOG_FILES` to point to the file whenever you use jade later on. (This method is also an option if OpenJade is already installed and you want to install the rest of the toolchain locally.)

   **Note:** Some users have reported encountering a segmentation fault using OpenJade 1.4-devel to build the PDFs, with a message like:

   ```bash
   openjade:./stylesheet.dsl:664:2:E: flow object not accepted by port; only display flow objects
   Downgrading to OpenJade 1.3 should get rid of this error.
   ```

2. Additionally, you should install the files `dsssl.dtd`, `fot.dtd`, `style-sheet.dtd`, and `catalog` from the `dsssl` directory somewhere, perhaps into `/usr/local/share/sgml/dsssl`. It’s probably easiest to copy the entire directory:

   ```bash
   cp -R dsssl /usr/local/share/sgml
   ```

3. Finally, create the file `/usr/local/share/sgml/catalog` and add this line to it:

   ```bash
   CATALOG "dsssl/catalog"
   ```

   (This is a relative path reference to the file installed in step 2. Be sure to adjust it if you chose your installation layout differently.)
J.2.5.2. Installing the DocBook DTD Kit

1. Obtain the DocBook V4.2 distribution\(^\text{13}\).

2. Create the directory `/usr/local/share/sgml/docbook-4.2` and change to it. (The exact location is irrelevant, but this one is reasonable within the layout we are following here.)
   ```
   $ mkdir /usr/local/share/sgml/docbook-4.2
   $ cd /usr/local/share/sgml/docbook-4.2
   ```

3. Unpack the archive:
   ```
   $ unzip -a ...../docbook-4.2.zip
   ```
   (The archive will unpack its files into the current directory.)

4. Edit the file `/usr/local/share/sgml/catalog` (or whatever you told jade during installation) and put a line like this into it:
   ```
   CATALOG "docbook-4.2/docbook.cat"
   ```

5. Download the ISO 8879 character entities archive\(^\text{14}\), unpack it, and put the files in the same directory you put the DocBook files in:
   ```
   $ cd /usr/local/share/sgml/docbook-4.2
   $ unzip ...../ISOEnts.zip
   ```

6. Run the following command in the directory with the DocBook and ISO files:
   ```
   perl -pi -e 's/iso-(.*).gml/ISO\1/g' docbook.cat
   ```
   (This fixes a mixup between the names used in the DocBook catalog file and the actual names of the ISO character entity files.)

J.2.5.3. Installing the DocBook DSSSL Style Sheets

To install the style sheets, unzip and untar the distribution and move it to a suitable place, for example `/usr/local/share/sgml`. (The archive will automatically create a subdirectory.)

```
$ gunzip docbook-dsssl-1.xx.tar.gz
$ tar -C /usr/local/share/sgml -xf docbook-dsssl-1.xx.tar
```  

The usual catalog entry in `/usr/local/share/sgml/catalog` can also be made:

```
CATALOG "docbook-dsssl-1.xx/catalog"
```  

Because stylesheets change rather often, and it's sometimes beneficial to try out alternative versions, PostgreSQL doesn't use this catalog entry. See Section J.2.6 for information about how to select the stylesheets instead.

\(^{13}\) http://www.docbook.org/sgml/4.2/docbook-4.2.zip

\(^{14}\) http://www.oasis-open.org/cover/ISOEnts.zip
J.2.5.4. Installing JadeTeX

To install and use JadeTeX, you will need a working installation of TeX and LaTeX2e, including the supported tools and graphics packages, Babel, AMS fonts and AMS-LaTeX, the PSNFSS extension and companion kit of “the 35 fonts”, the dvips program for generating PostScript, the macro packages fancy-hdr, hyperref, minitoc, url and ot2enc. All of these can be found on your friendly neighborhood CTAN site\footnote{http://www.ctan.org}. The installation of the TeX base system is far beyond the scope of this introduction. Binary packages should be available for any system that can run TeX.

Before you can use JadeTeX with the PostgreSQL documentation sources, you will need to increase the size of TeX’s internal data structures. Details on this can be found in the JadeTeX installation instructions.

Once that is finished you can install JadeTeX:

\begin{verbatim}
$ gunzip jadetex-xxx.tar.gz
$ tar xf jadetex-xxx.tar
$ cd jadetex
$ make install
$ mktexlsr
\end{verbatim}

The last two need to be done as root.

J.2.6. Detection by configure

Before you can build the documentation you need to run the configure script as you would when building the PostgreSQL programs themselves. Check the output near the end of the run, it should look something like this:

\begin{verbatim}
checking for onsgmls... onsgmls
checking for openjade... openjade
checking for DocBook V4.2... yes
checking for DocBook stylesheets... /usr/share/sgml/docbook/stylesheet/dsssl/modular
checking for collateindex.pl... /usr/bin/collateindex.pl
checking for xsltproc... xsltproc
checking for osx... osx
\end{verbatim}

If neither onsgmls nor nsgmls were found then some of the following tests will be skipped. nsgmls is part of the Jade package. You can pass the environment variables JADE and NSGMLS to configure to point to the programs if they are not found automatically. If “DocBook V4.2” was not found then you did not install the DocBook DTD kit in a place where Jade can find it, or you have not set up the catalog files correctly. See the installation hints above. The DocBook stylesheets are looked for in a number of relatively standard places, but if you have them some other place then you should set the environment variable DOCBOOKSTYLE to the location and rerun configure afterwards.
J.3. Building The Documentation

Once you have everything set up, change to the directory `doc/src/sgml` and run one of the commands described in the following subsections to build the documentation. (Remember to use GNU make.)

**J.3.1. HTML**

To build the HTML version of the documentation:

```
doc/src/sgml$ make html
```

This is also the default target. The output appears in the subdirectory `html`.

To create a proper index, the build might process several identical stages. If you do not care about the index, and just want to proof-read the output, use `draft`:

```
doc/src/sgml$ make draft
```

To build the documentation as a single HTML page, use:

```
doc/src/sgml$ make postgres.html
```

**J.3.2. Manpages**

We use the DocBook XSL stylesheets to convert DocBook `refentry` pages to *roff output suitable for man pages. The man pages are also distributed as a tar archive, similar to the HTML version. To create the man pages, use the commands:

```
cd doc/src/sgml
make man
```

**J.3.3. Print Output via JadeTeX**

If you want to use JadeTeX to produce a printable rendition of the documentation, you can use one of the following commands:

- To generate PostScript via DVI in A4 format:
  
  ```
doc/src/sgml$ make postgres-A4.ps
```

- In U.S. letter format:
  
  ```
doc/src/sgml$ make postgres-US.ps
```

- To make a PDF:
When using JadeTeX to build the PostgreSQL documentation, you will probably need to increase some of TeX’s internal parameters. These can be set in the file `texmf.cnf`. The following settings worked at the time of this writing:

```
hash_extra.jadetex = 200000
hash_extra.pdfjadetex = 200000
pool_size.jadetex = 2000000
pool_size.pdfjadetex = 2000000
string_vacancies.jadetex = 150000
string_vacancies.pdfjadetex = 150000
max_strings.jadetex = 300000
max_strings.pdfjadetex = 300000
save_size.jadetex = 15000
save_size.pdfjadetex = 15000
```

### J.3.4. Overflow Text

Occasionally text is too wide for the printed margins, and in extreme cases, too wide for the printed page, e.g. non-wrapped text, wide tables. Overly wide text generates “Overfull hbox” messages in the TeX log output file, e.g. `postgres-US.log` or `postgres-A4.log`. There are 72 points in an inch so anything reported as over 72 points too wide will probably not fit on the printed page (assuming one inch margins). To find the SGML text causing the overflow, find the first page number mentioned above the overflow message, e.g. `[50 ###]` (page 50), and look at the page after that (e.g. page 51) in the PDF file to see the overflow text and adjust the SGML accordingly.

### J.3.5. Print Output via RTF

You can also create a printable version of the PostgreSQL documentation by converting it to RTF and applying minor formatting corrections using an office suite. Depending on the capabilities of the particular office suite, you can then convert the documentation to PostScript or PDF. The procedure below illustrates this process using Applixware.

**Note:** It appears that current versions of the PostgreSQL documentation trigger some bug in or exceed the size limit of OpenJade. If the build process of the RTF version hangs for a long time and the output file still has size 0, then you might have hit that problem. (But keep in mind that a normal build takes 5 to 10 minutes, so don’t abort too soon.)
Applixware RTF Cleanup

OpenJade omits specifying a default style for body text. In the past, this undiagnosed problem led to a long process of table of contents generation. However, with great help from the Applixware folks the symptom was diagnosed and a workaround is available.

1. Generate the RTF version by typing:
   
   ```
   doc/src/sgml$ make postgres.rtf
   ```

2. Repair the RTF file to correctly specify all styles, in particular the default style. If the document contains `refentry` sections, one must also replace formatting hints which tie a preceding paragraph to the current paragraph, and instead tie the current paragraph to the following one. A utility, `fixrtf`, is available in `doc/src/sgml` to accomplish these repairs:
   
   ```
   doc/src/sgml$ ./fixrtf --refentry postgres.rtf
   ```

   The script adds `{\s0 Normal;}` as the zeroth style in the document. According to Applixware, the RTF standard would prohibit adding an implicit zeroth style, though Microsoft Word happens to handle this case. For repairing `refentry` sections, the script replaces `\keepn` tags with `\keep`.

3. Open a new document in Applixware Words and then import the RTF file.

4. Generate a new table of contents (ToC) using Applixware.

   a. Select the existing ToC lines, from the beginning of the first character on the first line to the last character of the last line.

   b. Build a new ToC using `Tools→Book Building→Create Table of Contents`. Select the first three levels of headers for inclusion in the ToC. This will replace the existing lines imported in the RTF with a native Applixware ToC.

   c. Adjust the ToC formatting by using `Format→Style`, selecting each of the three ToC styles, and adjusting the indents for `First` and `Left`. Use the following values:

<table>
<thead>
<tr>
<th>Style</th>
<th>First Indent (inches)</th>
<th>Left Indent (inches)</th>
</tr>
</thead>
<tbody>
<tr>
<td>TOC-Heading 1</td>
<td>0.4</td>
<td>0.4</td>
</tr>
<tr>
<td>TOC-Heading 2</td>
<td>0.8</td>
<td>0.8</td>
</tr>
<tr>
<td>TOC-Heading 3</td>
<td>1.2</td>
<td>1.2</td>
</tr>
</tbody>
</table>

5. Work through the document to:

   - Adjust page breaks.
   - Adjust table column widths.

6. Replace the right-justified page numbers in the Examples and Figures portions of the ToC with correct values. This only takes a few minutes.

7. Delete the index section from the document if it is empty.

8. Regenerate and adjust the table of contents.
a. Select the ToC field.
b. Select Tools → Book Building → Create Table of Contents.
c. Unbind the ToC by selecting Tools → Field Editing → Unprotect.
d. Delete the first line in the ToC, which is an entry for the ToC itself.

9. Save the document as native Applixware Words format to allow easier last minute editing later.

10. “Print” the document to a file in PostScript format.

J.3.6. Plain Text Files

The installation instructions are also distributed as plain text, in case they are needed in a situation where better reading tools are not available. The INSTALL file corresponds to Chapter 15, with some minor changes to account for the different context. To recreate the file, change to the directory doc/src/sgml and enter make INSTALL.

In the past, the release notes and regression testing instructions were also distributed as plain text, but this practice has been discontinued.

J.3.7. Syntax Check

Building the documentation can take very long. But there is a method to just check the correct syntax of the documentation files, which only takes a few seconds:

doc/src/sgml$ make check

J.4. Documentation Authoring

SGML and DocBook do not suffer from an oversupply of open-source authoring tools. The most common tool set is the Emacs/XEmacs editor with appropriate editing mode. On some systems these tools are provided in a typical full installation.

J.4.1. Emacs/PSGML

PSGML is the most common and most powerful mode for editing SGML documents. When properly configured, it will allow you to use Emacs to insert tags and check markup consistency. You could use it for HTML as well. Check the PSGML web site\(^\text{16}\) for downloads, installation instructions, and detailed documentation.

There is one important thing to note with PSGML: its author assumed that your main SGML DTD directory would be /usr/local/lib/sgml. If, as in the examples in this chapter, you use

you have to compensate for this, either by setting \texttt{SGML\_CATALOG\_FILES} environment variable, or you can customize your PSGML installation (its manual tells you how).

Put the following in your \texttt{~/.emacs} environment file (adjusting the path names to be appropriate for your system):

\begin{verbatim}
; ********** for SGML mode (psgml)
(setq sgml-omittag t)
(setq sgml-shorttag t)
(setq sgml-minimize-attributes nil)
(setq sgml-always-quote-attributes t)
(setq sgml-indent-step 1)
(setq sgml-indent-data t)
(setq sgml-parent-document nil)
(setq sgml-exposed-tags nil)
(setq sgml-catalog-files ’("/usr/local/share/sgml/catalog")

(autoload ’sgml-mode "psgml" "Major mode to edit SGML files." t )
\end{verbatim}

and in the same file add an entry for SGML into the (existing) definition for \texttt{auto-mode-alist}:

\begin{verbatim}
(setq auto-mode-alist
 ’("\.sgml" . sgml-mode))
\end{verbatim}

You might find that when using PSGML, a comfortable way of working with these separate files of book parts is to insert a proper \texttt{DOCTYPE} declaration while you’re editing them. If you are working on this source, for instance, it is an appendix chapter, so you would specify the document as an “appendix” instance of a DocBook document by making the first line look like this:

\begin{verbatim}
<!DOCTYPE appendix PUBLIC "-//OASIS//DTD DocBook V4.2//EN">
\end{verbatim}

This means that anything and everything that reads SGML will get it right, and I can verify the document with \texttt{nsgmls -s docguide.sgml}. (But you need to take out that line before building the entire documentation set.)

\section*{J.4.2. Other Emacs Modes}

GNU Emacs ships with a different SGML mode, which is not quite as powerful as PSGML, but it’s less confusing and lighter weight. Also, it offers syntax highlighting (font lock), which can be very helpful. \texttt{src/tools/editors/emacs.samples} contains sample settings for this mode.

Norm Walsh offers a major mode\footnote{http://nwalsh.com/emacs/docbookide/index.html} specifically for DocBook which also has font-lock and a number of features to reduce typing.
J.5. Style Guide

J.5.1. Reference Pages

Reference pages should follow a standard layout. This allows users to find the desired information more quickly, and it also encourages writers to document all relevant aspects of a command. Consistency is not only desired among PostgreSQL reference pages, but also with reference pages provided by the operating system and other packages. Hence the following guidelines have been developed. They are for the most part consistent with similar guidelines established by various operating systems.

Reference pages that describe executable commands should contain the following sections, in this order. Sections that do not apply can be omitted. Additional top-level sections should only be used in special circumstances; often that information belongs in the “Usage” section.

Name
This section is generated automatically. It contains the command name and a half-sentence summary of its functionality.

Synopsis
This section contains the syntax diagram of the command. The synopsis should normally not list each command-line option; that is done below. Instead, list the major components of the command line, such as where input and output files go.

Description
Several paragraphs explaining what the command does.

Options
A list describing each command-line option. If there are a lot of options, subsections can be used.

Exit Status
If the program uses 0 for success and non-zero for failure, then you do not need to document it. If there is a meaning behind the different non-zero exit codes, list them here.

Usage
Describe any sublanguage or run-time interface of the program. If the program is not interactive, this section can usually be omitted. Otherwise, this section is a catch-all for describing run-time features. Use subsections if appropriate.

Environment
List all environment variables that the program might use. Try to be complete; even seemingly trivial variables like SHELL might be of interest to the user.

Files
List any files that the program might access implicitly. That is, do not list input and output files that were specified on the command line, but list configuration files, etc.
Appendix J. Documentation

Diagnostics

Explain any unusual output that the program might create. Refrain from listing every possible error message. This is a lot of work and has little use in practice. But if, say, the error messages have a standard format that the user can parse, this would be the place to explain it.

Notes

Anything that doesn’t fit elsewhere, but in particular bugs, implementation flaws, security considerations, compatibility issues.

Examples

Examples

History

If there were some major milestones in the history of the program, they might be listed here. Usually, this section can be omitted.

Author

Author (only used in the contrib section)

See Also

Cross-references, listed in the following order: other PostgreSQL command reference pages, PostgreSQL SQL command reference pages, citation of PostgreSQL manuals, other reference pages (e.g., operating system, other packages), other documentation. Items in the same group are listed alphabetically.

Reference pages describing SQL commands should contain the following sections: Name, Synopsis, Description, Parameters, Outputs, Notes, Examples, Compatibility, History, See Also. The Parameters section is like the Options section, but there is more freedom about which clauses of the command can be listed. The Outputs section is only needed if the command returns something other than a default command-completion tag. The Compatibility section should explain to what extent this command conforms to the SQL standard(s), or to which other database system it is compatible. The See Also section of SQL commands should list SQL commands before cross-references to programs.
Appendix K. Acronyms

This is a list of acronyms commonly used in the PostgreSQL documentation and in discussions about PostgreSQL.
