• Update time zone data files to tzdata release 2015g for DST law changes in Cayman Islands, Fiji, Moldova, Morocco, Norfolk Island, North Korea, Turkey, and Uruguay. There is a new zone name America/Fort_Nelson for the Canadian Northern Rockies.

E.87. Release 9.2.13

**Release date:** 2015-06-12

This release contains a small number of fixes from 9.2.12. For information about new features in the 9.2 major release, see Section E.100.

E.87.1. Migration to Version 9.2.13

A dump/restore is not required for those running 9.2.X.

However, if you are upgrading from a version earlier than 9.2.11, see Section E.89.

E.87.2. Changes

• Fix rare failure to invalidate relation cache init file (Tom Lane)

  With just the wrong timing of concurrent activity, a VACUUM FULL on a system catalog might fail to update the “init file” that’s used to avoid cache-loading work for new sessions. This would result in later sessions being unable to access that catalog at all. This is a very ancient bug, but it’s so hard to trigger that no reproducible case had been seen until recently.

• Avoid deadlock between incoming sessions and CREATE/DROP DATABASE (Tom Lane)

  A new session starting in a database that is the target of a DROP DATABASE command, or is the template for a CREATE DATABASE command, could cause the command to wait for five seconds and then fail, even if the new session would have exited before that.

E.88. Release 9.2.12

**Release date:** 2015-06-04

This release contains a small number of fixes from 9.2.11. For information about new features in the 9.2 major release, see Section E.100.
E.88.1. Migration to Version 9.2.12

A dump/restore is not required for those running 9.2.X.

However, if you are upgrading from a version earlier than 9.2.11, see Section E.89.

E.88.2. Changes

- Avoid failures while fsync'ing data directory during crash restart (Abhijit Menon-Sen, Tom Lane)
  In the previous minor releases we added a patch to fsync everything in the data directory after a crash. Unfortunately its response to any error condition was to fail, thereby preventing the server from starting up, even when the problem was quite harmless. An example is that an unwritable file in the data directory would prevent restart on some platforms; but it is common to make SSL certificate files unwritable by the server. Revise this behavior so that permissions failures are ignored altogether, and other types of failures are logged but do not prevent continuing.

- Fix pg_get_functiondef() to show functions' LEAKPROOF property, if set (Jeevan Chalke)

- Remove configure's check prohibiting linking to a threaded libpython on OpenBSD (Tom Lane)
  The failure this restriction was meant to prevent seems to not be a problem anymore on current OpenBSD versions.

- Allow libpq to use TLS protocol versions beyond v1 (Noah Misch)
  For a long time, libpq was coded so that the only SSL protocol it would allow was TLS v1. Now that newer TLS versions are becoming popular, allow it to negotiate the highest commonly-supported TLS version with the server. (PostgreSQL servers were already capable of such negotiation, so no change is needed on the server side.) This is a back-patch of a change already released in 9.4.0.

E.89. Release 9.2.11

Release date: 2015-05-22

This release contains a variety of fixes from 9.2.10. For information about new features in the 9.2 major release, see Section E.100.

E.89.1. Migration to Version 9.2.11

A dump/restore is not required for those running 9.2.X.

However, if you use contrib/citext's regexp_matches() functions, see the changelog entry below about that.

Also, if you are upgrading from a version earlier than 9.2.10, see Section E.90.
E.89.2. Changes

- Avoid possible crash when client disconnects just before the authentication timeout expires (Benkocs Norbert Attila)

If the timeout interrupt fired partway through the session shutdown sequence, SSL-related state would be freed twice, typically causing a crash and hence denial of service to other sessions. Experimentation shows that an unauthenticated remote attacker could trigger the bug somewhat consistently, hence treat as security issue. (CVE-2015-3165)

- Improve detection of system-call failures (Noah Misch)

Our replacement implementation of `snprintf()` failed to check for errors reported by the underlying system library calls; the main case that might be missed is out-of-memory situations. In the worst case this might lead to information exposure, due to our code assuming that a buffer had been overwritten when it hadn’t been. Also, there were a few places in which security-relevant calls of other system library functions did not check for failure.

It remains possible that some calls of the `printf()` family of functions are vulnerable to information disclosure if an out-of-memory error occurs at just the wrong time. We judge the risk to not be large, but will continue analysis in this area. (CVE-2015-3166)

- In `contrib/pgcrypto`, uniformly report decryption failures as “Wrong key or corrupt data” (Noah Misch)

Previously, some cases of decryption with an incorrect key could report other error message texts. It has been shown that such variance in error reports can aid attackers in recovering keys from other systems. While it’s unknown whether `pgcrypto`’s specific behaviors are likewise exploitable, it seems better to avoid the risk by using a one-size-fits-all message. (CVE-2015-3167)

- Fix incorrect declaration of `contrib/citext`’s `regexp_matches()` functions (Tom Lane)

These functions should return `setof text[]`, like the core functions they are wrappers for; but they were incorrectly declared as returning just `text[]`. This mistake had two results: first, if there was no match you got a scalar null result, whereas what you should get is an empty set (zero rows). Second, the `g` flag was effectively ignored, since you would get only one result array even if there were multiple matches.

While the latter behavior is clearly a bug, there might be applications depending on the former behavior; therefore the function declarations will not be changed by default until PostgreSQL 9.5. In pre-9.5 branches, the old behavior exists in version 1.0 of the `citext` extension, while we have provided corrected declarations in version 1.1 (which is not installed by default). To adopt the fix in pre-9.5 branches, execute `ALTER EXTENSION citext UPDATE TO ’1.1’` in each database in which `citext` is installed. (You can also “update” back to 1.0 if you need to undo that.) Be aware that either update direction will require dropping and recreating any views or rules that use `citext`’s `regexp_matches()` functions.

- Fix incorrect checking of deferred exclusion constraints after a HOT update (Tom Lane)

If a new row that potentially violates a deferred exclusion constraint is HOT-updated (that is, no indexed columns change and the row can be stored back onto the same table page) later in the same transaction, the exclusion constraint would be reported as violated when the check finally occurred, even if the row(s) the new row originally conflicted with had been deleted.
• Fix planning of star-schema-style queries (Tom Lane)
  Sometimes, efficient scanning of a large table requires that index parameters be provided from more than one other table (commonly, dimension tables whose keys are needed to index a large fact table). The planner should be able to find such plans, but an overly restrictive search heuristic prevented it.

• Prevent improper reordering of antijoins (NOT EXISTS joins) versus other outer joins (Tom Lane)
  This oversight in the planner has been observed to cause “could not find RelOptInfo for given relids” errors, but it seems possible that sometimes an incorrect query plan might get past that consistency check and result in silently-wrong query output.

• Fix incorrect matching of subexpressions in outer-join plan nodes (Tom Lane)
  Previously, if textually identical non-strict subexpressions were used both above and below an outer join, the planner might try to re-use the value computed below the join, which would be incorrect because the executor would force the value to NULL in case of an unmatched outer row.

• Fix GEQO planner to cope with failure of its join order heuristic (Tom Lane)
  This oversight has been seen to lead to “failed to join all relations together” errors in queries involving LATERAL, and that might happen in other cases as well.

• Fix possible deadlock at startup when max_prepared_transactions is too small (Heikki Linnakangas)

• Don’t archive useless preallocated WAL files after a timeline switch (Heikki Linnakangas)

• Avoid “cannot GetMultiXactIdMembers() during recovery” error (Álvaro Herrera)

• Recursively fsync() the data directory after a crash (Abhijit Menon-Sen, Robert Haas)
  This ensures consistency if another crash occurs shortly later. (The second crash would have to be a system-level crash, not just a database crash, for there to be a problem.)

• Fix autovacuum launcher’s possible failure to shut down, if an error occurs after it receives SIGTERM (Álvaro Herrera)

• Cope with unexpected signals in LockBufferForCleanup() (Andres Freund)
  This oversight could result in spurious errors about “multiple backends attempting to wait for pinct 1”.

• Fix crash when doing COPY IN to a table with check constraints that contain whole-row references (Tom Lane)
  The known failure case only crashes in 9.4 and up, but there is very similar code in 9.3 and 9.2, so back-patch those branches as well.

• Avoid waiting for WAL flush or synchronous replication during commit of a transaction that was read-only so far as the user is concerned (Andres Freund)
  Previously, a delay could occur at commit in transactions that had written WAL due to HOT page pruning, leading to undesirable effects such as sessions getting stuck at startup if all synchronous replicas are down. Sessions have also been observed to get stuck in catchup interrupt processing when using synchronous replication; this will fix that problem as well.

• Fix crash when manipulating hash indexes on temporary tables (Heikki Linnakangas)

• Fix possible failure during hash index bucket split, if other processes are modifying the index concurrently (Tom Lane)
• Check for interrupts while analyzing index expressions (Jeff Janes)

*ANALYZE* executes index expressions many times; if there are slow functions in such an expression, it’s desirable to be able to cancel the *ANALYZE* before that loop finishes.

• Ensure tableoid of a foreign table is reported correctly when a *READ COMMITTED* recheck occurs after locking rows in *SELECT FOR UPDATE, UPDATE, or DELETE* (Etsuro Fujita)

• Add the name of the target server to object description strings for foreign-server user mappings (Álvaro Herrera)

• Recommend setting `include_realm` to 1 when using Kerberos/GSSAPI/SSPI authentication (Stephen Frost)

Without this, identically-named users from different realms cannot be distinguished. For the moment this is only a documentation change, but it will become the default setting in PostgreSQL 9.5.

• Remove code for matching IPv4 *pg_hba.conf* entries to IPv4-in-IPv6 addresses (Tom Lane)

This hack was added in 2003 in response to a report that some Linux kernels of the time would report IPv4 connections as having IPv4-in-IPv6 addresses. However, the logic was accidentally broken in 9.0. The lack of any field complaints since then shows that it’s not needed anymore. Now we have reports that the broken code causes crashes on some systems, so let’s just remove it rather than fix it. (Had we chosen to fix it, that would make for a subtle and potentially security-sensitive change in the effective meaning of IPv4 *pg_hba.conf* entries, which does not seem like a good thing to do in minor releases.)

• Report WAL flush, not insert, position in *IDENTIFY_SYSTEM* replication command (Heikki Linnakangas)

This avoids a possible startup failure in *pg_receivexlog*.

• While shutting down service on Windows, periodically send status updates to the Service Control Manager to prevent it from killing the service too soon; and ensure that *pg_ctl* will wait for shutdown (Krystian Bigaj)

• Reduce risk of network deadlock when using libpq’s non-blocking mode (Heikki Linnakangas)

When sending large volumes of data, it’s important to drain the input buffer every so often, in case the server has sent enough response data to cause it to block on output. (A typical scenario is that the server is sending a stream of NOTICE messages during *COPY FROM STDIN*.) This worked properly in the normal blocking mode, but not so much in non-blocking mode. We’ve modified libpq to opportunistically drain input when it can, but a full defense against this problem requires application cooperation: the application should watch for socket read-ready as well as write-ready conditions, and be sure to call `PQconsumeInput()` upon read-ready.

• In libpq, fix misparsing of empty values in URI connection strings (Thomas Fanghaenel)

• Fix array handling in ecpg (Michael Meskes)

• Fix psql to sanely handle URIs and conninfo strings as the first parameter to `\connect` (David Fetter, Andrew Dunstan, Álvaro Herrera)

This syntax has been accepted (but undocumented) for a long time, but previously some parameters might be taken from the old connection instead of the given string, which was agreed to be undesirable.

• Suppress incorrect complaints from psql on some platforms that it failed to write `~/.psql_history` at exit (Tom Lane)
This misbehavior was caused by a workaround for a bug in very old (pre-2006) versions of libedit. We fixed it by removing the workaround, which will cause a similar failure to appear for anyone still using such versions of libedit. Recommendation: upgrade that library, or use libreadline.

- Fix pg_dump’s rule for deciding which casts are system-provided casts that should not be dumped (Tom Lane)
- In pg_dump, fix failure to honor -Z compression level option together with -Fd (Michael Paquier)
- Make pg_dump consider foreign key relationships between extension configuration tables while choosing dump order (Gilles Darold, Michael Paquier, Stephen Frost)
  
This oversight could result in producing dumps that fail to reload because foreign key constraints are transiently violated.

- Fix dumping of views that are just VALUES(...) but have column aliases (Tom Lane)
- In pg_upgrade, force timeline 1 in the new cluster (Bruce Momjian)
  
This change prevents upgrade failures caused by bogus complaints about missing WAL history files.

- In pg_upgrade, check for improperly non-connectable databases before proceeding (Bruce Momjian)
- In pg_upgrade, quote directory paths properly in the generated delete_old_cluster script (Bruce Momjian)
- In pg_upgrade, preserve database-level freezing info properly (Bruce Momjian)
  
This oversight could cause missing-clog-file errors for tables within the postgres and template1 databases.

- Run pg_upgrade and pg_resetxlog with restricted privileges on Windows, so that they don’t fail when run by an administrator (Muhammad Asif Naeem)
- Improve handling of readdir() failures when scanning directories in initdb and pg_basebackup (Marco Nenciarini)
- Fix failure in pg_receivexlog (Andres Freund)
  
A patch merge mistake in 9.2.10 led to “could not create archive status file” errors.

- Fix slow sorting algorithm in contrib/intarray (Tom Lane)
- Fix compile failure on Sparc V8 machines (Rob Rowan)
- Update time zone data files to tzdata release 2015d for DST law changes in Egypt, Mongolia, and Palestine, plus historical changes in Canada and Chile. Also adopt revised zone abbreviations for the America/Adak zone (HST/HDT not HAST/HADT).

E.90. Release 9.2.10

Release date: 2015-02-05

This release contains a variety of fixes from 9.2.9. For information about new features in the 9.2 major release, see Section E.100.
E.90.1. Migration to Version 9.2.10

A dump/restore is not required for those running 9.2.X.

However, if you are a Windows user and are using the “Norwegian (Bokmål)” locale, manual action is needed after the upgrade to replace any “Norwegian (Bokmål)_Norway” locale names stored in PostgreSQL system catalogs with the plain-ASCII alias “Norwegian_Norway”. For details see http://wiki.postgresql.org/wiki/Changes_To_Norwegian_Locale

Also, if you are upgrading from a version earlier than 9.2.9, see Section E.91.

E.90.2. Changes

- Fix buffer overruns in to_char() (Bruce Momjian)

  When to_char() processes a numeric formatting template calling for a large number of digits, PostgreSQL would read past the end of a buffer. When processing a crafted timestamp formatting template, PostgreSQL would write past the end of a buffer. Either case could crash the server. We have not ruled out the possibility of attacks that lead to privilege escalation, though they seem unlikely. (CVE-2015-0241)

- Fix buffer overrun in replacement *printf() functions (Tom Lane)

  PostgreSQL includes a replacement implementation of printf and related functions. This code will overrun a stack buffer when formatting a floating point number (conversion specifiers e, E, f, F, g or G) with requested precision greater than about 500. This will crash the server, and we have not ruled out the possibility of attacks that lead to privilege escalation. A database user can trigger such a buffer overrun through the to_char() SQL function. While that is the only affected core PostgreSQL functionality, extension modules that use printf-family functions may be at risk as well.

  This issue primarily affects PostgreSQL on Windows. PostgreSQL uses the system implementation of these functions where adequate, which it is on other modern platforms. (CVE-2015-0242)

- Fix buffer overruns in contrib/pgcrypto (Marko Tiikkaja, Noah Misch)

  Errors in memory size tracking within the pgcrypto module permitted stack buffer overruns and improper dependence on the contents of uninitialized memory. The buffer overrun cases can crash the server, and we have not ruled out the possibility of attacks that lead to privilege escalation. (CVE-2015-0243)

- Fix possible loss of frontend/backend protocol synchronization after an error (Heikki Linnakangas)

  If any error occurred while the server was in the middle of reading a protocol message from the client, it could lose synchronization and incorrectly try to interpret part of the message’s data as a new protocol message. An attacker able to submit crafted binary data within a command parameter might succeed in injecting his own SQL commands this way. Statement timeout and query cancellation are the most likely sources of errors triggering this scenario. Particularly vulnerable are applications that use a timeout and also submit arbitrary user-crafted data as binary query parameters. Disabling statement timeout will reduce, but not eliminate, the risk of exploit. Our thanks to Emil Lenngren for reporting this issue. (CVE-2015-0244)

- Fix information leak via constraint-violation error messages (Stephen Frost)
Some server error messages show the values of columns that violate a constraint, such as a unique constraint. If the user does not have SELECT privilege on all columns of the table, this could mean exposing values that the user should not be able to see. Adjust the code so that values are displayed only when they came from the SQL command or could be selected by the user. (CVE-2014-8161)

- Lock down regression testing’s temporary installations on Windows (Noah Misch)
  
  Use SSPI authentication to allow connections only from the OS user who launched the test suite. This closes on Windows the same vulnerability previously closed on other platforms, namely that other users might be able to connect to the test postmaster. (CVE-2014-0067)
  
- Cope with the Windows locale named “Norwegian (Bokmål)” (Heikki Linnakangas)
  
  Non-ASCII locale names are problematic since it’s not clear what encoding they should be represented in. Map the troublesome locale name to a plain-ASCII alias, “Norwegian_Norway”.
  
- Avoid possible data corruption if \texttt{ALTER DATABASE SET TABLESPACE} is used to move a database to a new tablespace and then shortly later move it back to its original tablespace (Tom Lane)
  
- Avoid corrupting tables when \texttt{ANALYZE} inside a transaction is rolled back (Andres Freund, Tom Lane, Michael Paquier)
  
  If the failing transaction had earlier removed the last index, rule, or trigger from the table, the table would be left in a corrupted state with the relevant \texttt{pg_class} flags not set though they should be.
  
- Ensure that unlogged tables are copied correctly during \texttt{CREATE DATABASE} or \texttt{ALTER DATABASE SET TABLESPACE} (Pavan Deolasee, Andres Freund)
  
- Fix \texttt{DROP}’s dependency searching to correctly handle the case where a table column is recursively visited before its table (Petr Jelinek, Tom Lane)
  
  This case is only known to arise when an extension creates both a datatype and a table using that datatype. The faulty code might refuse a \texttt{DROP EXTENSION} unless \texttt{CASCADE} is specified, which should not be required.
  
- Fix use-of-already-freed-memory problem in EvalPlanQual processing (Tom Lane)
  
  In \texttt{READ COMMITTED} mode, queries that lock or update recently-updated rows could crash as a result of this bug.
  
- Fix planning of \texttt{SELECT FOR UPDATE} when using a partial index on a child table (Kyotaro Horiguchi)
  
  In \texttt{READ COMMITTED} mode, \texttt{SELECT FOR UPDATE} must also recheck the partial index’s \texttt{WHERE} condition when rechecking a recently-updated row to see if it still satisfies the query’s \texttt{WHERE} condition. This requirement was missed if the index belonged to an inheritance child table, so that it was possible to incorrectly return rows that no longer satisfy the query condition.
  
- Fix corner case wherein \texttt{SELECT FOR UPDATE} could return a row twice, and possibly miss returning other rows (Tom Lane)
  
  In \texttt{READ COMMITTED} mode, a \texttt{SELECT FOR UPDATE} that is scanning an inheritance tree could incorrectly return a row from a prior child table instead of the one it should return from a later child table.
  
- Reject duplicate column names in the referenced-columns list of a \texttt{FOREIGN KEY} declaration (David Rowley)
  
  This restriction is per SQL standard. Previously we did not reject the case explicitly, but later on the code would fail with bizarre-looking errors.
Appendix E. Release Notes

- Restore previous behavior of conversion of domains to JSON (Tom Lane)

  This change causes domains over numeric and boolean to be treated like their base types for purposes of conversion to JSON. It worked like that before 9.3.5 and 9.2.9, but was unintentionally changed while fixing a related problem.

- Fix bugs in raising a numeric value to a large integral power (Tom Lane)

  The previous code could get a wrong answer, or consume excessive amounts of time and memory before realizing that the answer must overflow.

- In numeric_recv(), truncate away any fractional digits that would be hidden according to the value’s dscale field (Tom Lane)

  A numeric value’s display scale (dscale) should never be less than the number of nonzero fractional digits; but apparently there’s at least one broken client application that transmits binary numeric values in which that’s true. This leads to strange behavior since the extra digits are taken into account by arithmetic operations even though they aren’t printed. The least risky fix seems to be to truncate away such “hidden” digits on receipt, so that the value is indeed what it prints as.

- Fix incorrect search for shortest-first regular expression matches (Tom Lane)

  Matching would often fail when the number of allowed iterations is limited by a ? quantifier or a bound expression.

- Reject out-of-range numeric timezone specifications (Tom Lane)

  Simple numeric timezone specifications exceeding +/- 168 hours (one week) would be accepted, but could then cause null-pointer dereference crashes in certain operations. There’s no use-case for such large UTC offsets, so reject them.

- Fix bugs in tsquery @> tsquery operator (Heikki Linnakangas)

  Two different terms would be considered to match if they had the same CRC. Also, if the second operand had more terms than the first, it would be assumed not to be contained in the first; which is wrong since it might contain duplicate terms.

- Improve ispell dictionary’s defenses against bad affix files (Tom Lane)

- Allow more than 64K phrases in a thesaurus dictionary (David Boutin)

  The previous coding could crash on an oversize dictionary, so this was deemed a back-patchable bug fix rather than a feature addition.

- Fix namespace handling in xpath() (Ali Akbar)

  Previously, the xml value resulting from an xpath() call would not have namespace declarations if the namespace declarations were attached to an ancestor element in the input xml value, rather than to the specific element being returned. Propagate the ancestral declaration so that the result is correct when considered in isolation.

- Ensure that whole-row variables expose nonempty column names to functions that pay attention to column names within composite arguments (Tom Lane)

  In some contexts, constructs like row_to_json(tab.*) may not produce the expected column names. This is fixed properly as of 9.4; in older branches, just ensure that we produce some nonempty name. (In some cases this will be the underlying table’s column name rather than the query-assigned alias that should theoretically be visible.)
• Fix mishandling of system columns, particularly `tableoid`, in FDW queries (Etsuro Fujita)

• Avoid doing `indexed_column = ANY (array)` as an index qualifier if that leads to an inferior plan (Andrew Gierth)

  In some cases, `= ANY` conditions applied to non-first index columns would be done as index conditions even though it would be better to use them as simple filter conditions.

• Fix planner problems with nested append relations, such as inherited tables within `UNION ALL` sub-queries (Tom Lane)

• Fail cleanly when a GiST index tuple doesn’t fit on a page, rather than going into infinite recursion (Andrew Gierth)

• Exempt tables that have per-table `cost_limit` and/or `cost_delay` settings from autovacuum’s global cost balancing rules (Álvaro Herrera)

  The previous behavior resulted in basically ignoring these per-table settings, which was unintended. Now, a table having such settings will be vacuumed using those settings, independently of what is going on in other autovacuum workers. This may result in heavier total I/O load than before, so such settings should be re-examined for sanity.

• Avoid wholesale autovacuuming when autovacuum is nominally off (Tom Lane)

  Even when autovacuum is nominally off, we will still launch autovacuum worker processes to vacuum tables that are at risk of XID wraparound. However, such a worker process then proceeded to vacuum all tables in the target database, if they met the usual thresholds for autovacuuming. This is at best pretty unexpected; at worst it delays response to the wraparound threat. Fix it so that if autovacuum is turned off, workers only do anti-wraparound vacuums and not any other work.

• During crash recovery, ensure that unlogged relations are rewritten as empty and are synced to disk before recovery is considered complete (Abhijit Menon-Sen, Andres Freund)

  This prevents scenarios in which unlogged relations might contain garbage data following database crash recovery.

• Fix race condition between hot standby queries and replaying a full-page image (Heikki Linnakangas)

  This mistake could result in transient errors in queries being executed in hot standby.

• Fix several cases where recovery logic improperly ignored WAL records for `COMMIT/ABORT PREPARED` (Heikki Linnakangas)

  The most notable oversight was that `recovery_target_xid` could not be used to stop at a two-phase commit.

• Prevent latest WAL file from being archived a second time at completion of crash recovery (Fujii Masao)

• Avoid creating unnecessary `.ready` marker files for timeline history files (Fujii Masao)

• Fix possible null pointer dereference when an empty prepared statement is used and the `log_statement` setting is `mod` or `ddl` (Fujii Masao)

• Change “`pgstat wait timeout`” warning message to be LOG level, and rephrase it to be more understandable (Tom Lane)

  This message was originally thought to be essentially a can’t-happen case, but it occurs often enough on our slower buildfarm members to be a nuisance. Reduce it to LOG level, and expend a bit more
Appendix E. Release Notes

• Fix SPARC spinlock implementation to ensure correctness if the CPU is being run in a non-TSO coherency mode, as some non-Solaris kernels do (Andres Freund)
• Warn if macOS’s `setlocale()` starts an unwanted extra thread inside the postmaster (Noah Misch)
• Fix processing of repeated `dbname` parameters in `PQconnectdbParams()` (Alex Shulgin)
  Unexpected behavior ensued if the first occurrence of `dbname` contained a connection string or URI to be expanded.
• Ensure that `libpq` reports a suitable error message on unexpected socket EOF (Marko Tiikkaja, Tom Lane)
  Depending on kernel behavior, libpq might return an empty error string rather than something useful when the server unexpectedly closed the socket.
• Clear any old error message during `PQreset()` (Heikki Linnakangas)
  If `PQreset()` is called repeatedly, and the connection cannot be re-established, error messages from the failed connection attempts kept accumulating in the `PGconn`’s error string.
• Properly handle out-of-memory conditions while parsing connection options in `libpq` (Alex Shulgin, Heikki Linnakangas)
• Fix array overrun in `ecpg`’s version of `ParseDateTime()` (Michael Paquier)
• In `initdb`, give a clearer error message if a password file is specified but is empty (Mats Erik Andersson)
• Fix `psql`’s `\s` command to work nicely with `libedit`, and add pager support (Stepan Rutz, Tom Lane)
  When using `libedit` rather than readline, `\s` printed the command history in a fairly unreadable encoded format, and on recent `libedit` versions might fail altogether. Fix that by printing the history ourselves rather than having the library do it. A pleasant side-effect is that the pager is used if appropriate.
  This patch also fixes a bug that caused newline encoding to be applied inconsistently when saving the command history with `libedit`. Multiline history entries written by older `psql` versions will be read cleanly with this patch, but perhaps not vice versa, depending on the exact `libedit` versions involved.
• Improve consistency of parsing of `psql`’s special variables (Tom Lane)
  Allow variant spellings of `on` and `off` (such as 1/0) for `ECHO_HIDDEN` and `ON_ERROR_ROLLBACK`. Report a warning for unrecognized values for `COMP_KEYWORD_CASE, ECHO, ECHO_HIDDEN, HISTCONTROL, ON_ERROR_ROLLBACK, and VERBOSITY`. Recognize all values for all these variables case-insensitively; previously there was a mishmash of case-sensitive and case-insensitive behaviors.
• Fix `psql`’s expanded-mode display to work consistently when using `border = 3` and `linestyle = ascii or unicode` (Stephen Frost)
• Improve performance of `pg_dump` when the database contains many instances of multiple dependency paths between the same two objects (Tom Lane)
• Fix `pg_dumpall` to restore its ability to dump from pre-8.1 servers (Gilles Darold)
• Fix possible deadlock during parallel restore of a schema-only dump (Robert Haas, Tom Lane)
• Fix core dump in `pg_dump --binary-upgrade` on zero-column composite type (Rushabh Lathia)
Appendix E. Release Notes

- Prevent WAL files created by `pg_basebackup -x/-X` from being archived again when the standby is promoted (Andres Freund)
- Fix failure of `contrib/auto_explain` to print per-node timing information when doing `EXPLAIN ANALYZE` (Tom Lane)
- Fix upgrade-from-unpackaged script for `contrib/citext` (Tom Lane)
- Fix block number checking in `contrib/pageinspect`'s `get_raw_page()` (Tom Lane)
  The incorrect checking logic could prevent access to some pages in non-main relation forks.
- Fix `contrib/pgcrypto`'s `pgp_sym_decrypt()` to not fail on messages whose length is 6 less than a power of 2 (Marko Tiikkaja)
- Fix file descriptor leak in `contrib/pg_test_fsync` (Jeff Janes)
  This could cause failure to remove temporary files on Windows.
- Handle unexpected query results, especially NULLs, safely in `contrib/tablefunc`'s `connectby()` (Michael Paquier)
  `connectby()` previously crashed if it encountered a NULL key value. It now prints that row but doesn’t recurse further.
- Avoid a possible crash in `contrib/xml2`'s `xslt_process()` (Mark Simonetti)
  `libxslt` seems to have an undocumented dependency on the order in which resources are freed; reorder our calls to avoid a crash.
- Mark some `contrib` I/O functions with correct volatility properties (Tom Lane)
  The previous over-conservative marking was immaterial in normal use, but could cause optimization problems or rejection of valid index expression definitions. Since the consequences are not large, we’ve just adjusted the function definitions in the extension modules’ scripts, without changing version numbers.
- Numerous cleanups of warnings from Coverity static code analyzer (Andres Freund, Tatsuo Ishii, Marko Kreen, Tom Lane, Michael Paquier)
  These changes are mostly cosmetic but in some cases fix corner-case bugs, for example a crash rather than a proper error report after an out-of-memory failure. None are believed to represent security issues.
- Detect incompatible OpenLDAP versions during build (Noah Misch)
  With OpenLDAP versions 2.4.24 through 2.4.31, inclusive, PostgreSQL backends can crash at exit. Raise a warning during configure based on the compile-time OpenLDAP version number, and test the crashing scenario in the `contrib/dblink` regression test.
- In non-MSVC Windows builds, ensure `libpq.dll` is installed with execute permissions (Noah Misch)
- Make `pg_regress` remove any temporary installation it created upon successful exit (Tom Lane)
  This results in a very substantial reduction in disk space usage during `make check-world`, since that sequence involves creation of numerous temporary installations.
- Support time zone abbreviations that change UTC offset from time to time (Tom Lane)
  Previously, PostgreSQL assumed that the UTC offset associated with a time zone abbreviation (such as `EST`) never changes in the usage of any particular locale. However this assumption fails in the real world, so introduce the ability for a zone abbreviation to represent a UTC offset that sometimes changes.
Appendix E. Release Notes

Update the zone abbreviation definition files to make use of this feature in timezone locales that have changed the UTC offset of their abbreviations since 1970 (according to the IANA timezone database). In such timezones, PostgreSQL will now associate the correct UTC offset with the abbreviation depending on the given date.

- Update time zone abbreviations lists (Tom Lane)

Add CST (China Standard Time) to our lists. Remove references to ADT as “Arabia Daylight Time”, an abbreviation that’s been out of use since 2007; therefore, claiming there is a conflict with “Atlantic Daylight Time” doesn’t seem especially helpful. Fix entirely incorrect GMT offsets for CKT (Cook Islands), FJT, and FJST (Fiji); we didn’t even have them on the proper side of the date line.

- Update time zone data files to tzdata release 2015a.

The IANA timezone database has adopted abbreviations of the form AxST/AxDT for all Australian time zones, reflecting what they believe to be current majority practice Down Under. These names do not conflict with usage elsewhere (other than ACST for Acre Summer Time, which has been in disuse since 1994). Accordingly, adopt these names into our “Default” timezone abbreviation set. The “Australia” abbreviation set now contains only CST, EAST, EST, SAST, SAT, and WST; all of which are thought to be mostly historical usage. Note that SAST has also been changed to be South Africa Standard Time in the “Default” abbreviation set.

Also, add zone abbreviations SRET (Asia/Srednekolymsk) and XJT (Asia/Urumqi), and use WSST/WSDT for western Samoa. Also, there were DST law changes in Chile, Mexico, the Turks & Caicos Islands (America/Grand_Turk), and Fiji. There is a new zone Pacific/Bougainville for portions of Papua New Guinea. Also, numerous corrections for historical (pre-1970) time zone data.

E.91. Release 9.2.9

Release date: 2014-07-24

This release contains a variety of fixes from 9.2.8. For information about new features in the 9.2 major release, see Section E.100.

E.91.1. Migration to Version 9.2.9

A dump/restore is not required for those running 9.2.X.

However, this release corrects an index corruption problem in some GiST indexes. See the first changelog entry below to find out whether your installation has been affected and what steps you should take if so.

Also, if you are upgrading from a version earlier than 9.2.6, see Section E.94.

E.91.2. Changes

- Correctly initialize padding bytes in contrib/btree_gist indexes on bit columns (Heikki Linnakangas)
This error could result in incorrect query results due to values that should compare equal not being seen as equal. Users with GiST indexes on `bit` or `bit varying` columns should **REINDEX** those indexes after installing this update.

- **Protect against torn pages when deleting GIN list pages** (Heikki Linnakangas)
  This fix prevents possible index corruption if a system crash occurs while the page update is being written to disk.

- **Don’t clear the right-link of a GiST index page while replaying updates from WAL** (Heikki Linnakangas)
  This error could lead to transiently wrong answers from GiST index scans performed in Hot Standby.

- **Fix corner-case infinite loop during insertion into an SP-GiST text index** (Tom Lane)

- **Fix feedback status when hot_standby_feedback is turned off on-the-fly** (Simon Riggs)

- **Fix possibly-incorrect cache invalidation during nested calls to** `ReceiveSharedInvalidMessages` (Andres Freund)

- **Fix planner’s mishandling of nested PlaceHolderVars generated in nested-nestloop plans** (Tom Lane)
  This oversight could result in “variable not found in subplan target lists” errors, or in silently wrong query results.

- **Fix “could not find pathkey item to sort” planner failures with** `UNION ALL` over subqueries reading from tables with inheritance children (David Rowley)
  This oversight could lead to misoptimization of constructs like `WHERE x IN (SELECT y, generate_series(1,10) FROM t GROUP BY y)`.

- **Improve planner to drop constant-NULL inputs of** `AND/OR` **when possible** (Tom Lane)
  This change fixes some cases where the more aggressive parameter substitution done by 9.2 and later can lead to a worse plan than older versions produced.

- **Fix identification of input type category in** `to_json()` **and friends** (Tom Lane)
  This is known to have led to inadequate quoting of `money` fields in the `JSON` result, and there may have been wrong results for other data types as well.

- **Fix failure to detoast fields in composite elements of structured types** (Tom Lane)
  This corrects cases where TOAST pointers could be copied into other tables without being dereferenced. If the original data is later deleted, it would lead to errors like “missing chunk number 0 for toast value ...” when the now-dangling pointer is used.

- **Fix “record type has not been registered” failures with whole-row references to the output of Append plan nodes** (Tom Lane)

- **Fix possible crash when invoking a user-defined function while rewinding a cursor** (Tom Lane)

- **Fix query-lifespan memory leak while evaluating the arguments for a function in** `FROM` **(Tom Lane)**

- **Fix session-lifespan memory leaks in regular-expression processing** (Tom Lane, Arthur O'Dwyer, Greg Stark)

- **Fix data encoding error in** `hungarian.stop` **(Tom Lane)**
Appendix E. Release Notes

- Prevent foreign tables from being created with OIDS when default_with_oids is true (Etsuro Fujita)
- Fix liveness checks for rows that were inserted in the current transaction and then deleted by a now-rolled-back subtransaction (Andres Freund)
  This could cause problems (at least spurious warnings, and at worst an infinite loop) if CREATE_INDEX or CLUSTER were done later in the same transaction.
- Clear pg_stat_activity.xact_start during PREPARE TRANSACTION (Andres Freund)
  After the PREPARE, the originating session is no longer in a transaction, so it should not continue to display a transaction start time.
- Fix REASSIGN OWNED to not fail for text search objects (Álvaro Herrera)
- Block signals during postmaster startup (Tom Lane)
  This ensures that the postmaster will properly clean up after itself if, for example, it receives SIGINT while still starting up.
- Fix client host name lookup when processing pg_hba.conf entries that specify host names instead of IP addresses (Tom Lane)
  Ensure that reverse-DNS lookup failures are reported, instead of just silently not matching such entries. Also ensure that we make only one reverse-DNS lookup attempt per connection, not one per host name entry, which is what previously happened if the lookup attempts failed.
- Allow the root user to use postgres -C variable andpostgres --describe-config (MauMau)
  The prohibition on starting the server as root does not need to extend to these operations, and relaxing it prevents failure of pg_ctl in some scenarios.
- Secure Unix-domain sockets of temporary postmasters started during make check (Noah Misch)
  Any local user able to access the socket file could connect as the server’s bootstrap superuser, then proceed to execute arbitrary code as the operating-system user running the test, as we previously noted in CVE-2014-0067. This change defends against that risk by placing the server’s socket in a temporary, mode 0700 subdirectory of /tmp. The hazard remains however on platforms where Unix sockets are not supported, notably Windows, because then the temporary postmaster must accept local TCP connections.
  A useful side effect of this change is to simplify make check testing in builds that override DEFAULT_PGSOCKET_DIR. Popular non-default values like /var/run/postgresql are often not writable by the build user, requiring workarounds that will no longer be necessary.
- Fix tablespace creation WAL replay to work on Windows (MauMau)
- Fix detection of socket creation failures on Windows (Bruce Momjian)
- On Windows, allow new sessions to absorb values of PGC_BACKEND parameters (such as log_connections) from the configuration file (Amit Kapila)
  Previously, if such a parameter were changed in the file post-startup, the change would have no effect.
- Properly quote executable path names on Windows (Nikhil Deshpande)
  This oversight could cause initdb and pg_upgrade to fail on Windows, if the installation path contained both spaces and @ signs.
- Fix linking of libpython on macOS (Tom Lane)
The method we previously used can fail with the Python library supplied by Xcode 5.0 and later. 

- Avoid buffer bloat in libpq when the server consistently sends data faster than the client can absorb it (Shin-ichi Morita, Tom Lane)

  libpq could be coerced into enlarging its input buffer until it runs out of memory (which would be reported misleadingly as “lost synchronization with server”). Under ordinary circumstances it’s quite far-fetched that data could be continuously transmitted more quickly than the `recv()` loop can absorb it, but this has been observed when the client is artificially slowed by scheduler constraints.

- Ensure that LDAP lookup attempts in libpq time out as intended (Laurenz Albe)

- Fix ecpg to do the right thing when an array of `char *` is the target for a FETCH statement returning more than one row, as well as some other array-handling fixes (Ashutosh Bapat)

- Fix `pg_restore`’s processing of old-style large object comments (Tom Lane)

  A direct-to-database restore from an archive file generated by a pre-9.0 version of `pg_dump` would usually fail if the archive contained more than a few comments for large objects.

- Fix `pg_upgrade` for cases where the new server creates a TOAST table but the old version did not (Bruce Momjian)

  This rare situation would manifest as “relation OID mismatch” errors.

- Prevent `contrib/auto_explain` from changing the output of a user’s `EXPLAIN` (Tom Lane)

  If `auto_explain` is active, it could cause an `EXPLAIN (ANALYZE, TIMING OFF)` command to nonetheless print timing information.

- Fix query-lifespan memory leak in `contrib/dblink` (MauMau, Joe Conway)

- In `contrib/pgcrypto` functions, ensure sensitive information is cleared from stack variables before returning (Marko Kreen)

- Prevent use of already-freed memory in `contrib/pgstattuple’s pgstat_heap()` (Noah Misch)

- In `contrib/uuid-ossp`, cache the state of the OSSP UUID library across calls (Tom Lane)

  This improves the efficiency of UUID generation and reduces the amount of entropy drawn from `/dev/urandom`, on platforms that have that.

- Update time zone data files to `tzdata` release 2014e for DST law changes in Crimea, Egypt, and Morocco.

---

### E.92. Release 9.2.8

**Release date:** 2014-03-20

This release contains a variety of fixes from 9.2.7. For information about new features in the 9.2 major release, see Section E.100.

---

### E.92.1. Migration to Version 9.2.8

A dump/restore is not required for those running 9.2.X.
However, if you are upgrading from a version earlier than 9.2.6, see Section E.94.

### E.92.2. Changes

- **Restore GIN metapages unconditionally to avoid torn-page risk (Heikki Linnakangas)**
  Although this oversight could theoretically result in a corrupted index, it is unlikely to have caused any problems in practice, since the active part of a GIN metapage is smaller than a standard 512-byte disk sector.

- **Avoid race condition in checking transaction commit status during receipt of a NOTIFY message (Marko Tiikkaja)**
  This prevents a scenario wherein a sufficiently fast client might respond to a notification before database updates made by the notifier have become visible to the recipient.

- **Allow regular-expression operators to be terminated early by query cancel requests (Tom Lane)**
  This prevents scenarios wherein a pathological regular expression could lock up a server process uninterruptibly for a long time.

- **Remove incorrect code that tried to allow OVERLAPS with single-element row arguments (Joshua Yanovski)**
  This code never worked correctly, and since the case is neither specified by the SQL standard nor documented, it seemed better to remove it than fix it.

- **Avoid getting more than AccessShareLock when de-parsing a rule or view (Dean Rasheed)**
  This oversight resulted in pg_dump unexpectedly acquiring RowExclusiveLock locks on tables mentioned as the targets of INSERT/UPDATE/DELETE commands in rules. While usually harmless, that could interfere with concurrent transactions that tried to acquire, for example, ShareLock on those tables.

- **Improve performance of index endpoint probes during planning (Tom Lane)**
  This change fixes a significant performance problem that occurred when there were many not-yet-committed rows at the end of the index, which is a common situation for indexes on sequentially-assigned values such as timestamps or sequence-generated identifiers.

- **Fix walsender’s failure to shut down cleanly when client is pg_receivexlog (Fujii Masao)**

- **Check WAL level and hot standby parameters correctly when doing crash recovery that will be followed by archive recovery (Heikki Linnakangas)**

- **Fix test to see if hot standby connections can be allowed immediately after a crash (Heikki Linnakangas)**

- **Prevent interrupts while reporting non-ERROR messages (Tom Lane)**
  This guards against rare server-process freezeups due to recursive entry to syslog(), and perhaps other related problems.

- **Fix memory leak in PL/Perl when returning a composite result, including multiple-OUT-parameter cases (Alex Hunsaker)**

- **Fix tracking of psql script line numbers during \copy from out-of-line data (Kumar Rajeev Rastogi, Amit Khandekar)**
incremented the script file line number for each data line, even if the data was not coming from the script file. This mistake resulted in wrong line numbers being reported for any errors occurring later in the same script file.

- Prevent intermittent “could not reserve shared memory region” failures on recent Windows versions (MauMau)
- Update time zone data files to tzdata release 2014a for DST law changes in Fiji and Turkey, plus historical changes in Israel and Ukraine.

E.93. Release 9.2.7

Release date: 2014-02-20

This release contains a variety of fixes from 9.2.6. For information about new features in the 9.2 major release, see Section E.100.

E.93.1. Migration to Version 9.2.7

A dump/restore is not required for those running 9.2.X.

However, if you are upgrading from a version earlier than 9.2.6, see Section E.94.

E.93.2. Changes

- Shore up GRANT ... WITH ADMIN OPTION restrictions (Noah Misch)
  Granting a role without ADMIN OPTION is supposed to prevent the grantee from adding or removing members from the granted role, but this restriction was easily bypassed by doing SET ROLE first. The security impact is mostly that a role member can revoke the access of others, contrary to the wishes of his grantor. Unapproved role member additions are a lesser concern, since an uncooperative role member could provide most of his rights to others anyway by creating views or SECURITY DEFINER functions. (CVE-2014-0060)

- Prevent privilege escalation via manual calls to PL validator functions (Andres Freund)
  The primary role of PL validator functions is to be called implicitly during CREATE FUNCTION, but they are also normal SQL functions that a user can call explicitly. Calling a validator on a function actually written in some other language was not checked for and could be exploited for privilege-escalation purposes. The fix involves adding a call to a privilege-checking function in each validator function. Non-core procedural languages will also need to make this change to their own validator functions, if any. (CVE-2014-0061)

- Avoid multiple name lookups during table and index DDL (Robert Haas, Andres Freund)
  If the name lookups come to different conclusions due to concurrent activity, we might perform some parts of the DDL on a different table than other parts. At least in the case of CREATE INDEX, this can be
used to cause the permissions checks to be performed against a different table than the index creation, allowing for a privilege escalation attack. (CVE-2014-0062)

- Prevent buffer overrun with long datetime strings (Noah Misch)

  The `MAXDATELEN` constant was too small for the longest possible value of type `interval`, allowing a buffer overrun in `interval_out()`. Although the datetime input functions were more careful about avoiding buffer overrun, the limit was short enough to cause them to reject some valid inputs, such as input containing a very long timezone name. The ecpg library contained these vulnerabilities along with some of its own. (CVE-2014-0063)

- Prevent buffer overrun due to integer overflow in size calculations (Noah Misch, Heikki Linnakangas)

  Several functions, mostly type input functions, calculated an allocation size without checking for overflow. If overflow did occur, a too-small buffer would be allocated and then written past. (CVE-2014-0064)

- Prevent overruns of fixed-size buffers (Peter Eisentraut, Jozef Mlich)

  Use `strlcpy()` and related functions to provide a clear guarantee that fixed-size buffers are not overrun. Unlike the preceding items, it is unclear whether these cases really represent live issues, since in most cases there appear to be previous constraints on the size of the input string. Nonetheless it seems prudent to silence all Coverity warnings of this type. (CVE-2014-0065)

- Avoid crashing if `crypt()` returns NULL (Honza Horak, Bruce Momjian)

  There are relatively few scenarios in which `crypt()` could return NULL, but `contrib/chkpass` would crash if it did. One practical case in which this could be an issue is if libc is configured to refuse to execute unapproved hashing algorithms (e.g., “FIPS mode”). (CVE-2014-0066)

- Document risks of `make check` in the regression testing instructions (Noah Misch, Tom Lane)

  Since the temporary server started by `make check` uses “trust” authentication, another user on the same machine could connect to it as database superuser, and then potentially exploit the privileges of the operating-system user who started the tests. A future release will probably incorporate changes in the testing procedure to prevent this risk, but some public discussion is needed first. So for the moment, just warn people against using `make check` when there are untrusted users on the same machine. (CVE-2014-0067)

- Fix possible mis-replay of WAL records when some segments of a relation aren’t full size (Greg Stark, Tom Lane)

  The WAL update could be applied to the wrong page, potentially many pages past where it should have been. Aside from corrupting data, this error has been observed to result in significant “bloat” of standby servers compared to their masters, due to updates being applied far beyond where the end-of-file should have been. This failure mode does not appear to be a significant risk during crash recovery, only when initially synchronizing a standby created from a base backup taken from a quickly-changing master.

- Fix bug in determining when recovery has reached consistency (Tomonari Katsumata, Heikki Linnakangas)

  In some cases WAL replay would mistakenly conclude that the database was already consistent at the start of replay, thus possibly allowing hot-standby queries before the database was really consistent. Other symptoms such as “PANIC: WAL contains references to invalid pages” were also possible.

- Fix improper locking of btree index pages while replaying a `VACUUM` operation in hot-standby mode (Andres Freund, Heikki Linnakangas, Tom Lane)
Appendix E. Release Notes

This error could result in “PANIC: WAL contains references to invalid pages” failures.

• Ensure that insertions into non-leaf GIN index pages write a full-page WAL record when appropriate (Heikki Linnakangas)

The previous coding risked index corruption in the event of a partial-page write during a system crash.

• When pause_at_recovery_target and recovery_target_inclusive are both set, ensure the target record is applied before pausing, not after (Heikki Linnakangas)

• Fix race conditions during server process exit (Robert Haas)
  Ensure that signal handlers don’t attempt to use the process’s MyProc pointer after it’s no longer valid.

• Fix race conditions in walsender shutdown logic and walreceiver SIGHUP signal handler (Tom Lane)

• Fix unsafe references to errno within error reporting logic (Christian Kruse)
  This would typically lead to odd behaviors such as missing or inappropriate HINT fields.

• Fix possible crashes from using ereport() too early during server startup (Tom Lane)
  The principal case we’ve seen in the field is a crash if the server is started in a directory it doesn’t have permission to read.

• Clear retry flags properly in OpenSSL socket write function (Alexander Kukushkin)
  This omission could result in a server lockup after unexpected loss of an SSL-encrypted connection.

• Fix length checking for Unicode identifiers (U&”...” syntax) containing escapes (Tom Lane)
  A spurious truncation warning would be printed for such identifiers if the escaped form of the identifier was too long, but the identifier actually didn’t need truncation after de-escaping.

• Allow keywords that are type names to be used in lists of roles (Stephen Frost)
  A previous patch allowed such keywords to be used without quoting in places such as role identifiers; but it missed cases where a list of role identifiers was permitted, such as DROP ROLE.

• Fix parser crash for EXISTS(SELECT * FROM zero_column_table) (Tom Lane)

• Fix possible crash due to invalid plan for nested sub-selects, such as WHERE (... x IN (SELECT ...) ...) IN (SELECT ...) (Tom Lane)

• Fix UPDATE/DELETE of an inherited target table that has UNION ALL subqueries (Tom Lane)
  Without this fix, UNION ALL subqueries aren’t correctly inserted into the update plans for inheritance child tables after the first one, typically resulting in no update happening for those child table(s).

• Ensure that ANALYZE creates statistics for a table column even when all the values in it are “too wide” (Tom Lane)
  ANALYZE intentionally omits very wide values from its histogram and most-common-values calculations, but it neglected to do something sane in the case that all the sampled entries are too wide.

• In ALTER TABLE ... SET TABLESPACE, allow the database’s default tablespace to be used without a permissions check (Stephen Frost)
  CREATE TABLE has always allowed such usage, but ALTER TABLE didn’t get the memo.

• Fix “cannot accept a set” error when some arms of a CASE return a set and others don’t (Tom Lane)

• Properly distinguish numbers from non-numbers when generating JSON output (Andrew Dunstan)
• Fix checks for all-zero client addresses in pgstat functions (Kevin Grittner)
• Fix possible misclassification of multibyte characters by the text search parser (Tom Lane)
  Non-ASCII characters could be misclassified when using C locale with a multibyte encoding. On Cygwin, non-C locales could fail as well.
• Fix possible misbehavior in plainto_tsquery() (Heikki Linnakangas)
  Use memmove() not memcpy() for copying overlapping memory regions. There have been no field reports of this actually causing trouble, but it’s certainly risky.
• Fix placement of permissions checks in pg_start_backup() and pg_stop_backup() (Andres Freund, Magnus Hagander)
  The previous coding might attempt to do catalog access when it shouldn’t.
• Accept SHIFT_JIS as an encoding name for locale checking purposes (Tatsuo Ishii)
• Fix *-qualification of named parameters in SQL-language functions (Tom Lane)
  Given a composite-type parameter named foo, $1.* worked fine, but foo.* not so much.
• Fix misbehavior of PQhost() on Windows (Fujii Masao)
  It should return localhost if no host has been specified.
• Improve error handling in libpq and psql for failures during COPY TO STDOUT/FROM STDIN (Tom Lane)
  In particular this fixes an infinite loop that could occur in 9.2 and up if the server connection was lost during COPY FROM STDIN. Variants of that scenario might be possible in older versions, or with other client applications.
• Fix incorrect translation handling in some psql \d commands (Peter Eisentraut, Tom Lane)
• Ensure pg_basebackup’s background process is killed when exiting its foreground process (Magnus Hagander)
• Fix possible incorrect printing of filenames in pg_basebackup’s verbose mode (Magnus Hagander)
• Avoid including tablespaces inside PGDATA twice in base backups (Dimitri Fontaine, Magnus Hagander)
• Fix misaligned descriptors in ecpg (MauMau)
• In ecpg, handle lack of a hostname in the connection parameters properly (Michael Meskes)
• Fix performance regression in contrib/dblink connection startup (Joe Conway)
  Avoid an unnecessary round trip when client and server encodings match.
• In contrib/isn, fix incorrect calculation of the check digit for ISMN values (Fabien Coelho)
• Fix contrib/pg_stat_statement’s handling of CURRENT_DATE and related constructs (Kyotaro Horiguchi)
• Ensure client-code-only installation procedure works as documented (Peter Eisentraut)
• In Mingw and Cygwin builds, install the libpq DLL in the bin directory (Andrew Dunstan)
  This duplicates what the MSVC build has long done. It should fix problems with programs like psql failing to start because they can’t find the DLL.
Appendix E. Release Notes

- Avoid using the deprecated dllwrap tool in Cygwin builds (Marco Atzeri)
- Don’t generate plain-text HISTORY and src/test/regress/README files anymore (Tom Lane)
  These text files duplicated the main HTML and PDF documentation formats. The trouble involved in maintaining them greatly outweighs the likely audience for plain-text format. Distribution tarballs will still contain files by these names, but they’ll just be stubs directing the reader to consult the main documentation. The plain-text INSTALL file will still be maintained, as there is arguably a use-case for that.
- Update time zone data files to tzdata release 2013i for DST law changes in Jordan and historical changes in Cuba.
  In addition, the zones Asia/Riyadh87, Asia/Riyadh88, and Asia/Riyadh89 have been removed, as they are no longer maintained by IANA, and never represented actual civil timekeeping practice.

E.94. Release 9.2.6

Release date: 2013-12-05

This release contains a variety of fixes from 9.2.5. For information about new features in the 9.2 major release, see Section E.100.

E.94.1. Migration to Version 9.2.6

A dump/restore is not required for those running 9.2.X.

However, this release corrects a number of potential data corruption issues. See the first two changelog entries below to find out whether your installation has been affected and what steps you can take if so.

Also, if you are upgrading from a version earlier than 9.2.4, see Section E.96.

E.94.2. Changes

- Fix VACUUM’s tests to see whether it can update relfrozenxid (Andres Freund)
  In some cases VACUUM (either manual or autovacuum) could incorrectly advance a table’s relfrozenxid value, allowing tuples to escape freezing, causing those rows to become invisible once $2^{31}$ transactions have elapsed. The probability of data loss is fairly low since multiple incorrect advancements would need to happen before actual loss occurs, but it’s not zero. In 9.2.0 and later, the probability of loss is higher, and it’s also possible to get “could not access status of transaction” errors as a consequence of this bug. Users upgrading from releases 9.0.4 or 8.4.8 or earlier are not affected, but all later versions contain the bug.

  The issue can be ameliorated by, after upgrading, vacuuming all tables in all databases while having vacuum_freeze_table_age set to zero. This will fix any latent corruption but will not be able to fix all pre-existing data errors. However, an installation can be presumed safe after performing this
Appendix E. Release Notes

vacuuming if it has executed fewer than $2^{31}$ update transactions in its lifetime (check this with `SELECT txid_current() < 2^{31}`).

- **Fix initialization of pg_clog and pg_subtrans during hot standby startup** (Andres Freund, Heikki Linnakangas)

  This bug can cause data loss on standby servers at the moment they start to accept hot-standby queries, by marking committed transactions as uncommitted. The likelihood of such corruption is small unless, at the time of standby startup, the primary server has executed many updating transactions since its last checkpoint. Symptoms include missing rows, rows that should have been deleted being still visible, and obsolete versions of updated rows being still visible alongside their newer versions.

  This bug was introduced in versions 9.3.0, 9.2.5, 9.1.10, and 9.0.14. Standby servers that have only been running earlier releases are not at risk. It's recommended that standby servers that have ever run any of the buggy releases be re-cloned from the primary (e.g., with a new base backup) after upgrading.

- **Fix dangling-pointer problem in fast-path locking** (Tom Lane)

  This could lead to corruption of the lock data structures in shared memory, causing “lock already held” and other odd errors.

- **Truncate pg_multixact contents during WAL replay** (Andres Freund)

  This avoids ever-increasing disk space consumption in standby servers.

- **Ensure an anti-wraparound VACUUM counts a page as scanned when it’s only verified that no tuples need freezing** (Sergey Burladyan, Jeff Janes)

  This bug could result in failing to advance `refrozenxid`, so that the table would still be thought to need another anti-wraparound vacuum. In the worst case the database might even shut down to prevent wraparound.

- **Fix race condition in GIN index posting tree page deletion** (Heikki Linnakangas)

  This could lead to transient wrong answers or query failures.

- **Fix “unexpected spgdoinst() failure” error during SP-GiST index creation** (Teodor Sigaev)

- **Avoid flattening a subquery whose SELECT list contains a volatile function wrapped inside a sub-SELECT** (Tom Lane)

  This avoids unexpected results due to extra evaluations of the volatile function.

- **Fix planner’s processing of non-simple-variable subquery outputs nested within outer joins** (Tom Lane)

  This error could lead to incorrect plans for queries involving multiple levels of subqueries within `JOIN` syntax.

- **Fix incorrect planning in cases where the same non-strict expression appears in multiple WHERE and outer JOIN equality clauses** (Tom Lane)

- **Fix planner crash with whole-row reference to a subquery** (Tom Lane)

- **Fix incorrect generation of optimized MIN()/MAX() plans for inheritance trees** (Tom Lane)

  The planner could fail in cases where the MIN()/MAX() argument was an expression rather than a simple variable.

- **Fix premature deletion of temporary files** (Andres Freund)

- **Prevent intra-transaction memory leak when printing range values** (Tom Lane)
This fix actually cures transient memory leaks in any datatype output function, but range types are the only ones known to have had a significant problem.

- Prevent incorrect display of dropped columns in NOT NULL and CHECK constraint violation messages (Michael Paquier and Tom Lane)
- Allow default arguments and named-argument notation for window functions (Tom Lane)
  Previously, these cases were likely to crash.
- Fix possible read past end of memory in rule printing (Peter Eisentraut)
- Fix array slicing of int2vector and oidvector values (Tom Lane)
  Expressions of this kind are now implicitly promoted to regular int2 or oid arrays.
- Fix incorrect behaviors when using a SQL-standard, simple GMT offset timezone (Tom Lane)
  In some cases, the system would use the simple GMT offset value when it should have used the regular timezone setting that had prevailed before the simple offset was selected. This change also causes the timeofday function to honor the simple GMT offset zone.
- Prevent possible misbehavior when logging translations of Windows error codes (Tom Lane)
- Properly quote generated command lines in pg_ctl (Naoya Anzai and Tom Lane)
  This fix applies only to Windows.
- Fix `pg_dumpall` to work when a source database sets `default_transaction_read_only` via `ALTER DATABASE SET` (Kevin Grittner)
  Previously, the generated script would fail during restore.
- Make ecpg search for quoted cursor names case-sensitively (Zoltán Böszörményi)
- Fix ecpg’s processing of lists of variables declared `varchar` (Zoltán Böszörményi)
- Make contrib/lo defend against incorrect trigger definitions (Marc Cousin)
- Update time zone data files to `tzdata` release 2013h for DST law changes in Argentina, Brazil, Jordan, Libya, Liechtenstein, Morocco, and Palestine. Also, new timezone abbreviations WIB, WIT, WITA for Indonesia.

**E.95. Release 9.2.5**

**Release date:** 2013-10-10

This release contains a variety of fixes from 9.2.4. For information about new features in the 9.2 major release, see Section E.100.

**E.95.1. Migration to Version 9.2.5**

A dump/restore is not required for those running 9.2.X.

However, if you are upgrading from a version earlier than 9.2.4, see Section E.96.
Appendix E. Release Notes

E.95.2. Changes

- Prevent corruption of multi-byte characters when attempting to case-fold identifiers (Andrew Dunstan)
- PostgreSQL case-folds non-ASCII characters only when using a single-byte server encoding.
- Fix memory leak when creating B-tree indexes on range columns (Heikki Linnakangas)
- Fix checkpoint memory leak in background writer when \texttt{wal\_level = hot\_standby} (Naoya Anzai)
- Fix memory leak caused by \texttt{lo\_open()} failure (Heikki Linnakangas)
- Fix memory overcommit bug when \texttt{work\_mem} is using more than 24GB of memory (Stephen Frost)
- Serializable snapshot fixes (Kevin Grittner, Heikki Linnakangas)
- Fix deadlock bug in \texttt{libpq} when using SSL (Stephen Frost)
- Fix possible SSL state corruption in threaded \texttt{libpq} applications (Nick Phillips, Stephen Frost)
- Improve estimate of planner cost when choosing between generic and custom plans (Tom Lane)
  This change will favor generic plans when planning cost is high.
- Properly compute row estimates for boolean columns containing many NULL values (Andrew Gierth)
  Previously tests like \texttt{col IS NOT TRUE} and \texttt{col IS NOT FALSE} did not properly factor in NULL values when estimating plan costs.
- Fix accounting for qualifier evaluation costs in \texttt{UNION ALL} and inheritance queries (Tom Lane)
  This fixes cases where suboptimal query plans could be chosen if some \texttt{WHERE} clauses are expensive to calculate.
- Prevent pushing down \texttt{WHERE} clauses into unsafe \texttt{UNION/INTERSECT} subqueries (Tom Lane)
  Subqueries of a \texttt{UNION} or \texttt{INTERSECT} that contain set-returning functions or volatile functions in their \texttt{SELECT} lists could be improperly optimized, leading to run-time errors or incorrect query results.
- Fix rare case of “failed to locate grouping columns” planner failure (Tom Lane)
- Fix \texttt{pg\_dump} of foreign tables with dropped columns (Andrew Dunstan)
  Previously such cases could cause a \texttt{pg\_upgrade} error.
- Reorder \texttt{pg\_dump} processing of extension-related rules and event triggers (Joe Conway)
- Force dumping of extension tables if specified by \texttt{pg\_dump -t} or \texttt{-n} (Joe Conway)
- Improve view dumping code’s handling of dropped columns in referenced tables (Tom Lane)
- Fix \texttt{pg\_restore -l} with the directory archive to display the correct format name (Fujii Masao)
- Properly record index comments created using \texttt{UNIQUE} and \texttt{PRIMARY KEY} syntax (Andres Freund)
  This fixes a parallel \texttt{pg\_restore} failure.
- Cause \texttt{pg\_basebackup -x} with an empty \texttt{xlog} directory to throw an error rather than crashing (Magnus Hagander, Haruka Takatsuka)
- Properly guarantee transmission of WAL files before clean switchover (Fujii Masao)
  Previously, the streaming replication connection might close before all WAL files had been replayed on the standby.
• Fix WAL segment timeline handling during recovery (Mitsumasa Kondo, Heikki Linnakangas)
  WAL file recycling during standby recovery could lead to premature recovery completion, resulting in data loss.
• Prevent errors in WAL replay due to references to uninitialized empty pages (Andres Freund)
• Fix `REINDEX TABLE` and `REINDEX DATABASE` to properly revalidate constraints and mark invalidated indexes as valid (Noah Misch)
  `REINDEX INDEX` has always worked properly.
• Avoid deadlocks during insertion into SP-GiST indexes (Teodor Sigaev)
• Fix possible deadlock during concurrent `CREATE INDEX CONCURRENTLY` operations (Tom Lane)
• Fix GiST index lookup crash (Tom Lane)
• Fix `regexp_matches()` handling of zero-length matches (Jeevan Chalke)
  Previously, zero-length matches like '^' could return too many matches.
• Fix crash for overly-complex regular expressions (Heikki Linnakangas)
• Fix regular expression match failures for back references combined with non-greedy quantifiers (Jeevan Chalke)
• Prevent `CREATE FUNCTION` from checking `SET` variables unless function body checking is enabled (Tom Lane)
• Allow `ALTER DEFAULT PRIVILEGES` to operate on schemas without requiring `CREATE` permission (Tom Lane)
• Loosen restriction on keywords used in queries (Tom Lane)
  Specifically, lessen keyword restrictions for role names, language names, `EXPLAIN` and `COPY` options, and `SET` values. This allows `COPY ... (FORMAT BINARY)` to work as expected; previously `BINARY` needed to be quoted.
• Print proper line number during `COPY` failure (Heikki Linnakangas)
• Fix `pgp_pub_decrypt()` so it works for secret keys with passwords (Marko Kreen)
• Make `pg_upgrade` use `pg_dump --quote-all-identifiers` to avoid problems with keyword changes between releases (Tom Lane)
• Remove rare inaccurate warning during vacuum of index-less tables (Heikki Linnakangas)
• Ensure that `VACUUM ANALYZE` still runs the `ANALYZE` phase if its attempt to truncate the file is cancelled due to lock conflicts (Kevin Grittner)
• Avoid possible failure when performing transaction control commands (e.g. `ROLLBACK`) in prepared queries (Tom Lane)
• Ensure that floating-point data input accepts standard spellings of “infinity” on all platforms (Tom Lane)
  The C99 standard says that allowable spellings are `inf`, `+inf`, `-inf`, `infinity`, `+infinity`, and `-infinity`. Make sure we recognize these even if the platform’s `strtod` function doesn’t.
• Avoid unnecessary reporting when `track_activities` is off (Tom Lane)
• Expand ability to compare rows to records and arrays (Rafal Rzepecki, Tom Lane)
• Prevent crash when `psql`’s `PSQLRC` variable contains a tilde (Bruce Momjian)
Appendix E. Release Notes

• Add spinlock support for ARM64 (Mark Salter)

• Update time zone data files to tzdata release 2013d for DST law changes in Israel, Morocco, Palestine, and Paraguay. Also, historical zone data corrections for Macquarie Island.

E.96. Release 9.2.4

Release date: 2013-04-04

This release contains a variety of fixes from 9.2.3. For information about new features in the 9.2 major release, see Section E.100.

E.96.1. Migration to Version 9.2.4

A dump/restore is not required for those running 9.2.X.

However, this release corrects several errors in management of GiST indexes. After installing this update, it is advisable to REINDEX any GiST indexes that meet one or more of the conditions described below.

Also, if you are upgrading from a version earlier than 9.2.2, see Section E.98.

E.96.2. Changes

• Fix insecure parsing of server command-line switches (Mitsumasa Kondo, Kyotaro Horiguchi)

  A connection request containing a database name that begins with “-” could be crafted to damage or destroy files within the server’s data directory, even if the request is eventually rejected. (CVE-2013-1899)

• Reset OpenSSL randomness state in each postmaster child process (Marko Kreen)

  This avoids a scenario wherein random numbers generated by contrib/pgcrypto functions might be relatively easy for another database user to guess. The risk is only significant when the postmaster is configured with ssl = on but most connections don’t use SSL encryption. (CVE-2013-1900)

• Make REPLICATION privilege checks test current user not authenticated user (Noah Misch)

  An unprivileged database user could exploit this mistake to call pg_start_backup() or pg_stop_backup(), thus possibly interfering with creation of routine backups. (CVE-2013-1901)

• Fix GiST indexes to not use “fuzzy” geometric comparisons when it’s not appropriate to do so (Alexander Korotkov)

  The core geometric types perform comparisons using “fuzzy” equality, but gist_box_same must do exact comparisons, else GiST indexes using it might become inconsistent. After installing this update, users should REINDEX any GiST indexes on box, polygon, circle, or point columns, since all of these use gist_box_same.

• Fix erroneous range-union and penalty logic in GiST indexes that use contrib/btree_gist for variable-width data types, that is text, bytea, bit, and numeric columns (Tom Lane)
These errors could result in inconsistent indexes in which some keys that are present would not be found by searches, and also in useless index bloat. Users are advised to **REINDEX** such indexes after installing this update.

- **Fix bugs in GiST page splitting code for multi-column indexes (Tom Lane)**
  These errors could result in inconsistent indexes in which some keys that are present would not be found by searches, and also in indexes that are unnecessarily inefficient to search. Users are advised to **REINDEX** multi-column GiST indexes after installing this update.

- **Fix **gist_point_consistent** to handle fuzziness consistently (Alexander Korotkov)**
  Index scans on GiST indexes on point columns would sometimes yield results different from a sequential scan, because **gist_point_consistent** disagreed with the underlying operator code about whether to do comparisons exactly or fuzzily.

- **Fix buffer leak in WAL replay (Heikki Linnakangas)**
  This bug could result in “incorrect local pin count” errors during replay, making recovery impossible.

- **Ensure we do crash recovery before entering archive recovery, if the database was not stopped cleanly and a recovery.conf file is present (Heikki Linnakangas, Kyotaro Horiguchi, Mitsumasa Kondo)**
  This is needed to ensure that the database is consistent in certain scenarios, such as initializing a standby server with a filesystem snapshot from a running server.

- **Avoid deleting not-yet-archived WAL files during crash recovery (Heikki Linnakangas, Fujii Masao)**

- **Fix race condition in **DELETE RETURNING** (Tom Lane)**
  Under the right circumstances, **DELETE RETURNING** could attempt to fetch data from a shared buffer that the current process no longer has any pin on. If some other process changed the buffer meanwhile, this would lead to garbage **RETURNING** output, or even a crash.

- **Fix infinite-loop risk in regular expression compilation (Tom Lane, Don Porter)**

- **Fix potential null-pointer dereference in regular expression compilation (Tom Lane)**

- **Fix **to_char()** to use ASCII-only case-folding rules where appropriate (Tom Lane)**
  This fixes misbehavior of some template patterns that should be locale-independent, but mishandled “i” and “ı” in Turkish locales.

- **Fix unwanted rejection of timestamp 1999-12-31 24:00:00 (Tom Lane)**

- **Fix SQL-language functions to be safely usable as support functions for range types (Tom Lane)**

- **Fix logic error when a single transaction does **UNLISTEN** then **LISTEN** (Tom Lane)**
  The session wound up not listening for notify events at all, though it surely should listen in this case.

- **Fix possible planner crash after columns have been added to a view that’s depended on by another view (Tom Lane)**

- **Fix performance issue in **EXPLAIN (ANALYZE, TIMING OFF)** (Pavel Stehule)**

- **Remove useless “picksplit doesn’t support secondary split” log messages (Josh Hansen, Tom Lane)**
  This message seems to have been added in expectation of code that was never written, and probably never will be, since GiST’s default handling of secondary splits is actually pretty good. So stop nagging end users about it.

- **Remove vestigial secondary-split support in **gist_box_picksplit()** (Tom Lane)**
Not only was this implementation of secondary-split not better than the default implementation, it’s actually worse. So remove it and let the default code path handle the case.

- Fix possible failure to send a session’s last few transaction commit/abort counts to the statistics collector (Tom Lane)
- Eliminate memory leaks in PL/Perl’s `spi_prepare()` function (Alex Hunsaker, Tom Lane)
- Fix `pg_dumpall` to handle database names containing “=” correctly (Heikki Linnakangas)
- Avoid crash in `pg_dump` when an incorrect connection string is given (Heikki Linnakangas)
- Ignore invalid indexes in `pg_dump` and `pg_upgrade` (Michael Paquier, Bruce Momjian)
  
  Dumping invalid indexes can cause problems at restore time, for example if the reason the index creation failed was because it tried to enforce a uniqueness condition not satisfied by the table’s data. Also, if the index creation is in fact still in progress, it seems reasonable to consider it to be an uncommitted DDL change, which `pg_dump` wouldn’t be expected to dump anyway. `pg_upgrade` now also skips invalid indexes rather than failing.

- In `pg_basebackup`, include only the current server version’s subdirectory when backing up a tablespace (Heikki Linnakangas)
- Add a server version check in `pg_basebackup` and `pg_receivexlog`, so they fail cleanly with version combinations that won’t work (Heikki Linnakangas)
- Fix `contrib/dblink` to handle inconsistent settings of `DateStyle` or `IntervalStyle` safely (Daniel Farina, Tom Lane)
  
  Previously, if the remote server had different settings of these parameters, ambiguous dates might be read incorrectly. This fix ensures that datetime and interval columns fetched by a `dblink` query will be interpreted correctly. Note however that inconsistent settings are still risky, since literal values appearing in SQL commands sent to the remote server might be interpreted differently than they would be locally.

- Fix `contrib/pg_trgm`’s `similarity()` function to return zero for trigram-less strings (Tom Lane)
  
  Previously it returned `NaN` due to internal division by zero.

- Enable building PostgreSQL with Microsoft Visual Studio 2012 (Brar Piening, Noah Misch)

- Update time zone data files to tzdata release 2013b for DST law changes in Chile, Haiti, Morocco, Paraguay, and some Russian areas. Also, historical zone data corrections for numerous places.
  
  Also, update the time zone abbreviation files for recent changes in Russia and elsewhere: CHOT, GET, IRKT, KGT, KRAT, MAGT, MAWT, MSK, NOVT, OMST, TKT, VLAT, WST, YAKT, YEKT now follow their current meanings, and VOLT (Europe/Volgograd) and MIST (Antarctica/Macquarie) are added to the default abbreviations list.

E.97. Release 9.2.3

Release date: 2013-02-07

This release contains a variety of fixes from 9.2.2. For information about new features in the 9.2 major release, see Section E.100.
E.97.1. Migration to Version 9.2.3

A dump/restore is not required for those running 9.2.X.

However, if you are upgrading from a version earlier than 9.2.2, see Section E.98.

E.97.2. Changes

- Prevent execution of `enum_recv` from SQL (Tom Lane)
  The function was misdeclared, allowing a simple SQL command to crash the server. In principle an attacker might be able to use it to examine the contents of server memory. Our thanks to Sumit Soni (via Secunia SVCRP) for reporting this issue. (CVE-2013-0255)
- Fix multiple problems in detection of when a consistent database state has been reached during WAL replay (Fujii Masao, Heikki Linnakangas, Simon Riggs, Andres Freund)
- Fix detection of end-of-backup point when no actual redo work is required (Heikki Linnakangas)
  This mistake could result in incorrect “WAL ends before end of online backup” errors.
- Update minimum recovery point when truncating a relation file (Heikki Linnakangas)
- Fix recycling of WAL segments after changing recovery target timeline (Heikki Linnakangas)
- Properly restore timeline history files from archive on cascading standby servers (Heikki Linnakangas)
- Fix lock conflict detection on hot-standby servers (Andres Freund, Robert Haas)
- Fix missing cancellations in hot standby mode (Noah Misch, Simon Riggs)
  The need to cancel conflicting hot-standby queries would sometimes be missed, allowing those queries to see inconsistent data.
- Prevent recovery pause feature from pausing before users can connect (Tom Lane)
- Fix SQL grammar to allow subscripting or field selection from a sub-SELECT result (Tom Lane)
- Fix performance problems with autovacuum truncation in busy workloads (Jan Wieck)
  Truncation of empty pages at the end of a table requires exclusive lock, but autovacuum was coded to fail (and release the table lock) when there are conflicting lock requests. Under load, it is easily possible that truncation would never occur, resulting in table bloat. Fix by performing a partial truncation, releasing the lock, then attempting to re-acquire the lock and continue. This fix also greatly reduces the average time before autovacuum releases the lock after a conflicting request arrives.
- Improve performance of `SPI_execute` and related functions, thereby improving PL/pgSQL’s `EXECUTE` (Heikki Linnakangas, Tom Lane)
  Remove some data-copying overhead that was added in 9.2 as a consequence of revisions in the plan caching mechanism. This eliminates a performance regression compared to 9.1, and also saves memory, especially when the query string to be executed contains many SQL statements.
  A side benefit is that multi-statement query strings are now processed fully serially, that is we complete execution of earlier statements before running parse analysis and planning on the following ones. This
eliminates a long-standing issue, in that DDL that should affect the behavior of a later statement will now behave as expected.

- Restore pre-9.2 cost estimates for index usage (Tom Lane)
  An ill-considered change of a fudge factor led to undesirably high cost estimates for use of very large indexes.

- Fix intermittent crash in DROP INDEX CONCURRENTLY (Tom Lane)

- Fix potential corruption of shared-memory lock table during CREATE/DROP INDEX CONCURRENTLY (Tom Lane)

- Fix COPY’s multiple-tuple-insertion code for the case of a tuple larger than page size minus fillfactor (Heikki Linnakangas)
  The previous coding could get into an infinite loop.

- Protect against race conditions when scanning pg_tablespace (Stephen Frost, Tom Lane)
  CREATE DATABASE and DROP DATABASE could misbehave if there were concurrent updates of pg_tablespace entries.

- Prevent DROP OWNED from trying to drop whole databases or tablespaces (Álvaro Herrera)
  For safety, ownership of these objects must be reassigned, not dropped.

- Fix error in vacuum_freeze_table_age implementation (Andres Freund)
  In installations that have existed for more than vacuum_freeze_min_age transactions, this mistake prevented autovacuum from using partial-table scans, so that a full-table scan would always happen instead.

- Prevent misbehavior when a RowExpr or XmlExpr is parse-analyzed twice (Andres Freund, Tom Lane)
  This mistake could be user-visible in contexts such as CREATE TABLE LIKE INCLUDING INDEXES.

- Improve defenses against integer overflow in hashtable sizing calculations (Jeff Davis)

- Fix some bugs associated with privileges on datatypes (Tom Lane)
  There were some issues with default privileges for types, and pg_dump failed to dump such privileges at all.

- Fix failure to ignore leftover temporary tables after a server crash (Tom Lane)

- Fix failure to rotate postmaster log files for size reasons on Windows (Jeff Janes, Heikki Linnakangas)

- Reject out-of-range dates in to_date() (Hitoshi Harada)

- Fix pg_extension_config_dump() to handle extension-update cases properly (Tom Lane)
  This function will now replace any existing entry for the target table, making it usable in extension update scripts.

- Fix PL/pgSQL’s reporting of plan-time errors in possibly-simple expressions (Tom Lane)
  The previous coding resulted in sometimes omitting the first line in the CONTEXT traceback for the error.

- Fix PL/Python’s handling of functions used as triggers on multiple tables (Andres Freund)

- Ensure that non-ASCII prompt strings are translated to the correct code page on Windows (Alexander Law, Noah Misch)
This bug affected psql and some other client programs.

- Fix possible crash in psql’s `\?` command when not connected to a database (Meng Qingzhong)
- Fix possible error if a relation file is removed while pg_basebackup is running (Heikki Linnakangas)
- Tolerate timeline switches while `pg_basebackup -X` fetch is backing up a standby server (Heikki Linnakangas)
- Make pg_dump exclude data of unlogged tables when running on a hot-standby server (Magnus Hagander)
  This would fail anyway because the data is not available on the standby server, so it seems most convenient to assume `--no-unlogged-table-data` automatically.
- Fix pg_upgrade to deal with invalid indexes safely (Bruce Momjian)
- Fix pg_upgrade’s `-O/-o` options (Marti Raudsepp)
- Fix one-byte buffer overrun in libpq’s `PQprintTuples` (Xi Wang)
  This ancient function is not used anywhere by PostgreSQL itself, but it might still be used by some client code.
- Make ecpglib use translated messages properly (Chen Huajun)
- Properly install ecpg_compatible and pgtypes libraries on MSVC (Jiang Guiqing)
- Include our version of `isinf()` in libecpg if it’s not provided by the system (Jiang Guiqing)
- Rearrange configure’s tests for supplied functions so it is not fooled by bogus exports from `libedit/libreadline` (Christoph Berg)
- Ensure Windows build number increases over time (Magnus Hagander)
- Make pgxs build executables with the right `.exe` suffix when cross-compiling for Windows (Zoltan Boszormenyi)
- Add new timezone abbreviation `FET` (Tom Lane)
  This is now used in some eastern-European time zones.

### E.98. Release 9.2.2

**Release date:** 2012-12-06

This release contains a variety of fixes from 9.2.1. For information about new features in the 9.2 major release, see Section E.100.

#### E.98.1. Migration to Version 9.2.2

A dump/restore is not required for those running 9.2.X.

However, you may need to perform `REINDEX` operations to correct problems in concurrently-built indexes, as described in the first changelog item below.

Also, if you are upgrading from version 9.2.0, see Section E.99.
E.98.2. Changes

- Fix multiple bugs associated with `CREATE/DROP INDEX CONCURRENTLY` (Andres Freund, Tom Lane, Simon Riggs, Pavan Deolasee)

  An error introduced while adding DROP INDEX CONCURRENTLY allowed incorrect indexing decisions to be made during the initial phase of CREATE INDEX CONCURRENTLY; so that indexes built by that command could be corrupt. It is recommended that indexes built in 9.2.X with CREATE INDEX CONCURRENTLY be rebuilt after applying this update.

  In addition, fix CREATE/DROP INDEX CONCURRENTLY to use in-place updates when changing the state of an index’s pg_index row. This prevents race conditions that could cause concurrent sessions to miss updating the target index, thus again resulting in corrupt concurrently-created indexes.

  Also, fix various other operations to ensure that they ignore invalid indexes resulting from a failed CREATE INDEX CONCURRENTLY command. The most important of these is VACUUM, because an auto-vacuum could easily be launched on the table before corrective action can be taken to fix or remove the invalid index.

  Also fix DROP INDEX CONCURRENTLY to not disable insertions into the target index until all queries using it are done.

  Also fix misbehavior if DROP INDEX CONCURRENTLY is canceled: the previous coding could leave an un-droppable index behind.

- Correct predicate locking for DROP INDEX CONCURRENTLY (Kevin Grittner)

  Previously, SSI predicate locks were processed at the wrong time, possibly leading to incorrect behavior of serializable transactions executing in parallel with the DROP.

- Fix buffer locking during WAL replay (Tom Lane)

  The WAL replay code was insufficiently careful about locking buffers when replaying WAL records that affect more than one page. This could result in hot standby queries transiently seeing inconsistent states, resulting in wrong answers or unexpected failures.

- Fix an error in WAL generation logic for GIN indexes (Tom Lane)

  This could result in index corruption, if a torn-page failure occurred.

- Fix an error in WAL replay logic for SP-GiST indexes (Tom Lane)

  This could result in index corruption after a crash, or on a standby server.

- Fix incorrect detection of end-of-base-backup location during WAL recovery (Heikki Linnakangas)

  This mistake allowed hot standby mode to start up before the database reaches a consistent state.

- Properly remove startup process’s virtual XID lock when promoting a hot standby server to normal running (Simon Riggs)

  This oversight could prevent subsequent execution of certain operations such as CREATE INDEX CONCURRENTLY.

- Avoid bogus “out-of-sequence timeline ID” errors in standby mode (Heikki Linnakangas)

- Prevent the postmaster from launching new child processes after it’s received a shutdown signal (Tom Lane)
This mistake could result in shutdown taking longer than it should, or even never completing at all without additional user action.

- Fix the syslogger process to not fail when \texttt{log\_rotation\_age} exceeds \(2^{31}\) milliseconds (about 25 days) (Tom Lane)

- Fix \texttt{WaitLatch()} to return promptly when the requested timeout expires (Jeff Janes, Tom Lane)

  With the previous coding, a steady stream of non-wait-terminating interrupts could delay return from \texttt{WaitLatch()} indefinitely. This has been shown to be a problem for the autovacuum launcher process, and might cause trouble elsewhere as well.

- Avoid corruption of internal hash tables when out of memory (Hitoshi Harada)

- Prevent file descriptors for dropped tables from being held open past transaction end (Tom Lane)

  This should reduce problems with long-since-dropped tables continuing to occupy disk space.

- Prevent database-wide crash and restart when a new child process is unable to create a pipe for its latch (Tom Lane)

  Although the new process must fail, there is no good reason to force a database-wide restart, so avoid that. This improves robustness when the kernel is nearly out of file descriptors.

- Avoid planner crash with joins to unflattened subqueries (Tom Lane)

- Fix planning of non-strict equivalence clauses above outer joins (Tom Lane)

  The planner could derive incorrect constraints from a clause equating a non-strict construct to something else, for example \texttt{WHERE COALESCE(foo, 0) = 0} when \texttt{foo} is coming from the nullable side of an outer join. 9.2 showed this type of error in more cases than previous releases, but the basic bug has been there for a long time.

- Fix \texttt{SELECT DISTINCT} with index-optimized \texttt{MIN/\texttt{MAX}} on an inheritance tree (Tom Lane)

  The planner would fail with “failed to re-find MinMaxAggInfo record” given this combination of factors.

- Make sure the planner sees implicit and explicit casts as equivalent for all purposes, except in the minority of cases where there’s actually a semantic difference (Tom Lane)

- Include join clauses when considering whether partial indexes can be used for a query (Tom Lane)

  A strict join clause can be sufficient to establish an \texttt{x IS NOT NULL} predicate, for example. This fixes a planner regression in 9.2, since previous versions could make comparable deductions.

- Limit growth of planning time when there are many indexable join clauses for the same index (Tom Lane)

- Improve planner’s ability to prove exclusion constraints from equivalence classes (Tom Lane)

- Fix partial-row matching in hashed subplans to handle cross-type cases correctly (Tom Lane)

  This affects multicol\texttt{umn NOT IN} subplans, such as \texttt{WHERE (a, b) NOT IN (SELECT x, y FROM ...)} when for instance \texttt{b} and \texttt{y} are \texttt{int4} and \texttt{int8} respectively. This mistake led to wrong answers or crashes depending on the specific datatypes involved.

- Fix btree mark/restore functions to handle array keys (Tom Lane)

  This oversight could result in wrong answers from merge joins whose inner side is an index scan using an \texttt{indexed\_column = ANY(array)} condition.
• Revert patch for taking fewer snapshots (Tom Lane)

The 9.2 change to reduce the number of snapshots taken during query execution led to some anomalous behaviors not seen in previous releases, because execution would proceed with a snapshot acquired before locking the tables used by the query. Thus, for example, a query would not be guaranteed to see updates committed by a preceding transaction even if that transaction had exclusive lock. We’ll probably revisit this in future releases, but meanwhile put it back the way it was before 9.2.

• Acquire buffer lock when re-fetching the old tuple for an AFTER ROW UPDATE/DELETE trigger (Andres Freund)

In very unusual circumstances, this oversight could result in passing incorrect data to a trigger WHEN condition, or to the precheck logic for a foreign-key enforcement trigger. That could result in a crash, or in an incorrect decision about whether to fire the trigger.

• Fix ALTER COLUMN TYPE to handle inherited check constraints properly (Pavan Deolasee)

This worked correctly in pre-8.4 releases, and now works correctly in 8.4 and later.

• Fix ALTER EXTENSION SET SCHEMA’s failure to move some subsidiary objects into the new schema (Álvaro Herrera, Dimitri Fontaine)

• Handle CREATE TABLE AS EXECUTE correctly in extended query protocol (Tom Lane)

• Don’t modify the input parse tree in DROP RULE IF NOT EXISTS and DROP TRIGGER IF NOT EXISTS (Tom Lane)

This mistake would cause errors if a cached statement of one of these types was re-executed.

• Fix REASSIGN OWNED to handle grants on tablespaces (Álvaro Herrera)

• Ignore incorrect pg_attribute entries for system columns for views (Tom Lane)

Views do not have any system columns. However, we forgot to remove such entries when converting a table to a view. That’s fixed properly for 9.3 and later, but in previous branches we need to defend against existing mis-converted views.

• Fix rule printing to dump INSERT INTO table DEFAULT VALUES correctly (Tom Lane)

• Guard against stack overflow when there are too many UNION/INTERSECT/EXCEPT clauses in a query (Tom Lane)

• Prevent platform-dependent failures when dividing the minimum possible integer value by -1 (Xi Wang, Tom Lane)

• Fix possible access past end of string in date parsing (Hitoshi Harada)

• Fix failure to advance XID epoch if XID wraparound happens during a checkpoint and wal_level is hot_standby (Tom Lane, Andres Freund)

While this mistake had no particular impact on PostgreSQL itself, it was bad for applications that rely on txid_current() and related functions: the TXID value would appear to go backwards.

• Fix pg_terminate_backend() and pg_cancel_backend() to not throw error for a non-existent target process (Josh Kupershmidt)

This case already worked as intended when called by a superuser, but not so much when called by ordinary users.

• Fix display of pg_stat_replication.sync_state at a page boundary (Kyotaro Horiguchi)

2741
Appendix E. Release Notes

• Produce an understandable error message if the length of the path name for a Unix-domain socket exceeds the platform-specific limit (Tom Lane, Andrew Dunstan)
  Formerly, this would result in something quite unhelpful, such as “Non-recoverable failure in name resolution”.

• Fix memory leaks when sending composite column values to the client (Tom Lane)

• Save some cycles by not searching for subtransaction locks at commit (Simon Riggs)
  In a transaction holding many exclusive locks, this useless activity could be quite costly.

• Make pg_ctl more robust about reading the postmaster.pid file (Heikki Linnakangas)
  This fixes race conditions and possible file descriptor leakage.

• Fix possible crash in psql if incorrectly-encoded data is presented and the client_encoding setting is a client-only encoding, such as SJIS (Jiang Guiqing)

• Make pg_dump dump SEQUENCE SET items in the data not pre-data section of the archive (Tom Lane)
  This fixes an undesirable inconsistency between the meanings of --data-only and --section=data, and also fixes dumping of sequences that are marked as extension configuration tables.

• Fix pg_dump’s handling of DROP DATABASE commands in --clean mode (Guillaume Lelarge)
  Beginning in 9.2.0, pg_dump --clean would issue a DROP DATABASE command, which was either useless or dangerous depending on the usage scenario. It no longer does that. This change also fixes the combination of --clean and --create to work sensibly, i.e., emit DROP DATABASE then CREATE DATABASE before reconnecting to the target database.

• Fix pg_dump for views with circular dependencies and no relation options (Tom Lane)
  The previous fix to dump relation options when a view is involved in a circular dependency didn’t work right for the case that the view has no options; it emitted ALTER VIEW foo SET () which is invalid syntax.

• Fix bugs in the restore.sql script emitted by pg_dump in tar output format (Tom Lane)
  The script would fail outright on tables whose names include upper-case characters. Also, make the script capable of restoring data in --inserts mode as well as the regular COPY mode.

• Fix pg_restore to accept POSIX-conformant tar files (Brian Weaver, Tom Lane)
  The original coding of pg_dump’s tar output mode produced files that are not fully conformant with the POSIX standard. This has been corrected for version 9.3. This patch updates previous branches so that they will accept both the incorrect and the corrected formats, in hopes of avoiding compatibility problems when 9.3 comes out.

• Fix tar files emitted by pg_basebackup to be POSIX conformant (Brian Weaver, Tom Lane)

• Fix pg_resetxlog to locate postmaster.pid correctly when given a relative path to the data directory (Tom Lane)
  This mistake could lead to pg_resetxlog not noticing that there is an active postmaster using the data directory.

• Fix libpq’s lo_import() and lo_export() functions to report file I/O errors properly (Tom Lane)

• Fix ecpg’s processing of nested structure pointer variables (Muhammad Usama)

2742
Appendix E. Release Notes

- Fix ecpg’s `ecpg_get_data` function to handle arrays properly (Michael Meskes)
- Prevent `pg_upgrade` from trying to process TOAST tables for system catalogs (Bruce Momjian)
  This fixes an error seen when the `information_schema` has been dropped and recreated. Other failures were also possible.
- Improve `pg_upgrade` performance by setting `synchronous_commit` to `off` in the new cluster (Bruce Momjian)
- Make `contrib/pageinspect`’s btree page inspection functions take buffer locks while examining pages (Tom Lane)
- Work around unportable behavior of `malloc(0)` and `realloc(NULL, 0)` (Tom Lane)
  On platforms where these calls return `NULL`, some code mistakenly thought that meant out-of-memory. This is known to have broken `pg_dump` for databases containing no user-defined aggregates. There might be other cases as well.
- Ensure that `make install` for an extension creates the extension installation directory (Cédric Villemain)
  Previously, this step was missed if `MODULEDIR` was set in the extension’s Makefile.
- Fix pgxs support for building loadable modules on AIX (Tom Lane)
  Building modules outside the original source tree didn’t work on AIX.
- Update time zone data files to `tzdata` release 2012j for DST law changes in Cuba, Israel, Jordan, Libya, Palestine, Western Samoa, and portions of Brazil.

E.99. Release 9.2.1

Release date: 2012-09-24
This release contains a variety of fixes from 9.2.0. For information about new features in the 9.2 major release, see Section E.100.

E.99.1. Migration to Version 9.2.1
A dump/restore is not required for those running 9.2.X.
However, you may need to perform `REINDEX` and/or `VACUUM` operations to recover from the effects of the data corruption bug described in the first changelog item below.

E.99.2. Changes

- Fix persistence marking of shared buffers during WAL replay (Jeff Davis)
  This mistake can result in buffers not being written out during checkpoints, resulting in data corruption if the server later crashes without ever having written those buffers. Corruption can occur on any server...
following crash recovery, but it is significantly more likely to occur on standby slave servers since those perform much more WAL replay. There is a low probability of corruption of btree and GIN indexes. There is a much higher probability of corruption of table “visibility maps”, which might lead to wrong answers from index-only scans. Table data proper cannot be corrupted by this bug.

While no index corruption due to this bug is known to have occurred in the field, as a precautionary measure it is recommended that production installations REINDEX all btree and GIN indexes at a convenient time after upgrading to 9.2.1.

Also, it is recommended to perform a VACUUM of all tables while having vacuum_freeze_table_age set to zero. This will fix any incorrect visibility map data. vacuum_cost_delay can be adjusted to reduce the performance impact of vacuuming, while causing it to take longer to finish.

- Fix possible incorrect sorting of output from queries involving WHERE indexed_column IN (list_of_values) (Tom Lane)
- Fix planner failure for queries involving GROUP BY expressions along with window functions and aggregates (Tom Lane)
- Fix planner’s assignment of executor parameters (Tom Lane)
  This error could result in wrong answers from queries that scan the same WITH subquery multiple times.
- Improve planner’s handling of join conditions in index scans (Tom Lane)
- Improve selectivity estimation for text search queries involving prefixes, i.e. word:* patterns (Tom Lane)
- Fix delayed recognition of permissions changes (Tom Lane)
  A command that needed no locks other than ones its transaction already had might fail to notice a concurrent GRANT or REVOKE that committed since the start of its transaction.
- Fix ANALYZE to not fail when a column is a domain over an array type (Tom Lane)
- Prevent PL/Perl from crashing if a recursive PL/Perl function is redefined while being executed (Tom Lane)
- Work around possible misoptimization in PL/Perl (Tom Lane)
  Some Linux distributions contain an incorrect version of pthread.h that results in incorrect compiled code in PL/Perl, leading to crashes if a PL/Perl function calls another one that throws an error.
- Remove unnecessary dependency on pg_config from pg_upgrade (Peter Eisentraut)
- Update time zone data files to tzdata release 2012f for DST law changes in Fiji

E.100. Release 9.2

Release date: 2012-09-10

E.100.1. Overview

This release has been largely focused on performance improvements, though new SQL features are not lacking. Work also continues in the area of replication support. Major enhancements include:
• Allow queries to retrieve data only from indexes, avoiding heap access (index-only scans)
• Allow the planner to generate custom plans for specific parameter values even when using prepared statements
• Improve the planner’s ability to use nested loops with inner index scans
• Allow streaming replication slaves to forward data to other slaves (cascading replication)
• Allow pg_basebackup to make base backups from standby servers
• Add a pg_recvexlog tool to archive WAL file changes as they are written
• Add the SP-GiST (Space-Partitioned GiST) index access method
• Add support for range data types
• Add a JSON data type
• Add a security_barrier option for views
• Allow libpq connection strings to have the format of a URI
• Add a single-row processing mode to libpq for better handling of large result sets

The above items are explained in more detail in the sections below.

E.100.2. Migration to Version 9.2

A dump/restore using pg_dump, or use of pg_upgrade, is required for those wishing to migrate data from any previous release.

Version 9.2 contains a number of changes that may affect compatibility with previous releases. Observe the following incompatibilities:

E.100.2.1. System Catalogs

• Remove the spclocation field from pg_tablespace (Magnus Hagander)
  This field was duplicative of the symbolic links that actually define tablespace locations, and thus risked errors of omission when moving a tablespace. This change allows tablespace directories to be moved while the server is down, by manually adjusting the symbolic links. To replace this field, we have added pg_tablespace_location() to allow querying of the symbolic links.
• Move tsvector most-common-element statistics to new pg_stats columns (Alexander Korotkov)
  Consult most_common_elems and most_common_elem_freqs for the data formerly available in most_common_vals and most_common_freqs for a tsvector column.

E.100.2.2. Functions

• Remove hstore’s => operator (Robert Haas)
Users should now use \texttt{hstore(text, text)}. Since PostgreSQL 9.0, a warning message has been emitted when an operator named \texttt{=>} is created because the SQL standard reserves that token for another use.

- Ensure that \texttt{xpath()} escapes special characters in string values (Florian Pflug)
  Without this it is possible for the result not to be valid XML.

- Make \texttt{pg_relation_size()} and friends return NULL if the object does not exist (Phil Sorber)
  This prevents queries that call these functions from returning errors immediately after a concurrent \texttt{DROP}.

- Make \texttt{EXTRACT(EPOCH FROM timestamp without time zone)} measure the epoch from local midnight, not UTC midnight (Tom Lane)
  This change reverts an ill-considered change made in release 7.3. Measuring from UTC midnight was inconsistent because it made the result dependent on the \texttt{timezone} setting, which computations for \texttt{timestamp without time zone} should not be. The previous behavior remains available by casting the input value to \texttt{timestamp with time zone}.

- Properly parse time strings with trailing \texttt{yesterday}, \texttt{today}, and \texttt{tomorrow} (Dean Rasheed)
  Previously, \texttt{SELECT ‘04:00:00 yesterday’::timestamp} returned yesterday’s date at midnight.

- Fix \texttt{to_date()} and \texttt{to_timestamp()} to wrap incomplete dates toward 2020 (Bruce Momjian)
  Previously, supplied years and year masks of less than four digits wrapped inconsistently.

\section*{E.100.2.3. Object Modification}

- Prevent \texttt{ALTER DOMAIN} from working on non-domain types (Peter Eisentraut)
  Owner and schema changes were previously possible on non-domain types.

- No longer forcibly lowercase procedural language names in \texttt{CREATE FUNCTION} (Robert Haas)
  While unquoted language identifiers are still lowercased, strings and quoted identifiers are no longer forcibly down-cased. Thus for example \texttt{CREATE FUNCTION ... LANGUAGE ‘C’} will no longer work; it must be spelled ‘\texttt{c}’, or better omit the quotes.

- Change system-generated names of foreign key enforcement triggers (Tom Lane)
  This change ensures that the triggers fire in the correct order in some corner cases involving self-referential foreign key constraints.

\section*{E.100.2.4. Command-Line Tools}

- Provide consistent backquote, variable expansion, and quoted substring behavior in psql meta-command arguments (Tom Lane)
  Previously, such references were treated oddly when not separated by whitespace from adjacent text. For example \texttt{’FOO’ BAR} was output as \texttt{FOO BAR} (unexpected insertion of a space) and \texttt{FOO’BAR’BAZ} was output unchanged (not removing the quotes as most would expect).
Appendix E. Release Notes

- No longer treat clusterdb table names as double-quoted; no longer treat reindexdb table and index names as double-quoted (Bruce Momjian)

  Users must now include double-quotes in the command arguments if quoting is wanted.

- createuser no longer prompts for option settings by default (Peter Eisentraut)

  Use --interactive to obtain the old behavior.

- Disable prompting for the user name in dropuser unless --interactive is specified (Peter Eisentraut)

E.100.2.5. Server Settings

- Add server parameters for specifying the locations of server-side SSL files (Peter Eisentraut)

  This allows changing the names and locations of the files that were previously hard-coded as server.crt, server.key, root.crt, and root.crl in the data directory. The server will no longer examine root.crt or root.crl by default; to load these files, the associated parameters must be set to non-default values.

- Remove the silent_mode parameter (Heikki Linnakangas)

  Similar behavior can be obtained with pg_ctl start -l postmaster.log.

- Remove the wal_sender_delay parameter, as it is no longer needed (Tom Lane)

- Remove the custom_variable_classes parameter (Tom Lane)

  The checking provided by this setting was dubious. Now any setting can be prefixed by any class name.

E.100.2.6. Monitoring

- Rename pg_stat_activity.procpid to pid, to match other system tables (Magnus Hagander)

- Create a separate pg_stat_activity column to report process state (Scott Mead, Magnus Hagander)

  The previous query and query_start values now remain available for an idle session, allowing enhanced analysis.

- Rename pg_stat_activity.current_query to query because it is not cleared when the query completes (Magnus Hagander)

- Change all SQL-level statistics timing values to be float8 columns measured in milliseconds (Tom Lane)

  This change eliminates the designed-in assumption that the values are accurate to microseconds and no more (since the float8 values can be fractional). The columns affected are pg_stat_user_functions.total_time, pg_stat_user_functions.self_time, pg_stat_xact_user_functions.total_time, and pg_stat_xact_user_functions.self_time. The statistics functions underlying these columns now also return float8 milliseconds, rather than bigint microseconds. contrib/pg_stat_statements' total_time column is now also measured in milliseconds.
E.100.3. Changes

Below you will find a detailed account of the changes between PostgreSQL 9.2 and the previous major release.

E.100.3.1. Server

E.100.3.1.1. Performance

- Allow queries to retrieve data only from indexes, avoiding heap access (Robert Haas, Ibrar Ahmed, Heikki Linnakangas, Tom Lane)
  This feature is often called index-only scans. Heap access can be skipped for heap pages containing only tuples that are visible to all sessions, as reported by the visibility map; so the benefit applies mainly to mostly-static data. The visibility map was made crash-safe as a necessary part of implementing this feature.
- Add the SP-GiST (Space-Partitioned GiST) index access method (Teodor Sigaev, Oleg Bartunov, Tom Lane)
  SP-GiST is comparable to GiST in flexibility, but supports unbalanced partitioned search structures rather than balanced trees. For suitable problems, SP-GiST can be faster than GiST in both index build time and search time.
- Allow group commit to work effectively under heavy load (Peter Geoghegan, Simon Riggs, Heikki Linnakangas)
  Previously, batching of commits became ineffective as the write workload increased, because of internal lock contention.
- Allow uncontended locks to be managed using a new fast-path lock mechanism (Robert Haas)
- Reduce overhead of creating virtual transaction ID locks (Robert Haas)
- Reduce the overhead of serializable isolation level locks (Dan Ports)
- Improve PowerPC and Itanium spinlock performance (Manabu Ori, Robert Haas, Tom Lane)
- Reduce overhead for shared invalidation cache messages (Robert Haas)
- Move the frequently accessed members of the PGPROC shared memory array to a separate array (Pavan Deolasee, Heikki Linnakangas, Robert Haas)
- Improve COPY performance by adding tuples to the heap in batches (Heikki Linnakangas)
- Improve GiST index performance for geometric data types by producing better trees with less memory allocation overhead (Alexander Korotkov)
- Improve GiST index build times (Alexander Korotkov, Heikki Linnakangas)
- Allow hint bits to be set sooner for temporary and unlogged tables (Robert Haas)
- Allow sorting to be performed by inlined, non-SQL-callable comparison functions (Peter Geoghegan, Robert Haas, Tom Lane)
- Make the number of CLOG buffers scale based on shared_buffers (Robert Haas, Simon Riggs, Tom Lane)
Appendix E. Release Notes

- Improve performance of buffer pool scans that occur when tables or databases are dropped (Jeff Janes, Simon Riggs)
- Improve performance of checkpointer’s fsync-request queue when many tables are being dropped or truncated (Tom Lane)
- Pass the safe number of file descriptors to child processes on Windows (Heikki Linnakangas)
  This allows Windows sessions to use more open file descriptors than before.

E.100.3.1.2. Process Management

- Create a dedicated background process to perform checkpoints (Simon Riggs)
  Formerly the background writer did both dirty-page writing and checkpointing. Separating this into two processes allows each goal to be accomplished more predictably.
- Improve asynchronous commit behavior by waking the walwriter sooner (Simon Riggs)
  Previously, only \texttt{wal_writer_delay} triggered WAL flushing to disk; now filling a WAL buffer also triggers WAL writes.
- Allow the bgwriter, walwriter, checkpointer, statistics collector, log collector, and archiver background processes to sleep more efficiently during periods of inactivity (Peter Geoghegan, Tom Lane)
  This series of changes reduces the frequency of process wake-ups when there is nothing to do, dramatically reducing power consumption on idle servers.

E.100.3.1.3. Optimizer

- Allow the planner to generate custom plans for specific parameter values even when using prepared statements (Tom Lane)
  In the past, a prepared statement always had a single “generic” plan that was used for all parameter values, which was frequently much inferior to the plans used for non-prepared statements containing explicit constant values. Now, the planner attempts to generate custom plans for specific parameter values. A generic plan will only be used after custom plans have repeatedly proven to provide no benefit. This change should eliminate the performance penalties formerly seen from use of prepared statements (including non-dynamic statements in PL/pgSQL).
- Improve the planner’s ability to use nested loops with inner index scans (Tom Lane)
  The new “parameterized path” mechanism allows inner index scans to use values from relations that are more than one join level up from the scan. This can greatly improve performance in situations where semantic restrictions (such as outer joins) limit the allowed join orderings.
- Improve the planning API for foreign data wrappers (Etsuro Fujita, Shigeru Hanada, Tom Lane)
  Wrappers can now provide multiple access “paths” for their tables, allowing more flexibility in join planning.
- Recognize self-contradictory restriction clauses for non-table relations (Tom Lane)
  This check is only performed when \texttt{constraint_exclusion} is on.
Appendix E. Release Notes

• Allow `indexed_col op ANY(ARRAY[...])` conditions to be used in plain index scans and index-only scans (Tom Lane)
  Formerly such conditions could only be used in bitmap index scans.
• Support `MIN/MAX` index optimizations on boolean columns (Marti Raudsepp)
• Account for set-returning functions in `SELECT` target lists when setting row count estimates (Tom Lane)
• Fix planner to handle indexes with duplicated columns more reliably (Tom Lane)
• Collect and use element-frequency statistics for arrays (Alexander Korotkov, Tom Lane)
  This change improves selectivity estimation for the array `<@`, `&&`, and `@>` operators (array containment and overlaps).
• Allow statistics to be collected for foreign tables (Etsuro Fujita)
• Improve cost estimates for use of partial indexes (Tom Lane)
• Improve the planner’s ability to use statistics for columns referenced in subqueries (Tom Lane)
• Improve statistical estimates for subqueries using `DISTINCT` (Tom Lane)

E.100.3.1.4. Authentication

• Do not treat role names and `samerole` specified in `pg_hba.conf` as automatically including superusers (Andrew Dunstan)
  This makes it easier to use `reject` lines with group roles.
• Adjust `pg_hba.conf` processing to handle token parsing more consistently (Brendan Jurd, Álvaro Herrera)
•Disallow empty `pg_hba.conf` files (Tom Lane)
  This was done to more quickly detect misconfiguration.
• Make superuser privilege imply replication privilege (Noah Misch)
  This avoids the need to explicitly assign such privileges.

E.100.3.1.5. Monitoring

• Attempt to log the current query string during a backend crash (Marti Raudsepp)
• Make logging of autovacuum I/O activity more verbose (Greg Smith, Noah Misch)
  This logging is triggered by `log_autovacuum_min_duration`.
• Make WAL replay report failures sooner (Fujii Masao)
  There were some cases where failures were only reported once the server went into master mode.
• Add `pg_xlog_location_diff()` to simplify WAL location comparisons (Euler Taveira de Oliveira)
  This is useful for computing replication lag.
• Support configurable event log application names on Windows (MauMau, Magnus Hagander)
This allows different instances to use the event log with different identifiers, by setting the event_source server parameter, which is similar to how syslog_ident works.

- Change “unexpected EOF” messages to DEBUG1 level, except when there is an open transaction (Magnus Hagander)
  This change reduces log chatter caused by applications that close database connections ungracefully.

**E.100.3.1.6. Statistical Views**

- Track temporary file sizes and file counts in the pg_stat_database system view (Tomas Vondra)
- Add a deadlock counter to the pg_stat_database system view (Magnus Hagander)
- Add a server parameter track_io_timing to track I/O timings (Ants Aasma, Robert Haas)
- Report checkpoint timing information in pg_stat_bgwriter (Greg Smith, Peter Geoghegan)

**E.100.3.1.7. Server Settings**

- Silently ignore nonexistent schemas specified in search_path (Tom Lane)
  This makes it more convenient to use generic path settings, which might include some schemas that don’t exist in all databases.
- Allow superusers to set deadlock_timeout per-session, not just per-cluster (Noah Misch)
  This allows deadlock_timeout to be reduced for transactions that are likely to be involved in a deadlock, thus detecting the failure more quickly. Alternatively, increasing the value can be used to reduce the chances of a session being chosen for cancellation due to a deadlock.
- Add a server parameter temp_file_limit to constrain temporary file space usage per session (Mark Kirkwood)
- Allow a superuser to SET an extension’s superuser-only custom variable before loading the associated extension (Tom Lane)
  The system now remembers whether a SET was performed by a superuser, so that proper privilege checking can be done when the extension is loaded.
- Add postmaster -C option to query configuration parameters (Bruce Momjian)
  This allows pg_ctl to better handle cases where PGDATA or -D points to a configuration-only directory.
- Replace an empty locale name with the implied value in CREATE DATABASE (Tom Lane)
  This prevents cases where pg_database.datcollate or datctype could be interpreted differently after a server restart.

**E.100.3.1.7.1. postgresql.conf**

- Allow multiple errors in postgresql.conf to be reported, rather than just the first one (Alexey Klyukin, Tom Lane)
• Allow a reload of `postgresql.conf` to be processed by all sessions, even if there are some settings that are invalid for particular sessions (Alexey Klyukin)
  Previously, such not-valid-within-session values would cause all setting changes to be ignored by that session.

• Add an `include_if_exists` facility for configuration files (Greg Smith)
  This works the same as `include`, except that an error is not thrown if the file is missing.

• Identify the server time zone during `initdb`, and set `postgresql.conf` entries `timezone` and `log_timezone` accordingly (Tom Lane)
  This avoids expensive time zone probes during server start.

• Fix `pg_settings` to report `postgresql.conf` line numbers on Windows (Tom Lane)

**E.100.3.2. Replication and Recovery**

• Allow streaming replication slaves to forward data to other slaves (*cascading replication*) (Fujii Masao)
  Previously, only the master server could supply streaming replication log files to standby servers.

• Add new `synchronous_commit` mode `remote_write` (Fujii Masao, Simon Riggs)
  This mode waits for the standby server to write transaction data to its own operating system, but does not wait for the data to be flushed to the standby’s disk.

• Add a `pg_receivexlog` tool to archive WAL file changes as they are written, rather than waiting for completed WAL files (Magnus Hagander)

• Allow `pg_basebackup` to make base backups from standby servers (Jun Ishizuka, Fujii Masao)
  This feature lets the work of making new base backups be off-loaded from the primary server.

• Allow streaming of WAL files while `pg_basebackup` is performing a backup (Magnus Hagander)
  This allows passing of WAL files to the standby before they are discarded on the primary.

**E.100.3.3. Queries**

• Cancel the running query if the client gets disconnected (Florian Pflug)
  If the backend detects loss of client connection during a query, it will now cancel the query rather than attempting to finish it.

• Retain column names at run time for row expressions (Andrew Dunstan, Tom Lane)
  This change allows better results when a row value is converted to `hstore` or `json` type: the fields of the resulting value will now have the expected names.

• Improve column labels used for sub-`SELECT` results (Marti Raudsepp)
  Previously, the generic label `?column?` was used.
Appendix E. Release Notes

- Improve heuristics for determining the types of unknown values (Tom Lane)
  The longstanding rule that an unknown constant might have the same type as the value on the other side of the operator using it is now applied when considering polymorphic operators, not only for simple operator matches.
- Warn about creating casts to or from domain types (Robert Haas)
  Such casts have no effect.
- When a row fails a CHECK or NOT NULL constraint, show the row’s contents as error detail (Jan Kundrát)
  This should make it easier to identify which row is problematic when an insert or update is processing many rows.

E.100.3.4. Object Manipulation

- Provide more reliable operation during concurrent DDL (Robert Haas, Noah Misch)
  This change adds locking that should eliminate “cache lookup failed” errors in many scenarios. Also, it is no longer possible to add relations to a schema that is being concurrently dropped, a scenario that formerly led to inconsistent system catalog contents.
- Add CONCURRENTLY option to DROP INDEX (Simon Riggs)
  This allows index removal without blocking other sessions.
- Allow foreign data wrappers to have per-column options (Shigeru Hanada)
- Improve pretty-printing of view definitions (Andrew Dunstan)

E.100.3.4.1. Constraints

- Allow CHECK constraints to be declared NOT VALID (Alvaro Herrera)
  Adding a NOT VALID constraint does not cause the table to be scanned to verify that existing rows meet the constraint. Subsequently, newly added or updated rows are checked. Such constraints are ignored by the planner when considering constraint_exclusion, since it is not certain that all rows meet the constraint.
  The new ALTER TABLE VALIDATE command allows NOT VALID constraints to be checked for existing rows, after which they are converted into ordinary constraints.
- Allow CHECK constraints to be declared NO INHERIT (Nikhil Sontakke, Alex Hunsaker, Alvaro Herrera)
  This makes them enforceable only on the parent table, not on child tables.
- Add the ability to rename constraints (Peter Eisentraut)

E.100.3.4.2. ALTER

- Reduce need to rebuild tables and indexes for certain ALTER TABLE ... ALTER COLUMN TYPE operations (Noah Misch)
Appendix E. Release Notes

Increasing the length limit for a `varchar` or `varbit` column, or removing the limit altogether, no longer requires a table rewrite. Similarly, increasing the allowable precision of a `numeric` column, or changing a column from constrained `numeric` to unconstrained `numeric`, no longer requires a table rewrite. Table rewrites are also avoided in similar cases involving the `interval`, `timestamp`, and `timestamptz` types.

- Avoid having `ALTER TABLE` revalidate foreign key constraints in some cases where it is not necessary (Noah Misch)
- Add `IF EXISTS` options to some `ALTER` commands (Pavel Stehule)
  For example, `ALTER FOREIGN TABLE IF EXISTS foo RENAME TO bar`.
- Add `ALTER FOREIGN DATA WRAPPER ... RENAME` and `ALTER SERVER ... RENAME` (Peter Eisentraut)
- Add `ALTER DOMAIN ... RENAME` (Peter Eisentraut)
  You could already rename domains using `ALTER TYPE`.
- Throw an error for `ALTER DOMAIN ... DROP CONSTRAINT` on a nonexistent constraint (Peter Eisentraut)
  An `IF EXISTS` option has been added to provide the previous behavior.

### E.100.3.4.3. CREATE TABLE

- Allow `CREATE TABLE (LIKE ...)` from foreign tables, views, and composite types (Peter Eisentraut)
  For example, this allows a table to be created whose schema matches a view.
- Fix `CREATE TABLE (LIKE ...)` to avoid index name conflicts when copying index comments (Tom Lane)
- Fix `CREATE TABLE ... AS EXECUTE` to handle `WITH NO DATA` and column name specifications (Tom Lane)

### E.100.3.4.4. Object Permissions

- Add a `security_barrier` option for views (KaiGai Kohei, Robert Haas)
  This option prevents optimizations that might allow view-protected data to be exposed to users, for example pushing a clause involving an insecure function into the `WHERE` clause of the view. Such views can be expected to perform more poorly than ordinary views.
- Add a new `LEAKPROOF` function attribute to mark functions that can safely be pushed down into `security_barrier` views (KaiGai Kohei)
- Add support for privileges on data types (Peter Eisentraut)
  This adds support for the SQL-conforming `USAGE` privilege on types and domains. The intent is to be able to restrict which users can create dependencies on types, since such dependencies limit the owner’s ability to alter the type.
- Check for `INSERT` privileges in `SELECT INTO / CREATE TABLE AS` (KaiGai Kohei)
Because the object is being created by `SELECT INTO` or `CREATE TABLE AS`, the creator would ordinarily have insert permissions; but there are corner cases where this is not true, such as when `ALTER DEFAULT PRIVILEGES` has removed such permissions.

### E.100.3.5. Utility Operations

- Allow `VACUUM` to more easily skip pages that cannot be locked (Simon Riggs, Robert Haas)
  
  This change should greatly reduce the incidence of `VACUUM` getting “stuck” waiting for other sessions.
- Make `EXPLAIN (BUFFERS)` count blocks dirtied and written (Robert Haas)
- Make `EXPLAIN ANALYZE` report the number of rows rejected by filter steps (Marko Tiikkaja)
- Allow `EXPLAIN ANALYZE` to avoid timing overhead when time values are not wanted (Tomas Vondra)
  
  This is accomplished by setting the new `TIMING` option to `FALSE`.

### E.100.3.6. Data Types

- Add support for range data types (Jeff Davis, Tom Lane, Alexander Korotkov)
  
  A range data type stores a lower and upper bound belonging to its base data type. It supports operations like contains, overlaps, and intersection.
- Add a `JSON` data type (Robert Haas)
  
  This type stores JSON (JavaScript Object Notation) data with proper validation.
- Add `array_to_json()` and `row_to_json()` (Andrew Dunstan)
- Add a `SMALLSERIAL` data type (Mike Pultz)
  
  This is like `SERIAL`, except it stores the sequence in a two-byte integer column (int2).
- Allow domains to be declared `NOT VALID` (Álvaro Herrera)
  
  This option can be set at domain creation time, or via `ALTER DOMAIN ... ADD CONSTRAINT ... NOT VALID`. `ALTER DOMAIN ... VALIDATE CONSTRAINT` fully validates the constraint.
- Support more locale-specific formatting options for the `money` data type (Tom Lane)
  
  Specifically, honor all the POSIX options for ordering of the value, sign, and currency symbol in monetary output. Also, make sure that the thousands separator is only inserted to the left of the decimal point, as required by POSIX.
- Add bitwise “and”, “or”, and “not” operators for the `macaddr` data type (Brendan Jurd)
- Allow `xpath()` to return a single-element XML array when supplied a scalar value (Florian Pflug)
  
  Previously, it returned an empty array. This change will also cause `xpath_exists()` to return true, not false, for such expressions.
- Improve XML error handling to be more robust (Florian Pflug)
Appendix E. Release Notes

E.100.3.7. Functions

• Allow non-superusers to use `pg_cancel_backend()` and `pg_terminate_backend()` on other sessions belonging to the same user (Magnus Hagander, Josh Kupershmidt, Dan Farina)
  Previously only superusers were allowed to use these functions.
• Allow importing and exporting of transaction snapshots (Joachim Wieland, Tom Lane)
  This allows multiple transactions to share identical views of the database state. Snapshots are exported via `pg_export_snapshot()` and imported via `SET TRANSACTION SNAPSHOT`. Only snapshots from currently-running transactions can be imported.
• Support `COLLATION FOR` on expressions (Peter Eisentraut)
  This returns a string representing the collation of the expression.
• Add `pg_opfamily_is_visible()` (Josh Kupershmidt)
• Add a numeric variant of `pg_size_pretty()` for use with `pg_xlog_location_diff()` (Fujii Masao)
• Add a `pg_trigger_depth()` function (Kevin Grittner)
  This reports the current trigger call depth.
• Allow `string_agg()` to process bytea values (Pavel Stehule)
• Fix regular expressions in which a back-reference occurs within a larger quantified subexpression (Tom Lane)
  For example, `^\(\w+\)( \1)+$`. Previous releases did not check that the back-reference actually matched the first occurrence.

E.100.3.8. Information Schema

• Add information schema views `role_udt_grants`, `udt_privileges`, and `user_defined_types` (Peter Eisentraut)
• Add composite-type attributes to the information schema `element_types` view (Peter Eisentraut)
• Implement `interval_type` columns in the information schema (Peter Eisentraut)
  Formerly these columns read as nulls.
• Implement collation-related columns in the information schema `attributes`, `columns`, `domains`, and `element_types` views (Peter Eisentraut)
• Implement the `with_hierarchy` column in the information schema `table_privileges` view (Peter Eisentraut)
• Add display of sequence `USAGE` privileges to information schema (Peter Eisentraut)
• Make the information schema show default privileges (Peter Eisentraut)
  Previously, non-empty default permissions were not represented in the views.
E.100.3.9. Server-Side Languages

E.100.3.9.1. PL/pgSQL Server-Side Language

- Allow the PL/pgSQL OPEN cursor command to supply parameters by name (Yeb Havinga)
- Add a GET STACKED DIAGNOSTICS PL/pgSQL command to retrieve exception info (Pavel Stehule)
- Speed up PL/pgSQL array assignment by caching type information (Pavel Stehule)
- Improve performance and memory consumption for long chains of ELSIF clauses (Tom Lane)
- Output the function signature, not just the name, in PL/pgSQL error messages (Pavel Stehule)

E.100.3.9.2. PL/Python Server-Side Language

- Add PL/Python SPI cursor support (Jan Urbanski)
  This allows PL/Python to read partial result sets.
- Add result metadata functions to PL/Python (Peter Eisentraut)
  Specifically, this adds result object functions .colnames, .coltypes, and .coltypmods.
- Remove support for Python 2.2 (Peter Eisentraut)

E.100.3.9.3. SQL Server-Side Language

- Allow SQL-language functions to reference parameters by name (Matthew Draper)
  To use this, simply name the function arguments and then reference the argument names in the SQL function body.

E.100.3.10. Client Applications

- Add initdb options --auth-local and --auth-host (Peter Eisentraut)
  This allows separate control of local and host pg_hba.conf authentication settings. --auth still controls both.
- Add --replication/--no-replication flags to createuser to control replication permission (Fujii Masao)
- Add the --if-exists option to dropdb and dropuser (Josh Kupershmidt)
- Give command-line tools the ability to specify the name of the database to connect to, and fall back to template1 if a postgres database connection fails (Robert Haas)
Appendix E. Release Notes

E.100.3.10.1. psql

• Add a display mode to auto-expand output based on the display width (Peter Eisentraut)
  This adds the auto option to the \x command, which switches to the expanded mode when the normal output would be wider than the screen.
• Allow inclusion of a script file that is named relative to the directory of the file from which it was invoked (Gurjeet Singh)
  This is done with a new command \ir.
• Add support for non-ASCII characters in psql variable names (Tom Lane)
• Add support for major-version-specific .psqlrc files (Bruce Momjian)
  psql already supported minor-version-specific .psqlrc files.
• Provide environment variable overrides for psql history and startup file locations (Andrew Dunstan)
  PSQL_HISTORY and PSQLRC now determine these file names if set.
• Add a \setenv command to modify the environment variables passed to child processes (Andrew Dunstan)
• Name psql’s temporary editor files with a .sql extension (Peter Eisentraut)
  This allows extension-sensitive editors to select the right mode.
• Allow psql to use zero-byte field and record separators (Peter Eisentraut)
  Various shell tools use zero-byte (NUL) separators, e.g. find.
• Make the \timing option report times for failed queries (Magnus Hagander)
  Previously times were reported only for successful queries.
• Unify and tighten psql’s treatment of \copy and SQL COPY (Noah Misch)
  This fix makes failure behavior more predictable and honors \set ON_ERROR_RRollback.

E.100.3.10.2. Informational Commands

• Make \d on a sequence show the table/column name owning it (Magnus Hagander)
• Show statistics target for columns in \d+ (Magnus Hagander)
• Show role password expiration dates in \du (Fabrízio de Royes Mello)
• Display comments for casts, conversions, domains, and languages (Josh Kupershmidt)
  These are included in the output of \dC+, \dc+, \dD+, and \dL respectively.
• Display comments for SQL/MED objects (Josh Kupershmidt)
  These are included in the output of \des+, \det+, and \dew+ for foreign servers, foreign tables, and foreign data wrappers respectively.
• Change \dd to display comments only for object types without their own backslash command (Josh Kupershmidt)
E.100.3.10.3. Tab Completion

- In psql tab completion, complete SQL keywords in either upper or lower case according to the new `COMP_KEYWORD_CASE` setting (Peter Eisentraut)
- Add tab completion support for `EXECUTE` (Andreas Karlsson)
- Allow tab completion of role references in `GRANT/REVOKE` (Peter Eisentraut)
- Allow tab completion of file names to supply quotes, when necessary (Noah Misch)
- Change tab completion support for `TABLE` to also include views (Magnus Hagander)

E.100.3.10.4. pg_dump

- Add an `--exclude-table-data` option to `pg_dump` (Andrew Dunstan)
  This allows dumping of a table’s definition but not its data, on a per-table basis.
- Add a `--section` option to `pg_dump` and `pg_restore` (Andrew Dunstan)
  Valid values are `pre-data`, `data`, and `post-data`. The option can be given more than once to select two or more sections.
- Make `pg_dumpall` dump all roles first, then all configuration settings on roles (Phil Sorber)
  This allows a role’s configuration settings to mention other roles without generating an error.
- Allow `pg_dumpall` to avoid errors if the `postgres` database is missing in the new cluster (Robert Haas)
- Dump foreign server user mappings in user name order (Peter Eisentraut)
  This helps produce deterministic dump files.
- Dump operators in a predictable order (Peter Eisentraut)
- Tighten rules for when extension configuration tables are dumped by `pg_dump` (Tom Lane)
- Make `pg_dump` emit more useful dependency information (Tom Lane)
  The dependency links included in archive-format dumps were formerly of very limited use, because they frequently referenced objects that appeared nowhere in the dump. Now they represent actual dependencies (possibly indirect) among the dumped objects.
- Improve `pg_dump`’s performance when dumping many database objects (Tom Lane)

E.100.3.11. libpq

- Allow `libpq` connection strings to have the format of a URI (Alexander Shulgin)
  The syntax begins with `postgres://`. This can allow applications to avoid implementing their own parser for URIs representing database connections.
- Add a connection option to disable SSL compression (Laurentz Albe)
  This can be used to remove the overhead of SSL compression on fast networks.
Appendix E. Release Notes

- Add a single-row processing mode for better handling of large result sets (Kyotaro Horiguchi, Marko Kreen)
  Previously, libpq always collected the entire query result in memory before passing it back to the application.
- Add const qualifiers to the declarations of the functions PQconnectdbParams, PQconnectStartParams, and PQpingParams (Lionel Elie Mamane)
- Allow the .pgpass file to include escaped characters in the password field (Robert Haas)
- Make library functions use abort() instead of exit() when it is necessary to terminate the process (Peter Eisentraut)
  This choice does not interfere with the normal exit codes used by the program, and generates a signal that can be caught by the caller.

E.100.3.12. Source Code

- Remove dead ports (Peter Eisentraut)
  The following platforms are no longer supported: dgux, nextstep, sunos4, svr4, ultrix4, univel, bsdi.
- Add support for building with MS Visual Studio 2010 (Brar Piening)
- Enable compiling with the MinGW-w64 32-bit compiler (Lars Kanis)
- Install plpgsql.h into include/server during installation (Heikki Linnakangas)
- Improve the latch facility to include detection of postmaster death (Peter Geoghegan, Heikki Linnakangas, Tom Lane)
  This eliminates one of the main reasons that background processes formerly had to wake up to poll for events.
- Use C flexible array members, where supported (Peter Eisentraut)
- Improve the concurrent transaction regression tests (isolationtester) (Noah Misch)
- Modify thread_test to create its test files in the current directory, rather than /tmp (Bruce Momjian)
- Improve flex and bison warning and error reporting (Tom Lane)
- Add memory barrier support (Robert Haas)
  This is currently unused.
- Modify pgindent to use a typedef file (Bruce Momjian)
- Add a hook for processing messages due to be sent to the server log (Martin Pihlak)
- Add object access hooks for DROP commands (KaiGai Kohei)
- Centralize DROP handling for some object types (KaiGai Kohei)
- Add a pg_upgrade test suite (Peter Eisentraut)
- Sync regular expression code with TCL 8.5.11 and improve internal processing (Tom Lane)
- Move CRC tables to libpqport, and provide them in a separate include file (Daniel Farina)
- Add options to git_changelog for use in major release note creation (Bruce Momjian)
Appendix E. Release Notes

• Support Linux’s /proc/self/oom_score_adj API (Tom Lane)

E.100.3.13. Additional Modules

• Improve efficiency of dblink by using libpq’s new single-row processing mode (Kyotaro Horiguchi, Marko Kreen)
  This improvement does not apply to dblink_send_query()/dblink_get_result().
• Support force_not_null option in file_fdw (Shigeru Hanada)
• Implement dry-run mode for pg_archivecleanup (Gabriele Bartolini)
  This only outputs the names of files to be deleted.
• Add new pgbench switches --unlogged-tables, --tablespace, and --index-tablespace (Robert Haas)
• Change pg_test_fsync to test for a fixed amount of time, rather than a fixed number of cycles (Bruce Momjian)
  The -cycles option was removed, and -seconds added.
• Add a pg_test_timing utility to measure clock monotonicity and timing overhead (Ants Aasma, Greg Smith)
• Add a tcn (triggered change notification) module to generate NOTIFY events on table changes (Kevin Grittner)

E.100.3.13.1. pg_upgrade

• Adjust pg_upgrade environment variables (Bruce Momjian)
  Rename data, bin, and port environment variables to begin with PG, and support PGPORoldt/PGPORTNEW, to replace PGPORT.
• Overhaul pg_upgrade logging and failure reporting (Bruce Momjian)
  Create four append-only log files, and delete them on success. Add -r/retain option to unconditionally retain these files. Also remove pg_upgrade options -g/-G options as unnecessary, and tighten log file permissions.
• Make pg_upgrade create a script to incrementally generate more accurate optimizer statistics (Bruce Momjian)
  This reduces the time needed to generate minimal cluster statistics after an upgrade.
• Allow pg_upgrade to upgrade an old cluster that does not have a postgres database (Bruce Momjian)
• Allow pg_upgrade to handle cases where some old or new databases are missing, as long as they are empty (Bruce Momjian)
• Allow pg_upgrade to handle configuration-only directory installations (Bruce Momjian)
• In pg_upgrade, add -o/-O options to pass parameters to the servers (Bruce Momjian)
  This is useful for configuration-only directory installs.
• Change pg_upgrade to use port 50432 by default (Bruce Momjian)
  This helps avoid unintended client connections during the upgrade.
• Reduce cluster locking in pg_upgrade (Bruce Momjian)
  Specifically, only lock the old cluster if link mode is used, and do it right after the schema is restored.

E.100.3.13.2. pg_stat_statements
• Allow pg_stat_statements to aggregate similar queries via SQL text normalization (Peter Geoghegan, Tom Lane)
  Users with applications that use non-parameterized SQL will now be able to monitor query performance without detailed log analysis.
• Add dirtied and written block counts and read/write times to pg_stat_statements (Robert Haas, Ants Aasma)
• Prevent pg_stat_statements from double-counting PREPARE and EXECUTE commands (Tom Lane)

E.100.3.13.3. sepgsql
• Support SECURITY LABEL on global objects (KaiGai Kohei, Robert Haas)
  Specifically, add security labels to databases, tablespaces, and roles.
• Allow sepgsql to honor database labels (KaiGai Kohei)
• Perform sepgsql permission checks during the creation of various objects (KaiGai Kohei)
• Add sepgsql_setcon() and related functions to control the sepgsql security domain (KaiGai Kohei)
• Add a user space access cache to sepgsql to improve performance (KaiGai Kohei)

E.100.3.14. Documentation
• Add a rule to optionally build HTML documentation using the stylesheet from the website (Magnus Hagander)
  Use gmake STYLE=website draft.
• Improve EXPLAIN documentation (Tom Lane)
• Document that user/database names are preserved with double-quoting by command-line tools like vacuumdb (Bruce Momjian)
• Document the actual string returned by the client for MD5 authentication (Cyan Ogilvie)
• Deprecate use of GLOBAL and LOCAL in CREATE TEMP TABLE (Noah Misch)
  PostgreSQL has long treated these keyword as no-ops, and continues to do so; but in future they might mean what the SQL standard says they mean, so applications should avoid using them.
Appendix E. Release Notes

Release date: 2016-10-27

This release contains a variety of fixes from 9.1.23. For information about new features in the 9.1 major release, see Section E.125.

This is expected to be the last PostgreSQL release in the 9.1.X series. Users are encouraged to update to a newer release branch soon.

E.101.1. Migration to Version 9.1.24

A dump/restore is not required for those running 9.1.X.

However, if you are upgrading from a version earlier than 9.1.16, see Section E.109.

E.101.2. Changes

• Fix EvalPlanQual rechecks involving CTE scans (Tom Lane)

  The recheck would always see the CTE as returning no rows, typically leading to failure to update rows that were recently updated.

• Fix improper repetition of previous results from hashed aggregation in a subquery (Andrew Gierth)

  The test to see if we can reuse a previously-computed hash table of the aggregate state values neglected the possibility of an outer query reference appearing in an aggregate argument expression. A change in the value of such a reference should lead to recalculating the hash table, but did not.

• Fix timeout length when VACUUM is waiting for exclusive table lock so that it can truncate the table (Simon Riggs)

  The timeout was meant to be 50 milliseconds, but it was actually only 50 microseconds, causing VACUUM to give up on truncation much more easily than intended. Set it to the intended value.

• Remove artificial restrictions on the values accepted by numeric_in() and numeric_recv() (Tom Lane)

  We allow numeric values up to the limit of the storage format (more than 1e100000), so it seems fairly pointless that numeric_in() rejected scientific-notation exponents above 1000. Likewise, it was silly for numeric_recv() to reject more than 1000 digits in an input value.

• Avoid very-low-probability data corruption due to testing tuple visibility without holding buffer lock (Thomas Munro, Peter Geoghegan, Tom Lane)

• Fix file descriptor leakage when truncating a temporary relation of more than 1GB (Andres Freund)

• Disallow starting a standalone backend with standby_mode turned on (Michael Paquier)

  This can’t do anything useful, since there will be no WAL receiver process to fetch more WAL data; and it could result in misbehavior in code that wasn’t designed with this situation in mind.

• Don’t try to share SSL contexts across multiple connections in libpq (Heikki Linnakangas)
This led to assorted corner-case bugs, particularly when trying to use different SSL parameters for different connections.

- Avoid corner-case memory leak in libpq (Tom Lane)

  The reported problem involved leaking an error report during `PQreset()`, but there might be related cases.

- Make `ecpg`'s `--help` and `--version` options work consistently with our other executables (Haribabu Kommi)

- Fix `contrib/intarray/bench/bench.pl` to print the results of the `EXPLAIN` it does when given the `-e` option (Daniel Gustafsson)

- Prevent failure of obsolete dynamic time zone abbreviations (Tom Lane)

  If a dynamic time zone abbreviation does not match any entry in the referenced time zone, treat it as equivalent to the time zone name. This avoids unexpected failures when IANA removes abbreviations from their time zone database, as they did in tzdata release 2016f and seem likely to do again in the future. The consequences were not limited to not recognizing the individual abbreviation; any mismatch caused the `pg_timezone_abbrevs` view to fail altogether.

- Update time zone data files to tzdata release 2016h for DST law changes in Palestine and Turkey, plus historical corrections for Turkey and some regions of Russia. Switch to numeric abbreviations for some time zones in Antarctica, the former Soviet Union, and Sri Lanka.

  The IANA time zone database previously provided textual abbreviations for all time zones, sometimes making up abbreviations that have little or no currency among the local population. They are in process of reversing that policy in favor of using numeric UTC offsets in zones where there is no evidence of real-world use of an English abbreviation. At least for the time being, PostgreSQL will continue to accept such removed abbreviations for timestamp input. But they will not be shown in the `pg_timezone_names` view nor used for output.

  In this update, `AMT` is no longer shown as being in use to mean Armenia Time. Therefore, we have changed the `Default` abbreviation set to interpret it as Amazon Time, thus UTC-4 not UTC+4.

### E.102. Release 9.1.23

**Release date:** 2016-08-11

This release contains a variety of fixes from 9.1.22. For information about new features in the 9.1 major release, see Section E.125.

The PostgreSQL community will stop releasing updates for the 9.1.X release series in September 2016. Users are encouraged to update to a newer release branch soon.

#### E.102.1. Migration to Version 9.1.23

A dump/restore is not required for those running 9.1.X.

However, if you are upgrading from a version earlier than 9.1.16, see Section E.109.
E.102.2. Changes

- Fix possible mis-evaluation of nested CASE-WHEN expressions (Heikki Linnakangas, Michael Paquier, Tom Lane)
  
  A CASE expression appearing within the test value subexpression of another CASE could become confused about whether its own test value was null or not. Also, inlining of a SQL function implementing the equality operator used by a CASE expression could result in passing the wrong test value to functions called within a CASE expression in the SQL function’s body. If the test values were of different data types, a crash might result; moreover such situations could be abused to allow disclosure of portions of server memory. (CVE-2016-5423)

- Fix client programs’ handling of special characters in database and role names (Noah Misch, Nathan Bossart, Michael Paquier)
  
  Numerous places in vacuumdb and other client programs could become confused by database and role names containing double quotes or backslashes. Tighten up quoting rules to make that safe. Also, ensure that when a conninfo string is used as a database name parameter to these programs, it is correctly treated as such throughout.

  Fix handling of paired double quotes in psql’s `\connect` and `\password` commands to match the documentation.

  Introduce a new `-reuse-previous` option in psql’s `\connect` command to allow explicit control of whether to re-use connection parameters from a previous connection. (Without this, the choice is based on whether the database name looks like a conninfo string, as before.) This allows secure handling of database names containing special characters in `pg_dumpall` scripts.

  `pg_dumpall` now refuses to deal with database and role names containing carriage returns or newlines, as it seems impractical to quote those characters safely on Windows. In future we may reject such names on the server side, but that step has not been taken yet.

  These are considered security fixes because crafted object names containing special characters could have been used to execute commands with superuser privileges the next time a superuser executes `pg_dumpall` or other routine maintenance operations. (CVE-2016-5424)

- Fix corner-case misbehaviors for IS NULL/IS NOT NULL applied to nested composite values (Andrew Gierth, Tom Lane)
  
  The SQL standard specifies that `IS NULL` should return TRUE for a row of all null values (thus `ROW(NULL,NULL) IS NULL` yields TRUE), but this is not meant to apply recursively (thus `ROW(NULL, ROW(NULL,NULL)) IS NULL` yields FALSE). The core executor got this right, but certain planner optimizations treated the test as recursive (thus producing TRUE in both cases), and `contrib/postgres_fdw` could produce remote queries that misbehaved similarly.

- Make the inet and cidr data types properly reject IPv6 addresses with too many colon-separated fields (Tom Lane)

- Prevent crash in `close_ps()` (the point `## lseg` operator) for NaN input coordinates (Tom Lane)
  
  Make it return NULL instead of crashing.

- Fix several one-byte buffer over-reads in `to_number()` (Peter Eisentraut)
  
  In several cases the `to_number()` function would read one more character than it should from the input string. There is a small chance of a crash, if the input happens to be adjacent to the end of memory.
Appendix E. Release Notes

• Avoid unsafe intermediate state during expensive paths through heap_update() (Masahiko Sawada, Andres Freund)

Previously, these cases locked the target tuple (by setting its XMAX) but did not WAL-log that action, thus risking data integrity problems if the page were spilled to disk and then a database crash occurred before the tuple update could be completed.

• Avoid consuming a transaction ID during VACUUM (Alexander Korotkov)

Some cases in VACUUM unnecessarily caused an XID to be assigned to the current transaction. Normally this is negligible, but if one is up against the XID wraparound limit, consuming more XIDs during anti-wraparound vacuums is a very bad thing.

• Avoid canceling hot-standby queries during VACUUM FREEZE (Simon Riggs, Álvaro Herrera)

VACUUM FREEZE on an otherwise-idle master server could result in unnecessary cancellations of queries on its standby servers.

• When a manual ANALYZE specifies a column list, don’t reset the table’s changes_since_analyze counter (Tom Lane)

If we’re only analyzing some columns, we should not prevent routine auto-analyze from happening for the other columns.

• Fix ANALYZE’s overestimation of n_distinct for a unique or nearly-unique column with many null entries (Tom Lane)

The nulls could get counted as though they were themselves distinct values, leading to serious planner misestimates in some types of queries.

• Prevent autovacuum from starting multiple workers for the same shared catalog (Álvaro Herrera)

Normally this isn’t much of a problem because the vacuum doesn’t take long anyway; but in the case of a severely bloated catalog, it could result in all but one worker uselessly waiting instead of doing useful work on other tables.

• Fix contrib/btree_gin to handle the smallest possible bigint value correctly (Peter Eisentraut)

• Teach libpq to correctly decode server version from future servers (Peter Eisentraut)

It’s planned to switch to two-part instead of three-part server version numbers for releases after 9.6. Make sure that PQserverVersion() returns the correct value for such cases.

• Fix ecpg’s code for unsigned long long array elements (Michael Meskes)

• Make pg_basebackup accept -Z 0 as specifying no compression (Fujii Masao)

• Revert to the old heuristic timeout for pg_ctl start -w (Tom Lane)

The new method adopted as of release 9.1.20 does not work when silent_mode is enabled, so go back to the old way.

• Fix makefiles’ rule for building AIX shared libraries to be safe for parallel make (Noah Misch)

• Fix TAP tests and MSVC scripts to work when build directory’s path name contains spaces (Michael Paquier, Kyotoaru Horiguchi)

• Make regression tests safe for Danish and Welsh locales (Jeff Janes, Tom Lane)

Change some test data that triggered the unusual sorting rules of these locales.

• Update our copy of the timezone code to match IANA’s tzcode release 2016c (Tom Lane)
This is needed to cope with anticipated future changes in the time zone data files. It also fixes some corner-case bugs in coping with unusual time zones.

- Update time zone data files to tzdata release 2016f for DST law changes in Kemerovo and Novosibirsk, plus historical corrections for Azerbaijan, Belarus, and Morocco.

### E.103. Release 9.1.22

**Release date:** 2016-05-12

This release contains a variety of fixes from 9.1.21. For information about new features in the 9.1 major release, see Section E.125.

The PostgreSQL community will stop releasing updates for the 9.1.X release series in September 2016. Users are encouraged to update to a newer release branch soon.

#### E.103.1. Migration to Version 9.1.22

A dump/restore is not required for those running 9.1.X.

However, if you are upgrading from a version earlier than 9.1.16, see Section E.109.

#### E.103.2. Changes

- Clear the OpenSSL error queue before OpenSSL calls, rather than assuming it’s clear already; and make sure we leave it clear afterwards (Peter Geoghegan, Dave Vitek, Peter Eisentraut)

This change prevents problems when there are multiple connections using OpenSSL within a single process and not all the code involved follows the same rules for when to clear the error queue. Failures have been reported specifically when a client application uses SSL connections in libpq concurrently with SSL connections using the PHP, Python, or Ruby wrappers for OpenSSL. It’s possible for similar problems to arise within the server as well, if an extension module establishes an outgoing SSL connection.

- Fix “failed to build any $way joins” planner error with a full join enclosed in the right-hand side of a left join (Tom Lane)

- Fix possible misbehavior of \texttt{TH}, \texttt{th}, and \texttt{Y}, \texttt{YYY} format codes in \texttt{to_timestamp()} (Tom Lane)

These could advance off the end of the input string, causing subsequent format codes to read garbage.

- Fix dumping of rules and views in which the \texttt{array} argument of a \texttt{value operator ANY (array)} construct is a sub-SELECT (Tom Lane)

- Make \texttt{pg_regress} use a startup timeout from the \texttt{PGCTLTIMEOUT} environment variable, if that’s set (Tom Lane)

This is for consistency with a behavior recently added to \texttt{pg_ctl}; it eases automated testing on slow machines.
• Fix pg_upgrade to correctly restore extension membership for operator families containing only one operator class (Tom Lane)

In such a case, the operator family was restored into the new database, but it was no longer marked as part of the extension. This had no immediate ill effects, but would cause later pg_dump runs to emit output that would cause (harmless) errors on restore.

• Rename internal function strtoi() to strtol() to avoid conflict with a NetBSD library function (Thomas Munro)

• Fix reporting of errors from bind() and listen() system calls on Windows (Tom Lane)

• Reduce verbosity of compiler output when building with Microsoft Visual Studio (Christian Ullrich)

• Avoid possibly-unsafe use of Windows’ FormatMessage() function (Christian Ullrich)

  Use the FORMAT_MESSAGE_IGNORE_INSERTS flag where appropriate. No live bug is known to exist here, but it seems like a good idea to be careful.

• Update time zone data files to tzdata release 2016d for DST law changes in Russia and Venezuela. There are new zone names Europe/Kirov and Asia/Tomsk to reflect the fact that these regions now have different time zone histories from adjacent regions.

E.104. Release 9.1.21

Release date: 2016-03-31

This release contains a variety of fixes from 9.1.20. For information about new features in the 9.1 major release, see Section E.125.

E.104.1. Migration to Version 9.1.21

A dump/restore is not required for those running 9.1.X.

However, if you are upgrading from a version earlier than 9.1.16, see Section E.109.

E.104.2. Changes

• Fix incorrect handling of NULL index entries in indexed ROW() comparisons (Tom Lane)

  An index search using a row comparison such as \texttt{ROW(a, b) > ROW('x', 'y')} would stop upon reaching a NULL entry in the \texttt{b} column, ignoring the fact that there might be non-NULL \texttt{b} values associated with later values of \texttt{a}.

• Avoid unlikely data-loss scenarios due to renaming files without adequate \texttt{fsync()} calls before and after (Michael Paquier, Tomas Vondra, Andres Freund)

• Correctly handle cases where \texttt{pg_subtrans} is close to XID wraparound during server startup (Jeff Janes)

• Fix corner-case crash due to trying to free \texttt{localeconv()} output strings more than once (Tom Lane)
Appendix E. Release Notes

• Fix parsing of affix files for `ispell` dictionaries (Tom Lane)
  The code could go wrong if the affix file contained any characters whose byte length changes during case-folding, for example 'I' in Turkish UTF8 locales.

• Avoid use of `sscanf()` to parse `ispell` dictionary files (Artur Zakirov)
  This dodges a portability problem on FreeBSD-derived platforms (including macOS).

• Avoid a crash on old Windows versions (before 7SP1/2008R2SP1) with an AVX2-capable CPU and a Postgres build done with Visual Studio 2013 (Christian Ullrich)
  This is a workaround for a bug in Visual Studio 2013’s runtime library, which Microsoft have stated they will not fix in that version.

• Fix `psql`’s tab completion logic to handle multibyte characters properly (Kyotaro Horiguchi, Robert Haas)

• Fix `psql`’s tab completion for `SECURITY LABEL` (Tom Lane)
  Pressing TAB after `SECURITY LABEL` might cause a crash or offering of inappropriate keywords.

• Make `pg_ctl` accept a wait timeout from the `PGCTLTIMEOUT` environment variable, if none is specified on the command line (Noah Misch)
  This eases testing of slower buildfarm members by allowing them to globally specify a longer-than-normal timeout for postmaster startup and shutdown.

• Fix incorrect test for Windows service status in `pg_ctl` (Manuel Mathar)
  The previous set of minor releases attempted to fix `pg_ctl` to properly determine whether to send log messages to Window’s Event Log, but got the test backwards.

• Fix `pgbench` to correctly handle the combination of `-C` and `-M prepared options (Tom Lane)

• In PL/Perl, properly translate empty Postgres arrays into empty Perl arrays (Alex Hunsaker)

• Make PL/Python cope with function names that aren’t valid Python identifiers (Jim Nasby)

• Fix multiple mistakes in the statistics returned by `contrib/pgstattuple`'s `pgstatindex()` function (Tom Lane)

• Remove dependency on `psed` in MSVC builds, since it’s no longer provided by core Perl (Michael Paquier, Andrew Dunstan)

• Update time zone data files to `tzdata` release 2016c for DST law changes in Azerbaijan, Chile, Haiti, Palestine, and Russia (Altai, Astrakhan, Kirov, Sakhalin, Ulyanovsk regions), plus historical corrections for Lithuania, Moldova, and Russia (Kaliningrad, Samara, Volgograd).

---

E.105. Release 9.1.20

Release date: 2016-02-11

This release contains a variety of fixes from 9.1.19. For information about new features in the 9.1 major release, see Section E.125.
Appendix E. Release Notes

E.105.1. Migration to Version 9.1.20

A dump/restore is not required for those running 9.1.X.
However, if you are upgrading from a version earlier than 9.1.16, see Section E.109.

E.105.2. Changes

- Fix infinite loops and buffer-overrun problems in regular expressions (Tom Lane)
  Very large character ranges in bracket expressions could cause infinite loops in some cases, and memory
  overwrites in other cases. (CVE-2016-0773)
- Perform an immediate shutdown if the postmaster.pid file is removed (Tom Lane)
  The postmaster now checks every minute or so that postmaster.pid is still there and still contains
  its own PID. If not, it performs an immediate shutdown, as though it had received SIGQUIT. The main
  motivation for this change is to ensure that failed buildfarm runs will get cleaned up without manual
  intervention; but it also serves to limit the bad effects if a DBA forcibly removes postmaster.pid
  and then starts a new postmaster.
- In SERIALIZABLE transaction isolation mode, serialization anomalies could be missed due to race
  conditions during insertions (Kevin Grittner, Thomas Munro)
- Fix failure to emit appropriate WAL records when doing ALTER TABLE ... SET TABLESPACE for
  unlogged relations (Michael Paquier, Andres Freund)
  Even though the relation’s data is unlogged, the move must be logged or the relation will be inaccessible
  after a standby is promoted to master.
- Fix possible misinitialization of unlogged relations at the end of crash recovery (Andres Freund,
  Michael Paquier)
- Fix ALTER COLUMN TYPE to reconstruct inherited check constraints properly (Tom Lane)
- Fix REASSIGN OWNED to change ownership of composite types properly (Álvaro Herrera)
- Fix REASSIGN OWNED and ALTER OWNER to correctly update granted-permissions lists when changing
  owners of data types, foreign data wrappers, or foreign servers (Bruce Momjian, Álvaro Herrera)
- Fix REASSIGN OWNED to ignore foreign user mappings, rather than fail (Álvaro Herrera)
- Add more defenses against bad planner cost estimates for GIN index scans when the index’s internal
  statistics are very out-of-date (Tom Lane)
- Make planner cope with hypothetical GIN indexes suggested by an index advisor plug-in (Julien
  Rouhaud)
- Fix dumping of whole-row Vars in ROW() and VALUES() lists (Tom Lane)
- Fix possible internal overflow in numeric division (Dean Rasheed)
- Fix enforcement of restrictions inside parentheses within regular expression lookahead constraints (Tom
  Lane)
Lookahead constraints aren’t allowed to contain backrefs, and parentheses within them are always considered non-capturing, according to the manual. However, the code failed to handle these cases properly inside a parenthesized subexpression, and would give unexpected results.

- Conversion of regular expressions to indexscan bounds could produce incorrect bounds from regexps containing lookahead constraints (Tom Lane)
- Fix regular-expression compiler to handle loops of constraint arcs (Tom Lane)
  The code added for CVE-2007-4772 was both incomplete, in that it didn’t handle loops involving more than one state, and incorrect, in that it could cause assertion failures (though there seem to be no bad consequences of that in a non-assert build). Multi-state loops would cause the compiler to run until the query was canceled or it reached the too-many-states error condition.
- Improve memory-usage accounting in regular-expression compiler (Tom Lane)
  This causes the code to emit “regular expression is too complex” errors in some cases that previously used unreasonable amounts of time and memory.
- Improve performance of regular-expression compiler (Tom Lane)
- Make %h and %r escapes in log_line_prefix work for messages emitted due to log_connections (Tom Lane)
  Previously, %h/%r started to work just after a new session had emitted the “connection received” log message; now they work for that message too.
- On Windows, ensure the shared-memory mapping handle gets closed in child processes that don’t need it (Tom Lane, Amit Kapila)
  This oversight resulted in failure to recover from crashes whenever logging_collector is turned on.
- Fix possible failure to detect socket EOF in non-blocking mode on Windows (Tom Lane)
  It’s not entirely clear whether this problem can happen in pre-9.5 branches, but if it did, the symptom would be that a walsender process would wait indefinitely rather than noticing a loss of connection.
- Avoid leaking a token handle during SSPI authentication (Christian Ullrich)
- In psql, ensure that libreadline’s idea of the screen size is updated when the terminal window size changes (Merlin Moncure)
  Previously, libreadline did not notice if the window was resized during query output, leading to strange behavior during later input of multiline queries.
- Fix psql’s \det command to interpret its pattern argument the same way as other \d commands with potentially schema-qualified patterns do (Reece Hart)
- Avoid possible crash in psql’s \c command when previous connection was via Unix socket and command specifies a new hostname and same username (Tom Lane)
- In pg_ctl start -w, test child process status directly rather than relying on heuristics (Tom Lane, Michael Paquier)
  Previously, pg_ctl relied on an assumption that the new postmaster would always create postmaster.pid within five seconds. But that can fail on heavily-loaded systems, causing pg_ctl to report incorrectly that the postmaster failed to start.
Appendix E. Release Notes

Except on Windows, this change also means that a `pg_ctl start -w` done immediately after another such command will now reliably fail, whereas previously it would report success if done within two seconds of the first command.

- In `pg_ctl start -w`, don’t attempt to use a wildcard listen address to connect to the postmaster (Kondo Yuta)

  On Windows, `pg_ctl` would fail to detect postmaster startup if `listen_addresses` is set to `0.0.0.0` or `::`, because it would try to use that value verbatim as the address to connect to, which doesn’t work. Instead assume that `127.0.0.1` or `::1`, respectively, is the right thing to use.

- In `pg_ctl` on Windows, check service status to decide where to send output, rather than checking if standard output is a terminal (Michael Paquier)

- In `pg_dump` and `pg_basebackup`, adopt the GNU convention for handling tar-archive members exceeding 8GB (Tom Lane)

  The POSIX standard for tar file format does not allow archive member files to exceed 8GB, but most modern implementations of tar support an extension that fixes that. Adopt this extension so that `pg_dump` with `-Ft` no longer fails on tables with more than 8GB of data, and so that `pg_basebackup` can handle files larger than 8GB. In addition, fix some portability issues that could cause failures for members between 4GB and 8GB on some platforms. Potentially these problems could cause unrecoverable data loss due to unreadable backup files.

- Fix assorted corner-case bugs in `pg_dump`’s processing of extension member objects (Tom Lane)

- Make `pg_dump` mark a view’s triggers as needing to be processed after its rule, to prevent possible failure during parallel `pg_restore` (Tom Lane)

- Ensure that relation option values are properly quoted in `pg_dump` (Kouhei Sutou, Tom Lane)

  A reloption value that isn’t a simple identifier or number could lead to dump/reload failures due to syntax errors in CREATE statements issued by `pg_dump`. This is not an issue with any reloption currently supported by core PostgreSQL, but extensions could allow reloptions that cause the problem.

- Fix `pg_upgrade`’s file-copying code to handle errors properly on Windows (Bruce Momjian)

- Install guards in `pgbench` against corner-case overflow conditions during evaluation of script-specified division or modulo operators (Fabien Coelho, Michael Paquier)

- Prevent certain PL/Java parameters from being set by non-superusers (Noah Misch)

  This change mitigates a PL/Java security bug (CVE-2016-0766), which was fixed in PL/Java by marking these parameters as superuser-only. To fix the security hazard for sites that update PostgreSQL more frequently than PL/Java, make the core code aware of them also.

- Improve `libpq`’s handling of out-of-memory situations (Michael Paquier, Amit Kapila, Heikki Linnakangas)

- Fix order of arguments in `ecpg`-generated `typedef` statements (Michael Meskes)

- Use `%g` not `%f` format in `ecpg`’s `PGTYPESnumeric_from_double()` (Tom Lane)

- Fix `ecpg`-supplied header files to not contain comments continued from a preprocessor directive line onto the next line (Michael Meskes)

  Such a comment is rejected by `ecpg`. It’s not yet clear whether `ecpg` itself should be changed.
Appendix E. Release Notes

- Ensure that contrib/pgcrypto's crypt() function can be interrupted by query cancel (Andreas Karlsson)
- Accept flex versions later than 2.5.x (Tom Lane, Michael Paquier)
  Now that flex 2.6.0 has been released, the version checks in our build scripts needed to be adjusted.
- Install our missing script where PGXS builds can find it (Jim Nasby)
  This allows sane behavior in a PGXS build done on a machine where build tools such as bison are missing.
- Ensure that dynloader.h is included in the installed header files in MSVC builds (Bruce Momjian, Michael Paquier)
- Add variant regression test expected-output file to match behavior of current libxml2 (Tom Lane)
  The fix for libxml2's CVE-2015-7499 causes it not to output error context reports in some cases where it used to do so. This seems to be a bug, but we'll probably have to live with it for some time, so work around it.
- Update time zone data files to tzdata release 2016a for DST law changes in Cayman Islands, Metlakatla, and Trans-Baikal Territory (Zabaykalsky Krai), plus historical corrections for Pakistan.

E.106. Release 9.1.19

Release date: 2015-10-08

This release contains a variety of fixes from 9.1.18. For information about new features in the 9.1 major release, see Section E.125.

E.106.1. Migration to Version 9.1.19

A dump/restore is not required for those running 9.1.X.

However, if you are upgrading from a version earlier than 9.1.16, see Section E.109.

E.106.2. Changes

- Fix contrib/pgcrypto to detect and report too-short crypt() salts (Josh Kupershmidt)
  Certain invalid salt arguments crashed the server or disclosed a few bytes of server memory. We have not ruled out the viability of attacks that arrange for presence of confidential information in the disclosed bytes, but they seem unlikely. (CVE-2015-5288)
- Fix subtransaction cleanup after a portal (cursor) belonging to an outer subtransaction fails (Tom Lane, Michael Paquier)
  A function executed in an outer-subtransaction cursor could cause an assertion failure or crash by referencing a relation created within an inner subtransaction.
Appendix E. Release Notes

- Fix insertion of relations into the relation cache “init file” (Tom Lane)

  An oversight in a patch in the most recent minor releases caused `pg_trigger_tgrelid_tgname_index` to be omitted from the init file. Subsequent sessions detected this, then deemed the init file to be broken and silently ignored it, resulting in a significant degradation in session startup time. In addition to fixing the bug, install some guards so that any similar future mistake will be more obvious.

- Avoid O(N^2) behavior when inserting many tuples into a SPI query result (Neil Conway)

- Improve `LISTEN` startup time when there are many unread notifications (Matt Newell)

- Back-patch 9.3-era addition of per-resource-owner lock caches (Jeff Janes)

  This substantially improves performance when `pg_dump` tries to dump a large number of tables.

- Disable SSL renegotiation by default (Michael Paquier, Andres Freund)

  While use of SSL renegotiation is a good idea in theory, we have seen too many bugs in practice, both in the underlying OpenSSL library and in our usage of it. Renegotiation will be removed entirely in 9.5 and later. In the older branches, just change the default value of `ssl_renegotiation_limit` to zero (disabled).

- Lower the minimum values of the `*_freeze_max_age` parameters (Andres Freund)

  This is mainly to make tests of related behavior less time-consuming, but it may also be of value for installations with limited disk space.

- Limit the maximum value of `wal_buffers` to 2GB to avoid server crashes (Josh Berkus)

- Fix rare internal overflow in multiplication of numeric values (Dean Rasheed)

- Guard against hard-to-reach stack overflows involving record types, range types, `json`, `jsonb`, `tsquery`, `ltxtquery` and `query_int` (Noah Misch)

- Fix handling of DOW and DOY in datetime input (Greg Stark)

  These tokens aren’t meant to be used in datetime values, but previously they resulted in opaque internal error messages rather than “invalid input syntax”.

- Add more query-cancel checks to regular expression matching (Tom Lane)

- Add recursion depth protections to regular expression, `SIMILAR TO`, and `LIKE` matching (Tom Lane)

  Suitable search patterns and a low stack depth limit could lead to stack-overrun crashes.

- Fix potential infinite loop in regular expression execution (Tom Lane)

  A search pattern that can apparently match a zero-length string, but actually doesn’t match because of a back reference, could lead to an infinite loop.

- Fix low-memory failures in regular expression compilation (Andreas Seltenreich)

- Fix low-probability memory leak during regular expression execution (Tom Lane)

- Fix rare low-memory failure in lock cleanup during transaction abort (Tom Lane)

- Fix “unexpected out-of-memory situation during sort” errors when using tuplestores with small `work_mem` settings (Tom Lane)

- Fix very-low-probability stack overrun in `qsort` (Tom Lane)
Appendix E. Release Notes

- Fix “invalid memory alloc request size” failure in hash joins with large `work_mem` settings (Tomas Vondra, Tom Lane)

- Fix assorted planner bugs (Tom Lane)
  These mistakes could lead to incorrect query plans that would give wrong answers, or to assertion failures in assert-enabled builds, or to odd planner errors such as “could not devise a query plan for the given query”, “could not find pathkey item to sort”, “plan should not reference subplan’s variable”, or “failed to assign all NestLoopParams to plan nodes”. Thanks are due to Andreas Seltenreich and Piotr Stefaniak for fuzz testing that exposed these problems.

- Use fuzzy path cost tiebreaking rule in all supported branches (Tom Lane)
  This change is meant to avoid platform-specific behavior when alternative plan choices have effectively-identical estimated costs.

- Ensure standby promotion trigger files are removed at postmaster startup (Michael Paquier, Fujii Masao)
  This prevents unwanted promotion from occurring if these files appear in a database backup that is used to initialize a new standby server.

- During postmaster shutdown, ensure that per-socket lock files are removed and listen sockets are closed before we remove the `postmaster.pid` file (Tom Lane)
  This avoids race-condition failures if an external script attempts to start a new postmaster as soon as `pg_ctl stop` returns.

- Fix postmaster’s handling of a startup-process crash during crash recovery (Tom Lane)
  If, during a crash recovery cycle, the startup process crashes without having restored database consistency, we’d try to launch a new startup process, which typically would just crash again, leading to an infinite loop.

- Do not print a `WARNING` when an autovacuum worker is already gone when we attempt to signal it, and reduce log verbosity for such signals (Tom Lane)

- Prevent autovacuum launcher from sleeping unduly long if the server clock is moved backwards a large amount (Álvaro Herrera)

- Ensure that cleanup of a GIN index’s pending-insertions list is interruptable by cancel requests (Jeff Janes)

- Allow all-zeroes pages in GIN indexes to be reused (Heikki Linnakangas)
  Such a page might be left behind after a crash.

- Fix off-by-one error that led to otherwise-harmless warnings about “apparent wraparound” in subtrans/multixact truncation (Thomas Munro)

- Fix misreporting of `CONTINUE` and `MOVE` statement types in PL/pgSQL’s error context messages (Pavel Stehule, Tom Lane)

- Fix PL/Perl to handle non-ASCII error message texts correctly (Alex Hunsaker)

- Fix PL/Python crash when returning the string representation of a `record` result (Tom Lane)

- Fix some places in PL/Tcl that neglected to check for failure of `malloc()` calls (Michael Paquier, Álvaro Herrera)

- In `contrib/isn`, fix output of ISBN-13 numbers that begin with 979 (Fabien Coelho)
Appendix E. Release Notes

EANs beginning with 979 (but not 9790) are considered ISBNs, but they must be printed in the new 13-digit format, not the 10-digit format.

- Improve libpq’s handling of out-of-memory conditions (Michael Paquier, Heikki Linnakangas)
- Fix memory leaks and missing out-of-memory checks in ecpg (Michael Paquier)
- Fix psql’s code for locale-aware formatting of numeric output (Tom Lane)
  
  The formatting code invoked by \pset numericlocale on did the wrong thing for some uncommon cases such as numbers with an exponent but no decimal point. It could also mangle already-localized output from the money data type.

- Prevent crash in psql’s \c command when there is no current connection (Noah Misch)
- Fix selection of default zlib compression level in pg_dump’s directory output format (Andrew Dunstan)
- Ensure that temporary files created during a pg_dump run with tar-format output are not world-readable (Michael Paquier)
- Fix pg_dump and pg_upgrade to support cases where the postgres or template1 database is in a non-default tablesapce (Marti Raudsepp, Bruce Momjian)
- Fix pg_dump to handle object privileges sanely when dumping from a server too old to have a particular privilege type (Tom Lane)

  When dumping functions or procedural languages from pre-7.3 servers, pg_dump would produce GRANT/REVOKE commands that revoked the owner’s grantable privileges and instead granted all privileges to PUBLIC. Since the privileges involved are just USAGE and EXECUTE, this isn’t a security problem, but it’s certainly a surprising representation of the older systems’ behavior. Fix it to leave the default privilege state alone in these cases.

- Fix pg_dump to dump shell types (Tom Lane)
  
  Shell types (that is, not-yet-fully-defined types) aren’t useful for much, but nonetheless pg_dump should dump them.

- Fix assorted minor memory leaks in pg_dump and other client-side programs (Michael Paquier)
- Fix spinlock assembly code for PPC hardware to be compatible with AIX’s native assembler (Tom Lane)
  
  Building with gcc didn’t work if gcc had been configured to use the native assembler, which is becoming more common.

- On AIX, test the -qlonglong compiler option rather than just assuming it’s safe to use (Noah Misch)
- On AIX, use -Wl,-brtl1ib link option to allow symbols to be resolved at runtime (Noah Misch)
  
  Perl relies on this ability in 5.8.0 and later.

- Avoid use of inline functions when compiling with 32-bit xlc, due to compiler bugs (Noah Misch)
- Use librt for sched_yield() when necessary, which it is on some Solaris versions (Oskari Saarenmaa)
- Fix Windows install.bat script to handle target directory names that contain spaces (Heikki Linnakangas)
- Make the numeric form of the PostgreSQL version number (e.g., 90405) readily available to extension Makefiles, as a variable named VERSION_NUM (Michael Paquier)
• Update time zone data files to tzdata release 2015g for DST law changes in Cayman Islands, Fiji, Moldova, Morocco, Norfolk Island, North Korea, Turkey, and Uruguay. There is a new zone name America/Fort_Nelson for the Canadian Northern Rockies.

E.107. Release 9.1.18

Release date: 2015-06-12
This release contains a small number of fixes from 9.1.17. For information about new features in the 9.1 major release, see Section E.125.

E.107.1. Migration to Version 9.1.18
A dump/restore is not required for those running 9.1.X.
However, if you are upgrading from a version earlier than 9.1.16, see Section E.109.

E.107.2. Changes

• Fix rare failure to invalidate relation cache init file (Tom Lane)
  With just the wrong timing of concurrent activity, a VACUUM FULL on a system catalog might fail to update the “init file” that’s used to avoid cache-loading work for new sessions. This would result in later sessions being unable to access that catalog at all. This is a very ancient bug, but it’s so hard to trigger that no reproducible case had been seen until recently.

• Avoid deadlock between incoming sessions and CREATE/DROP DATABASE (Tom Lane)
  A new session starting in a database that is the target of a DROP DATABASE command, or is the template for a CREATE DATABASE command, could cause the command to wait for five seconds and then fail, even if the new session would have exited before that.

E.108. Release 9.1.17

Release date: 2015-06-04
This release contains a small number of fixes from 9.1.16. For information about new features in the 9.1 major release, see Section E.125.

E.108.1. Migration to Version 9.1.17
A dump/restore is not required for those running 9.1.X.
However, if you are upgrading from a version earlier than 9.1.16, see Section E.109.
E.108.2. Changes

- Avoid failures while fsync’ing data directory during crash restart (Abhijit Menon-Sen, Tom Lane)
  
  In the previous minor releases we added a patch to fsync everything in the data directory after a crash. Unfortunately its response to any error condition was to fail, thereby preventing the server from starting up, even when the problem was quite harmless. An example is that an unwritable file in the data directory would prevent restart on some platforms; but it is common to make SSL certificate files unwritable by the server. Revise this behavior so that permissions failures are ignored altogether, and other types of failures are logged but do not prevent continuing.

- Remove configure’s check prohibiting linking to a threaded libpython on OpenBSD (Tom Lane)
  
  The failure this restriction was meant to prevent seems to not be a problem anymore on current OpenBSD versions.

- Allow libpq to use TLS protocol versions beyond v1 (Noah Misch)
  
  For a long time, libpq was coded so that the only SSL protocol it would allow was TLS v1. Now that newer TLS versions are becoming popular, allow it to negotiate the highest commonly-supported TLS version with the server. (PostgreSQL servers were already capable of such negotiation, so no change is needed on the server side.) This is a back-patch of a change already released in 9.4.0.

E.109. Release 9.1.16

Release date: 2015-05-22

This release contains a variety of fixes from 9.1.15. For information about new features in the 9.1 major release, see Section E.125.

E.109.1. Migration to Version 9.1.16

A dump/restore is not required for those running 9.1.X.

However, if you use contrib/citext’s regexp_matches() functions, see the changelog entry below about that.

Also, if you are upgrading from a version earlier than 9.1.14, see Section E.111.

E.109.2. Changes

- Avoid possible crash when client disconnects just before the authentication timeout expires (Benkocs Norbert Attila)
  
  If the timeout interrupt fired partway through the session shutdown sequence, SSL-related state would be freed twice, typically causing a crash and hence denial of service to other sessions. Experimentation shows that an unauthenticated remote attacker could trigger the bug somewhat consistently, hence treat as security issue. (CVE-2015-3165)
Appendix E. Release Notes

• Improve detection of system-call failures (Noah Misch)

Our replacement implementation of `snprintf()` failed to check for errors reported by the underlying system library calls; the main case that might be missed is out-of-memory situations. In the worst case this might lead to information exposure, due to our code assuming that a buffer had been overwritten when it hadn’t been. Also, there were a few places in which security-relevant calls of other system library functions did not check for failure.

It remains possible that some calls of the `*printf()` family of functions are vulnerable to information disclosure if an out-of-memory error occurs at just the wrong time. We judge the risk to not be large, but will continue analysis in this area. (CVE-2015-3166)

• In `contrib/pgcrypto`, uniformly report decryption failures as “Wrong key or corrupt data” (Noah Misch)

Previously, some cases of decryption with an incorrect key could report other error message texts. It has been shown that such variance in error reports can aid attackers in recovering keys from other systems. While it’s unknown whether `pgcrypto`’s specific behaviors are likewise exploitable, it seems better to avoid the risk by using a one-size-fits-all message. (CVE-2015-3167)

• Fix incorrect declaration of `contrib/citext`’s `regexp_matches()` functions (Tom Lane)

These functions should return `setof text[]`, like the core functions they are wrappers for; but they were incorrectly declared as returning just `text[]`. This mistake had two results: first, if there was no match you got a scalar null result, whereas what you should get is an empty set (zero rows). Second, the `g` flag was effectively ignored, since you would get only one result array even if there were multiple matches.

While the latter behavior is clearly a bug, there might be applications depending on the former behavior; therefore the function declarations will not be changed by default until PostgreSQL 9.5. In pre-9.5 branches, the old behavior exists in version 1.0 of the `citext` extension, while we have provided corrected declarations in version 1.1 (which is not installed by default). To adopt the fix in pre-9.5 branches, execute `ALTER EXTENSION citext UPDATE TO '1.1'` in each database in which `citext` is installed. (You can also “update” back to 1.0 if you need to undo that.) Be aware that either update direction will require dropping and recreating any views or rules that use `citext`’s `regexp_matches()` functions.

• Fix incorrect checking of deferred exclusion constraints after a HOT update (Tom Lane)

If a new row that potentially violates a deferred exclusion constraint is HOT-updated (that is, no indexed columns change and the row can be stored back onto the same table page) later in the same transaction, the exclusion constraint would be reported as violated when the check finally occurred, even if the row(s) the new row originally conflicted with had been deleted.

• Prevent improper reordering of antijoins (NOT EXISTS joins) versus other outer joins (Tom Lane)

This oversight in the planner has been observed to cause “could not find RelOptInfo for given relids” errors, but it seems possible that sometimes an incorrect query plan might get past that consistency check and result in silently-wrong query output.

• Fix incorrect matching of subexpressions in outer-join plan nodes (Tom Lane)

Previously, if textually identical non-strict subexpressions were used both above and below an outer join, the planner might try to re-use the value computed below the join, which would be incorrect because the executor would force the value to NULL in case of an unmatched outer row.
• Fix GEQO planner to cope with failure of its join order heuristic (Tom Lane)
  This oversight has been seen to lead to “failed to join all relations together” errors in queries involving LATERAL, and that might happen in other cases as well.
• Fix possible deadlock at startup when max_prepared_transactions is too small (Heikki Linnakangas)
• Don’t archive useless preallocated WAL files after a timeline switch (Heikki Linnakangas)
• Avoid “cannot GetMultiXactIdMembers() during recovery” error (Álvaro Herrera)
• Recursively fsync() the data directory after a crash (Abhijit Menon-Sen, Robert Haas)
  This ensures consistency if another crash occurs shortly later. (The second crash would have to be a system-level crash, not just a database crash, for there to be a problem.)
• Fix autovacuum launcher’s possible failure to shut down, if an error occurs after it receives SIGTERM (Álvaro Herrera)
• Cope with unexpected signals in LockBufferForCleanup() (Andres Freund)
  This oversight could result in spurious errors about “multiple backends attempting to wait for pincount 1”.
• Avoid waiting for WAL flush or synchronous replication during commit of a transaction that was read-only so far as the user is concerned (Andres Freund)
  Previously, a delay could occur at commit in transactions that had written WAL due to HOT page pruning, leading to undesirable effects such as sessions getting stuck at startup if all synchronous replicas are down. Sessions have also been observed to get stuck in catchup interrupt processing when using synchronous replication; this will fix that problem as well.
• Fix crash when manipulating hash indexes on temporary tables (Heikki Linnakangas)
• Fix possible failure during hash index bucket split, if other processes are modifying the index concurrently (Tom Lane)
• Check for interrupts while analyzing index expressions (Jeff Janes)
  \texttt{ANALYZE} executes index expressions many times; if there are slow functions in such an expression, it’s desirable to be able to cancel the \texttt{ANALYZE} before that loop finishes.
• Ensure tableoid of a foreign table is reported correctly when a READ COMMITTED recheck occurs after locking rows in \texttt{SELECT FOR UPDATE, UPDATE, or DELETE} (Etsuro Fujita)
• Add the name of the target server to object description strings for foreign-server user mappings (Álvaro Herrera)
• Recommend setting \texttt{include_realm} to 1 when using Kerberos/GSSAPI/SSPI authentication (Stephen Frost)
  Without this, identically-named users from different realms cannot be distinguished. For the moment this is only a documentation change, but it will become the default setting in PostgreSQL 9.5.
• Remove code for matching IPv4 pg_hba.conf entries to IPv4-in-IPv6 addresses (Tom Lane)
  This hack was added in 2003 in response to a report that some Linux kernels of the time would report IPv4 connections as having IPv4-in-IPv6 addresses. However, the logic was accidentally broken in 9.0. The lack of any field complaints since then shows that it’s not needed anymore. Now we have reports that the broken code causes crashes on some systems, so let’s just remove it rather than fix it. (Had we
chosen to fix it, that would make for a subtle and potentially security-sensitive change in the effective
meaning of IPv4 pg_hba.conf entries, which does not seem like a good thing to do in minor releases.)

- Report WAL flush, not insert, position in IDENTIFY_SYSTEM replication command (Heikki Linnakangas)

  This avoids a possible startup failure in pg_receivexlog.

- While shutting down service on Windows, periodically send status updates to the Service Control Manager
to prevent it from killing the service too soon; and ensure that pg_ctl will wait for shutdown (Krystian Bigaj)

- Reduce risk of network deadlock when using libpq’s non-blocking mode (Heikki Linnakangas)

  When sending large volumes of data, it’s important to drain the input buffer every so often, in case the
server has sent enough response data to cause it to block on output. (A typical scenario is that the server
is sending a stream of NOTICE messages during COPY FROM STDIN.) This worked properly in the
normal blocking mode, but not so much in non-blocking mode. We’ve modified libpq to opportunisti-
cally drain input when it can, but a full defense against this problem requires application cooperation:
the application should watch for socket read-ready as well as write-ready conditions, and be sure to call
PQconsumeInput() upon read-ready.

- Fix array handling in ecpg (Michael Meskes)

- Fix psql to sanely handle URIs and conninfo strings as the first parameter to \connect (David Fetter,
Andrew Dunstan, Álvaro Herrera)

  This syntax has been accepted (but undocumented) for a long time, but previously some parameters
might be taken from the old connection instead of the given string, which was agreed to be undesirable.

- Suppress incorrect complaints from psql on some platforms that it failed to write ~/.psql_history
at exit (Tom Lane)

  This misbehavior was caused by a workaround for a bug in very old (pre-2006) versions of libedit. We
fixed it by removing the workaround, which will cause a similar failure to appear for anyone still using
such versions of libedit. Recommendation: upgrade that library, or use libreadline.

- Fix pg_dump’s rule for deciding which casts are system-provided casts that should not be dumped (Tom
Lane)

- In pg_dump, fix failure to honor -Z compression level option together with -Fd (Michael Paquier)

- Make pg_dump consider foreign key relationships between extension configuration tables while choos-
ing dump order (Gilles Darold, Michael Paquier, Stephen Frost)

  This oversight could result in producing dumps that fail to reload because foreign key constraints are
transiently violated.

- Fix dumping of views that are just VALUES(...) but have column aliases (Tom Lane)

- In pg_upgrade, force timeline 1 in the new cluster (Bruce Momjian)

  This change prevents upgrade failures caused by bogus complaints about missing WAL history files.

- In pg_upgrade, check for improperly non-connectable databases before proceeding (Bruce Momjian)

- In pg_upgrade, quote directory paths properly in the generated delete_old_cluster script (Bruce
Momjian)

- In pg_upgrade, preserve database-level freezing info properly (Bruce Momjian)
This oversight could cause missing-clog-file errors for tables within the `postgres` and `template1` databases.

- Run `pg_upgrade` and `pg_resetxlog` with restricted privileges on Windows, so that they don’t fail when run by an administrator (Muhammad Asif Naeem)
- Improve handling of `readdir()` failures when scanning directories in `initdb` and `pg_basebackup` (Marco Nenciarini)
- Fix slow sorting algorithm in `contrib/intarray` (Tom Lane)
- Fix compile failure on Sparc V8 machines (Rob Rowan)
- Update time zone data files to `tzdata` release 2015d for DST law changes in Egypt, Mongolia, and Palestine, plus historical changes in Canada and Chile. Also adopt revised zone abbreviations for the America/Adak zone (HST/HDT not HAST/HADT).

**E.110. Release 9.1.15**

**Release date:** 2015-02-05

This release contains a variety of fixes from 9.1.14. For information about new features in the 9.1 major release, see Section E.125.

**E.110.1. Migration to Version 9.1.15**

A dump/restore is not required for those running 9.1.X.

However, if you are upgrading from a version earlier than 9.1.14, see Section E.111.

**E.110.2. Changes**

- Fix buffer overruns in `to_char()` (Bruce Momjian)
  When `to_char()` processes a numeric formatting template calling for a large number of digits, PostgreSQL would read past the end of a buffer. When processing a crafted timestamp formatting template, PostgreSQL would write past the end of a buffer. Either case could crash the server. We have not ruled out the possibility of attacks that lead to privilege escalation, though they seem unlikely. (CVE-2015-0241)
- Fix buffer overrun in replacement `*printf()` functions (Tom Lane)
  PostgreSQL includes a replacement implementation of `printf` and related functions. This code will overrun a stack buffer when formatting a floating point number (conversion specifiers `e`, `E`, `f`, `F`, `g` or `G`) with requested precision greater than about 500. This will crash the server, and we have not ruled out the possibility of attacks that lead to privilege escalation. A database user can trigger such a buffer overrun through the `to_char()` SQL function. While that is the only affected core PostgreSQL functionality, extension modules that use printf-family functions may be at risk as well.
Appendix E. Release Notes

This issue primarily affects PostgreSQL on Windows. PostgreSQL uses the system implementation of these functions where adequate, which it is on other modern platforms. (CVE-2015-0242)

- **Fix buffer overruns in contrib/pgcrypto** (Marko Tiikkaja, Noah Misch)
  Errors in memory size tracking within the `pgcrypto` module permitted stack buffer overruns and improper dependence on the contents of uninitialized memory. The buffer overrun cases can crash the server, and we have not ruled out the possibility of attacks that lead to privilege escalation. (CVE-2015-0243)

- **Fix possible loss of frontend/backend protocol synchronization after an error** (Heikki Linnakangas)
  If any error occurred while the server was in the middle of reading a protocol message from the client, it could lose synchronization and incorrectly try to interpret part of the message’s data as a new protocol message. An attacker able to submit crafted binary data within a command parameter might succeed in injecting his own SQL commands this way. Statement timeout and query cancellation are the most likely sources of errors triggering this scenario. Particularly vulnerable are applications that use a timeout and also submit arbitrary user-crafted data as binary query parameters. Disabling statement timeout will reduce, but not eliminate, the risk of exploit. Our thanks to Emil Lenngren for reporting this issue. (CVE-2015-0244)

- **Fix information leak via constraint-violation error messages** (Stephen Frost)
  Some server error messages show the values of columns that violate a constraint, such as a unique constraint. If the user does not have `SELECT` privilege on all columns of the table, this could mean exposing values that the user should not be able to see. Adjust the code so that values are displayed only when they came from the SQL command or could be selected by the user. (CVE-2014-8161)

- **Lock down regression testing’s temporary installations on Windows** (Noah Misch)
  Use SSPI authentication to allow connections only from the OS user who launched the test suite. This closes on Windows the same vulnerability previously closed on other platforms, namely that other users might be able to connect to the test postmaster. (CVE-2014-0067)

- **Avoid possible data corruption if `ALTER DATABASE SET TABLESPACE` is used to move a database to a new tablespace and then shortly later move it back to its original tablespace** (Tom Lane)

- **Avoid corrupting tables when `ANALYZE` inside a transaction is rolled back** (Andres Freund, Tom Lane, Michael Paquier)
  If the failing transaction had earlier removed the last index, rule, or trigger from the table, the table would be left in a corrupted state with the relevant `pg_class` flags not set though they should be.

- **Ensure that unlogged tables are copied correctly during `CREATE DATABASE` or `ALTER DATABASE SET TABLESPACE`** (Pavan Deolasee, Andres Freund)

- **Fix `DROP`’s dependency searching to correctly handle the case where a table column is recursively visited before its table** (Petr Jelinek, Tom Lane)
  This case is only known to arise when an extension creates both a datatype and a table using that datatype. The faulty code might refuse a `DROP EXTENSION` unless `CASCADE` is specified, which should not be required.

- **Fix use-of-already-freed-memory problem in EvalPlanQual processing** (Tom Lane)
  In `READ COMMITTED` mode, queries that lock or update recently-updated rows could crash as a result of this bug.
• Fix planning of `SELECT FOR UPDATE` when using a partial index on a child table (Kyotaro Horiguchi)

In **READ COMMITTED** mode, `SELECT FOR UPDATE` must also recheck the partial index’s `WHERE` condition when rechecking a recently-updated row to see if it still satisfies the query’s `WHERE` condition. This requirement was missed if the index belonged to an inheritance child table, so that it was possible to incorrectly return rows that no longer satisfy the query condition.

• Fix corner case wherein `SELECT FOR UPDATE` could return a row twice, and possibly miss returning other rows (Tom Lane)

In **READ COMMITTED** mode, a `SELECT FOR UPDATE` that is scanning an inheritance tree could incorrectly return a row from a prior child table instead of the one it should return from a later child table.

• Reject duplicate column names in the referenced-columns list of a `FOREIGN KEY` declaration (David Rowley)

This restriction is per SQL standard. Previously we did not reject the case explicitly, but later on the code would fail with bizarre-looking errors.

• Fix bugs in raising a numeric value to a large integral power (Tom Lane)

The previous code could get a wrong answer, or consume excessive amounts of time and memory before realizing that the answer must overflow.

• In `numeric_recv()`, truncate away any fractional digits that would be hidden according to the value’s `dscale` field (Tom Lane)

A numeric value’s display scale (`dscale`) should never be less than the number of nonzero fractional digits; but apparently there’s at least one broken client application that transmits binary numeric values in which that’s true. This leads to strange behavior since the extra digits are taken into account by arithmetic operations even though they aren’t printed. The least risky fix seems to be to truncate away such “hidden” digits on receipt, so that the value is indeed what it prints as.

• Reject out-of-range numeric timezone specifications (Tom Lane)

Simple numeric timezone specifications exceeding +/- 168 hours (one week) would be accepted, but could then cause null-pointer dereference crashes in certain operations. There’s no use-case for such large UTC offsets, so reject them.

• Fix bugs in `tsquery @> tsquery` operator (Heikki Linnakangas)

Two different terms would be considered to match if they had the same CRC. Also, if the second operand had more terms than the first, it would be assumed not to be contained in the first; which is wrong since it might contain duplicate terms.

• Improve ispell dictionary’s defenses against bad affix files (Tom Lane)

• Allow more than 64K phrases in a thesaurus dictionary (David Boutin)

The previous coding could crash on an oversize dictionary, so this was deemed a back-patchable bug fix rather than a feature addition.

• Fix namespace handling in `xpath()` (Ali Akbar)

Previously, the `xml` value resulting from an `xpath()` call would not have namespace declarations if the namespace declarations were attached to an ancestor element in the input `xml` value, rather than to the specific element being returned. Propagate the ancestral declaration so that the result is correct when considered in isolation.
Appendix E. Release Notes

- Fix planner problems with nested append relations, such as inherited tables within \texttt{UNION ALL} sub-queries (Tom Lane)
- Fail cleanly when a GiST index tuple doesn’t fit on a page, rather than going into infinite recursion (Andrew Gierth)
- Exempt tables that have per-table \texttt{cost_limit} and/or \texttt{cost_delay} settings from autovacuum’s global cost balancing rules (Álvaro Herrera)
  
The previous behavior resulted in basically ignoring these per-table settings, which was unintended. Now, a table having such settings will be vacuumed using those settings, independently of what is going on in other autovacuum workers. This may result in heavier total I/O load than before, so such settings should be re-examined for sanity.
- Avoid wholesale autovacuuming when autovacuum is nominally off (Tom Lane)
  
  Even when autovacuum is nominally off, we will still launch autovacuum worker processes to vacuum tables that are at risk of XID wraparound. However, such a worker process then proceeded to vacuum all tables in the target database, if they met the usual thresholds for autovacuuming. This is at best pretty unexpected; at worst it delays response to the wraparound threat. Fix it so that if autovacuum is turned off, workers \emph{only} do anti-wraparound vacuums and not any other work.
- During crash recovery, ensure that unlogged relations are rewritten as empty and are synced to disk before recovery is considered complete (Abhijit Menon-Sen, Andres Freund)
  
  This prevents scenarios in which unlogged relations might contain garbage data following database crash recovery.
- Fix race condition between hot standby queries and replaying a full-page image (Heikki Linnakangas)
  
  This mistake could result in transient errors in queries being executed in hot standby.
- Fix several cases where recovery logic improperly ignored WAL records for COMMIT/ABORT PREPARED (Heikki Linnakangas)
  
  The most notable oversight was that \texttt{recovery_target_xid} could not be used to stop at a two-phase commit.
- Avoid creating unnecessary \texttt{.ready} marker files for timeline history files (Fujii Masao)
- Fix possible null pointer dereference when an empty prepared statement is used and the \texttt{log_statement} setting is \texttt{mod} or \texttt{ddl} (Fujii Masao)
- Change “\texttt{pgstat wait timeout}” warning message to be LOG level, and rephrase it to be more understandable (Tom Lane)
  
  This message was originally thought to be essentially a can’t-happen case, but it occurs often enough on our slower buildfarm members to be a nuisance. Reduce it to LOG level, and expend a bit more effort on the wording: it now reads “using stale statistics instead of current ones because stats collector is not responding”.
- Fix SPARC spinlock implementation to ensure correctness if the CPU is being run in a non-TSO coherency mode, as some non-Solaris kernels do (Andres Freund)
- Warn if macOS’s \texttt{setlocale()} starts an unwanted extra thread inside the postmaster (Noah Misch)
- Fix processing of repeated \texttt{dbname} parameters in \texttt{PQconnectdbParams()} (Alex Shulgin)
Appendix E. Release Notes

Unexpected behavior ensued if the first occurrence of dbname contained a connection string or URI to be expanded.

- Ensure that libpq reports a suitable error message on unexpected socket EOF (Marko Tiikkaja, Tom Lane)
  Depending on kernel behavior, libpq might return an empty error string rather than something useful when the server unexpectedly closed the socket.

- Clear any old error message during PQreset() (Heikki Linnakangas)
  If PQreset() is called repeatedly, and the connection cannot be re-established, error messages from the failed connection attempts kept accumulating in the PGconn’s error string.

- Properly handle out-of-memory conditions while parsing connection options in libpq (Alex Shulgin, Heikki Linnakangas)

- Fix array overrun in ecpg’s version of ParseDateTime() (Michael Paquier)

- In initdb, give a clearer error message if a password file is specified but is empty (Mats Erik Andersson)

- Fix psql’s \s command to work nicely with libedit, and add pager support (Stepan Rutz, Tom Lane)
  When using libedit rather than readline, \s printed the command history in a fairly unreadable encoded format, and on recent libedit versions might fail altogether. Fix that by printing the history ourselves rather than having the library do it. A pleasant side-effect is that the pager is used if appropriate.

  This patch also fixes a bug that caused newline encoding to be applied inconsistently when saving the command history with libedit. Multiline history entries written by older psql versions will be read cleanly with this patch, but perhaps not vice versa, depending on the exact libedit versions involved.

- Improve consistency of parsing of psql’s special variables (Tom Lane)
  Allow variant spellings of on and off (such as 1/0) for ECHO_HIDDEN and ON_ERROR_ROLLBACK. Report a warning for unrecognized values for COMP_KEYWORD_CASE, ECHO, ECHO_HIDDEN, HISTCONTROL, ON_ERROR_ROLLBACK, and VERBOSITY. Recognize all values for all these variables case-insensitively; previously there was a mishmash of case-sensitive and case-insensitive behaviors.

- Fix psql’s expanded-mode display to work consistently when using border = 3 and linestyle = ascii or unicode (Stephen Frost)

- Improve performance of pg_dump when the database contains many instances of multiple dependency paths between the same two objects (Tom Lane)

- Fix possible deadlock during parallel restore of a schema-only dump (Robert Haas, Tom Lane)

- Fix core dump in pg_dump --binary-upgrade on zero-column composite type (Rushabh Lathia)

- Prevent WAL files created by pg_basebackup -x/-X from being archived again when the standby is promoted (Andres Freund)

- Fix upgrade-from-unpackaged script for contrib/citext (Tom Lane)

- Fix block number checking in contrib/pageinspect’s get_raw_page() (Tom Lane)
  The incorrect checking logic could prevent access to some pages in non-main relation forks.

- Fix contrib/pgcrypto’s pgp_sym_decrypt() to not fail on messages whose length is 6 less than a power of 2 (Marko Tiikkaja)

- Fix file descriptor leak in contrib/pg_test_fsync (Jeff Janes)
This could cause failure to remove temporary files on Windows.

- Handle unexpected query results, especially NULLs, safely in contrib/tablefunc's `connectby()`
  (Michael Paquier)

  `connectby()` previously crashed if it encountered a NULL key value. It now prints that row but
  doesn’t recurse further.

- Avoid a possible crash in contrib/xml2’s `xslt_process()` (Mark Simonetti)

  libxslt seems to have an undocumented dependency on the order in which resources are freed; reorder
  our calls to avoid a crash.

- Mark some contrib I/O functions with correct volatility properties (Tom Lane)

  The previous over-conservative marking was immaterial in normal use, but could cause optimization
  problems or rejection of valid index expression definitions. Since the consequences are not large, we’ve
  just adjusted the function definitions in the extension modules’ scripts, without changing version num-
  bers.

- Numerous cleanups of warnings from Coverity static code analyzer (Andres Freund, Tatsuo Ishii,
  Marko Kreen, Tom Lane, Michael Paquier)

  These changes are mostly cosmetic but in some cases fix corner-case bugs, for example a crash rather
  than a proper error report after an out-of-memory failure. None are believed to represent security issues.

- Detect incompatible OpenLDAP versions during build (Noah Misch)

  With OpenLDAP versions 2.4.24 through 2.4.31, inclusive, PostgreSQL backends can crash at exit.
  Raise a warning during configure based on the compile-time OpenLDAP version number, and test the
  crashing scenario in the contrib/dblink regression test.

- In non-MSVC Windows builds, ensure `libpq.dll` is installed with execute permissions (Noah Misch)

- Make `pg_regress` remove any temporary installation it created upon successful exit (Tom Lane)

  This results in a very substantial reduction in disk space usage during `make check-world`, since that
  sequence involves creation of numerous temporary installations.

- Support time zone abbreviations that change UTC offset from time to time (Tom Lane)

  Previously, PostgreSQL assumed that the UTC offset associated with a time zone abbreviation (such
  as EST) never changes in the usage of any particular locale. However this assumption fails in the real
  world, so introduce the ability for a zone abbreviation to represent a UTC offset that sometimes changes.
  Update the zone abbreviation definition files to make use of this feature in timezone locales that have
  changed the UTC offset of their abbreviations since 1970 (according to the IANA timezone database).
  In such timezones, PostgreSQL will now associate the correct UTC offset with the abbreviation de-
  pending on the given date.

- Update time zone abbreviations lists (Tom Lane)

  Add CST (China Standard Time) to our lists. Remove references to ADT as “Arabia Daylight Time”,
  an abbreviation that’s been out of use since 2007; therefore, claiming there is a conflict with “Atlantic
  Daylight Time” doesn’t seem especially helpful. Fix entirely incorrect GMT offsets for CKT (Cook
  Islands), FJT, and FJST (Fiji); we didn’t even have them on the proper side of the date line.

- Update time zone data files to tzdata release 2015a.
The IANA timezone database has adopted abbreviations of the form $AxST/AxDT$ for all Australian time zones, reflecting what they believe to be current majority practice Down Under. These names do not conflict with usage elsewhere (other than ACST for Acre Summer Time, which has been in disuse since 1994). Accordingly, adopt these names into our “Default” timezone abbreviation set. The “Australia” abbreviation set now contains only CST, EAST, EST, SAST, SAT, and WST, all of which are thought to be mostly historical usage. Note that SAST has also been changed to be South Africa Standard Time in the “Default” abbreviation set.

Also, add zone abbreviations SRET (Asia/Srednekolymsk) and XJT (Asia/Urumqi), and use WSST/WSDT for western Samoa. Also, there were DST law changes in Chile, Mexico, the Turks & Caicos Islands (America/Grand_Turk), and Fiji. There is a new zone Pacific/Bougainville for portions of Papua New Guinea. Also, numerous corrections for historical (pre-1970) time zone data.

E.111. Release 9.1.14

**Release date:** 2014-07-24

This release contains a variety of fixes from 9.1.13. For information about new features in the 9.1 major release, see Section E.125.

E.111.1. Migration to Version 9.1.14

A dump/restore is not required for those running 9.1.X.

However, this release corrects an index corruption problem in some GiST indexes. See the first changelog entry below to find out whether your installation has been affected and what steps you should take if so.

Also, if you are upgrading from a version earlier than 9.1.11, see Section E.114.

E.111.2. Changes

- Correctly initialize padding bytes in contrib/btree_gist indexes on bit columns (Heikki Linnakangas)
  
  This error could result in incorrect query results due to values that should compare equal not being seen as equal. Users with GiST indexes on bit or bit varying columns should **REINDEX** those indexes after installing this update.

- Protect against torn pages when deleting GIN list pages (Heikki Linnakangas)
  
  This fix prevents possible index corruption if a system crash occurs while the page update is being written to disk.

- Don’t clear the right-link of a GiST index page while replaying updates from WAL (Heikki Linnakan-gas)
  
  This error could lead to transiently wrong answers from GiST index scans performed in Hot Standby.

- Fix feedback status when hot_standby_feedback is turned off on-the-fly (Simon Riggs)
Appendix E. Release Notes

- Fix possibly-incorrect cache invalidation during nested calls to `ReceiveSharedInvalidMessages` (Andres Freund)
- Fix “could not find pathkey item to sort” planner failures with `UNION ALL` over subqueries reading from tables with inheritance children (Tom Lane)
- Don’t assume a subquery’s output is unique if there’s a set-returning function in its targetlist (David Rowley)
  This oversight could lead to misoptimization of constructs like `WHERE x IN (SELECT y, generate_series(1,10) FROM t GROUP BY y)`.
- Fix failure to detoast fields in composite elements of structured types (Tom Lane)
  This corrects cases where TOAST pointers could be copied into other tables without being dereferenced. If the original data is later deleted, it would lead to errors like “missing chunk number 0 for toast value ...” when the now-dangling pointer is used.
- Fix “record type has not been registered” failures with whole-row references to the output of Append plan nodes (Tom Lane)
- Fix possible crash when invoking a user-defined function while rewinding a cursor (Tom Lane)
- Fix query-lifespan memory leak while evaluating the arguments for a function in `FROM` (Tom Lane)
- Fix session-lifespan memory leaks in regular-expression processing (Tom Lane, Arthur O’Dwyer, Greg Stark)
- Fix data encoding error in `hungarian.stop` (Tom Lane)
- Prevent foreign tables from being created with OIDS when `default_with_oids` is true (Etsuro Fujita)
- Fix liveness checks for rows that were inserted in the current transaction and then deleted by a now-rolled-back subtransaction (Andres Freund)
  This could cause problems (at least spurious warnings, and at worst an infinite loop) if `CREATE INDEX` or `CLUSTER` were done later in the same transaction.
- Clear `pg_stat_activity.xact_start` during `PREPARE TRANSACTION` (Andres Freund)
  After the `PREPARE`, the originating session is no longer in a transaction, so it should not continue to display a transaction start time.
- Fix `REASSIGN OWNED` to not fail for text search objects (Álvaro Herrera)
- Block signals during postmaster startup (Tom Lane)
  This ensures that the postmaster will properly clean up after itself if, for example, it receives SIGINT while still starting up.
- Fix client host name lookup when processing `pg_hba.conf` entries that specify host names instead of IP addresses (Tom Lane)
  Ensure that reverse-DNS lookup failures are reported, instead of just silently not matching such entries. Also ensure that we make only one reverse-DNS lookup attempt per connection, not one per host name entry, which is what previously happened if the lookup attempts failed.
- Secure Unix-domain sockets of temporary postmasters started during `make check` (Noah Misch)
  Any local user able to access the socket file could connect as the server’s bootstrap superuser, then proceed to execute arbitrary code as the operating-system user running the test, as we previously noted
Appendix E. Release Notes

in CVE-2014-0067. This change defends against that risk by placing the server’s socket in a temporary, mode 0700 subdirectory of /tmp. The hazard remains however on platforms where Unix sockets are not supported, notably Windows, because then the temporary postmaster must accept local TCP connections.

A useful side effect of this change is to simplify make check testing in builds that override DEFAULT_PGSOCKET_DIR. Popular non-default values like /var/run/postgresql are often not writable by the build user, requiring workarounds that will no longer be necessary.

- Fix tablespace creation WAL replay to work on Windows (MauMau)
- Fix detection of socket creation failures on Windows (Bruce Momjian)
- On Windows, allow new sessions to absorb values of PGC_BACKEND parameters (such as log_connections) from the configuration file (Amit Kapila)
  Previously, if such a parameter were changed in the file post-startup, the change would have no effect.
- Properly quote executable path names on Windows (Nikhil Deshpande)
  This oversight could cause initdb and pg_upgrade to fail on Windows, if the installation path contained both spaces and @ signs.
- Fix linking of libpython on macOS (Tom Lane)
  The method we previously used can fail with the Python library supplied by Xcode 5.0 and later.
- Avoid buffer bloat in libpq when the server consistently sends data faster than the client can absorb it (Shin-ichi Morita, Tom Lane)
  libpq could be coerced into enlarging its input buffer until it runs out of memory (which would be reported misleadingly as “lost synchronization with server”). Under ordinary circumstances it’s quite far-fetched that data could be continuously transmitted more quickly than the recv() loop can absorb it, but this has been observed when the client is artificially slowed by scheduler constraints.
- Ensure that LDAP lookup attempts in libpq time out as intended (Laurenz Albe)
- Fix ecpg to do the right thing when an array of char * is the target for a FETCH statement returning more than one row, as well as some other array-handling fixes (Ashutosh Bapat)
- Fix pg_restore’s processing of old-style large object comments (Tom Lane)
  A direct-to-database restore from an archive file generated by a pre-9.0 version of pg_dump would usually fail if the archive contained more than a few comments for large objects.
- In contrib/pgcrypto functions, ensure sensitive information is cleared from stack variables before returning (Marko Kreen)
- In contrib/uuid-ossp, cache the state of the OSSP UUID library across calls (Tom Lane)
  This improves the efficiency of UUID generation and reduces the amount of entropy drawn from /dev/urandom, on platforms that have that.
- Update time zone data files to tzdata release 2014e for DST law changes in Crimea, Egypt, and Morocco.
E.112. Release 9.1.13

Release date: 2014-03-20

This release contains a variety of fixes from 9.1.12. For information about new features in the 9.1 major release, see Section E.125.

E.112.1. Migration to Version 9.1.13

A dump/restore is not required for those running 9.1.X.

However, if you are upgrading from a version earlier than 9.1.11, see Section E.114.

E.112.2. Changes

• Restore GIN metapages unconditionally to avoid torn-page risk (Heikki Linnakangas)
  Although this oversight could theoretically result in a corrupted index, it is unlikely to have caused any problems in practice, since the active part of a GIN metapage is smaller than a standard 512-byte disk sector.

• Avoid race condition in checking transaction commit status during receipt of a NOTIFY message (Marko Tiikkaja)
  This prevents a scenario wherein a sufficiently fast client might respond to a notification before database updates made by the notifier have become visible to the recipient.

• Allow regular-expression operators to be terminated early by query cancel requests (Tom Lane)
  This prevents scenarios wherein a pathological regular expression could lock up a server process uninterruptibly for a long time.

• Remove incorrect code that tried to allow OVERLAPS with single-element row arguments (Joshua Yanovski)
  This code never worked correctly, and since the case is neither specified by the SQL standard nor documented, it seemed better to remove it than fix it.

• Avoid getting more than AccessShareLock when de-parsing a rule or view (Dean Rasheed)
  This oversight resulted in pg_dump unexpectedly acquiring RowExclusiveLock locks on tables mentioned as the targets of INSERT/UPDATE/DELETE commands in rules. While usually harmless, that could interfere with concurrent transactions that tried to acquire, for example, ShareLock on those tables.

• Improve performance of index endpoint probes during planning (Tom Lane)
  This change fixes a significant performance problem that occurred when there were many not-yet-committed rows at the end of the index, which is a common situation for indexes on sequentially-assigned values such as timestamps or sequence-generated identifiers.

• Fix walsender’s failure to shut down cleanly when client is pg_receivexlog (Fujii Masao)

• Fix test to see if hot standby connections can be allowed immediately after a crash (Heikki Linnakangas)

• Prevent interrupts while reporting non-ERROR messages (Tom Lane)
This guards against rare server-process freezeups due to recursive entry to `syslog()`, and perhaps other related problems.

- Fix memory leak in PL/Perl when returning a composite result, including multiple-OUT-parameter cases (Alex Hunsaker)
- Prevent intermittent “could not reserve shared memory region” failures on recent Windows versions (MauMau)
- Update time zone data files to tzdata release 2014a for DST law changes in Fiji and Turkey, plus historical changes in Israel and Ukraine.

### E.113. Release 9.1.12

**Release date:** 2014-02-20

This release contains a variety of fixes from 9.1.11. For information about new features in the 9.1 major release, see Section E.125.

#### E.113.1. Migration to Version 9.1.12

A dump/restore is not required for those running 9.1.X.

However, if you are upgrading from a version earlier than 9.1.11, see Section E.114.

#### E.113.2. Changes

- **Shore up `GRANT ... WITH ADMIN OPTION` restrictions (Noah Misch)**
  
  Granting a role without `ADMIN OPTION` is supposed to prevent the grantee from adding or removing members from the granted role, but this restriction was easily bypassed by doing `SET ROLE` first. The security impact is mostly that a role member can revoke the access of others, contrary to the wishes of his grantor. Unapproved role member additions are a lesser concern, since an uncooperative role member could provide most of his rights to others anyway by creating views or `SECURITY DEFINER` functions. (CVE-2014-0060)

- **Prevent privilege escalation via manual calls to PL validator functions (Andres Freund)**
  
  The primary role of PL validator functions is to be called implicitly during `CREATE FUNCTION`, but they are also normal SQL functions that a user can call explicitly. Calling a validator on a function actually written in some other language was not checked for and could be exploited for privilege-escalation purposes. The fix involves adding a call to a privilege-checking function in each validator function. Non-core procedural languages will also need to make this change to their own validator functions, if any. (CVE-2014-0061)

- **Avoid multiple name lookups during table and index DDL (Robert Haas, Andres Freund)**
  
  If the name lookups come to different conclusions due to concurrent activity, we might perform some parts of the DDL on a different table than other parts. At least in the case of `CREATE INDEX`, this can be
used to cause the permissions checks to be performed against a different table than the index creation, allowing for a privilege escalation attack. (CVE-2014-0062)

- Prevent buffer overrun with long datetime strings (Noah Misch)
  The `MAXDATELEN` constant was too small for the longest possible value of type `interval`, allowing a buffer overrun in `interval_out()`. Although the datetime input functions were more careful about avoiding buffer overrun, the limit was short enough to cause them to reject some valid inputs, such as input containing a very long timezone name. The ecpg library contained these vulnerabilities along with some of its own. (CVE-2014-0063)

- Prevent buffer overrun due to integer overflow in size calculations (Noah Misch, Heikki Linnakangas)
  Several functions, mostly type input functions, calculated an allocation size without checking for overflow. If overflow did occur, a too-small buffer would be allocated and then written past. (CVE-2014-0064)

- Prevent overruns of fixed-size buffers (Peter Eisentraut, Jozef Mlich)
  Use `strlcpy()` and related functions to provide a clear guarantee that fixed-size buffers are not overrun. Unlike the preceding items, it is unclear whether these cases really represent live issues, since in most cases there appear to be previous constraints on the size of the input string. Nonetheless it seems prudent to silence all Coverity warnings of this type. (CVE-2014-0065)

- Avoid crashing if `crypt()` returns NULL (Honza Horak, Bruce Momjian)
  There are relatively few scenarios in which `crypt()` could return NULL, but `contrib/chkpass` would crash if it did. One practical case in which this could be an issue is if `libc` is configured to refuse to execute unapproved hashing algorithms (e.g., “FIPS mode”). (CVE-2014-0066)

- Document risks of `make check` in the regression testing instructions (Noah Misch, Tom Lane)
  Since the temporary server started by `make check` uses “trust” authentication, another user on the same machine could connect to it as database superuser, and then potentially exploit the privileges of the operating-system user who started the tests. A future release will probably incorporate changes in the testing procedure to prevent this risk, but some public discussion is needed first. So for the moment, just warn people against using `make check` when there are untrusted users on the same machine. (CVE-2014-0067)

- Fix possible mis-replay of WAL records when some segments of a relation aren’t full size (Greg Stark, Tom Lane)
  The WAL update could be applied to the wrong page, potentially many pages past where it should have been. Aside from corrupting data, this error has been observed to result in significant “bloat” of standby servers compared to their masters, due to updates being applied far beyond where the end-of-file should have been. This failure mode does not appear to be a significant risk during crash recovery, only when initially synchronizing a standby created from a base backup taken from a quickly-changing master.

- Fix bug in determining when recovery has reached consistency (Tomonari Katsumata, Heikki Linnakangas)
  In some cases WAL replay would mistakenly conclude that the database was already consistent at the start of replay, thus possibly allowing hot-standby queries before the database was really consistent. Other symptoms such as “PANIC: WAL contains references to invalid pages” were also possible.

- Fix improper locking of btree index pages while replaying a `VACUUM` operation in hot-standby mode (Andres Freund, Heikki Linnakangas, Tom Lane)
Appendix E. Release Notes

This error could result in “PANIC: WAL contains references to invalid pages” failures.

- Ensure that insertions into non-leaf GIN index pages write a full-page WAL record when appropriate (Heikki Linnakangas)

  The previous coding risked index corruption in the event of a partial-page write during a system crash.

- When `pause_at_recovery_target` and `recovery_target_inclusive` are both set, ensure the target record is applied before pausing, not after (Heikki Linnakangas)

- Fix race conditions during server process exit (Robert Haas)
  Ensure that signal handlers don’t attempt to use the process’s `MyProc` pointer after it’s no longer valid.

- Fix race conditions in walsender shutdown logic and walreceiver SIGHUP signal handler (Tom Lane)

- Fix unsafe references to `errno` within error reporting logic (Christian Kruse)
  This would typically lead to odd behaviors such as missing or inappropriate `HINT` fields.

- Fix possible crashes from using `ereport()` too early during server startup (Tom Lane)
  The principal case we’ve seen in the field is a crash if the server is started in a directory it doesn’t have permission to read.

- Clear retry flags properly in OpenSSL socket write function (Alexander Kukushkin)
  This omission could result in a server lockup after unexpected loss of an SSL-encrypted connection.

- Fix length checking for Unicode identifiers (`U&"..."` syntax) containing escapes (Tom Lane)
  A spurious truncation warning would be printed for such identifiers if the escaped form of the identifier was too long, but the identifier actually didn’t need truncation after de-escaping.

- Allow keywords that are type names to be used in lists of roles (Stephen Frost)
  A previous patch allowed such keywords to be used without quoting in places such as role identifiers; but it missed cases where a list of role identifiers was permitted, such as `DROP ROLE`.

- Fix parser crash for `EXISTS(SELECT * FROM zero_column_table)` (Tom Lane)

- Fix possible crash due to invalid plan for nested sub-selects, such as `WHERE (... x IN (SELECT ...) ...) IN (SELECT ...)` (Tom Lane)

- Ensure that `ANALYZE` creates statistics for a table column even when all the values in it are “too wide” (Tom Lane)
  `ANALYZE` intentionally omits very wide values from its histogram and most-common-values calculations, but it neglected to do something sane in the case that all the sampled entries are too wide.

- In `ALTER TABLE ... SET TABLESPACE`, allow the database’s default tablespace to be used without a permissions check (Stephen Frost)
  `CREATE TABLE` has always allowed such usage, but `ALTER TABLE` didn’t get the memo.

- Fix “cannot accept a set” error when some arms of a `CASE` return a set and others don’t (Tom Lane)

- Fix checks for all-zero client addresses in `pgstat` functions (Kevin Grittner)

- Fix possible misclassification of multibyte characters by the text search parser (Tom Lane)
  Non-ASCII characters could be misclassified when using C locale with a multibyte encoding. On Cygwin, non-C locales could fail as well.
Appendix E. Release Notes

- Fix possible misbehavior in \texttt{plainto\_tsquery()} (Heikki Linnakangas)
  
  Use \texttt{memmove()} not \texttt{memcpy()} for copying overlapping memory regions. There have been no field reports of this actually causing trouble, but it’s certainly risky.

- Fix placement of permissions checks in \texttt{pg\_start\_backup()} and \texttt{pg\_stop\_backup()} (Andres Freund, Magnus Hagander)
  
  The previous coding might attempt to do catalog access when it shouldn’t.

- Accept \texttt{SHIFT\_JIS} as an encoding name for locale checking purposes (Tatsuo Ishii)

- Fix misbehavior of \texttt{PQhost()} on Windows (Fujii Masao)
  
  It should return \texttt{localhost} if no host has been specified.

- Improve error handling in \texttt{libpq} and \texttt{psql} for failures during \texttt{COPY TO STDOUT/FROM STDIN} (Tom Lane)
  
  In particular this fixes an infinite loop that could occur in 9.2 and up if the server connection was lost during \texttt{COPY FROM STDIN}. Variants of that scenario might be possible in older versions, or with other client applications.

- Fix possible incorrect printing of filenames in \texttt{pg\_basebackup}’s verbose mode (Magnus Hagander)

- Avoid including tablespaces inside \texttt{PGDATA} twice in base backups (Dimitri Fontaine, Magnus Hagander)

- Fix misaligned descriptors in \texttt{ecpg} (MauMau)

- In \texttt{ecpg}, handle lack of a hostname in the connection parameters properly (Michael Meskes)

- Fix performance regression in \texttt{contrib/dblink} connection startup (Joe Conway)
  
  Avoid an unnecessary round trip when client and server encodings match.

- In \texttt{contrib/isn}, fix incorrect calculation of the check digit for ISMN values (Fabien Coelho)

- Ensure client-code-only installation procedure works as documented (Peter Eisentraut)

- In Mingw and Cygwin builds, install the \texttt{libpq} DLL in the \texttt{bin} directory (Andrew Dunstan)
  
  This duplicates what the MSVC build has long done. It should fix problems with programs like \texttt{psql} failing to start because they can’t find the DLL.

- Avoid using the deprecated \texttt{dllwrap} tool in Cygwin builds (Marco Atzeri)

- Don’t generate plain-text \texttt{HISTORY} and \texttt{src/test/regress/README} files anymore (Tom Lane)
  
  These text files duplicated the main HTML and PDF documentation formats. The trouble involved in maintaining them greatly outweighs the likely audience for plain-text format. Distribution tarballs will still contain files by these names, but they’ll just be stubs directing the reader to consult the main documentation. The plain-text \texttt{INSTALL} file will still be maintained, as there is arguably a use-case for that.

- Update time zone data files to \texttt{tzdata} release 2013i for DST law changes in Jordan and historical changes in Cuba.

  In addition, the zones \texttt{Asia/Riyadh87}, \texttt{Asia/Riyadh88}, and \texttt{Asia/Riyadh89} have been removed, as they are no longer maintained by IANA, and never represented actual civil timekeeping practice.
E.114. Release 9.1.11

Release date: 2013-12-05

This release contains a variety of fixes from 9.1.10. For information about new features in the 9.1 major release, see Section E.125.

E.114.1. Migration to Version 9.1.11

A dump/restore is not required for those running 9.1.X.

However, this release corrects a number of potential data corruption issues. See the first two changelog entries below to find out whether your installation has been affected and what steps you can take if so.

Also, if you are upgrading from a version earlier than 9.1.9, see Section E.116.

E.114.2. Changes

- **Fix VACUUM's tests to see whether it can update relfrozenxid (Andres Freund)**
  In some cases VACUUM (either manual or autovacuum) could incorrectly advance a table's relfrozenxid value, allowing tuples to escape freezing, causing those rows to become invisible once $2^{31}$ transactions have elapsed. The probability of data loss is fairly low since multiple incorrect advancements would need to happen before actual loss occurs, but it's not zero. Users upgrading from releases 9.0.4 or 8.4.8 or earlier are not affected, but all later versions contain the bug.

  The issue can be ameliorated by, after upgrading, vacuuming all tables in all databases while having vacuum_freeze_table_age set to zero. This will fix any latent corruption but will not be able to fix all pre-existing data errors. However, an installation can be presumed safe after performing this vacuuming if it has executed fewer than $2^{31}$ update transactions in its lifetime (check this with `SELECT txid_current() < 2^{31}`).

- **Fix initialization of pg_clog and pg_subtrans during hot standby startup (Andres Freund, Heikki Linnakangas)**
  This bug can cause data loss on standby servers at the moment they start to accept hot-standby queries, by marking committed transactions as uncommitted. The likelihood of such corruption is small unless, at the time of standby startup, the primary server has executed many updating transactions since its last checkpoint. Symptoms include missing rows, rows that should have been deleted being still visible, and obsolete versions of updated rows being still visible alongside their newer versions.

  This bug was introduced in versions 9.3.0, 9.2.5, 9.1.10, and 9.0.14. Standby servers that have only been running earlier releases are not at risk. It's recommended that standby servers that have ever run any of the buggy releases be re-cloned from the primary (e.g., with a new base backup) after upgrading.

- **Truncate pg_multixact contents during WAL replay (Andres Freund)**
  This avoids ever-increasing disk space consumption in standby servers.

- **Fix race condition in GIN index posting tree page deletion (Heikki Linnakangas)**
  This could lead to transient wrong answers or query failures.
• Avoid flattening a subquery whose SELECT list contains a volatile function wrapped inside a sub-
SELECT (Tom Lane)
This avoids unexpected results due to extra evaluations of the volatile function.
• Fix planner’s processing of non-simple-variable subquery outputs nested within outer joins (Tom Lane)
This error could lead to incorrect plans for queries involving multiple levels of subqueries within JOIN
syntax.
• Fix incorrect generation of optimized MIN()/MAX() plans for inheritance trees (Tom Lane)
The planner could fail in cases where the MIN()/MAX() argument was an expression rather than a
simple variable.
• Fix premature deletion of temporary files (Andres Freund)
• Fix possible read past end of memory in rule printing (Peter Eisentraut)
• Fix array slicing of int2vector and oidvector values (Tom Lane)
Expressions of this kind are now implicitly promoted to regular int2 or oid arrays.
• Fix incorrect behaviors when using a SQL-standard, simple GMT offset timezone (Tom Lane)
In some cases, the system would use the simple GMT offset value when it should have used the regular
timezone setting that had prevailed before the simple offset was selected. This change also causes the
timeofday function to honor the simple GMT offset zone.
• Prevent possible misbehavior when logging translations of Windows error codes (Tom Lane)
• Properly quote generated command lines in pg_ctl (Naoya Anzai and Tom Lane)
  This fix applies only to Windows.
• Fix pg_dumpall to work when a source database sets default_transaction_read_only via ALTER
  DATABASE SET (Kevin Grittner)
  Previously, the generated script would fail during restore.
• Make ecpg search for quoted cursor names case-sensitively (Zoltán Böszörményi)
• Fix ecpg’s processing of lists of variables declared varchar (Zoltán Böszörményi)
• Make contrib/lo defend against incorrect trigger definitions (Marc Cousin)
• Update time zone data files to tzdata release 2013h for DST law changes in Argentina, Brazil, Jordan,
  Libya, Liechtenstein, Morocco, and Palestine. Also, new timezone abbreviations WIB, WIT, WITA for
  Indonesia.

E.115. Release 9.1.10

Release date: 2013-10-10

This release contains a variety of fixes from 9.1.9. For information about new features in the 9.1 major
release, see Section E.125.
E.115.1. Migration to Version 9.1.10

A dump/restore is not required for those running 9.1.X. However, if you are upgrading from a version earlier than 9.1.9, see Section E.116.

E.115.2. Changes

- Prevent corruption of multi-byte characters when attempting to case-fold identifiers (Andrew Dunstan)
  PostgreSQL case-folds non-ASCII characters only when using a single-byte server encoding.
- Fix checkpoint memory leak in background writer when `wal_level = hot_standby` (Naoya Anzai)
- Fix memory leak caused by `lo_open()` failure (Heikki Linnakangas)
- Fix memory overcommit bug when `work_mem` is using more than 24GB of memory (Stephen Frost)
- Serializable snapshot fixes (Kevin Grittner, Heikki Linnakangas)
- Fix deadlock bug in libpq when using SSL (Stephen Frost)
- Fix possible SSL state corruption in threaded libpq applications (Nick Phillips, Stephen Frost)
- Properly compute row estimates for boolean columns containing many NULL values (Andrew Gierth)
  Previously tests like `col IS NOT TRUE` and `col IS NOT FALSE` did not properly factor in NULL values when estimating plan costs.
- Prevent pushing down `WHERE` clauses into unsafe `UNION/INTERSECT` subqueries (Tom Lane)
  Subqueries of a `UNION` or `INTERSECT` that contain set-returning functions or volatile functions in their `SELECT` lists could be improperly optimized, leading to run-time errors or incorrect query results.
- Fix rare case of “failed to locate grouping columns” planner failure (Tom Lane)
- Fix `pg_dump` of foreign tables with dropped columns (Andrew Dunstan)
  Previously such cases could cause a `pg_upgrade` error.
- Reorder `pg_dump` processing of extension-related rules and event triggers (Joe Conway)
- Force dumping of extension tables if specified by `pg_dump -t` or `-n` (Joe Conway)
- Improve view dumping code’s handling of dropped columns in referenced tables (Tom Lane)
- Fix `pg_restore -1` with the directory archive to display the correct format name (Fujii Masao)
- Properly record index comments created using `UNIQUE` and `PRIMARY KEY` syntax (Andres Freund)
  This fixes a parallel `pg_restore` failure.
- Properly guarantee transmission of WAL files before clean switchover (Fujii Masao)
  Previously, the streaming replication connection might close before all WAL files had been replayed on the standby.
- Fix WAL segment timeline handling during recovery (Mitsumasa Kondo, Heikki Linnakangas)
  WAL file recycling during standby recovery could lead to premature recovery completion, resulting in data loss.
Appendix E. Release Notes

- Fix `REINDEX TABLE` and `REINDEX DATABASE` to properly revalidate constraints and mark invalidated indexes as valid (Noah Misch)
  
  `REINDEX INDEX` has always worked properly.

- Fix possible deadlock during concurrent `CREATE INDEX CONCURRENTLY` operations (Tom Lane)

- Fix `regexp_matches()` handling of zero-length matches (Jeevan Chalke)
  
  Previously, zero-length matches like '\'' could return too many matches.

- Fix crash for overly-complex regular expressions (Heikki Linnakangas)

- Fix regular expression match failures for back references combined with non-greedy quantifiers (Jeevan Chalke)

- Prevent `CREATE FUNCTION` from checking `SET` variables unless function body checking is enabled (Tom Lane)

- Allow `ALTER DEFAULT PRIVILEGES` to operate on schemas without requiring `CREATE` permission (Tom Lane)

- Loosen restriction on keywords used in queries (Tom Lane)
  
  Specifically, lessen keyword restrictions for role names, language names, `EXPLAIN` and `COPY` options, and `SET` values. This allows `COPY ... (FORMAT BINARY)` to work as expected; previously `BINARY` needed to be quoted.

- Fix `pgp_pub_decrypt()` so it works for secret keys with passwords (Marko Kreen)

- Make `pg_upgrade` use `pg_dump --quote-all-identifiers` to avoid problems with keyword changes between releases (Tom Lane)

- Remove rare inaccurate warning during vacuum of index-less tables (Heikki Linnakangas)

- Ensure that `VACUUM ANALYZE` still runs the `ANALYZE` phase if its attempt to truncate the file is cancelled due to lock conflicts (Kevin Grittner)

- Avoid possible failure when performing transaction control commands (e.g. `ROLLBACK`) in prepared queries (Tom Lane)

- Ensure that floating-point data input accepts standard spellings of "infinity" on all platforms (Tom Lane)
  
  The C99 standard says that allowable spellings are `inf`, `+inf`, `-inf`, `infinity`, `+infinity`, and `-infinity`. Make sure we recognize these even if the platform’s `strtod` function doesn’t.

- Expand ability to compare rows to records and arrays (Rafal Rzepecki, Tom Lane)

- Update time zone data files to `tzdata` release 2013d for DST law changes in Israel, Morocco, Palestine, and Paraguay. Also, historical zone data corrections for Macquarie Island.

---

E.116. Release 9.1.9

Release date: 2013-04-04

This release contains a variety of fixes from 9.1.8. For information about new features in the 9.1 major release, see Section E.125.
Appendix E. Release Notes

E.116.1. Migration to Version 9.1.9

A dump/restore is not required for those running 9.1.X.

However, this release corrects several errors in management of GiST indexes. After installing this update, it is advisable to REINDEX any GiST indexes that meet one or more of the conditions described below.

Also, if you are upgrading from a version earlier than 9.1.6, see Section E.119.

E.116.2. Changes

- Fix insecure parsing of server command-line switches (Mitsumasa Kondo, Kyotaro Horiguchi)
  A connection request containing a database name that begins with “-” could be crafted to damage or destroy files within the server’s data directory, even if the request is eventually rejected. (CVE-2013-1899)

- Reset OpenSSL randomness state in each postmaster child process (Marko Kreen)
  This avoids a scenario wherein random numbers generated by contrib/pgcrypto functions might be relatively easy for another database user to guess. The risk is only significant when the postmaster is configured with ssl = on but most connections don’t use SSL encryption. (CVE-2013-1900)

- Make REPLICATION privilege checks test current user not authenticated user (Noah Misch)
  An unprivileged database user could exploit this mistake to call pg_start_backup() or pg_stop_backup(), thus possibly interfering with creation of routine backups. (CVE-2013-1901)

- Fix GiST indexes to not use “fuzzy” geometric comparisons when it’s not appropriate to do so (Alexander Korotkov)
  The core geometric types perform comparisons using “fuzzy” equality, but gist_box_same must do exact comparisons, else GiST indexes using it might become inconsistent. After installing this update, users should REINDEX any GiST indexes on box, polygon, circle, or point columns, since all of these use gist_box_same.

- Fix erroneous range-union and penalty logic in GiST indexes that use contrib/btree_gist for variable-width data types, that is text, bytea, bit, and numeric columns (Tom Lane)
  These errors could result in inconsistent indexes in which some keys that are present would not be found by searches, and also in useless index bloat. Users are advised to REINDEX such indexes after installing this update.

- Fix bugs in GiST page splitting code for multi-column indexes (Tom Lane)
  These errors could result in inconsistent indexes in which some keys that are present would not be found by searches, and also in indexes that are unnecessarily inefficient to search. Users are advised to REINDEX multi-column GiST indexes after installing this update.

- Fix gist_point_consistent to handle fuzziness consistently (Alexander Korotkov)
  Index scans on GiST indexes on point columns would sometimes yield results different from a sequential scan, because gist_point_consistent disagreed with the underlying operator code about whether to do comparisons exactly or fuzzily.

- Fix buffer leak in WAL replay (Heikki Linnakangas)
This bug could result in “incorrect local pin count” errors during replay, making recovery impossible.

• Fix race condition in `DELETE RETURNING` (Tom Lane)

Under the right circumstances, `DELETE RETURNING` could attempt to fetch data from a shared buffer that the current process no longer has any pin on. If some other process changed the buffer meanwhile, this would lead to garbage `RETURNING` output, or even a crash.

• Fix infinite-loop risk in regular expression compilation (Tom Lane, Don Porter)

• Fix potential null-pointer dereference in regular expression compilation (Tom Lane)

• Fix `to_char()` to use ASCII-only case-folding rules where appropriate (Tom Lane)

This fixes misbehavior of some template patterns that should be locale-independent, but mishandled “ı” and “İ” in Turkish locales.

• Fix unwanted rejection of timestamp 1999-12-31 24:00:00 (Tom Lane)

• Fix logic error when a single transaction does `UNLISTEN` then `LISTEN` (Tom Lane)

The session wound up not listening for notify events at all, though it surely should listen in this case.

• Fix possible planner crash after columns have been added to a view that’s depended on by another view (Tom Lane)

• Remove useless “picksplit doesn’t support secondary split” log messages (Josh Hansen, Tom Lane)

This message seems to have been added in expectation of code that was never written, and probably never will be, since GiST’s default handling of secondary splits is actually pretty good. So stop nagging end users about it.

• Fix possible failure to send a session’s last few transaction commit/abort counts to the statistics collector (Tom Lane)

• Eliminate memory leaks in PL/Perl’s `spi_prepare()` function (Alex Hunsaker, Tom Lane)

• Fix `pg_dumpall` to handle database names containing “=” correctly (Heikki Linnakangas)

• Avoid crash in `pg_dump` when an incorrect connection string is given (Heikki Linnakangas)

• Ignore invalid indexes in `pg_dump` and `pg_upgrade` (Michael Paquier, Bruce Momjian)

Dumping invalid indexes can cause problems at restore time, for example if the reason the index creation failed was because it tried to enforce a uniqueness condition not satisfied by the table’s data. Also, if the index creation is in fact still in progress, it seems reasonable to consider it to be an uncommitted DDL change, which `pg_dump` wouldn’t be expected to dump anyway. `pg_upgrade` now also skips invalid indexes rather than failing.

• In `pg_basebackup`, include only the current server version’s subdirectory when backing up a tablespace (Heikki Linnakangas)

• Add a server version check in `pg_basebackup` and `pg接收evlog`, so they fail cleanly with version combinations that won’t work (Heikki Linnakangas)

• Fix contrib/pg_trgm’s `similarity()` function to return zero for trigram-less strings (Tom Lane)

Previously it returned NaN due to internal division by zero.

• Update time zone data files to tzdata release 2013b for DST law changes in Chile, Haiti, Morocco, Paraguay, and some Russian areas. Also, historical zone data corrections for numerous places.
Appendix E. Release Notes

Also, update the time zone abbreviation files for recent changes in Russia and elsewhere: CHOT, GET, IRKT, KGT, KRAT, MAGT, MAWT, MSK, NOVT, OMST, TKT, VLAT, WST, YAKT, YEKT now follow their current meanings, and VOLT (Europe/Volgograd) and MIST (Antarctica/Macquarie) are added to the default abbreviations list.

E.117. Release 9.1.8

Release date: 2013-02-07

This release contains a variety of fixes from 9.1.7. For information about new features in the 9.1 major release, see Section E.125.

E.117.1. Migration to Version 9.1.8

A dump/restore is not required for those running 9.1.X. However, if you are upgrading from a version earlier than 9.1.6, see Section E.119.

E.117.2. Changes

• Prevent execution of enum_recv from SQL (Tom Lane)
  The function was misdeclared, allowing a simple SQL command to crash the server. In principle an attacker might be able to use it to examine the contents of server memory. Our thanks to Sumit Soni (via Secunia SVCRP) for reporting this issue. (CVE-2013-0255)
• Fix multiple problems in detection of when a consistent database state has been reached during WAL replay (Fujii Masao, Heikki Linnakangas, Simon Riggs, Andres Freund)
• Update minimum recovery point when truncating a relation file (Heikki Linnakangas)
  Once data has been discarded, it’s no longer safe to stop recovery at an earlier point in the timeline.
• Fix recycling of WAL segments after changing recovery target timeline (Heikki Linnakangas)
• Fix missing cancellations in hot standby mode (Noah Misch, Simon Riggs)
  The need to cancel conflicting hot-standby queries would sometimes be missed, allowing those queries to see inconsistent data.
• Prevent recovery pause feature from pausing before users can connect (Tom Lane)
• Fix SQL grammar to allow subscripting or field selection from a sub-SELECT result (Tom Lane)
• Fix performance problems with autovacuum truncation in busy workloads (Jan Wieck)
  Truncation of empty pages at the end of a table requires exclusive lock, but autovacuum was coded to fail (and release the table lock) when there are conflicting lock requests. Under load, it is easily possible that truncation would never occur, resulting in table bloat. Fix by performing a partial truncation, releasing the lock, then attempting to re-acquire the lock and continue. This fix also greatly reduces the average time before autovacuum releases the lock after a conflicting request arrives.
Appendix E. Release Notes

- Protect against race conditions when scanning `pg_tablespace` (Stephen Frost, Tom Lane)

  `CREATE DATABASE` and `DROP DATABASE` could misbehave if there were concurrent updates of `pg_tablespace` entries.

- Prevent `DROP OWNED` from trying to drop whole databases or tablespaces (Álvaro Herrera)

  For safety, ownership of these objects must be reassigned, not dropped.

- Fix error in `vacuum_freeze_table_age` implementation (Andres Freund)

  In installations that have existed for more than `vacuum_freeze_min_age` transactions, this mistake prevented autovacuum from using partial-table scans, so that a full-table scan would always happen instead.

- Prevent misbehavior when a `RowExpr` or `XmlExpr` is parse-analyzed twice (Andres Freund, Tom Lane)

  This mistake could be user-visible in contexts such as `CREATE TABLE LIKE INCLUDING INDEXES`.

- Improve defenses against integer overflow in hashtable sizing calculations (Jeff Davis)

- Fix failure to ignore leftover temporary tables after a server crash (Tom Lane)

- Reject out-of-range dates in `to_date()` (Hitoshi Harada)

- Fix `pg_extension_config_dump()` to handle extension-update cases properly (Tom Lane)

  This function will now replace any existing entry for the target table, making it usable in extension update scripts.

- Fix PL/Python’s handling of functions used as triggers on multiple tables (Andres Freund)

- Ensure that non-ASCII prompt strings are translated to the correct code page on Windows (Alexander Law, Noah Misch)

  This bug affected `psql` and some other client programs.

- Fix possible crash in `psql`’s `\?` command when not connected to a database (Meng Qingzhong)

- Fix possible error if a relation file is removed while `pg_basebackup` is running (Heikki Linnakangas)

- Make `pg_dump` exclude data of unlogged tables when running on a hot-standby server (Magnus Hagander)

  This would fail anyway because the data is not available on the standby server, so it seems most convenient to assume `--no-unlogged-table-data` automatically.

- Fix `pg_upgrade` to deal with invalid indexes safely (Bruce Momjian)

- Fix one-byte buffer overrun in `libpq`’s `PQprintTuples` (Xi Wang)

  This ancient function is not used anywhere by PostgreSQL itself, but it might still be used by some client code.

- Make `ecpglib` use translated messages properly (Chen Huajun)

- Properly install `ecpg_compat` and `pgtypes` libraries on MSVC (Jiang Guiqing)

- Include our version of `isinf()` in `libecpg` if it’s not provided by the system (Jiang Guiqing)

- Rearrange configure’s tests for supplied functions so it is not fooled by bogus exports from `libedit/libreadline` (Christoph Berg)

- Ensure Windows build number increases over time (Magnus Hagander)
• Make pgxs build executables with the right .exe suffix when cross-compiling for Windows (Zoltan Boszormenyi)
• Add new timezone abbreviation FET (Tom Lane)
  This is now used in some eastern-European time zones.

E.118. Release 9.1.7

Release date: 2012-12-06

This release contains a variety of fixes from 9.1.6. For information about new features in the 9.1 major release, see Section E.125.

E.118.1. Migration to Version 9.1.7

A dump/restore is not required for those running 9.1.X.

However, if you are upgrading from a version earlier than 9.1.6, see Section E.119.

E.118.2. Changes

• Fix multiple bugs associated with CREATE INDEX CONCURRENTLY (Andres Freund, Tom Lane)
  Fix CREATE INDEX CONCURRENTLY to use in-place updates when changing the state of an index’s pg_index row. This prevents race conditions that could cause concurrent sessions to miss updating the target index, thus resulting in corrupt concurrently-created indexes.
  Also, fix various other operations to ensure that they ignore invalid indexes resulting from a failed CREATE INDEX CONCURRENTLY command. The most important of these is VACUUM, because an auto-vacuum could easily be launched on the table before corrective action can be taken to fix or remove the invalid index.
• Fix buffer locking during WAL replay (Tom Lane)
  The WAL replay code was insufficiently careful about locking buffers when replaying WAL records that affect more than one page. This could result in hot standby queries transiently seeing inconsistent states, resulting in wrong answers or unexpected failures.
• Fix an error in WAL generation logic for GIN indexes (Tom Lane)
  This could result in index corruption, if a torn-page failure occurred.
• Properly remove startup process’s virtual XID lock when promoting a hot standby server to normal running (Simon Riggs)
  This oversight could prevent subsequent execution of certain operations such as CREATE INDEX CONCURRENTLY.
• Avoid bogus “out-of-sequence timeline ID” errors in standby mode (Heikki Linnakangas)
• Prevent the postmaster from launching new child processes after it’s received a shutdown signal (Tom Lane)
  This mistake could result in shutdown taking longer than it should, or even never completing at all without additional user action.
• Avoid corruption of internal hash tables when out of memory (Hitoshi Harada)
• Prevent file descriptors for dropped tables from being held open past transaction end (Tom Lane)
  This should reduce problems with long-since-dropped tables continuing to occupy disk space.
• Prevent database-wide crash and restart when a new child process is unable to create a pipe for its latch (Tom Lane)
  Although the new process must fail, there is no good reason to force a database-wide restart, so avoid that. This improves robustness when the kernel is nearly out of file descriptors.
• Fix planning of non-strict equivalence clauses above outer joins (Tom Lane)
  The planner could derive incorrect constraints from a clause equating a non-strict construct to something else, for example WHERE COALESCE(foo, 0) = 0 when foo is coming from the nullable side of an outer join.
• Fix SELECT DISTINCT with index-optimized MIN/MAX on an inheritance tree (Tom Lane)
  The planner would fail with “failed to re-find MinMaxAggInfo record” given this combination of factors.
• Improve planner’s ability to prove exclusion constraints from equivalence classes (Tom Lane)
• Fix partial-row matching in hashed subplans to handle cross-type cases correctly (Tom Lane)
  This affects multicolumn NOT IN subplans, such as WHERE (a, b) NOT IN (SELECT x, y FROM . . .) when for instance b and y are int4 and int8 respectively. This mistake led to wrong answers or crashes depending on the specific datatypes involved.
• Acquire buffer lock when re-fetching the old tuple for an AFTER ROW UPDATE/DELETE trigger (Andres Freund)
  In very unusual circumstances, this oversight could result in passing incorrect data to a trigger WHEN condition, or to the precheck logic for a foreign-key enforcement trigger. That could result in a crash, or in an incorrect decision about whether to fire the trigger.
• Fix ALTER COLUMN TYPE to handle inherited check constraints properly (Pavan Deolasee)
  This worked correctly in pre-8.4 releases, and now works correctly in 8.4 and later.
• Fix ALTER EXTENSION SET SCHEMA’s failure to move some subsidiary objects into the new schema (Álvaro Herrera, Dimitri Fontaine)
• Fix REASSIGN OWNED to handle grants on tablespaces (Álvaro Herrera)
• Ignore incorrect pg_attribute entries for system columns for views (Tom Lane)
  Views do not have any system columns. However, we forgot to remove such entries when converting a table to a view. That’s fixed properly for 9.3 and later, but in previous branches we need to defend against existing mis-converted views.
• Fix rule printing to dump INSERT INTO table DEFAULT VALUES correctly (Tom Lane)
Appendix E. Release Notes

- Guard against stack overflow when there are too many UNION/INTERSECT/EXCEPT clauses in a query (Tom Lane)
- Prevent platform-dependent failures when dividing the minimum possible integer value by -1 (Xi Wang, Tom Lane)
- Fix possible access past end of string in date parsing (Hitoshi Harada)
- Fix failure to advance XID epoch if XID wraparound happens during a checkpoint and wal_level is hot_standby (Tom Lane, Andres Freund)
  
  While this mistake had no particular impact on PostgreSQL itself, it was bad for applications that rely on txid_current() and related functions: the TXID value would appear to go backwards.
- Fix display of pg_stat_replication.sync_state at a page boundary (Kyotaro Horiguchi)
- Produce an understandable error message if the length of the path name for a Unix-domain socket exceeds the platform-specific limit (Tom Lane, Andrew Dunstan)
  
  Formerly, this would result in something quite unhelpful, such as “Non-recoverable failure in name resolution”.
- Fix memory leaks when sending composite column values to the client (Tom Lane)
- Make pg_ctl more robust about reading the postmaster.pid file (Heikki Linnakangas)
  
  Fix race conditions and possible file descriptor leakage.
- Fix possible crash in psql if incorrectly-encoded data is presented and the client_encoding setting is a client-only encoding, such as SJIS (Jiang Guiqing)
- Make pg_dump dump SEQUENCE SET items in the data not pre-data section of the archive (Tom Lane)
  
  This change fixes dumping of sequences that are marked as extension configuration tables.
- Fix bugs in the restore.sql script emitted by pg_dump in tar output format (Tom Lane)
  
  The script would fail outright on tables whose names include upper-case characters. Also, make the script capable of restoring data in --inserts mode as well as the regular COPY mode.
- Fix pg_restore to accept POSIX-conformant tar files (Brian Weaver, Tom Lane)
  
  The original coding of pg_dump's tar output mode produced files that are not fully conformant with the POSIX standard. This has been corrected for version 9.3. This patch updates previous branches so that they will accept both the incorrect and the corrected formats, in hopes of avoiding compatibility problems when 9.3 comes out.
- Fix tar files emitted by pg_basebackup to be POSIX conformant (Brian Weaver, Tom Lane)
- Fix pg_resettllog to locate postmaster.pid correctly when given a relative path to the data directory (Tom Lane)
  
  This mistake could lead to pg_resettllog not noticing that there is an active postmaster using the data directory.
- Fix libpq’s lo_import() and lo_export() functions to report file I/O errors properly (Tom Lane)
- Fix ecpg’s processing of nested structure pointer variables (Muhammad Usama)
- Fix ecpg’s ecpg_get_data function to handle arrays properly (Michael Meskes)
- Make contrib/pageinspect’s btree page inspection functions take buffer locks while examining pages (Tom Lane)
Appendix E. Release Notes

- Ensure that `make install` for an extension creates the extension installation directory (Cédric Villemain)
  Previously, this step was missed if `MODULEDIR` was set in the extension’s Makefile.
- Fix pgxs support for building loadable modules on AIX (Tom Lane)
  Building modules outside the original source tree didn’t work on AIX.
- Update time zone data files to tzdata release 2012j for DST law changes in Cuba, Israel, Jordan, Libya, Palestine, Western Samoa, and portions of Brazil.

E.119. Release 9.1.6

Release date: 2012-09-24
This release contains a variety of fixes from 9.1.5. For information about new features in the 9.1 major release, see Section E.125.

E.119.1. Migration to Version 9.1.6

A dump/restore is not required for those running 9.1.X.
However, you may need to perform `REINDEX` operations to recover from the effects of the data corruption bug described in the first changelog item below.
Also, if you are upgrading from a version earlier than 9.1.4, see Section E.121.

E.119.2. Changes

- Fix persistence marking of shared buffers during WAL replay (Jeff Davis)
  This mistake can result in buffers not being written out during checkpoints, resulting in data corruption if the server later crashes without ever having written those buffers. Corruption can occur on any server following crash recovery, but it is significantly more likely to occur on standby slave servers since those perform much more WAL replay. There is a low probability of corruption of btree and GIN indexes. There is a much higher probability of corruption of table “visibility maps”. Fortunately, visibility maps are non-critical data in 9.1, so the worst consequence of such corruption in 9.1 installations is transient inefficiency of vacuuming. Table data proper cannot be corrupted by this bug.
  While no index corruption due to this bug is known to have occurred in the field, as a precautionary measure it is recommended that production installations `REINDEX` all btree and GIN indexes at a convenient time after upgrading to 9.1.6.
  Also, if you intend to do an in-place upgrade to 9.2.X, before doing so it is recommended to perform a `VACUUM` of all tables while having `vacuum_freeze_table_age` set to zero. This will ensure that any lingering wrong data in the visibility maps is corrected before 9.2.X can depend on it. `vacuum_cost_delay` can be adjusted to reduce the performance impact of vacuuming, while causing it to take longer to finish.
• Fix planner’s assignment of executor parameters, and fix executor’s rescan logic for CTE plan nodes (Tom Lane)
  These errors could result in wrong answers from queries that scan the same WITH subquery multiple times.
• Fix misbehavior when default_transaction_isolation is set to serializable (Kevin Grittner, Tom Lane, Heikki Linnakangas)
  Symptoms include crashes at process start on Windows, and crashes in hot standby operation.
• Improve selectivity estimation for text search queries involving prefixes, i.e. word:* patterns (Tom Lane)
• Improve page-splitting decisions in GiST indexes (Alexander Korotkov, Robert Haas, Tom Lane)
  Multi-column GiST indexes might suffer unexpected bloat due to this error.
• Fix cascading privilege revoke to stop if privileges are still held (Tom Lane)
  If we revoke a grant option from some role X, but X still holds that option via a grant from someone else, we should not recursively revoke the corresponding privilege from role(s) Y that X had granted it to.
• Disallow extensions from containing the schema they are assigned to (Thom Brown)
  This situation creates circular dependencies that confuse pg_dump and probably other things. It’s confusing for humans too, so disallow it.
• Improve error messages for Hot Standby misconfiguration errors (Gurjeet Singh)
• Make configure probe for mbstowcs_l (Tom Lane)
  This fixes build failures on some versions of AIX.
• Fix handling of SIGFPE when PL/Perl is in use (Andres Freund)
  Perl resets the process’s SIGFPE handler to SIG_IGN, which could result in crashes later on. Restore the normal PostgreSQL signal handler after initializing PL/Perl.
• Prevent PL/Perl from crashing if a recursive PL/Perl function is redefined while being executed (Tom Lane)
• Work around possible misoptimization in PL/Perl (Tom Lane)
  Some Linux distributions contain an incorrect version of pthread.h that results in incorrect compiled code in PL/Perl, leading to crashes if a PL/Perl function calls another one that throws an error.
• Fix bugs in contrib/pg_trgm’s LIKE pattern analysis code (Fujii Masao)
  LIKE queries using a trigram index could produce wrong results if the pattern contained LIKE escape characters.
• Fix pg_upgrade’s handling of line endings on Windows (Andrew Dunstan)
  Previously, pg_upgrade might add or remove carriage returns in places such as function bodies.
• On Windows, make pg_upgrade use backslash path separators in the scripts it emits (Andrew Dunstan)
• Remove unnecessary dependency on pg_config from pg_upgrade (Peter Eisentraut)
• Update time zone data files to tzdata release 2012f for DST law changes in Fiji
E.120. Release 9.1.5

Release date: 2012-08-17

This release contains a variety of fixes from 9.1.4. For information about new features in the 9.1 major release, see Section E.125.

E.120.1. Migration to Version 9.1.5

A dump/restore is not required for those running 9.1.X.

However, if you are upgrading from a version earlier than 9.1.4, see Section E.121.

E.120.2. Changes

- Prevent access to external files/URLs via XML entity references (Noah Misch, Tom Lane)
  
  `xml_parse()` would attempt to fetch external files or URLs as needed to resolve DTD and entity references in an XML value, thus allowing unprivileged database users to attempt to fetch data with the privileges of the database server. While the external data wouldn’t get returned directly to the user, portions of it could be exposed in error messages if the data didn’t parse as valid XML; and in any case the mere ability to check existence of a file might be useful to an attacker. (CVE-2012-3489)

- Prevent access to external files/URLs via `contrib/xml2’s xslt_process()` (Peter Eisentraut)
  libxslt offers the ability to read and write both files and URLs through stylesheet commands, thus allowing unprivileged database users to both read and write data with the privileges of the database server. Disable that through proper use of libxslt’s security options. (CVE-2012-3488)

  Also, remove `xslt_process()`’s ability to fetch documents and stylesheets from external files/URLs. While this was a documented “feature”, it was long regarded as a bad idea. The fix for CVE-2012-3489 broke that capability, and rather than expend effort on trying to fix it, we’re just going to summarily remove it.

- Prevent too-early recycling of btree index pages (Noah Misch)
  
  When we allowed read-only transactions to skip assigning XIDs, we introduced the possibility that a deleted btree page could be recycled while a read-only transaction was still in flight to it. This would result in incorrect index search results. The probability of such an error occurring in the field seems very low because of the timing requirements, but nonetheless it should be fixed.

- Fix crash-safety bug with newly-created-or-reset sequences (Tom Lane)
  
  If `ALTER SEQUENCE` was executed on a freshly created or reset sequence, and then precisely one `nextval()` call was made on it, and then the server crashed, WAL replay would restore the sequence to a state in which it appeared that no `nextval()` had been done, thus allowing the first sequence value to be returned again by the next `nextval()` call. In particular this could manifest for serial columns, since creation of a serial column’s sequence includes an `ALTER SEQUENCE OWNED BY` step.

- Fix race condition in enum-type value comparisons (Robert Haas, Tom Lane)
  
  Comparisons could fail when encountering an enum value added since the current query started.
• Fix \texttt{txid\_current()} to report the correct epoch when not in hot standby (Heikki Linnakangas)
  This fixes a regression introduced in the previous minor release.
• Prevent selection of unsuitable replication connections as the synchronous standby (Fujii Masao)
  The master might improperly choose pseudo-servers such as \texttt{pg\_receivexlog} or \texttt{pg\_basebackup} as the synchronous standby, and then wait indefinitely for them.
• Fix bug in startup of Hot Standby when a master transaction has many subtransactions (Andres Freund)
  This mistake led to failures reported as “out-of-order XID insertion in KnownAssignedXids”.
• Ensure the \texttt{backup\_label} file is fsync’d after \texttt{pg\_start\_backup()} (Dave Kerr)
• Fix timeout handling in walsender processes (Tom Lane)
  WAL sender background processes neglected to establish a SIGALRM handler, meaning they would wait forever in some corner cases where a timeout ought to happen.
• Wake walsenders after each background flush by walwriter (Andres Freund, Simon Riggs)
  This greatly reduces replication delay when the workload contains only asynchronously-committed transactions.
• Fix \texttt{LISTEN}/\texttt{NOTIFY} to cope better with I/O problems, such as out of disk space (Tom Lane)
  After a write failure, all subsequent attempts to send more \texttt{NOTIFY} messages would fail with messages like “Could not read from file “\texttt{pg\_notify/nnnn}" at offset \texttt{nnnnn: Success}”.
• Only allow autovacuum to be auto-canceled by a directly blocked process (Tom Lane)
  The original coding could allow inconsistent behavior in some cases; in particular, an autovacuum could get canceled after less than \texttt{deadlock\_timeout} grace period.
• Improve logging of autovacuum cancels (Robert Haas)
• Fix log collector so that \texttt{log\_truncate\_on\_rotation} works during the very first log rotation after server start (Tom Lane)
• Fix \texttt{WITH} attached to a nested set operation (\texttt{UNION/INTERSECT/EXCEPT}) (Tom Lane)
• Ensure that a whole-row reference to a subquery doesn’t include any extra \texttt{GROUP BY} or \texttt{ORDER BY} columns (Tom Lane)
• Fix dependencies generated during \texttt{ALTER TABLE ... ADD CONSTRAINT USING INDEX} (Tom Lane)
  This command left behind a redundant \texttt{pg\_depend} entry for the index, which could confuse later operations, notably \texttt{ALTER TABLE ... ALTER COLUMN TYPE} on one of the indexed columns.
• Fix \texttt{REASSIGN OWNED} to work on extensions (Alvaro Herrera)
• Disallow copying whole-row references in \texttt{CHECK} constraints and index definitions during \texttt{CREATE TABLE} (Tom Lane)
  This situation can arise in \texttt{CREATE TABLE with LIKE or INHERITS}. The copied whole-row variable was incorrectly labeled with the row type of the original table not the new one. Rejecting the case seems reasonable for \texttt{LIKE}, since the row types might well diverge later. For \texttt{INHERITS} we should ideally allow it, with an implicit coercion to the parent table’s row type; but that will require more work than seems safe to back-patch.
• Fix memory leak in \texttt{ARRAY(SELECT \ldots)} subqueries (Heikki Linnakangas, Tom Lane)
• Fix planner to pass correct collation to operator selectivity estimators (Tom Lane)
  This was not previously required by any core selectivity estimation function, but third-party code might
  need it.

• Fix extraction of common prefixes from regular expressions (Tom Lane)
  The code could get confused by quantified parenthesized subexpressions, such as ^\{foo\}?bar. This
  would lead to incorrect index optimization of searches for such patterns.

• Fix bugs with parsing signed \texttt{hh:mm} and \texttt{hh:mm:ss} fields in \texttt{interval} constants (Amit Kapila, Tom
  Lane)

• Fix \texttt{pg_dump} to better handle views containing partial \texttt{GROUP BY} lists (Tom Lane)
  A view that lists only a primary key column in \texttt{GROUP BY}, but uses other table columns as if they
  were grouped, gets marked as depending on the primary key. Improper handling of such primary key
  dependencies in \texttt{pg_dump} resulted in poorly-ordered dumps, which at best would be inefficient to
  restore and at worst could result in outright failure of a parallel \texttt{pg_restore} run.

• In \texttt{PL/Perl}, avoid setting UTF8 flag when in SQL\_ASCII encoding (Alex Hunsaker, Kyotaro Horiguchi,
  Alvaro Herrera)

• Use Postgres’ encoding conversion functions, not Python’s, when converting a Python Unicode string
  to the server encoding in \texttt{PL/Python} (Jan Urbanski)
  This avoids some corner-case problems, notably that Python doesn’t support all the encodings Postgres
  does. A notable functional change is that if the server encoding is SQL\_ASCII, you will get the UTF-8
  representation of the string; formerly, any non-ASCII characters in the string would result in an error.

• Fix mapping of PostgreSQL encodings to Python encodings in \texttt{PL/Python} (Jan Urbanski)

• Report errors properly in \texttt{contrib/xml2’s xslt_process()} (Tom Lane)

• Update time zone data files to \texttt{tzdata} release 2012e for DST law changes in Morocco and Tokelau

\section*{E.121. Release 9.1.4}

\textbf{Release date:} 2012-06-04

This release contains a variety of fixes from 9.1.3. For information about new features in the 9.1 major
release, see Section E.125.

\section*{E.121.1. Migration to Version 9.1.4}

A dump/restore is not required for those running 9.1.X.

However, if you use the \texttt{citext} data type, and you upgraded from a previous major release by run-
ning \texttt{pg\_upgrade}, you should run \texttt{CREATE EXTENSION citext FROM unpackaged} to avoid collation-
related failures in \texttt{citext} operations. The same is necessary if you restore a dump from a pre-9.1 database
that contains an instance of the \texttt{citext} data type. If you’ve already run the \texttt{CREATE EXTENSION} com-
mand before upgrading to 9.1.4, you will instead need to do manual catalog updates as explained in the
third changelog item below.
Appendix E. Release Notes

Also, if you are upgrading from a version earlier than 9.1.2, see Section E.123.

E.121.2. Changes

• Fix incorrect password transformation in contrib/pgcrypto's DES crypt() function (Solar Designer)

  If a password string contained the byte value 0x80, the remainder of the password was ignored, causing the password to be much weaker than it appeared. With this fix, the rest of the string is properly included in the DES hash. Any stored password values that are affected by this bug will thus no longer match, so the stored values may need to be updated. (CVE-2012-2143)

• Ignore SECURITY DEFINER and SET attributes for a procedural language's call handler (Tom Lane)

  Applying such attributes to a call handler could crash the server. (CVE-2012-2655)

• Make contrib/citext's upgrade script fix collations of citext arrays and domains over citext (Tom Lane)

  Release 9.1.2 provided a fix for collations of citext columns and indexes in databases upgraded or reloaded from pre-9.1 installations, but that fix was incomplete: it neglected to handle arrays and domains over citext. This release extends the module's upgrade script to handle these cases. As before, if you have already run the upgrade script, you'll need to run the collation update commands by hand instead. See the 9.1.2 release notes for more information about doing this.

• Allow numeric timezone offsets in timestamp input to be up to 16 hours away from UTC (Tom Lane)

  Some historical time zones have offsets larger than 15 hours, the previous limit. This could result in dumped data values being rejected during reload.

• Fix timestamp conversion to cope when the given time is exactly the last DST transition time for the current timezone (Tom Lane)

  This oversight has been there a long time, but was not noticed previously because most DST-using zones are presumed to have an indefinite sequence of future DST transitions.

• Fix text to name and char to name casts to perform string truncation correctly in multibyte encodings (Karl Schnaitter)

• Fix memory copying bug in to_tsquery() (Heikki Linnakangas)

• Ensure txid_current() reports the correct epoch when executed in hot standby (Simon Riggs)

• Fix planner's handling of outer PlaceHolderVars within subqueries (Tom Lane)

  This bug concerns sub-SELECTs that reference variables coming from the nullable side of an outer join of the surrounding query. In 9.1, queries affected by this bug would fail with “ERROR: Upper-level PlaceHolderVar found where not expected”. But in 9.0 and 8.4, you'd silently get possibly-wrong answers, since the value transmitted into the subquery wouldn't go to null when it should.

• Fix planning of UNION ALL subqueries with output columns that are not simple variables (Tom Lane)

  Planning of such cases got noticeably worse in 9.1 as a result of a misguided fix for “MergeAppend child’s targetlist doesn’t match MergeAppend” errors. Revert that fix and do it another way.

• Fix slow session startup when pg_attribute is very large (Tom Lane)
If `pg_attribute` exceeds one-fourth of `shared_buffers`, cache rebuilding code that is sometimes needed during session start would trigger the synchronized-scan logic, causing it to take many times longer than normal. The problem was particularly acute if many new sessions were starting at once.

- Ensure sequential scans check for query cancel reasonably often (Merlin Moncure)
  A scan encountering many consecutive pages that contain no live tuples would not respond to interrupts meanwhile.

- Ensure the Windows implementation of `PGSemaphoreLock()` clears `ImmediateInterruptOK` before returning (Tom Lane)
  This oversight meant that a query-cancel interrupt received later in the same query could be accepted at an unsafe time, with unpredictable but not good consequences.

- Show whole-row variables safely when printing views or rules (Abbas Butt, Tom Lane)
  Corner cases involving ambiguous names (that is, the name could be either a table or column name of the query) were printed in an ambiguous way, risking that the view or rule would be interpreted differently after dump and reload. Avoid the ambiguous case by attaching a no-op cast.

- Fix `COPY FROM` to properly handle null marker strings that correspond to invalid encoding (Tom Lane)
  A null marker string such as `E'\0'` should work, and did work in the past, but the case got broken in 8.4.

- Fix `EXPLAIN VERBOSE` for writable CTEs containing `RETURNING` clauses (Tom Lane)

- Fix `PREPARE TRANSACTION` to work correctly in the presence of advisory locks (Tom Lane)
  Historically, `PREPARE TRANSACTION` has simply ignored any session-level advisory locks the session holds, but this case was accidentally broken in 9.1.

- Fix truncation of unlogged tables (Robert Haas)

- Ignore missing schemas during non-interactive assignments of `search_path` (Tom Lane)
  This re-aligns 9.1’s behavior with that of older branches. Previously 9.1 would throw an error for nonexistent schemas mentioned in `search_path` settings obtained from places such as `ALTER DATABASE SET`.

- Fix bugs with temporary or transient tables used in extension scripts (Tom Lane)
  This includes cases such as a rewriting `ALTER TABLE` within an extension update script, since that uses a transient table behind the scenes.

- Ensure autovacuum worker processes perform stack depth checking properly (Heikki Linnakangas)
  Previously, infinite recursion in a function invoked by auto-`ANALYZE` could crash worker processes.

- Fix logging collector to not lose log coherency under high load (Andrew Dunstan)
  The collector previously could fail to reassemble large messages if it got too busy.

- Fix logging collector to ensure it will restart file rotation after receiving SIGHUP (Tom Lane)

- Fix “too many LWLocks taken” failure in GiST indexes (Heikki Linnakangas)

- Fix WAL replay logic for GIN indexes to not fail if the index was subsequently dropped (Tom Lane)

- Correctly detect SSI conflicts of prepared transactions after a crash (Dan Ports)
Appendix E. Release Notes

- Avoid synchronous replication delay when committing a transaction that only modified temporary tables (Heikki Linnakangas)
  
  In such a case the transaction’s commit record need not be flushed to standby servers, but some of the code didn’t know that and waited for it to happen anyway.

- Fix error handling in pg_basebackup (Thomas Ogrisegg, Fujii Masao)

- Fix walsender to not go into a busy loop if connection is terminated (Fujii Masao)

- Fix memory leak in PL/pgSQL’s RETURN NEXT command (Joe Conway)

- Fix PL/pgSQL’s GET DIAGNOSTICS command when the target is the function’s first variable (Tom Lane)

- Ensure that PL/Perl package-qualifies the _TD variable (Alex Hunsaker)
  
  This bug caused trigger invocations to fail when they are nested within a function invocation that changes the current package.

- Fix PL/Python functions returning composite types to accept a string for their result value (Jan Urbanski)
  
  This case was accidentally broken by the 9.1 additions to allow a composite result value to be supplied in other formats, such as dictionaries.

- Fix potential access off the end of memory in psql’s expanded display (\x) mode (Peter Eisentraut)

- Fix several performance problems in pg_dump when the database contains many objects (Jeff Janes, Tom Lane)
  
  pg_dump could get very slow if the database contained many schemas, or if many objects are in dependency loops, or if there are many owned sequences.

- Fix memory and file descriptor leaks in pg_restore when reading a directory-format archive (Peter Eisentraut)

- Fix pg_upgrade for the case that a database stored in a non-default tablespace contains a table in the cluster’s default tablespace (Bruce Momjian)

- In ecpg, fix rare memory leaks and possible overwrite of one byte after the sqlca_t structure (Peter Eisentraut)

- Fix contrib/dblink’s dblink_exec() to not leak temporary database connections upon error (Tom Lane)

- Fix contrib/dblink to report the correct connection name in error messages (Kyotaro Horiguchi)

- Fix contrib/vacuumlo to use multiple transactions when dropping many large objects (Tim Lewis, Robert Haas, Tom Lane)
  
  This change avoids exceeding max_locks_per_transaction when many objects need to be dropped. The behavior can be adjusted with the new -l (limit) option.

- Update time zone data files to tzdata release 2012c for DST law changes in Antarctica, Armenia, Chile, Cuba, Falkland Islands, Gaza, Haiti, Hebron, Morocco, Syria, and Tokelau Islands; also historical corrections for Canada.

**E.122. Release 9.1.3**

**Release date:** 2012-02-27

This release contains a variety of fixes from 9.1.2. For information about new features in the 9.1 major release, see Section E.125.

**E.122.1. Migration to Version 9.1.3**

A dump/restore is not required for those running 9.1.X.

However, if you are upgrading from a version earlier than 9.1.2, see Section E.123.

**E.122.2. Changes**

- **Require execute permission on the trigger function for `CREATE TRIGGER`**
  (Robert Haas)

  This missing check could allow another user to execute a trigger function with forged input data, by installing it on a table he owns. This is only of significance for trigger functions marked `SECURITY DEFINER`, since otherwise trigger functions run as the table owner anyway. (CVE-2012-0866)

- **Remove arbitrary limitation on length of common name in SSL certificates**
  (Heikki Linnakangas)

  Both libpq and the server truncated the common name extracted from an SSL certificate at 32 bytes. Normally this would cause nothing worse than an unexpected verification failure, but there are some rather-implausible scenarios in which it might allow one certificate holder to impersonate another. The victim would have to have a common name exactly 32 bytes long, and the attacker would have to persuade a trusted CA to issue a certificate in which the common name has that string as a prefix. Impersonating a server would also require some additional exploit to redirect client connections. (CVE-2012-0867)

- **Convert newlines to spaces in names written in `pg_dump` comments**
  (Robert Haas)

  `pg_dump` was incautious about sanitizing object names that are emitted within SQL comments in its output script. A name containing a newline would at least render the script syntactically incorrect. Maliciously crafted object names could present a SQL injection risk when the script is reloaded. (CVE-2012-0868)

- **Fix btree index corruption from insertions concurrent with vacuuming**
  (Tom Lane)

  An index page split caused by an insertion could sometimes cause a concurrently-running `VACUUM` to miss removing index entries that it should remove. After the corresponding table rows are removed, the dangling index entries would cause errors (such as “could not read block N in file ...”) or worse, silently wrong query results after unrelated rows are re-inserted at the now-free table locations. This bug has been present since release 8.2, but occurs so infrequently that it was not diagnosed until now. If you have reason to suspect that it has happened in your database, reindexing the affected index will fix things.

- **Fix transient zeroing of shared buffers during WAL replay**
  (Tom Lane)

  The replay logic would sometimes zero and refill a shared buffer, so that the contents were transiently invalid. In hot standby mode this can result in a query that’s executing in parallel seeing garbage data.
Various symptoms could result from that, but the most common one seems to be “invalid memory alloc request size”.

• Fix handling of data-modifying WITH subplans in READ COMMITTED rechecking (Tom Lane)

    A WITH clause containing INSERT/UPDATE/DELETE would crash if the parent UPDATE or DELETE command needed to be re-evaluated at one or more rows due to concurrent updates in READ COMMITTED mode.

• Fix corner case in SSI transaction cleanup (Dan Ports)

    When finishing up a read-write serializable transaction, a crash could occur if all remaining active serializable transactions are read-only.

• Fix postmaster to attempt restart after a hot-standby crash (Tom Lane)

    A logic error caused the postmaster to terminate, rather than attempt to restart the cluster, if any backend process crashed while operating in hot standby mode.

• Fix CLUSTER/VACUUM FULL handling of toast values owned by recently-updated rows (Tom Lane)

    This oversight could lead to “duplicate key value violates unique constraint” errors being reported against the toast table’s index during one of these commands.

• Update per-column permissions, not only per-table permissions, when changing table owner (Tom Lane)

    Failure to do this meant that any previously granted column permissions were still shown as having been granted by the old owner. This meant that neither the new owner nor a superuser could revoke the now-untraceable-to-table-owner permissions.

• Support foreign data wrappers and foreign servers in REASSIGN OWNED (Alvaro Herrera)

    This command failed with “unexpected classid” errors if it needed to change the ownership of any such objects.

• Allow non-existent values for some settings in ALTER USER/DATABASE SET (Heikki Linnakangas)

    Allow default_text_search_config, default_tablespace, and temp_tablespaces to be set to names that are not known. This is because they might be known in another database where the setting is intended to be used, or for the tablespace cases because the tablespace might not be created yet. The same issue was previously recognized for search_path, and these settings now act like that one.

• Fix “unsupported node type” error caused by COLLATE in an INSERT expression (Tom Lane)

• Avoid crashing when we have problems deleting table files post-commit (Tom Lane)

    Dropping a table should lead to deleting the underlying disk files only after the transaction commits. In event of failure then (for instance, because of wrong file permissions) the code is supposed to just emit a warning message and go on, since it’s too late to abort the transaction. This logic got broken as of release 8.4, causing such situations to result in a PANIC and an unrestartable database.

• Recover from errors occurring during WAL replay of DROP TABLESPACE (Tom Lane)

    Replay will attempt to remove the tablespace’s directories, but there are various reasons why this might fail (for example, incorrect ownership or permissions on those directories). Formerly the replay code would panic, rendering the database unrestartable without manual intervention. It seems better to log the problem and continue, since the only consequence of failure to remove the directories is some wasted disk space.
• Fix race condition in logging AccessExclusiveLocks for hot standby (Simon Riggs)
Sometimes a lock would be logged as being held by “transaction zero”. This is at least known to produce assertion failures on slave servers, and might be the cause of more serious problems.

• Track the OID counter correctly during WAL replay, even when it wraps around (Tom Lane)
Previously the OID counter would remain stuck at a high value until the system exited replay mode. The practical consequences of that are usually nil, but there are scenarios wherein a standby server that’s been promoted to master might take a long time to advance the OID counter to a reasonable value once values are needed.

• Prevent emitting misleading “consistent recovery state reached” log message at the beginning of crash recovery (Heikki Linnakangas)

• Fix initial value of \texttt{pg\_stat\_replication.replay\_location} (Fujii Masao)
Previously, the value shown would be wrong until at least one WAL record had been replayed.

• Fix regular expression back-references with \texttt{*} attached (Tom Lane)
Rather than enforcing an exact string match, the code would effectively accept any string that satisfies the pattern sub-expression referenced by the back-reference symbol.
A similar problem still afflicts back-references that are embedded in a larger quantified expression, rather than being the immediate subject of the quantifier. This will be addressed in a future PostgreSQL release.

• Fix recently-introduced memory leak in processing of \texttt{inet/cidr} values (Heikki Linnakangas)
A patch in the December 2011 releases of PostgreSQL caused memory leakage in these operations, which could be significant in scenarios such as building a btree index on such a column.

• Fix planner’s ability to push down index-expression restrictions through \texttt{UNION ALL} (Tom Lane)
This type of optimization was inadvertently disabled by a fix for another problem in 9.1.2.

• Fix planning of \texttt{WITH} clauses referenced in \texttt{UPDATE/DELETE} on an inherited table (Tom Lane)
This bug led to “could not find plan for CTE” failures.

• Fix GIN cost estimation to handle \texttt{column IN (...) index conditions} (Marti Raudsepp)
This oversight would usually lead to crashes if such a condition could be used with a GIN index.

• Prevent assertion failure when exiting a session with an open, failed transaction (Tom Lane)
This bug has no impact on normal builds with asserts not enabled.

• Fix dangling pointer after \texttt{CREATE TABLE AS SELECT INTO} in a SQL-language function (Tom Lane)
In most cases this only led to an assertion failure in assert-enabled builds, but worse consequences seem possible.

• Avoid double close of file handle in syslogger on Windows (MauMau)
Ordinarily this error was invisible, but it would cause an exception when running on a debug version of Windows.

• Fix I/O-conversion-related memory leaks in plpgsql (Andres Freund, Jan Urbanski, Tom Lane)
Certain operations would leak memory until the end of the current function.

• Work around bug in perl’s \texttt{SvPVutf8()} function (Andrew Dunstan)
Appendix E. Release Notes

This function crashes when handed a typeglob or certain read-only objects such as $\$^V$. Make plperl avoid passing those to it.

- In pg_dump, don’t dump contents of an extension’s configuration tables if the extension itself is not being dumped (Tom Lane)
- Improve pg_dump’s handling of inherited table columns (Tom Lane)

pg_dump mishandled situations where a child column has a different default expression than its parent column. If the default is textually identical to the parent’s default, but not actually the same (for instance, because of schema search path differences) it would not be recognized as different, so that after dump and restore the child would be allowed to inherit the parent’s default. Child columns that are NOT NULL where their parent is not could also be restored subtly incorrectly.

- Fix pg_restore’s direct-to-database mode for INSERT-style table data (Tom Lane)

Direct-to-database restores from archive files made with \texttt{--inserts} or \texttt{--column-inserts} options fail when using pg_restore from a release dated September or December 2011, as a result of an oversight in a fix for another problem. The archive file itself is not at fault, and text-mode output is okay.

- Teach pg_upgrade to handle renaming of plpython’s shared library (Bruce Momjian)

Upgrading a pre-9.1 database that included plpython would fail because of this oversight.

- Allow pg_upgrade to process tables containing regclass columns (Bruce Momjian)

Since pg_upgrade now takes care to preserve pg_class OIDs, there was no longer any reason for this restriction.

- Make libpq ignore ENOTDIR errors when looking for an SSL client certificate file (Magnus Hagander)

This allows SSL connections to be established, though without a certificate, even when the user’s home directory is set to something like /dev/null.

- Fix some more field alignment issues in ecpg’s SQLDA area (Zoltan Boszormenyi)

- Allow AT option in ecpg DEALLOCATE statements (Michael Meskes)

The infrastructure to support this has been there for awhile, but through an oversight there was still an error check rejecting the case.

- Do not use the variable name when defining a varchar structure in ecpg (Michael Meskes)

- Fix contrib/auto_explain’s JSON output mode to produce valid JSON (Andrew Dunstan)

The output used brackets at the top level, when it should have used braces.

- Fix error in contrib/intarray’s int[] & int[] operator (Guillaume Lelarge)

If the smallest integer the two input arrays have in common is 1, and there are smaller values in either array, then 1 would be incorrectly omitted from the result.

- Fix error detection in contrib/pgcrypto’s encrypt_iv() and decrypt_iv() (Marko Kreen)

These functions failed to report certain types of invalid-input errors, and would instead return random garbage values for incorrect input.

- Fix one-byte buffer overrun in contrib/test_parser (Paul Guyot)

The code would try to read one more byte than it should, which would crash in corner cases. Since contrib/test_parser is only example code, this is not a security issue in itself, but bad example code is still bad.
• Use __sync_lock_test_and_set() for spinlocks on ARM, if available (Martin Pitt)

This function replaces our previous use of the SWPB instruction, which is deprecated and not available on ARMv6 and later. Reports suggest that the old code doesn’t fail in an obvious way on recent ARM boards, but simply doesn’t interlock concurrent accesses, leading to bizarre failures in multiprocess operation.

• Use -fexcess-precision=standard option when building with gcc versions that accept it (Andrew Dunstan)

This prevents assorted scenarios wherein recent versions of gcc will produce creative results.

• Allow use of threaded Python on FreeBSD (Chris Rees)

Our configure script previously believed that this combination wouldn’t work; but FreeBSD fixed the problem, so remove that error check.

• Allow MinGW builds to use standardly-named OpenSSL libraries (Tomasz Ostrowski)

## E.123. Release 9.1.2

Release date: 2011-12-05

This release contains a variety of fixes from 9.1.1. For information about new features in the 9.1 major release, see Section E.125.

### E.123.1. Migration to Version 9.1.2

A dump/restore is not required for those running 9.1.X.

However, a longstanding error was discovered in the definition of the information_schema.referential_constraints view. If you rely on correct results from that view, you should replace its definition as explained in the first changelog item below.

Also, if you use the citext data type, and you upgraded from a previous major release by running pg_upgrade, you should run CREATE EXTENSION citext FROM unpackaged to avoid collation-related failures in citext operations. The same is necessary if you restore a dump from a pre-9.1 database that contains an instance of the citext data type. If you’ve already run the CREATE EXTENSION command before upgrading to 9.1.2, you will instead need to do manual catalog updates as explained in the second changelog item.

### E.123.2. Changes

• Fix bugs in information_schema.referential_constraints view (Tom Lane)

This view was being insufficiently careful about matching the foreign-key constraint to the depended-on primary or unique key constraint. That could result in failure to show a foreign key constraint at all, or showing it multiple times, or claiming that it depends on a different constraint than the one it really does.
Appendix E. Release Notes

Since the view definition is installed by initdb, merely upgrading will not fix the problem. If you need to fix this in an existing installation, you can (as a superuser) drop the information_schema schema then re-create it by sourcing $SHAREDIR/information_schema.sql. (Run pg_config --sharedir if you’re uncertain where $SHAREDIR is.) This must be repeated in each database to be fixed.

- Make contrib/citext’s upgrade script fix collations of citext columns and indexes (Tom Lane)

Existing citext columns and indexes aren’t correctly marked as being of a collatable data type during pg_upgrade from a pre-9.1 server, or when a pre-9.1 dump containing the citext type is loaded into a 9.1 server. That leads to operations on these columns failing with errors such as “could not determine which collation to use for string comparison”. This change allows them to be fixed by the same script that upgrades the citext module into a proper 9.1 extension during CREATE EXTENSION citext FROM unpackaged.

If you have a previously-upgraded database that is suffering from this problem, and you already ran the CREATE EXTENSION command, you can manually run (as superuser) the UPDATE commands found at the end of $SHAREDIR/extension/citext--unpackaged--1.0.sql. (Run pg_config --sharedir if you’re uncertain where $SHAREDIR is.) There is no harm in doing this again if unsure.

- Fix possible crash during UPDATE or DELETE that joins to the output of a scalar-returning function (Tom Lane)

A crash could only occur if the target row had been concurrently updated, so this problem surfaced only intermittently.

- Fix incorrect replay of WAL records for GIN index updates (Tom Lane)

This could result in transiently failing to find index entries after a crash, or on a hot-standby server. The problem would be repaired by the next VACUUM of the index, however.

- Fix TOAST-related data corruption during CREATE TABLE dest AS SELECT * FROM src or INSERT INTO dest SELECT * FROM src (Tom Lane)

If a table has been modified by ALTER TABLE ADD COLUMN, attempts to copy its data verbatim to another table could produce corrupt results in certain corner cases. The problem can only manifest in this precise form in 8.4 and later, but we patched earlier versions as well in case there are other code paths that could trigger the same bug.

- Fix possible failures during hot standby startup (Simon Riggs)

- Start hot standby faster when initial snapshot is incomplete (Simon Riggs)

- Fix race condition during toast table access from stale syscache entries (Tom Lane)

The typical symptom was transient errors like “missing chunk number 0 for toast value NNNNN in pg_toast_2619”, where the cited toast table would always belong to a system catalog.

- Track dependencies of functions on items used in parameter default expressions (Tom Lane)

Previously, a referenced object could be dropped without having dropped or modified the function, leading to misbehavior when the function was used. Note that merely installing this update will not fix the missing dependency entries; to do that, you’d need to CREATE OR REPLACE each such function afterwards. If you have functions whose defaults depend on non-built-in objects, doing so is recommended.

- Fix incorrect management of placeholder variables in nestloop joins (Tom Lane)
Appendix E. Release Notes

This bug is known to lead to “variable not found in subplan target list” planner errors, and could possibly result in wrong query output when outer joins are involved.

- Fix window functions that sort by expressions involving aggregates (Tom Lane)
  Previously these could fail with “could not find pathkey item to sort” planner errors.
- Fix “MergeAppend child’s targetlist doesn’t match MergeAppend” planner errors (Tom Lane)
- Fix index matching for operators with both collatable and noncollatable inputs (Tom Lane)
  In 9.1.0, an indexable operator that has a non-collatable left-hand input type and a collatable right-hand input type would not be recognized as matching the left-hand column’s index. An example is the `hstore ? text` operator.
- Allow inlining of set-returning SQL functions with multiple OUT parameters (Tom Lane)
- Don’t trust deferred-unique indexes for join removal (Tom Lane and Marti Raudsepp)
  A deferred uniqueness constraint might not hold intra-transaction, so assuming that it does could give incorrect query results.
- Make `DatumGetInetP()` unpack inet datums that have a 1-byte header, and add a new macro, `DatumGetInetPP()`, that does not (Heikki Linnakangas)
  This change affects no core code, but might prevent crashes in add-on code that expects `DatumGetInetP()` to produce an unpacked datum as per usual convention.
- Improve locale support in `money` type’s input and output (Tom Lane)
  Aside from not supporting all standard `lc_monetary` formatting options, the input and output functions were inconsistent, meaning there were locales in which dumped `money` values could not be re-read.
- Don’t let `transform_null_equals` affect `CASE foo WHEN NULL ...` constructs (Heikki Linnakangas)
  `transform_null_equals` is only supposed to affect `foo = NULL` expressions written directly by the user, not equality checks generated internally by this form of `CASE`.
- Change foreign-key trigger creation order to better support self-referential foreign keys (Tom Lane)
  For a cascading foreign key that references its own table, a row update will fire both the `ON UPDATE` trigger and the `CHECK` trigger as one event. The `ON UPDATE` trigger must execute first, else the `CHECK` will check a non-final state of the row and possibly throw an inappropriate error. However, the firing order of these triggers is determined by their names, which generally sort in creation order since the triggers have auto-generated names following the convention “RI_ConstraintTrigger_NNNN”. A proper fix would require modifying that convention, which we will do in 9.2, but it seems risky to change it in existing releases. So this patch just changes the creation order of the triggers. Users encountering this type of error should drop and re-create the foreign key constraint to get its triggers into the right order.
- Fix `IF EXISTS` to work correctly in `DROP OPERATOR FAMILY` (Robert Haas)
-Disallow dropping of an extension from within its own script (Tom Lane)
  This prevents odd behavior in case of incorrect management of extension dependencies.
- Don’t mark auto-generated types as extension members (Robert Haas)
Relation rowtypes and automatically-generated array types do not need to have their own extension membership entries in `pg_depend`, and creating such entries complicates matters for extension upgrades.

- **Cope with invalid pre-existing `search_path` settings during `CREATE EXTENSION` (Tom Lane)**

- **Avoid floating-point underflow while tracking buffer allocation rate (Greg Matthews)**
  While harmless in itself, on certain platforms this would result in annoying kernel log messages.

- **Prevent autovacuum transactions from running in serializable mode (Tom Lane)**
  Autovacuum formerly used the cluster-wide default transaction isolation level, but there is no need for it to use anything higher than READ COMMITTED, and using SERIALIZABLE could result in unnecessary delays for other processes.

- **Ensure walsender processes respond promptly to SIGTERM (Magnus Hagander)**

- **Exclude `postmaster.opts` from base backups (Magnus Hagander)**

- **Preserve configuration file name and line number values when starting child processes under Windows (Tom Lane)**
  Formerly, these would not be displayed correctly in the `pg_settings` view.

- **Fix incorrect field alignment in `ecpg`’s SQLDA area (Zoltan Boszormenyi)**

- **Preserve blank lines within commands in `psql`’s command history (Robert Haas)**
  The former behavior could cause problems if an empty line was removed from within a string literal, for example.

- **Avoid platform-specific infinite loop in `pg_dump` (Steve Singer)**

- **Fix compression of plain-text output format in `pg_dump` (Adrian Klaver and Tom Lane)**
  `pg_dump` has historically understood `-z` with no `-F` switch to mean that it should emit a gzip-compressed version of its plain text output. Restore that behavior.

- **Fix `pg_dump` to dump user-defined casts between auto-generated types, such as table rowtypes (Tom Lane)**

- **Fix missed quoting of foreign server names in `pg_dump` (Tom Lane)**

- **Assorted fixes for `pg_upgrade` (Bruce Momjian)**
  Handle exclusion constraints correctly, avoid failures on Windows, don’t complain about mismatched toast table names in 8.4 databases.

- **In PL/pgSQL, allow foreign tables to define row types (Alexander Soudakov)**

- **Fix up conversions of PL/Perl functions’ results (Alex Hunsaker and Tom Lane)**
  Restore the pre-9.1 behavior that PL/Perl functions returning `void` ignore the result value of their last Perl statement; 9.1.0 would throw an error if that statement returned a reference. Also, make sure it works to return a string value for a composite type, so long as the string meets the type’s input format. In addition, throw errors for attempts to return Perl arrays or hashes when the function’s declared result type is not an array or composite type, respectively. (Pre-9.1 versions rather uselessly returned strings like `ARRAY(0x221a9a0)` or `HASH(0x221aa90)` in such cases.)

- **Ensure PL/Perl strings are always correctly UTF8-encoded (Amit Khandekar and Alex Hunsaker)**
• Use the preferred version of xsubpp to build PL/Perl, not necessarily the operating system’s main copy (David Wheeler and Alex Hunsaker)
• Correctly propagate SQLSTATE in PL/Python exceptions (Mika Eloranta and Jan Urbanski)
• Do not install PL/Python extension files for Python major versions other than the one built against (Peter Eisentraut)
• Change all the contrib extension script files to report a useful error message if they are fed to psql (Andrew Dunstan and Tom Lane)
  This should help teach people about the new method of using \texttt{CREATE EXTENSION} to load these files. In most cases, sourcing the scripts directly would fail anyway, but with harder-to-interpret messages.
• Fix incorrect coding in contrib/dict_int and contrib/dict_xsyn (Tom Lane)
  Some functions incorrectly assumed that memory returned by \texttt{palloc()} is guaranteed zeroed.
• Remove contrib/sepgsql tests from the regular regression test mechanism (Tom Lane)
  Since these tests require root privileges for setup, they’re impractical to run automatically. Switch over to a manual approach instead, and provide a testing script to help with that.
• Fix assorted errors in contrib/unaccent’s configuration file parsing (Tom Lane)
• Honor query cancel interrupts promptly in pgstatindex() (Robert Haas)
• Fix incorrect quoting of log file name in macOS start script (Sidar Lopez)
• Revert unintentional enabling of \texttt{WAL_DEBUG} (Robert Haas)
  Fortunately, as debugging tools go, this one is pretty cheap; but it’s not intended to be enabled by default, so revert.
• Ensure VPATH builds properly install all server header files (Peter Eisentraut)
• Shorten file names reported in verbose error messages (Peter Eisentraut)
  Regular builds have always reported just the name of the C file containing the error message call, but VPATH builds formerly reported an absolute path name.
• Fix interpretation of Windows timezone names for Central America (Tom Lane)
  Map “Central America Standard Time” to \texttt{CST6}, not \texttt{CST6CDT}, because DST is generally not observed anywhere in Central America.
• Update time zone data files to tzdata release 2011n for DST law changes in Brazil, Cuba, Fiji, Palestine, Russia, and Samoa; also historical corrections for Alaska and British East Africa.

\textbf{E.124. Release 9.1.1}

\textit{Release date:} 2011-09-26
This release contains a small number of fixes from 9.1.0. For information about new features in the 9.1 major release, see Section E.125.
E.124.1. Migration to Version 9.1.1

A dump/restore is not required for those running 9.1.X.

E.124.2. Changes

- Make `pg_options_to_table` return NULL for an option with no value (Tom Lane)
  Previously such cases would result in a server crash.
- Fix memory leak at end of a GiST index scan (Tom Lane)
  Commands that perform many separate GiST index scans, such as verification of a new GiST-based
  exclusion constraint on a table already containing many rows, could transiently require large amounts
  of memory due to this leak.
- Fix explicit reference to `pg_temp` schema in `CREATE TEMPORARY TABLE` (Robert Haas)
  This used to be allowed, but failed in 9.1.0.

E.125. Release 9.1

*Release date:* 2011-09-12

E.125.1. Overview

This release shows PostgreSQL moving beyond the traditional relational-database feature set with new,
ground-breaking functionality that is unique to PostgreSQL. The streaming replication feature introduced
in release 9.0 is significantly enhanced by adding a synchronous-replication option, streaming backups,
and monitoring improvements. Major enhancements include:

- Allow synchronous replication
- Add support for foreign tables
- Add per-column collation support
- Add extensions which simplify packaging of additions to PostgreSQL
- Add a true serializable isolation level
- Support unlogged tables using the `UNLOGGED` option in `CREATE TABLE`
- Allow data-modification commands (`INSERT/UPDATE/DELETE`) in `WITH` clauses
- Add nearest-neighbor (order-by-operator) searching to GiST indexes
- Add a `SECURITY LABEL` command and support for SELinux permissions control
- Update the PL/Python server-side language

The above items are explained in more detail in the sections below.
E.125.2. Migration to Version 9.1

A dump/restore using pg_dump, or use of pg_upgrade, is required for those wishing to migrate data from any previous release.

Version 9.1 contains a number of changes that may affect compatibility with previous releases. Observe the following incompatibilities:

E.125.2.1. Strings

• Change the default value of standard_conforming_strings to on (Robert Haas)

By default, backslashes are now ordinary characters in string literals, not escape characters. This change removes a long-standing incompatibility with the SQL standard. escape_string_warning has produced warnings about this usage for years. E" strings are the proper way to embed backslash escapes in strings and are unaffected by this change.

Warning
This change can break applications that are not expecting it and do their own string escaping according to the old rules. The consequences could be as severe as introducing SQL-injection security holes. Be sure to test applications that are exposed to untrusted input, to ensure that they correctly handle single quotes and backslashes in text strings.

E.125.2.2. Casting

• Disallow function-style and attribute-style data type casts for composite types (Tom Lane)

For example, disallow composite_value.text and text(composite_value). Unintentional uses of this syntax have frequently resulted in bug reports; although it was not a bug, it seems better to go back to rejecting such expressions. The CAST and :: syntaxes are still available for use when a cast of an entire composite value is actually intended.

• Tighten casting checks for domains based on arrays (Tom Lane)

When a domain is based on an array type, it is allowed to “look through” the domain type to access the array elements, including subscripting the domain value to fetch or assign an element. Assignment to an element of such a domain value, for instance via UPDATE ... SET domaincol[5] = ..., will now result in rechecking the domain type’s constraints, whereas before the checks were skipped.

E.125.2.3. Arrays

• Change string_to_array() to return an empty array for a zero-length string (Pavel Stehule)

Previously this returned a null value.
Appendix E. Release Notes

- Change `string_to_array()` so a NULL separator splits the string into characters (Pavel Stehule)
  Previously this returned a null value.

E.125.2.4. Object Modification

- Fix improper checks for before/after triggers (Tom Lane)
  Triggers can now be fired in three cases: BEFORE, AFTER, or INSTEAD OF some action. Trigger function authors should verify that their logic behaves sanely in all three cases.
- Require superuser or CREATEROLE permissions in order to set comments on roles (Tom Lane)

E.125.2.5. Server Settings

- Change `pg_last_xlog_receive_location()` so it never moves backwards (Fujii Masao)
  Previously, the value of `pg_last_xlog_receive_location()` could move backward when streaming replication is restarted.
- Have logging of replication connections honor `log_connections` (Magnus Hagander)
  Previously, replication connections were always logged.

E.125.2.6. PL/pgSQL Server-Side Language

- Change PL/pgSQL’s `RAISE` command without parameters to be catchable by the attached exception block (Piyush Newe)
  Previously `RAISE` in a code block was always scoped to an attached exception block, so it was uncatchable at the same scope.
- Adjust PL/pgSQL’s error line numbering code to be consistent with other PLs (Pavel Stehule)
  Previously, PL/pgSQL would ignore (not count) an empty line at the start of the function body. Since this was inconsistent with all other languages, the special case was removed.
- Make PL/pgSQL complain about conflicting IN and OUT parameter names (Tom Lane)
  Formerly, the collision was not detected, and the name would just silently refer to only the OUT parameter.
- Type modifiers of PL/pgSQL variables are now visible to the SQL parser (Tom Lane)
  A type modifier (such as a varchar length limit) attached to a PL/pgSQL variable was formerly enforced during assignments, but was ignored for all other purposes. Such variables will now behave more like table columns declared with the same modifier. This is not expected to make any visible difference in most cases, but it could result in subtle changes for some SQL commands issued by PL/pgSQL functions.
E.125.2.7. Contrib

- All contrib modules are now installed with `CREATE EXTENSION` rather than by manually invoking their SQL scripts (Dimitri Fontaine, Tom Lane)

To update an existing database containing the 9.0 version of a contrib module, use `CREATE EXTENSION ... FROM unpackaged` to wrap the existing contrib module’s objects into an extension. When updating from a pre-9.0 version, drop the contrib module’s objects using its old uninstall script, then use `CREATE EXTENSION`.

E.125.2.8. Other Incompatibilities

- Make `pg_stat_reset()` reset all database-level statistics (Tomas Vondra)
  Some `pg_stat_database` counters were not being reset.
- Fix some `information_schema.triggers` column names to match the new SQL-standard names (Dean Rasheed)
- Treat ECPG cursor names as case-insensitive (Zoltan Boszormenyi)

E.125.3. Changes

Below you will find a detailed account of the changes between PostgreSQL 9.1 and the previous major release.

E.125.3.1. Server

E.125.3.1.1. Performance

- Support unlogged tables using the `UNLOGGED` option in `CREATE TABLE` (Robert Haas)
  Such tables provide better update performance than regular tables, but are not crash-safe: their contents are automatically cleared in case of a server crash. Their contents do not propagate to replication slaves, either.
- Allow `FULL OUTER JOIN` to be implemented as a hash join, and allow either side of a `LEFT OUTER JOIN` or `RIGHT OUTER JOIN` to be hashed (Tom Lane)
  Previously `FULL OUTER JOIN` could only be implemented as a merge join, and `LEFT OUTER JOIN` and `RIGHT OUTER JOIN` could hash only the nullable side of the join. These changes provide additional query optimization possibilities.
- Merge duplicate fsync requests (Robert Haas, Greg Smith)
  This greatly improves performance under heavy write loads.
- Improve performance of `commit_siblings` (Greg Smith)
  This allows the use of `commit_siblings` with less overhead.
• Reduce the memory requirement for large ispell dictionaries (Pavel Stehule, Tom Lane)

• Avoid leaving data files open after “blind writes” (Alvaro Herrera)
  
  This fixes scenarios in which backends might hold files open long after they were deleted, preventing the kernel from reclaiming disk space.

**E.125.3.1.2. Optimizer**

• Allow inheritance table scans to return meaningfully-sorted results (Greg Stark, Hans-Jurgen Schonig, Robert Haas, Tom Lane)
  
  This allows better optimization of queries that use ORDER BY, LIMIT, or MIN/MAX with inherited tables.

• Improve GIN index scan cost estimation (Teodor Sigaev)

• Improve cost estimation for aggregates and window functions (Tom Lane)

**E.125.3.1.3. Authentication**

• Support host names and host suffixes (e.g. .example.com) in pg_hba.conf (Peter Eisentraut)
  
  Previously only host IP addresses and CIDR values were supported.

• Support the key word all in the host column of pg_hba.conf (Peter Eisentraut)
  
  Previously people used 0.0.0.0/0 or ::/0 for this.

• Reject local lines in pg_hba.conf on platforms that don’t support Unix-socket connections (Magnus Hagander)
  
  Formerly, such lines were silently ignored, which could be surprising. This makes the behavior more like other unsupported cases.

• Allow GSSAPI to be used to authenticate to servers via SSPI (Christian Ullrich)
  
  Specifically this allows Unix-based GSSAPI clients to do SSPI authentication with Windows servers.

• ident authentication over local sockets is now known as peer (Magnus Hagander)
  
  The old term is still accepted for backward compatibility, but since the two methods are fundamentally different, it seemed better to adopt different names for them.

• Rewrite peer authentication to avoid use of credential control messages (Tom Lane)
  
  This change makes the peer authentication code simpler and better-performing. However, it requires the platform to provide the getpeereid function or an equivalent socket operation. So far as is known, the only platform for which peer authentication worked before and now will not is pre-5.0 NetBSD.

**E.125.3.1.4. Monitoring**

• Add details to the logging of restartpoints and checkpoints, which is controlled by log_checkpoints (Fujii Masao, Greg Smith)
  
  New details include WAL file and sync activity.
Appendix E. Release Notes

- Add `log_file_mode` which controls the permissions on log files created by the logging collector (Martin Pihlak)
- Reduce the default maximum line length for syslog logging to 900 bytes plus prefixes (Noah Misch)
  
  This avoids truncation of long log lines on syslog implementations that have a 1KB length limit, rather than the more common 2KB.

**E.125.3.1.5. Statistical Views**

- Add `client_hostname` column to `pg_stat_activity` (Peter Eisentraut)
  
  Previously only the client address was reported.
- Add `pg_stat_xact_*` statistics functions and views (Joel Jacobson)
  
  These are like the database-wide statistics counter views, but reflect counts for only the current transaction.
- Add time of last reset in database-level and background writer statistics views (Tomas Vondra)
- Add columns showing the number of vacuum and analyze operations in `pg_stat_*_tables` views (Magnus Hagander)
- Add `buffers_backend_fsync` column to `pg_stat_bgwriter` (Greg Smith)
  
  This new column counts the number of times a backend fsyncs a buffer.

**E.125.3.1.6. Server Settings**

- Provide auto-tuning of `wal_buffers` (Greg Smith)
  
  By default, the value of `wal_buffers` is now chosen automatically based on the value of `shared_buffers`.
- Increase the maximum values for `deadlock_timeout`, `log_min_duration_statement`, and `log_autovacuum_min_duration` (Peter Eisentraut)
  
  The maximum value for each of these parameters was previously only about 35 minutes. Much larger values are now allowed.

**E.125.3.2. Replication and Recovery**

**E.125.3.2.1. Streaming Replication and Continuous Archiving**

- Allow synchronous replication (Simon Riggs, Fujii Masao)
  
  This allows the primary server to wait for a standby to write a transaction’s information to disk before acknowledging the commit. One standby at a time can take the role of the synchronous standby, as controlled by the `synchronous_standby_names` setting. Synchronous replication can be enabled or disabled on a per-transaction basis using the `synchronous_commit` setting.
Appendix E. Release Notes

- Add protocol support for sending file system backups to standby servers using the streaming replication network connection (Magnus Hagander, Heikki Linnakangas)
  This avoids the requirement of manually transferring a file system backup when setting up a standby server.
- Add `replication_timeout` setting (Fujii Masao, Heikki Linnakangas)
  Replication connections that are idle for more than the `replication_timeout` interval will be terminated automatically. Formerly, a failed connection was typically not detected until the TCP timeout elapsed, which is inconveniently long in many situations.
- Add command-line tool `pg_basebackup` for creating a new standby server or database backup (Magnus Hagander)
- Add a replication permission for roles (Magnus Hagander)
  This is a read-only permission used for streaming replication. It allows a non-superuser role to be used for replication connections. Previously only superusers could initiate replication connections; superusers still have this permission by default.

E.125.3.2.2. Replication Monitoring

- Add system view `pg_stat_replication` which displays activity of WAL sender processes (Itagaki Takahiro, Simon Riggs)
  This reports the status of all connected standby servers.
- Add monitoring function `pg_last_xact_replay_timestamp()` (Fujii Masao)
  This returns the time at which the primary generated the most recent commit or abort record applied on the standby.

E.125.3.2.3. Hot Standby

- Add configuration parameter `hot_standby_feedback` to enable standbys to postpone cleanup of old row versions on the primary (Simon Riggs)
  This helps avoid canceling long-running queries on the standby.
- Add the `pg_stat_database_conflicts` system view to show queries that have been canceled and the reason (Magnus Hagander)
  Cancellations can occur because of dropped tablespaces, lock timeouts, old snapshots, pinned buffers, and deadlocks.
- Add a `conflicts` count to `pg_stat_database` (Magnus Hagander)
  This is the number of conflicts that occurred in the database.
- Increase the maximum values for `max_standby_archive_delay` and `max_standby_streaming_delay`
  The maximum value for each of these parameters was previously only about 35 minutes. Much larger values are now allowed.
• Add ERRCODE_T_R_DATABASE_DROPPED error code to report recovery conflicts due to dropped databases (Tatsuo Ishii)
   This is useful for connection pooling software.

E.125.3.2.4. Recovery Control

• Add functions to control streaming replication replay (Simon Riggs)
  The new functions are `pg_xlog_replay_pause()`, `pg_xlog_replay_resume()`, and the status function `pg_is_xlog_replay_paused()`.
• Add `recovery.conf` setting `pause_at_recovery_target` to pause recovery at target (Simon Riggs)
  This allows a recovery server to be queried to check whether the recovery point is the one desired.
• Add the ability to create named restore points using `pg_create_restore_point()` (Jaime Casanova)
  These named restore points can be specified as recovery targets using the new `recovery.conf` setting `recovery_target_name`.
• Allow standby recovery to switch to a new timeline automatically (Heikki Linnakangas)
  Now standby servers scan the archive directory for new timelines periodically.
• Add `restart_after_crash` setting which disables automatic server restart after a backend crash (Robert Haas)
  This allows external cluster management software to control whether the database server restarts or not.
• Allow `recovery.conf` to use the same quoting behavior as `postgresql.conf` (Dimitri Fontaine)
  Previously all values had to be quoted.

E.125.3.3. Queries

• Add a true serializable isolation level (Kevin Grittner, Dan Ports)
  Previously, asking for serializable isolation guaranteed only that a single MVCC snapshot would be used for the entire transaction, which allowed certain documented anomalies. The old snapshot isolation behavior is still available by requesting the `REPEATABLE READ` isolation level.
• Allow data-modification commands (`INSERT/UPDATE/DELETE`) in `WITH` clauses (Marko Tiikkaja, Hitoshi Harada)
  These commands can use `RETURNING` to pass data up to the containing query.
• Allow `WITH` clauses to be attached to `INSERT, UPDATE, DELETE` statements (Marko Tiikkaja, Hitoshi Harada)
• Allow non-`GROUP BY` columns in the query target list when the primary key is specified in the `GROUP BY` clause (Peter Eisentraut)
Appendix E. Release Notes

The SQL standard allows this behavior, and because of the primary key, the result is unambiguous.

- **Allow use of the key word DISTINCT in UNION/INTERSECT/EXCEPT clauses** (Tom Lane)
  
  DISTINCT is the default behavior so use of this key word is redundant, but the SQL standard allows it.

- **Fix ordinary queries with rules to use the same snapshot behavior as EXPLAIN ANALYZE** (Marko Tikkaja)
  
  Previously EXPLAIN ANALYZE used slightly different snapshot timing for queries involving rules. The EXPLAIN ANALYZE behavior was judged to be more logical.

E.125.3.3.1. Strings

- **Add per-column collation support** (Peter Eisentraut, Tom Lane)
  
  Previously collation (the sort ordering of text strings) could only be chosen at database creation. Collation can now be set per column, domain, index, or expression, via the SQL-standard COLLATE clause.

E.125.3.4. Object Manipulation

- **Add extensions which simplify packaging of additions to PostgreSQL** (Dimitri Fontaine, Tom Lane)
  
  Extensions are controlled by the new CREATE/ALTER/DROP EXTENSION commands. This replaces ad-hoc methods of grouping objects that are added to a PostgreSQL installation.

- **Add support for foreign tables** (Shigeru Hanada, Robert Haas, Jan Urbanski, Heikki Linnakangas)
  
  This allows data stored outside the database to be used like native PostgreSQL-stored data. Foreign tables are currently read-only, however.

- **Allow new values to be added to an existing enum type via ALTER TYPE** (Andrew Dunstan)

- **Add ALTER TYPE ... ADD/DROP/ALTER/RENAME ATTRIBUTE** (Peter Eisentraut)
  
  This allows modification of composite types.

E.125.3.4.1. ALTER Object

- **Add RESTRICT/CASCADE to ALTER TYPE operations on typed tables** (Peter Eisentraut)
  
  This controls ADD/DROP/ALTER/RENAME ATTRIBUTE cascading behavior.

- **Support ALTER TABLE name {OF | NOT OF} type** (Noah Misch)
  
  This syntax allows a standalone table to be made into a typed table, or a typed table to be made standalone.

- **Add support for more object types in ALTER ... SET SCHEMA commands** (Dimitri Fontaine)
  
  This command is now supported for conversions, operators, operator classes, operator families, text search configurations, text search dictionaries, text search parsers, and text search templates.
Appendix E. Release Notes

**E.125.3.4.2. CREATE/ALTER TABLE**

- Add `ALTER TABLE ... ADD UNIQUE/PRIMARY KEY USING INDEX` (Gurjeet Singh)
  This allows a primary key or unique constraint to be defined using an existing unique index, including a concurrently created unique index.

- Allow `ALTER TABLE` to add foreign keys without validation (Simon Riggs)
  The new option is called `NOT VALID`. The constraint’s state can later be modified to `VALIDATED` and validation checks performed. Together these allow you to add a foreign key with minimal impact on read and write operations.

- Allow `ALTER TABLE ... SET DATA TYPE` to avoid table rewrites in appropriate cases (Noah Misch, Robert Haas)
  For example, converting a `varchar` column to `text` no longer requires a rewrite of the table. However, increasing the length constraint on a `varchar` column still requires a table rewrite.

- Add `CREATE TABLE IF NOT EXISTS` syntax (Robert Haas)
  This allows table creation without causing an error if the table already exists.

- Fix possible “tuple concurrently updated” error when two backends attempt to add an inheritance child to the same table at the same time (Robert Haas)
  `ALTER TABLE` now takes a stronger lock on the parent table, so that the sessions cannot try to update it simultaneously.

**E.125.3.4.3. Object Permissions**

- Add a `SECURITY LABEL` command (KaiGai Kohei)
  This allows security labels to be assigned to objects.

**E.125.3.5. Utility Operations**

- Add transaction-level advisory locks (Marko Tiikkaja)
  These are similar to the existing session-level advisory locks, but such locks are automatically released at transaction end.

- Make `TRUNCATE ... RESTART IDENTITY` restart sequences transactionally (Steve Singer)
  Previously the counter could have been left out of sync if a backend crashed between the on-commit truncation activity and commit completion.

**E.125.3.5.1. COPY**

- Add `ENCODING` option to `COPY TO/FROM` (Hitoshi Harada, Itagaki Takahiro)
  This allows the encoding of the `COPY` file to be specified separately from client encoding.
• Add bidirectional COPY protocol support (Fujii Masao)
  This is currently only used by streaming replication.

**E.125.3.5.2. EXPLAIN**

• Make EXPLAINVERBOSE show the function call expression in a FunctionScan node (Tom Lane)

**E.125.3.5.3. VACUUM**

• Add additional details to the output of VACUUMFULLVERBOSE and CLUSTERVERBOSE (Itagaki Takahiro)
  New information includes the live and dead tuple count and whether CLUSTER is using an index to rebuild.
• Prevent autovacuum from waiting if it cannot acquire a table lock (Robert Haas)
  It will try to vacuum that table later.

**E.125.3.5.4. CLUSTER**

• Allow CLUSTER to sort the table rather than scanning the index when it seems likely to be cheaper (Leonardo Francalanci)

**E.125.3.5.5. Indexes**

• Add nearest-neighbor (order-by-operator) searching to GiST indexes (Teodor Sigaev, Tom Lane)
  This allows GiST indexes to quickly return the \(N\) closest values in a query with LIMIT. For example
  \[
  \text{SELECT } * \text{ FROM places ORDER BY location } \leftrightarrow \text{ point '}(101,456)' \text{ LIMIT 10;}
  \]
  finds the ten places closest to a given target point.
• Allow GIN indexes to index null and empty values (Tom Lane)
  This allows full GIN index scans, and fixes various corner cases in which GIN scans would fail.
• Allow GIN indexes to better recognize duplicate search entries (Tom Lane)
  This reduces the cost of index scans, especially in cases where it avoids unnecessary full index scans.
• Fix GiST indexes to be fully crash-safe (Heikki Linnakangas)
  Previously there were rare cases where a REINDEX would be required (you would be informed).
Appendix E. Release Notes

E.125.3.6. Data Types

- Allow numeric to use a more compact, two-byte header in common cases (Robert Haas)
  Previously all numeric values had four-byte headers; this change saves on disk storage.
- Add support for dividing money by money (Andy Balholm)
- Allow binary I/O on type void (Radoslaw Smogura)
- Improve hypotenuse calculations for geometric operators (Paul Matthews)
  This avoids unnecessary overflows, and may also be more accurate.
- Support hashing array values (Tom Lane)
  This provides additional query optimization possibilities.
- Don’t treat a composite type as sortable unless all its column types are sortable (Tom Lane)
  This avoids possible “could not identify a comparison function” failures at runtime, if it is possible to
  implement the query without sorting. Also, ANALYZE won’t try to use inappropriate statistics-gathering
  methods for columns of such composite types.

E.125.3.6.1. Casting

- Add support for casting between money and numeric (Andy Balholm)
- Add support for casting from int4 and int8 to money (Joey Adams)
- Allow casting a table’s row type to the table’s supertype if it’s a typed table (Peter Eisentraut)
  This is analogous to the existing facility that allows casting a row type to a supertable’s row type.

E.125.3.6.2. XML

- Add XML function XML_EXISTS and xpath_exists() functions (Mike Fowler)
  These are used for XPath matching.
- Add XML functions xml_is_well_formed(), xml_is_well_formed_document(),
  xml_is_well_formed_content() (Mike Fowler)
  These check whether the input is properly-formed XML. They provide functionality that was previously
  available only in the deprecated contrib/xml2 module.

E.125.3.7. Functions

- Add SQL function format(text, ...), which behaves analogously to C’s printf() (Pavel Stehule, Robert Haas)
  It currently supports formats for strings, SQL literals, and SQL identifiers.
- Add string functions concat(), concat_ws(), left(), right(), and reverse() (Pavel Stehule)
These improve compatibility with other database products.

- Add function `pg_read_binary_file()` to read binary files (Dimitri Fontaine, Itagaki Takahiro)
- Add a single-parameter version of function `pg_read_file()` to read an entire file (Dimitri Fontaine, Itagaki Takahiro)
- Add three-parameter forms of `array_to_string()` and `string_to_array()` for null value processing control (Pavel Stehule)

### E.125.3.7.1. Object Information Functions

- Add the `pg_describe_object()` function (Alvaro Herrera)
  This function is used to obtain a human-readable string describing an object, based on the `pg_class` OID, object OID, and sub-object ID. It can be used to help interpret the contents of `pg_depend`.
- Update comments for built-in operators and their underlying functions (Tom Lane)
  Functions that are meant to be used via an associated operator are now commented as such.
- Add variable `quote_all_identifiers` to force the quoting of all identifiers in `EXPLAIN` and in system catalog functions like `pg_get_viewdef()` (Robert Haas)
  This makes exporting schemas to tools and other databases with different quoting rules easier.
- Add columns to the `information_schema.sequences` system view (Peter Eisentraut)
  Previously, though the view existed, the columns about the sequence parameters were unimplemented.
- Allow `public` as a pseudo-role name in `has_table_privilege()` and related functions (Alvaro Herrera)
  This allows checking for public permissions.

### E.125.3.7.2. Function and Trigger Creation

- Support `INSTEAD OF` triggers on views (Dean Rasheed)
  This feature can be used to implement fully updatable views.

### E.125.3.8. Server-Side Languages

#### E.125.3.8.1. PL/pgSQL Server-Side Language

- Add `FOREACH IN ARRAY` to PL/pgSQL (Pavel Stehule)
  This is more efficient and readable than previous methods of iterating through the elements of an array value.
- Allow `RAISE` without parameters to be caught in the same places that could catch a `RAISE ERROR` from the same location (Piyush Newe)
Appendix E. Release Notes

The previous coding threw the error from the block containing the active exception handler. The new behavior is more consistent with other DBMS products.

E.125.3.8.2. PL/Perl Server-Side Language

- Allow generic record arguments to PL/Perl functions (Andrew Dunstan)
  PL/Perl functions can now be declared to accept type `record`. The behavior is the same as for any named composite type.
- Convert PL/Perl array arguments to Perl arrays (Alexey Klyukin, Alex Hunsaker)
  String representations are still available.
- Convert PL/Perl composite-type arguments to Perl hashes (Alexey Klyukin, Alex Hunsaker)
  String representations are still available.

E.125.3.8.3. PL/Python Server-Side Language

- Add table function support for PL/Python (Jan Urbanski)
  PL/Python can now return multiple `OUT` parameters and record sets.
- Add a validator to PL/Python (Jan Urbanski)
  This allows PL/Python functions to be syntax-checked at function creation time.
- Allow exceptions for SQL queries in PL/Python (Jan Urbanski)
  This allows access to SQL-generated exception error codes from PL/Python exception blocks.
- Add explicit subtransactions to PL/Python (Jan Urbanski)
- Add PL/Python functions for quoting strings (Jan Urbanski)
  These functions are `plpy.quote_ident`, `plpy.quote_literal`, and `plpy.quote_nullable`.
- Add traceback information to PL/Python errors (Jan Urbanski)
- Report PL/Python errors from iterators with `PLy_elog` (Jan Urbanski)
- Fix exception handling with Python 3 (Jan Urbanski)
  Exception classes were previously not available in `plpy` under Python 3.

E.125.3.9. Client Applications

- Mark createlang and droplang as deprecated now that they just invoke extension commands (Tom Lane)
E.125.3.9.1. psql

- Add psql command \conninfo to show current connection information (David Christensen)
- Add psql command \sf to show a function’s definition (Pavel Stehule)
- Add psql command \dL to list languages (Fernando Ike)
- Add the S (“system”) option to psql’s \dn (list schemas) command (Tom Lane)
  \dn without S now suppresses system schemas.
- Allow psql’s \e and \ef commands to accept a line number to be used to position the cursor in the editor (Pavel Stehule)
  This is passed to the editor according to the PSQL_EDITOR_LINENUMBER_ARG environment variable.
- Have psql set the client encoding from the operating system locale by default (Heikki Linnakangas)
  This only happens if the PGCLIENTENCODING environment variable is not set.
- Make \d distinguish between unique indexes and unique constraints (Josh Kupershmidt)
- Make \dt+ report pg_table_size instead of pg_relation_size when talking to 9.0 or later servers (Bernd Helmle)
  This is a more useful measure of table size, but note that it is not identical to what was previously reported in the same display.
- Additional tab completion support (Itagaki Takahiro, Pavel Stehule, Andrey Popp, Christoph Berg, David Fetter, Josh Kupershmidt)

E.125.3.9.2. pg_dump

- Add pg_dump and pg_dumpall option --quote-all-identifiers to force quoting of all identifiers (Robert Haas)
- Add directory format to pg_dump (Joachim Wieland, Heikki Linnakangas)
  This is internally similar to the tar pg_dump format.

E.125.3.9.3. pg_ctl

- Fix pg_ctl so it no longer incorrectly reports that the server is not running (Bruce Momjian)
  Previously this could happen if the server was running but pg_ctl could not authenticate.
- Improve pg_ctl start’s “wait” (-w) option (Bruce Momjian, Tom Lane)
  The wait mode is now significantly more robust. It will not get confused by non-default postmaster port numbers, non-default Unix-domain socket locations, permission problems, or stale postmaster lock files.
- Add promote option to pg_ctl to switch a standby server to primary (Fujii Masao)
E.125.3.10. Development Tools

E.125.3.10.1. libpq

- Add a libpq connection option `client_encoding` which behaves like the `PGCLIENTENCODING` environment variable (Heikki Linnakangas)
  The value `auto` sets the client encoding based on the operating system locale.
- Add `PQlibVersion()` function which returns the libpq library version (Magnus Hagander)
  `libpq` already had `PQserverVersion()` which returns the server version.
- Allow libpq-using clients to check the user name of the server process when connecting via Unix-domain sockets, with the new `requirepeer` connection option (Peter Eisentraut)
  `PostgreSQL` already allowed servers to check the client user name when connecting via Unix-domain sockets.
- Add `PQping()` and `PQpingParams()` to libpq (Bruce Momjian, Tom Lane)
  These functions allow detection of the server’s status without trying to open a new session.

E.125.3.10.2. ECPG

- Allow ECPG to accept dynamic cursor names even in `WHERE CURRENT OF` clauses (Zoltan Boszormenyi)
- Make `ecpglib` write `double` values with a precision of 15 digits, not 14 as formerly (Akira Kurosawa)

E.125.3.11. Build Options

- Use `+Olibmerrno` compile flag with HP-UX C compilers that accept it (Ibrar Ahmed)
  This avoids possible misbehavior of math library calls on recent HP platforms.

E.125.3.11.1. Makefiles

- Improved parallel make support (Peter Eisentraut)
  This allows for faster compiles. Also, `make -k` now works more consistently.
- Require GNU make 3.80 or newer (Peter Eisentraut)
  This is necessary because of the parallel-make improvements.
- Add `make maintainer-check` target (Peter Eisentraut)
  This target performs various source code checks that are not appropriate for either the build or the regression tests. Currently: `duplicate_oids`, SGML syntax and tabs check, NLS syntax check.
- Support `make check` in `contrib` (Peter Eisentraut)
Appendix E. Release Notes

Formerly only `make installcheck` worked, but now there is support for testing in a temporary installation. The top-level `make check-world` target now includes testing `contrib` this way.

E.125.3.11.2. Windows

- On Windows, allow pg_ctl to register the service as auto-start or start-on-demand (Quan Zongliang)
- Add support for collecting crash dumps on Windows (Craig Ringer, Magnus Hagander)
  Minidumps can now be generated by non-debug Windows binaries and analyzed by standard debugging tools.
- Enable building with the MinGW64 compiler (Andrew Dunstan)
  This allows building 64-bit Windows binaries even on non-Windows platforms via cross-compiling.

E.125.3.12. Source Code

- Revise the API for GUC variable assign hooks (Tom Lane)
  The previous functions of assign hooks are now split between check hooks and assign hooks, where the former can fail but the latter shouldn’t. This change will impact add-on modules that define custom GUC parameters.
- Add latches to the source code to support waiting for events (Heikki Linnakangas)
- Centralize data modification permissions-checking logic (KaiGai Kohei)
- Add missing `get_object_oid()` functions, for consistency (Robert Haas)
- Improve ability to use C++ compilers for compiling add-on modules by removing conflicting key words (Tom Lane)
- Add support for DragonFly BSD (Rumko)
- Expose `quote_literal_cstr()` for backend use (Robert Haas)
- Run regression tests in the default encoding (Peter Eisentraut)
  Regression tests were previously always run with `SQL_ASCII` encoding.
- Add `src/tools/git_changelog` to replace cvs2cl and pgevslog (Robert Haas, Tom Lane)
- Add `git-external-diff` script to `src/tools` (Bruce Momjian)
  This is used to generate context diffs from git.
- Improve support for building with Clang (Peter Eisentraut)

E.125.3.12.1. Server Hooks

- Add source code hooks to check permissions (Robert Haas, Stephen Frost)
- Add post-object-creation function hooks for use by security frameworks (KaiGai Kohei)
- Add a client authentication hook (KaiGai Kohei)
E.125.3.13. Contrib

- Modify contrib modules and procedural languages to install via the new extension mechanism (Tom Lane, Dimitri Fontaine)
- Add contrib/file_fdw foreign-data wrapper (Shigeru Hanada)
  Foreign tables using this foreign data wrapper can read flat files in a manner very similar to COPY.
- Add nearest-neighbor search support to contrib/pg_trgm and contrib/btree_gist (Teodor Sigaev)
- Add contrib/btree_gist support for searching on not-equals (Jeff Davis)
- Fix contrib/fuzzystmatch’s levenshtein() function to handle multibyte characters (Alexander Korotkov)
- Add ssl_cipher() and ssl_version() functions to contrib/sslinfo (Robert Haas)
- Fix contrib/intarray and contrib/hstore to give consistent results with indexed empty arrays (Tom Lane)
  Previously an empty-array query that used an index might return different results from one that used a sequential scan.
- Allow contrib/intarray to work properly on multidimensional arrays (Tom Lane)
- In contrib/intarray, avoid errors complaining about the presence of nulls in cases where no nulls are actually present (Tom Lane)
- In contrib/intarray, fix behavior of containment operators with respect to empty arrays (Tom Lane)
  Empty arrays are now correctly considered to be contained in any other array.
- Remove contrib/xml2’s arbitrary limit on the number of parameter=value pairs that can be handled by xslt_process() (Pavel Stehule)
  The previous limit was 10.
- In contrib/pageinspect, fix heap_page_item to return infomasks as 32-bit values (Alvaro Herrera)
  This avoids returning negative values, which was confusing. The underlying value is a 16-bit unsigned integer.

E.125.3.13.1. Security

- Add contrib/sepgsql to interface permission checks with SELinux (KaiGai Kohei)
  This uses the new SECURITY_LABEL facility.
- Add contrib module auth_delay (KaiGai Kohei)
  This causes the server to pause before returning authentication failure; it is designed to make brute force password attacks more difficult.
- Add dummy_seclabel contrib module (KaiGai Kohei)
  This is used for permission regression testing.
E.125.3.13.2. Performance

• Add support for LIKE and ILIKE index searches to contrib/pg_trgm (Alexander Korotkov)
• Add levenshtein_less_equal() function to contrib/fuzzystrmatch, which is optimized for small distances (Alexander Korotkov)
• Improve performance of index lookups on contrib/seg columns (Alexander Korotkov)
• Improve performance of pg_upgrade for databases with many relations (Bruce Momjian)
• Add flag to contrib/pgbench to report per-statement latencies (Florian Pflug)

E.125.3.13.3. Fsync Testing

• Move src/tools/test_fsync to contrib/pg_test_fsync (Bruce Momjian, Tom Lane)
• Add O_DIRECT support to contrib/pg_test_fsync (Bruce Momjian)
  This matches the use of O_DIRECT by wal_sync_method.
• Add new tests to contrib/pg_test_fsync (Bruce Momjian)

E.125.3.14. Documentation

• Extensive ECPG documentation improvements (Satoshi Nagayasu)
• Extensive proofreading and documentation improvements (Thom Brown, Josh Kupershmidt, Susanne Ebrecht)
• Add documentation for exit_on_error (Robert Haas)
  This parameter causes sessions to exit on any error.
• Add documentation for pg_options_to_table() (Josh Berkus)
  This function shows table storage options in a readable form.
• Document that it is possible to access all composite type fields using (compositeval).* syntax (Peter Eisentraut)
• Document that translate() removes characters in from that don’t have a corresponding to character (Josh Kupershmidt)
• Merge documentation for CREATE CONSTRAINT TRIGGER and CREATE TRIGGER (Alvaro Herrera)
• Centralize permission and upgrade documentation (Bruce Momjian)
• Add kernel tuning documentation for Solaris 10 (Josh Berkus)
  Previously only Solaris 9 kernel tuning was documented.
• Handle non-ASCII characters consistently in HISTORY file (Peter Eisentraut)
  While the HISTORY file is in English, we do have to deal with non-ASCII letters in contributor names.
  These are now transliterated so that they are reasonably legible without assumptions about character set.
E.126. Release 9.0.23

**Release date:** 2015-10-08

This release contains a variety of fixes from 9.0.22. For information about new features in the 9.0 major release, see Section E.149.

This is expected to be the last PostgreSQL release in the 9.0.X series. Users are encouraged to update to a newer release branch soon.

E.126.1. Migration to Version 9.0.23

A dump/restore is not required for those running 9.0.X.

However, if you are upgrading from a version earlier than 9.0.18, see Section E.131.

E.126.2. Changes

- Fix contrib/pgcrypto to detect and report too-short crypt() salts (Josh Kupershmidt)
  Certain invalid salt arguments crashed the server or disclosed a few bytes of server memory. We have not ruled out the viability of attacks that arrange for presence of confidential information in the disclosed bytes, but they seem unlikely. (CVE-2015-5288)

- Fix subtransaction cleanup after a portal (cursor) belonging to an outer subtransaction fails (Tom Lane, Michael Paquier)
  A function executed in an outer-subtransaction cursor could cause an assertion failure or crash by referencing a relation created within an inner subtransaction.

- Fix insertion of relations into the relation cache “init file” (Tom Lane)
  An oversight in a patch in the most recent minor releases caused pg_trigger_tgrelid_tgname_index to be omitted from the init file. Subsequent sessions detected this, then deemed the init file to be broken and silently ignored it, resulting in a significant degradation in session startup time. In addition to fixing the bug, install some guards so that any similar future mistake will be more obvious.

- Avoid O(N^2) behavior when inserting many tuples into a SPI query result (Neil Conway)

- Improve LISTEN startup time when there are many unread notifications (Matt Newell)

- Disable SSL renegotiation by default (Michael Paquier, Andres Freund)
  While use of SSL renegotiation is a good idea in theory, we have seen too many bugs in practice, both in the underlying OpenSSL library and in our usage of it. Renegotiation will be removed entirely in 9.5 and later. In the older branches, just change the default value of ssl_renegotiation_limit to zero (disabled).

- Lower the minimum values of the *_freeze_max_age parameters (Andres Freund)
  This is mainly to make tests of related behavior less time-consuming, but it may also be of value for installations with limited disk space.
Appendix E. Release Notes

- Limit the maximum value of wal_buffers to 2GB to avoid server crashes (Josh Berkus)
- Fix rare internal overflow in multiplication of numeric values (Dean Rasheed)
- Guard against hard-to-reach stack overflows involving record types, range types, json, jsonb, tsquery, ltxtquery and query_int (Noah Misch)
- Fix handling of DOW and DOY in datetime input (Greg Stark)
  These tokens aren’t meant to be used in datetime values, but previously they resulted in opaque internal error messages rather than “invalid input syntax”.
- Add more query-cancel checks to regular expression matching (Tom Lane)
- Add recursion depth protections to regular expression, SIMILAR TO, and LIKE matching (Tom Lane)
  Suitable search patterns and a low stack depth limit could lead to stack-overflow crashes.
- Fix potential infinite loop in regular expression execution (Tom Lane)
  A search pattern that can apparently match a zero-length string, but actually doesn’t match because of a back reference, could lead to an infinite loop.
- Fix low-memory failures in regular expression compilation (Andreas Seltenreich)
- Fix low-probability memory leak during regular expression execution (Tom Lane)
- Fix rare low-memory failure in lock cleanup during transaction abort (Tom Lane)
- Fix “unexpected out-of-memory situation during sort” errors when using tuplestores with small work_mem settings (Tom Lane)
- Fix very-low-probability stack overrun in qsort (Tom Lane)
- Fix “invalid memory alloc request size” failure in hash joins with large work_mem settings (Tomas Vondra, Tom Lane)
- Fix assorted planner bugs (Tom Lane)
  These mistakes could lead to incorrect query plans that would give wrong answers, or to assertion failures in assert-enabled builds, or to odd planner errors such as “could not devise a query plan for the given query”, “could not find pathkey item to sort”, “plan should not reference subplan’s variable”, or “failed to assign all NestLoopParams to plan nodes”. Thanks are due to Andreas Seltenreich and Piotr Stefaniak for fuzz testing that exposed these problems.
- Use fuzzy path cost tiebreaking rule in all supported branches (Tom Lane)
  This change is meant to avoid platform-specific behavior when alternative plan choices have effectively-identical estimated costs.
- During postmaster shutdown, ensure that per-socket lock files are removed and listen sockets are closed before we remove the postmaster.pid file (Tom Lane)
  This avoids race-condition failures if an external script attempts to start a new postmaster as soon as pg_ctl stop returns.
- Fix postmaster’s handling of a startup-process crash during crash recovery (Tom Lane)
  If, during a crash recovery cycle, the startup process crashes without having restored database consistency, we’d try to launch a new startup process, which typically would just crash again, leading to an infinite loop.
Appendix E. Release Notes

- Do not print a WARNING when an autovacuum worker is already gone when we attempt to signal it, and reduce log verbosity for such signals (Tom Lane)
- Prevent autovacuum launcher from sleeping unduly long if the server clock is moved backwards a large amount (Álvaro Herrera)
- Ensure that cleanup of a GIN index’s pending-insertions list is interruptable by cancel requests (Jeff Janes)
- Allow all-zeroes pages in GIN indexes to be reused (Heikki Linnakangas)
  Such a page might be left behind after a crash.
- Fix off-by-one error that led to otherwise-harmless warnings about “apparent wraparound” in subtrans/multixact truncation (Thomas Munro)
- Fix misreporting of CONTINUE and MOVE statement types in PL/pgSQL’s error context messages (Pavel Stehule, Tom Lane)
- Fix some places in PL/Tcl that neglected to check for failure of malloc() calls (Michael Paquier, Álvaro Herrera)
- Improve libpq’s handling of out-of-memory conditions (Michael Paquier, Heikki Linnakangas)
- Fix memory leaks and missing out-of-memory checks in ecpg (Michael Paquier)
- Fix psql’s code for locale-aware formatting of numeric output (Tom Lane)
  The formatting code invoked by \pset numericlocale on did the wrong thing for some uncommon cases such as numbers with an exponent but no decimal point. It could also mangle already-localized output from the money data type.
- Prevent crash in psql’s \c command when there is no current connection (Noah Misch)
- Ensure that temporary files created during a pg_dump run with tar-format output are not world-readable (Michael Paquier)
- Fix pg_dump and pg_upgrade to support cases where the postgres or template1 database is in a non-default tablespace (Marti Raudsepp, Bruce Momjian)
- Fix pg_dump to handle object privileges sanely when dumping from a server too old to have a particular privilege type (Tom Lane)
  When dumping functions or procedural languages from pre-7.3 servers, pg_dump would produce GRANT/REVOKE commands that revoked the owner’s grantable privileges and instead granted all privileges to PUBLIC. Since the privileges involved are just USAGE and EXECUTE, this isn’t a security problem, but it’s certainly a surprising representation of the older systems’ behavior. Fix it to leave the default privilege state alone in these cases.
- Fix pg_dump to dump shell types (Tom Lane)
  Shell types (that is, not-yet-fully-defined types) aren’t useful for much, but nonetheless pg_dump should dump them.
- Fix spinlock assembly code for PPC hardware to be compatible with AIX’s native assembler (Tom Lane)
  Building with gcc didn’t work if gcc had been configured to use the native assembler, which is becoming more common.
- On AIX, test the -qlonglong compiler option rather than just assuming it’s safe to use (Noah Misch)
Appendix E. Release Notes

- On AIX, use `-Wl,-brtllib` link option to allow symbols to be resolved at runtime (Noah Misch)
  Perl relies on this ability in 5.8.0 and later.
- Avoid use of inline functions when compiling with 32-bit xlc, due to compiler bugs (Noah Misch)
- Use `librt` for `sched_yield()` when necessary, which it is on some Solaris versions (Oskari Saarenmaa)
- Fix Windows `install.bat` script to handle target directory names that contain spaces (Heikki Linnakangas)
- Make the numeric form of the PostgreSQL version number (e.g., 90405) readily available to extension Makefiles, as a variable named `VERSION_NUM` (Michael Paquier)
- Update time zone data files to `tzdata` release 2015g for DST law changes in Cayman Islands, Fiji, Moldova, Morocco, Norfolk Island, North Korea, Turkey, and Uruguay. There is a new zone name America/Fort_Nelson for the Canadian Northern Rockies.

E.127. Release 9.0.22

**Release date:** 2015-06-12

This release contains a small number of fixes from 9.0.21. For information about new features in the 9.0 major release, see Section E.149.

The PostgreSQL community will stop releasing updates for the 9.0.X release series in September 2015. Users are encouraged to update to a newer release branch soon.

E.127.1. Migration to Version 9.0.22

A dump/restore is not required for those running 9.0.X.

However, if you are upgrading from a version earlier than 9.0.18, see Section E.131.

E.127.2. Changes

- Fix rare failure to invalidate relation cache init file (Tom Lane)
  With just the wrong timing of concurrent activity, a `VACUUM FULL` on a system catalog might fail to update the “init file” that’s used to avoid cache-loading work for new sessions. This would result in later sessions being unable to access that catalog at all. This is a very ancient bug, but it’s so hard to trigger that no reproducible case had been seen until recently.
- Avoid deadlock between incoming sessions and `CREATE/DROP DATABASE` (Tom Lane)
  A new session starting in a database that is the target of a `DROP DATABASE` command, or is the template for a `CREATE DATABASE` command, could cause the command to wait for five seconds and then fail, even if the new session would have exited before that.
E.128. Release 9.0.21

**Release date:** 2015-06-04

This release contains a small number of fixes from 9.0.20. For information about new features in the 9.0 major release, see Section E.149.

The PostgreSQL community will stop releasing updates for the 9.0.X release series in September 2015. Users are encouraged to update to a newer release branch soon.

E.128.1. Migration to Version 9.0.21

A dump/restore is not required for those running 9.0.X. However, if you are upgrading from a version earlier than 9.0.18, see Section E.131.

E.128.2. Changes

- **Avoid failures while fsync’ing data directory during crash restart** (Abhijit Menon-Sen, Tom Lane)
  
  In the previous minor releases we added a patch to `fsync` everything in the data directory after a crash. Unfortunately its response to any error condition was to fail, thereby preventing the server from starting up, even when the problem was quite harmless. An example is that an unwritable file in the data directory would prevent restart on some platforms; but it is common to make SSL certificate files unwritable by the server. Revise this behavior so that permissions failures are ignored altogether, and other types of failures are logged but do not prevent continuing.

- **Remove configure’s check prohibiting linking to a threaded libpython on OpenBSD** (Tom Lane)
  
  The failure this restriction was meant to prevent seems to not be a problem anymore on current OpenBSD versions.

- **Allow libpq to use TLS protocol versions beyond v1** (Noah Misch)
  
  For a long time, libpq was coded so that the only SSL protocol it would allow was TLS v1. Now that newer TLS versions are becoming popular, allow it to negotiate the highest commonly-supported TLS version with the server. (PostgreSQL servers were already capable of such negotiation, so no change is needed on the server side.) This is a back-patch of a change already released in 9.4.0.

E.129. Release 9.0.20

**Release date:** 2015-05-22

This release contains a variety of fixes from 9.0.19. For information about new features in the 9.0 major release, see Section E.149.

The PostgreSQL community will stop releasing updates for the 9.0.X release series in September 2015. Users are encouraged to update to a newer release branch soon.
E.129.1. Migration to Version 9.0.20

A dump/restore is not required for those running 9.0.X.
However, if you are upgrading from a version earlier than 9.0.18, see Section E.131.

E.129.2. Changes

- Avoid possible crash when client disconnects just before the authentication timeout expires (Benkocs Norbert Attila)
  If the timeout interrupt fired partway through the session shutdown sequence, SSL-related state would be freed twice, typically causing a crash and hence denial of service to other sessions. Experimentation shows that an unauthenticated remote attacker could trigger the bug somewhat consistently, hence treat as security issue. (CVE-2015-3165)

- Improve detection of system-call failures (Noah Misch)
  Our replacement implementation of `snprintf()` failed to check for errors reported by the underlying system library calls; the main case that might be missed is out-of-memory situations. In the worst case this might lead to information exposure, due to our code assuming that a buffer had been overwritten when it hadn’t been. Also, there were a few places in which security-relevant calls of other system library functions did not check for failure.
  It remains possible that some calls of the `*printf()` family of functions are vulnerable to information disclosure if an out-of-memory error occurs at just the wrong time. We judge the risk to not be large, but will continue analysis in this area. (CVE-2015-3166)

- In `contrib/pgcrypto`, uniformly report decryption failures as “Wrong key or corrupt data” (Noah Misch)
  Previously, some cases of decryption with an incorrect key could report other error message texts. It has been shown that such variance in error reports can aid attackers in recovering keys from other systems. While it’s unknown whether `pgcrypto`’s specific behaviors are likewise exploitable, it seems better to avoid the risk by using a one-size-fits-all message. (CVE-2015-3167)

- Fix incorrect checking of deferred exclusion constraints after a HOT update (Tom Lane)
  If a new row that potentially violates a deferred exclusion constraint is HOT-updated (that is, no indexed columns change and the row can be stored back onto the same table page) later in the same transaction, the exclusion constraint would be reported as violated when the check finally occurred, even if the row(s) the new row originally conflicted with had been deleted.

- Prevent improper reordering of antijoins (NOT EXISTS joins) versus other outer joins (Tom Lane)
  This oversight in the planner has been observed to cause “could not find RelOptInfo for given relids” errors, but it seems possible that sometimes an incorrect query plan might get past that consistency check and result in silently-wrong query output.

- Fix incorrect matching of subexpressions in outer-join plan nodes (Tom Lane)
  Previously, if textually identical non-strict subexpressions were used both above and below an outer join, the planner might try to re-use the value computed below the join, which would be incorrect because the executor would force the value to NULL in case of an unmatched outer row.
• Fix GEQO planner to cope with failure of its join order heuristic (Tom Lane)
  This oversight has been seen to lead to “failed to join all relations together” errors in queries involving LATERAL, and that might happen in other cases as well.
• Fix possible deadlock at startup when max_prepared_transactions is too small (Heikki Linnakangas)
• Don’t archive useless preallocated WAL files after a timeline switch (Heikki Linnakangas)
• Avoid “cannot GetMultiXactIdMembers() during recovery” error (Álvaro Herrera)
• Recursively fsync() the data directory after a crash (Abhijit Menon-Sen, Robert Haas)
  This ensures consistency if another crash occurs shortly later. (The second crash would have to be a system-level crash, not just a database crash, for there to be a problem.)
• Fix autovacuum launcher’s possible failure to shut down, if an error occurs after it receives SIGTERM (Álvaro Herrera)
• Cope with unexpected signals in LockBufferForCleanup() (Andres Freund)
  This oversight could result in spurious errors about “multiple backends attempting to wait for pincount 1”.
• Avoid waiting for WAL flush or synchronous replication during commit of a transaction that was read-only so far as the user is concerned (Andres Freund)
  Previously, a delay could occur at commit in transactions that had written WAL due to HOT page pruning, leading to undesirable effects such as sessions getting stuck at startup if all synchronous replicas are down. Sessions have also been observed to get stuck in catchup interrupt processing when using synchronous replication; this will fix that problem as well.
• Fix crash when manipulating hash indexes on temporary tables (Heikki Linnakangas)
• Fix possible failure during hash index bucket split, if other processes are modifying the index concurrently (Tom Lane)
• Check for interrupts while analyzing index expressions (Jeff Janes)
  ANALYZE executes index expressions many times; if there are slow functions in such an expression, it’s desirable to be able to cancel the ANALYZE before that loop finishes.
• Add the name of the target server to object description strings for foreign-server user mappings (Álvaro Herrera)
• Recommend setting include_realm to 1 when using Kerberos/GSSAPI/SSPI authentication (Stephen Frost)
  Without this, identically-named users from different realms cannot be distinguished. For the moment this is only a documentation change, but it will become the default setting in PostgreSQL 9.5.
• Remove code for matching IPv4 pg_hba.conf entries to IPv4-in-IPv6 addresses (Tom Lane)
  This hack was added in 2003 in response to a report that some Linux kernels of the time would report IPv4 connections as having IPv4-in-IPv6 addresses. However, the logic was accidentally broken in 9.0. The lack of any field complaints since then shows that it’s not needed anymore. Now we have reports that the broken code causes crashes on some systems, so let’s just remove it rather than fix it. (Had we chosen to fix it, that would make for a subtle and potentially security-sensitive change in the effective meaning of IPv4 pg_hba.conf entries, which does not seem like a good thing to do in minor releases.)
• While shutting down service on Windows, periodically send status updates to the Service Control Manager to prevent it from killing the service too soon; and ensure that pg_ctl will wait for shutdown (Krystian Bigaj)

• Reduce risk of network deadlock when using libpq’s non-blocking mode (Heikki Linnakangas)

    When sending large volumes of data, it’s important to drain the input buffer every so often, in case the server has sent enough response data to cause it to block on output. (A typical scenario is that the server is sending a stream of NOTICE messages during COPY FROM STDIN.) This worked properly in the normal blocking mode, but not so much in non-blocking mode. We’ve modified libpq to opportunistically drain input when it can, but a full defense against this problem requires application cooperation: the application should watch for socket read-ready as well as write-ready conditions, and be sure to call PQconsumeInput() upon read-ready.

• Fix array handling in ecpg (Michael Meskes)

• Fix psql to sanely handle URIs and conninfo strings as the first parameter to \connect (David Fetter, Andrew Dunstan, Álvaro Herrera)

    This syntax has been accepted (but undocumented) for a long time, but previously some parameters might be taken from the old connection instead of the given string, which was agreed to be undesirable.

• Suppress incorrect complaints from psql on some platforms that it failed to write ~/.psql_history at exit (Tom Lane)

    This misbehavior was caused by a workaround for a bug in very old (pre-2006) versions of libedit. We fixed it by removing the workaround, which will cause a similar failure to appear for anyone still using such versions of libedit. Recommendation: upgrade that library, or use libreadline.

• Fix pg_dump’s rule for deciding which casts are system-provided casts that should not be dumped (Tom Lane)

• Fix dumping of views that are just VALUES(...) but have column aliases (Tom Lane)

• In pg_upgrade, force timeline 1 in the new cluster (Bruce Momjian)

    This change prevents upgrade failures caused by bogus complaints about missing WAL history files.

• In pg_upgrade, check for improperly non-connectable databases before proceeding (Bruce Momjian)

• In pg_upgrade, quote directory paths properly in the generated delete_old_cluster script (Bruce Momjian)

• In pg_upgrade, preserve database-level freezing info properly (Bruce Momjian)

    This oversight could cause missing-clog-file errors for tables within the postgres and template databases.

• Run pg_upgrade and pg_resetxlog with restricted privileges on Windows, so that they don’t fail when run by an administrator (Muhammad Asif Naeem)

• Fix slow sorting algorithm in contrib/intarray (Tom Lane)

• Fix compile failure on Sparc V8 machines (Rob Rowan)

• Update time zone data files to tzdata release 2015d for DST law changes in Egypt, Mongolia, and Palestine, plus historical changes in Canada and Chile. Also adopt revised zone abbreviations for the America/Adak zone (HST/HDT not HAST/HADT).
E.130. Release 9.0.19

Release date: 2015-02-05

This release contains a variety of fixes from 9.0.18. For information about new features in the 9.0 major release, see Section E.149.

E.130.1. Migration to Version 9.0.19

A dump/restore is not required for those running 9.0.X.

However, if you are upgrading from a version earlier than 9.0.18, see Section E.131.

E.130.2. Changes

- Fix buffer overruns in `to_char()` (Bruce Momjian)

  When `to_char()` processes a numeric formatting template calling for a large number of digits, PostgresQL would read past the end of a buffer. When processing a crafted timestamp formatting template, PostgreSQL would write past the end of a buffer. Either case could crash the server. We have not ruled out the possibility of attacks that lead to privilege escalation, though they seem unlikely. (CVE-2015-0241)

- Fix buffer overrun in replacement `*printf()` functions (Tom Lane)

  PostgreSQL includes a replacement implementation of `printf` and related functions. This code will overrun a stack buffer when formatting a floating point number (conversion specifiers `e`, `E`, `f`, `F`, `g` or `G`) with requested precision greater than about 500. This will crash the server, and we have not ruled out the possibility of attacks that lead to privilege escalation. A database user can trigger such a buffer overrun through the `to_char()` SQL function. While that is the only affected core PostgreSQL functionality, extension modules that use printf-family functions may be at risk as well.

  This issue primarily affects PostgreSQL on Windows. PostgreSQL uses the system implementation of these functions where adequate, which it is on other modern platforms. (CVE-2015-0242)

- Fix buffer overruns in `contrib/pgcrypto` (Marko Tiikkaja, Noah Misch)

  Errors in memory size tracking within the `pgcrypto` module permitted stack buffer overruns and improper dependence on the contents of uninitialized memory. The buffer overrun cases can crash the server, and we have not ruled out the possibility of attacks that lead to privilege escalation. (CVE-2015-0243)

- Fix possible loss of frontend/backend protocol synchronization after an error (Heikki Linnakangas)

  If any error occurred while the server was in the middle of reading a protocol message from the client, it could lose synchronization and incorrectly try to interpret part of the message’s data as a new protocol message. An attacker able to submit crafted binary data within a command parameter might succeed in injecting his own SQL commands this way. Statement timeout and query cancellation are the most likely sources of errors triggering this scenario. Particularly vulnerable are applications that use a timeout and also submit arbitrary user-crafted data as binary query parameters. Disabling statement timeout will
reduce, but not eliminate, the risk of exploit. Our thanks to Emil Lenngren for reporting this issue. (CVE-2015-0244)

- Fix information leak via constraint-violation error messages (Stephen Frost)
  Some server error messages show the values of columns that violate a constraint, such as a unique constraint. If the user does not have `SELECT` privilege on all columns of the table, this could mean exposing values that the user should not be able to see. Adjust the code so that values are displayed only when they came from the SQL command or could be selected by the user. (CVE-2014-8161)

- Lock down regression testing’s temporary installations on Windows (Noah Misch)
  Use SSPI authentication to allow connections only from the OS user who launched the test suite. This closes on Windows the same vulnerability previously closed on other platforms, namely that other users might be able to connect to the test postmaster. (CVE-2014-0067)

- Avoid possible data corruption if `ALTER DATABASE SET TABLESPACE` is used to move a database to a new tablespace and then shortly later move it back to its original tablespace (Tom Lane)

- Avoid corrupting tables when `ANALYZE` inside a transaction is rolled back (Andres Freund, Tom Lane, Michael Paquier)
  If the failing transaction had earlier removed the last index, rule, or trigger from the table, the table would be left in a corrupted state with the relevant `pg_class` flags not set though they should be.

- Fix use-of-already-freed-memory problem in EvalPlanQual processing (Tom Lane)
  In `READ COMMITTED` mode, queries that lock or update recently-updated rows could crash as a result of this bug.

- Fix planning of `SELECT FOR UPDATE` when using a partial index on a child table (Kyotaro Horiguchi)
  In `READ COMMITTED` mode, `SELECT FOR UPDATE` must also recheck the partial index’s `WHERE` condition when rechecking a recently-updated row to see if it still satisfies the query’s `WHERE` condition. This requirement was missed if the index belonged to an inheritance child table, so that it was possible to incorrectly return rows that no longer satisfy the query condition.

- Fix corner case wherein `SELECT FOR UPDATE` could return a row twice, and possibly miss returning other rows (Tom Lane)
  In `READ COMMITTED` mode, a `SELECT FOR UPDATE` that is scanning an inheritance tree could incorrectly return a row from a prior child table instead of the one it should return from a later child table.

- Reject duplicate column names in the referenced-columns list of a `FOREIGN KEY` declaration (David Rowley)
  This restriction is per SQL standard. Previously we did not reject the case explicitly, but later on the code would fail with bizarre-looking errors.

- Fix bugs in raising a `numeric` value to a large integral power (Tom Lane)
  The previous code could get a wrong answer, or consume excessive amounts of time and memory before realizing that the answer must overflow.

- In `numeric_recv()`, truncate away any fractional digits that would be hidden according to the value’s `dscale` field (Tom Lane)
  A `numeric` value’s display scale (`dscale`) should never be less than the number of nonzero fractional digits; but apparently there’s at least one broken client application that transmits binary `numeric` values
Appendix E. Release Notes

in which that’s true. This leads to strange behavior since the extra digits are taken into account by arithmetic operations even though they aren’t printed. The least risky fix seems to be to truncate away such “hidden” digits on receipt, so that the value is indeed what it prints as.

- Reject out-of-range numeric timezone specifications (Tom Lane)

  Simple numeric timezone specifications exceeding +/- 168 hours (one week) would be accepted, but could then cause null-pointer dereference crashes in certain operations. There’s no use-case for such large UTC offsets, so reject them.

- Fix bugs in tsquery @> tsquery operator (Heikki Linnakangas)

  Two different terms would be considered to match if they had the same CRC. Also, if the second operand had more terms than the first, it would be assumed not to be contained in the first; which is wrong since it might contain duplicate terms.

- Improve ispell dictionary’s defenses against bad affix files (Tom Lane)

- Allow more than 64K phrases in a thesaurus dictionary (David Boutin)

  The previous coding could crash on an oversize dictionary, so this was deemed a back-patchable bug fix rather than a feature addition.

- Fix namespace handling in xpath() (Ali Akbar)

  Previously, the xml value resulting from an xpath() call would not have namespace declarations if the namespace declarations were attached to an ancestor element in the input xml value, rather than to the specific element being returned. Propagate the ancestral declaration so that the result is correct when considered in isolation.

- Fix planner problems with nested append relations, such as inherited tables within UNION ALL sub-queries (Tom Lane)

- Fail cleanly when a GiST index tuple doesn’t fit on a page, rather than going into infinite recursion (Andrew Gierth)

- Exempt tables that have per-table cost_limit and/or cost_delay settings from autovacuum’s global cost balancing rules (Álvaro Herrera)

  The previous behavior resulted in basically ignoring these per-table settings, which was unintended. Now, a table having such settings will be vacuumed using those settings, independently of what is going on in other autovacuum workers. This may result in heavier total I/O load than before, so such settings should be re-examined for sanity.

- Avoid wholesale autovacuuming when autovacuum is nominally off (Tom Lane)

  Even when autovacuum is nominally off, we will still launch autovacuum worker processes to vacuum tables that are at risk of XID wraparound. However, such a worker process then proceeded to vacuum all tables in the target database, if they met the usual thresholds for autovacuuming. This is at best pretty unexpected; at worst it delays response to the wraparound threat. Fix it so that if autovacuum is turned off, workers only do anti-wraparound vacuums and not any other work.

- Fix race condition between hot standby queries and replaying a full-page image (Heikki Linnakangas)

  This mistake could result in transient errors in queries being executed in hot standby.

- Fix several cases where recovery logic improperly ignored WAL records for COMMIT/ABORT PREPARED (Heikki Linnakangas)
The most notable oversight was that `recovery_target_xid` could not be used to stop at a two-phase commit.

- Avoid creating unnecessary `.ready` marker files for timeline history files (Fujii Masao)
- Fix possible null pointer dereference when an empty prepared statement is used and the `log_statement` setting is `mod` or `ddl` (Fujii Masao)
- Change “pgstat wait timeout” warning message to be LOG level, and rephrase it to be more understandable (Tom Lane)

This message was originally thought to be essentially a can’t-happen case, but it occurs often enough on our slower buildfarm members to be a nuisance. Reduce it to LOG level, and expend a bit more effort on the wording: it now reads “using stale statistics instead of current ones because stats collector is not responding”.

- Fix SPARC spinlock implementation to ensure correctness if the CPU is being run in a non-TSO coherence mode, as some non-Solaris kernels do (Andres Freund)
- Warn if OS X’s `setlocale()` starts an unwanted extra thread inside the postmaster (Noah Misch)
- Fix processing of repeated `dbname` parameters in `PQconnectdbParams()` (Alex Shulgin)

Unexpected behavior ensued if the first occurrence of `dbname` contained a connection string or URI to be expanded.

- Ensure that `libpq` reports a suitable error message on unexpected socket EOF (Marko Tiikkaja, Tom Lane)

Depending on kernel behavior, `libpq` might return an empty error string rather than something useful when the server unexpectedly closed the socket.

- Clear any old error message during `PQreset()` (Heikki Linnakangas)

If `PQreset()` is called repeatedly, and the connection cannot be re-established, error messages from the failed connection attempts kept accumulating in the `PGconn`’s error string.

- Properly handle out-of-memory conditions while parsing connection options in `libpq` (Alex Shulgin, Heikki Linnakangas)

- Fix array overrun in `ecpg`’s version of `ParseDateTime()` (Michael Paquier)
- In `initdb`, give a clearer error message if a password file is specified but is empty (Mats Erik Andersson)

- Fix `psql`’s `\s` command to work nicely with `libedit`, and add pager support (Stepan Rutz, Tom Lane)

When using `libedit` rather than `readline`, `\s` printed the command history in a fairly unreadable encoded format, and on recent `libedit` versions might fail altogether. Fix that by printing the history ourselves rather than having the library do it. A pleasant side-effect is that the pager is used if appropriate.

This patch also fixes a bug that caused newline encoding to be applied inconsistently when saving the command history with `libedit`. Multiline history entries written by older `psql` versions will be read cleanly with this patch, but perhaps not vice versa, depending on the exact `libedit` versions involved.

- Improve consistency of parsing of `psql`’s special variables (Tom Lane)

Allow variant spellings of `on` and `off` (such as `1/0`) for `ECHO_HIDDEN` and `ON_ERROR_ROLLBACK`. Report a warning for unrecognized values for `COMP_KEYWORD_CASE`, `ECHO`, `ECHO_HIDDEN`, `HISTCONTROL`, `ON_ERROR_ROLLBACK`, and `VERBOSITY`. Recognize all values for all these variables case-insensitively; previously there was a mishmash of case-sensitive and case-insensitive behaviors.
Appendix E. Release Notes

- Fix psql’s expanded-mode display to work consistently when using `border = 3` and `linestyle = ascii` or `unicode` (Stephen Frost)
- Fix possible deadlock during parallel restore of a schema-only dump (Robert Haas, Tom Lane)
- Fix core dump in `pg_dump --binary-upgrade` on zero-column composite type (Rushabh Lathia)
- Fix block number checking in `contrib/pageinspect`’s `get_raw_page()` (Tom Lane)
  The incorrect checking logic could prevent access to some pages in non-main relation forks.
- Fix `contrib/pgcrypto`’s `pgp_sym_decrypt()` to not fail on messages whose length is 6 less than a power of 2 (Marko Tiikkaja)
- Handle unexpected query results, especially NULLs, safely in `contrib/tablefunc`’s `connectby()` (Michael Paquier)
  `connectby()` previously crashed if it encountered a NULL key value. It now prints that row but doesn’t recurse further.
- Avoid a possible crash in `contrib/xml2`’s `xslt_process()` (Mark Simonetti)
  libxslt seems to have an undocumented dependency on the order in which resources are freed; reorder our calls to avoid a crash.
- Numerous cleanups of warnings from Coverity static code analyzer (Andres Freund, Tatsuo Ishii, Marko Kreen, Tom Lane, Michael Paquier)
  These changes are mostly cosmetic but in some cases fix corner-case bugs, for example a crash rather than a proper error report after an out-of-memory failure. None are believed to represent security issues.
- Detect incompatible OpenLDAP versions during build (Noah Misch)
  With OpenLDAP versions 2.4.24 through 2.4.31, inclusive, PostgreSQL backends can crash at exit. Raise a warning during configure based on the compile-time OpenLDAP version number, and test the crashing scenario in the `contrib/dblink` regression test.
- In non-MSVC Windows builds, ensure `libpq.dll` is installed with execute permissions (Noah Misch)
- Make `pg_regress` remove any temporary installation it created upon successful exit (Tom Lane)
  This results in a very substantial reduction in disk space usage during `make check-world`, since that sequence involves creation of numerous temporary installations.
- Support time zone abbreviations that change UTC offset from time to time (Tom Lane)
  Previously, PostgreSQL assumed that the UTC offset associated with a time zone abbreviation (such as `EST`) never changes in the usage of any particular locale. However this assumption fails in the real world, so introduce the ability for a zone abbreviation to represent a UTC offset that sometimes changes.
  Update the zone abbreviation definition files to make use of this feature in timezone locales that have changed the UTC offset of their abbreviations since 1970 (according to the IANA timezone database). In such timezones, PostgreSQL will now associate the correct UTC offset with the abbreviation depending on the given date.
- Update time zone abbreviations lists (Tom Lane)
  Add CST (China Standard Time) to our lists. Remove references to ADT as “Arabia Daylight Time”, an abbreviation that’s been out of use since 2007; therefore, claiming there is a conflict with “Atlantic Daylight Time” doesn’t seem especially helpful. Fix entirely incorrect GMT offsets for CKT (Cook Islands), FJT, and FJST (Fiji); we didn’t even have them on the proper side of the date line.
• Update time zone data files to tzdata release 2015a.

The IANA timezone database has adopted abbreviations of the form \texttt{AxST/AxDT} for all Australian time zones, reflecting what they believe to be current majority practice Down Under. These names do not conflict with usage elsewhere (other than ACST for Acre Summer Time, which has been in disuse since 1994). Accordingly, adopt these names into our “Default” timezone abbreviation set. The “Australia” abbreviation set now contains only CST, EAST, EST, SAST, SAT, and WST, all of which are thought to be mostly historical usage. Note that SAST has also been changed to be South Africa Standard Time in the “Default” abbreviation set.

Also, add zone abbreviations SRET (Asia/Srednekolymsk) and XJT (Asia/Urumqi), and use WSST/WSDT for western Samoa. Also, there were DST law changes in Chile, Mexico, the Turks & Caicos Islands (America/Grand_Turk), and Fiji. There is a new zone Pacific/Bougainville for portions of Papua New Guinea. Also, numerous corrections for historical (pre-1970) time zone data.

\section*{E.131. Release 9.0.18}

\textbf{Release date:} 2014-07-24

This release contains a variety of fixes from 9.0.17. For information about new features in the 9.0 major release, see Section E.149.

\subsection*{E.131.1. Migration to Version 9.0.18}

A dump/restore is not required for those running 9.0.X.

However, this release corrects an index corruption problem in some GiST indexes. See the first changelog entry below to find out whether your installation has been affected and what steps you should take if so.

Also, if you are upgrading from a version earlier than 9.0.15, see Section E.134.

\subsection*{E.131.2. Changes}

• Correctly initialize padding bytes in \texttt{contrib/btree_gist} indexes on \texttt{bit} columns (Heikki Linnakangas)

This error could result in incorrect query results due to values that should compare equal not being seen as equal. Users with GiST indexes on \texttt{bit} or \texttt{bit varying} columns should \texttt{REINDEX} those indexes after installing this update.

• Protect against torn pages when deleting GIN list pages (Heikki Linnakangas)

This fix prevents possible index corruption if a system crash occurs while the page update is being written to disk.

• Don’t clear the right-link of a GiST index page while replaying updates from WAL (Heikki Linnakangas)

This error could lead to transiently wrong answers from GiST index scans performed in Hot Standby.
• Fix possibly-incorrect cache invalidation during nested calls to `ReceiveSharedInvalidMessages` (Andres Freund)

• Don’t assume a subquery’s output is unique if there’s a set-returning function in its targetlist (David Rowley)
  This oversight could lead to misoptimization of constructs like `WHERE x IN (SELECT y, generate_series(1,10) FROM t GROUP BY y)`.

• Fix failure to detoast fields in composite elements of structured types (Tom Lane)
  This corrects cases where TOAST pointers could be copied into other tables without being dereferenced. If the original data is later deleted, it would lead to errors like “missing chunk number 0 for toast value ...” when the now-dangling pointer is used.

• Fix “record type has not been registered” failures with whole-row references to the output of Append plan nodes (Tom Lane)

• Fix possible crash when invoking a user-defined function while rewinding a cursor (Tom Lane)

• Fix query-lifespan memory leak while evaluating the arguments for a function in `FROM` (Tom Lane)

• Fix session-lifespan memory leaks in regular-expression processing (Tom Lane, Arthur O’Dwyer, Greg Stark)

• Fix data encoding error in `hungarian.stop` (Tom Lane)

• Fix liveness checks for rows that were inserted in the current transaction and then deleted by a now-rolled-back subtransaction (Andres Freund)
  This could cause problems (at least spurious warnings, and at worst an infinite loop) if `CREATE INDEX` or `CLUSTER` were done later in the same transaction.

• Clear `pg_stat_activity.xact_start` during `PREPARE TRANSACTION` (Andres Freund)
  After the `PREPARE`, the originating session is no longer in a transaction, so it should not continue to display a transaction start time.

• Fix `REASSIGN OWNED` to not fail for text search objects (Álvaro Herrera)

• Block signals during postmaster startup (Tom Lane)
  This ensures that the postmaster will properly clean up after itself if, for example, it receives SIGINT while still starting up.

• Secure Unix-domain sockets of temporary postmasters started during `make check` (Noah Misch)
  Any local user able to access the socket file could connect as the server’s bootstrap superuser, then proceed to execute arbitrary code as the operating-system user running the test, as we previously noted in CVE-2014-0067. This change defends against that risk by placing the server’s socket in a temporary, mode 0700 subdirectory of `/tmp`. The hazard remains however on platforms where Unix sockets are not supported, notably Windows, because then the temporary postmaster must accept local TCP connections.
  A useful side effect of this change is to simplify `make check` testing in builds that override `DEFAULT_PGSOCKET_DIR`. Popular non-default values like `/var/run/postgresql` are often not writable by the build user, requiring workarounds that will no longer be necessary.

• Fix tablespace creation WAL replay to work on Windows (MauMau)

• Fix detection of socket creation failures on Windows (Bruce Momjian)
• On Windows, allow new sessions to absorb values of PGC_BACKEND parameters (such as log_connections) from the configuration file (Amit Kapila)
  Previously, if such a parameter were changed in the file post-startup, the change would have no effect.
• Properly quote executable path names on Windows (Nikhil Deshpande)
  This oversight could cause initdb and pg_upgrade to fail on Windows, if the installation path contained both spaces and @ signs.
• Fix linking of libpython on OS X (Tom Lane)
  The method we previously used can fail with the Python library supplied by Xcode 5.0 and later.
• Avoid buffer bloat in libpq when the server consistently sends data faster than the client can absorb it (Shin-ichi Morita, Tom Lane)
  libpq could be coerced into enlarging its input buffer until it runs out of memory (which would be reported misleadingly as “lost synchronization with server”). Under ordinary circumstances it’s quite far-fetched that data could be continuously transmitted more quickly than the recv() loop can absorb it, but this has been observed when the client is artificially slowed by scheduler constraints.
• Ensure that LDAP lookup attempts in libpq time out as intended (Laurenz Albe)
• Fix ecpg to do the right thing when an array of char * is the target for a FETCH statement returning more than one row, as well as some other array-handling fixes (Ashutosh Bapat)
• Fix pg_restore’s processing of old-style large object comments (Tom Lane)
  A direct-to-database restore from an archive file generated by a pre-9.0 version of pg_dump would usually fail if the archive contained more than a few comments for large objects.
• In contrib/pgcrypto functions, ensure sensitive information is cleared from stack variables before returning (Marko Kreen)
• In contrib/uuid-ossp, cache the state of the OSSP UUID library across calls (Tom Lane)
  This improves the efficiency of UUID generation and reduces the amount of entropy drawn from /dev/urandom, on platforms that have that.
• Update time zone data files to tzdata release 2014e for DST law changes in Crimea, Egypt, and Morocco.

E.132. Release 9.0.17

Release date: 2014-03-20

This release contains a variety of fixes from 9.0.16. For information about new features in the 9.0 major release, see Section E.149.

E.132.1. Migration to Version 9.0.17

A dump/restore is not required for those running 9.0.X.

However, if you are upgrading from a version earlier than 9.0.15, see Section E.134.
E.132.2. Changes

- Restore GIN metapages unconditionally to avoid torn-page risk (Heikki Linnakangas)
  Although this oversight could theoretically result in a corrupted index, it is unlikely to have caused any problems in practice, since the active part of a GIN metapage is smaller than a standard 512-byte disk sector.

- Avoid race condition in checking transaction commit status during receipt of a NOTIFY message (Marko Tiikkaja)
  This prevents a scenario wherein a sufficiently fast client might respond to a notification before database updates made by the notifier have become visible to the recipient.

- Allow regular-expression operators to be terminated early by query cancel requests (Tom Lane)
  This prevents scenarios wherein a pathological regular expression could lock up a server process uninterruptibly for a long time.

- Remove incorrect code that tried to allow OVERLAPS with single-element row arguments (Joshua Yanovski)
  This code never worked correctly, and since the case is neither specified by the SQL standard nor documented, it seemed better to remove it than fix it.

- Avoid getting more than AccessShareLock when de-parsing a rule or view (Dean Rasheed)
  This oversight resulted in pg_dump unexpectedly acquiring RowExclusiveLock locks on tables mentioned as the targets of INSERT/UPDATE/DELETE commands in rules. While usually harmless, that could interfere with concurrent transactions that tried to acquire, for example, ShareLock on those tables.

- Improve performance of index endpoint probes during planning (Tom Lane)
  This change fixes a significant performance problem that occurred when there were many not-yet-committed rows at the end of the index, which is a common situation for indexes on sequentially-assigned values such as timestamps or sequence-generated identifiers.

- Fix test to see if hot standby connections can be allowed immediately after a crash (Heikki Linnakangas)

- Prevent interrupts while reporting non-ERROR messages (Tom Lane)
  This guards against rare server-process freezeups due to recursive entry to syslog(), and perhaps other related problems.

- Prevent intermittent “could not reserve shared memory region” failures on recent Windows versions (MauMau)

- Update time zone data files to tzdata release 2014a for DST law changes in Fiji and Turkey, plus historical changes in Israel and Ukraine.

E.133. Release 9.0.16

Release date: 2014-02-20
This release contains a variety of fixes from 9.0.15. For information about new features in the 9.0 major release, see Section E.149.

E.133.1. Migration to Version 9.0.16

A dump/restore is not required for those running 9.0.X.

However, if you are upgrading from a version earlier than 9.0.15, see Section E.134.

E.133.2. Changes

- Shore up `GRANT ... WITH ADMIN OPTION` restrictions (Noah Misch)
  
  Granting a role without `ADMIN OPTION` is supposed to prevent the grantee from adding or removing members from the granted role, but this restriction was easily bypassed by doing `SET ROLE` first. The security impact is mostly that a role member can revoke the access of others, contrary to the wishes of his grantor. Unapproved role member additions are a lesser concern, since an uncooperative role member could provide most of his rights to others anyway by creating views or `SECURITY DEFINER` functions. (CVE-2014-0060)

- Prevent privilege escalation via manual calls to PL validator functions (Andres Freund)
  
  The primary role of PL validator functions is to be called implicitly during `CREATE FUNCTION`, but they are also normal SQL functions that a user can call explicitly. Calling a validator on a function actually written in some other language was not checked for and could be exploited for privilege-escalation purposes. The fix involves adding a call to a privilege-checking function in each validator function. Non-core procedural languages will also need to make this change to their own validator functions, if any. (CVE-2014-0061)

- Avoid multiple name lookups during table and index DDL (Robert Haas, Andres Freund)
  
  If the name lookups come to different conclusions due to concurrent activity, we might perform some parts of the DDL on a different table than other parts. At least in the case of `CREATE INDEX`, this can be used to cause the permissions checks to be performed against a different table than the index creation, allowing for a privilege escalation attack. (CVE-2014-0062)

- Prevent buffer overrun with long datetime strings (Noah Misch)
  
  The `MAXDATELEN` constant was too small for the longest possible value of type `interval`, allowing a buffer overrun in `interval_out()`. Although the datetime input functions were more careful about avoiding buffer overrun, the limit was short enough to cause them to reject some valid inputs, such as input containing a very long timezone name. The ecpg library contained these vulnerabilities along with some of its own. (CVE-2014-0063)

- Prevent buffer overrun due to integer overflow in size calculations (Noah Misch, Heikki Linnakangas)
  
  Several functions, mostly type input functions, calculated an allocation size without checking for overflow. If overflow did occur, a too-small buffer would be allocated and then written past. (CVE-2014-0064)

- Prevent overruns of fixed-size buffers (Peter Eisentraut, Jozef Mlích)
Appendix E. Release Notes

Use `strlcpy()` and related functions to provide a clear guarantee that fixed-size buffers are not overrun. Unlike the preceding items, it is unclear whether these cases really represent live issues, since in most cases there appear to be previous constraints on the size of the input string. Nonetheless it seems prudent to silence all Coverity warnings of this type. (CVE-2014-0065)

- Avoid crashing if `crypt()` returns NULL (Honza Horak, Bruce Momjian)

There are relatively few scenarios in which `crypt()` could return NULL, but `contrib/chkpass` would crash if it did. One practical case in which this could be an issue is if libc is configured to refuse to execute unapproved hashing algorithms (e.g., “FIPS mode”). (CVE-2014-0066)

- Document risks of `make check` in the regression testing instructions (Noah Misch, Tom Lane)

Since the temporary server started by `make check` uses “trust” authentication, another user on the same machine could connect to it as database superuser, and then potentially exploit the privileges of the operating-system user who started the tests. A future release will probably incorporate changes in the testing procedure to prevent this risk, but some public discussion is needed first. So for the moment, just warn people against using `make check` when there are untrusted users on the same machine. (CVE-2014-0067)

- Fix possible mis-replay of WAL records when some segments of a relation aren’t full size (Greg Stark, Tom Lane)

The WAL update could be applied to the wrong page, potentially many pages past where it should have been. Aside from corrupting data, this error has been observed to result in significant “bloat” of standby servers compared to their masters, due to updates being applied far beyond where the end-of-file should have been. This failure mode does not appear to be a significant risk during crash recovery, only when initially synchronizing a standby created from a base backup taken from a quickly-changing master.

- Fix bug in determining when recovery has reached consistency (Tomonari Katsumata, Heikki Linnakangas)

In some cases WAL replay would mistakenly conclude that the database was already consistent at the start of replay, thus possibly allowing hot-standby queries before the database was really consistent. Other symptoms such as “PANIC: WAL contains references to invalid pages” were also possible.

- Fix improper locking of btree index pages while replaying a `VACUUM` operation in hot-standby mode (Andres Freund, Heikki Linnakangas, Tom Lane)

This error could result in “PANIC: WAL contains references to invalid pages” failures.

- Ensure that insertions into non-leaf GIN index pages write a full-page WAL record when appropriate (Heikki Linnakangas)

The previous coding risked index corruption in the event of a partial-page write during a system crash.

- Fix race conditions during server process exit (Robert Haas)

Ensure that signal handlers don’t attempt to use the process’s `MyProc` pointer after it’s no longer valid.

- Fix unsafe references to `errno` within error reporting logic (Christian Kruse)

This would typically lead to odd behaviors such as missing or inappropriate `HINT` fields.

- Fix possible crashes from using `ereport()` too early during server startup (Tom Lane)

The principal case we’ve seen in the field is a crash if the server is started in a directory it doesn’t have permission to read.
• Clear retry flags properly in OpenSSL socket write function (Alexander Kukushkin)

This omission could result in a server lockup after unexpected loss of an SSL-encrypted connection.

• Fix length checking for Unicode identifiers (Us"."" syntax) containing escapes (Tom Lane)

A spurious truncation warning would be printed for such identifiers if the escaped form of the identifier was too long, but the identifier actually didn’t need truncation after de-escaping.

• Allow keywords that are type names to be used in lists of roles (Stephen Frost)

A previous patch allowed such keywords to be used without quoting in places such as role identifiers; but it missed cases where a list of role identifiers was permitted, such as DROP ROLE.

• Fix possible crash due to invalid plan for nested sub-selects, such as WHERE (... x IN (SELECT ...) ...) IN (SELECT ...) (Tom Lane)

• Ensure that ANALYZE creates statistics for a table column even when all the values in it are “too wide” (Tom Lane)

ANALYZE intentionally omits very wide values from its histogram and most-common-values calculations, but it neglected to do something sane in the case that all the sampled entries are too wide.

• In ALTER TABLE ... SET TABLESPACE, allow the database’s default tablespace to be used without a permissions check (Stephen Frost)

CREATE TABLE has always allowed such usage, but ALTER TABLE didn’t get the memo.

• Fix “cannot accept a set” error when some arms of a CASE return a set and others don’t (Tom Lane)

• Fix checks for all-zero client addresses in pgstat functions (Kevin Grittner)

• Fix possible misclassification of multibyte characters by the text search parser (Tom Lane)

Non-ASCII characters could be misclassified when using C locale with a multibyte encoding. On Cygwin, non-C locales could fail as well.

• Fix possible misbehavior in plainto_tsquery() (Heikki Linnakangas)

Use memmove() not memcpy() for copying overlapping memory regions. There have been no field reports of this actually causing trouble, but it’s certainly risky.

• Accept SHIFT_JIS as an encoding name for locale checking purposes (Tatsuo Ishii)

• Fix misbehavior of PQhost() on Windows (Fujii Masao)

It should return localhost if no host has been specified.

• Improve error handling in libpq and psql for failures during COPY TO STDOUT/FROM STDIN (Tom Lane)

In particular this fixes an infinite loop that could occur in 9.2 and up if the server connection was lost during COPY FROM STDIN. Variants of that scenario might be possible in older versions, or with other client applications.

• Fix misaligned descriptors in ecpg (MauMau)

• In ecpg, handle lack of a hostname in the connection parameters properly (Michael Meskes)

• Fix performance regression in contrib/dblink connection startup (Joe Conway)

Avoid an unnecessary round trip when client and server encodings match.

• In contrib/isn, fix incorrect calculation of the check digit for ISMN values (Fabien Coelho)
Appendix E. Release Notes

- Ensure client-code-only installation procedure works as documented (Peter Eisentraut)
- In Mingw and Cygwin builds, install the libpq DLL in the bin directory (Andrew Dunstan)
  This duplicates what the MSVC build has long done. It should fix problems with programs like psql failing to start because they can’t find the DLL.
- Avoid using the deprecated dllwrap tool in Cygwin builds (Marco Atzeri)
- Don’t generate plain-text HISTORY and src/test/regress/README files anymore (Tom Lane)
  These text files duplicated the main HTML and PDF documentation formats. The trouble involved in maintaining them greatly outweighs the likely audience for plain-text format. Distribution tarballs will still contain files by these names, but they’ll just be stubs directing the reader to consult the main documentation. The plain-text INSTALL file will still be maintained, as there is arguably a use-case for that.
- Update time zone data files to tzdata release 2013i for DST law changes in Jordan and historical changes in Cuba.
  In addition, the zones Asia/Riyadh87, Asia/Riyadh88, and Asia/Riyadh89 have been removed, as they are no longer maintained by IANA, and never represented actual civil timekeeping practice.

E.134. Release 9.0.15

Release date: 2013-12-05

This release contains a variety of fixes from 9.0.14. For information about new features in the 9.0 major release, see Section E.149.

E.134.1. Migration to Version 9.0.15

A dump/restore is not required for those running 9.0.X.

However, this release corrects a number of potential data corruption issues. See the first two changelog entries below to find out whether your installation has been affected and what steps you can take if so.

Also, if you are upgrading from a version earlier than 9.0.13, see Section E.136.

E.134.2. Changes

- Fix VACUUM’s tests to see whether it can update relfrozenxid (Andres Freund)
  In some cases VACUUM (either manual or autovacuum) could incorrectly advance a table’s relfrozenxid value, allowing tuples to escape freezing, causing those rows to become invisible once $2^{31}$ transactions have elapsed. The probability of data loss is fairly low since multiple incorrect advancements would need to happen before actual loss occurs, but it’s not zero. Users upgrading from releases 9.0.4 or 8.4.8 or earlier are not affected, but all later versions contain the bug.
The issue can be ameliorated by, after upgrading, vacuuming all tables in all databases while having \texttt{vacuum\_freeze\_table\_age} set to zero. This will fix any latent corruption but will not be able to fix all pre-existing data errors. However, an installation can be presumed safe after performing this vacuuming if it has executed fewer than $2^{31}$ update transactions in its lifetime (check this with \texttt{SELECT \text{txid\_current}() < 2^{31}}).

- Fix initialization of \texttt{pg\_clog} and \texttt{pg\_subtrans} during hot standby startup (Andres Freund, Heikki Linnakangas)

This bug can cause data loss on standby servers at the moment they start to accept hot-standby queries, by marking committed transactions as uncommitted. The likelihood of such corruption is small unless, at the time of standby startup, the primary server has executed many updating transactions since its last checkpoint. Symptoms include missing rows, rows that should have been deleted being still visible, and obsolete versions of updated rows being still visible alongside their newer versions.

This bug was introduced in versions 9.3.0, 9.2.5, 9.1.10, and 9.0.14. Standby servers that have only been running earlier releases are not at risk. It’s recommended that standby servers that have ever run any of the buggy releases be re-cloned from the primary (e.g., with a new base backup) after upgrading.

- Truncate \texttt{pg\_multixact} contents during WAL replay (Andres Freund)

This avoids ever-increasing disk space consumption in standby servers.

- Fix race condition in GIN index posting tree page deletion (Heikki Linnakangas)

This could lead to transient wrong answers or query failures.

- Avoid flattening a subquery whose \texttt{SELECT} list contains a volatile function wrapped inside a sub-\texttt{SELECT} (Tom Lane)

This avoids unexpected results due to extra evaluations of the volatile function.

- Fix planner’s processing of non-simple-variable subquery outputs nested within outer joins (Tom Lane)

This error could lead to incorrect plans for queries involving multiple levels of subqueries within \texttt{JOIN} syntax.

- Fix premature deletion of temporary files (Andres Freund)

- Fix possible read past end of memory in rule printing (Peter Eisentraut)

- Fix array slicing of \texttt{int2vector} and \texttt{oidvector} values (Tom Lane)

Expressions of this kind are now implicitly promoted to regular \texttt{int2} or \texttt{oid} arrays.

- Fix incorrect behaviors when using a SQL-standard, simple GMT offset timezone (Tom Lane)

In some cases, the system would use the simple GMT offset value when it should have used the regular timezone setting that had prevailed before the simple offset was selected. This change also causes the \texttt{timeofday} function to honor the simple GMT offset zone.

- Prevent possible misbehavior when logging translations of Windows error codes (Tom Lane)

- Properly quote generated command lines in \texttt{pg\_ctl} (Naoya Anzai and Tom Lane)

This fix applies only to Windows.

- Fix \texttt{pg\_dumpall} to work when a source database sets \texttt{default\_transaction\_read\_only} via \texttt{ALTER DATABASE SET} (Kevin Grittner)

Previously, the generated script would fail during restore.
Appendix E. Release Notes

• Fix ecpg’s processing of lists of variables declared varchar (Zoltán Bőszörményi)
• Make contrib/lo defend against incorrect trigger definitions (Marc Cousin)
• Update time zone data files to tzdata release 2013h for DST law changes in Argentina, Brazil, Jordan, Libya, Liechtenstein, Morocco, and Palestine. Also, new timezone abbreviations WIB, WIT, WITA for Indonesia.

E.135. Release 9.0.14

Release date: 2013-10-10

This release contains a variety of fixes from 9.0.13. For information about new features in the 9.0 major release, see Section E.149.

E.135.1. Migration to Version 9.0.14

A dump/restore is not required for those running 9.0.X.

However, if you are upgrading from a version earlier than 9.0.13, see Section E.136.

E.135.2. Changes

• Prevent corruption of multi-byte characters when attempting to case-fold identifiers (Andrew Dunstan)
   PostgreSQL case-folds non-ASCII characters only when using a single-byte server encoding.
• Fix checkpoint memory leak in background writer when wal_level = hot_standby (Naoya Anzai)
• Fix memory leak caused by lo_open() failure (Heikki Linnakangas)
• Fix memory overcommit bug when work_mem is using more than 24GB of memory (Stephen Frost)
• Fix deadlock bug in libpq when using SSL (Stephen Frost)
• Fix possible SSL state corruption in threaded libpq applications (Nick Phillips, Stephen Frost)
• Properly compute row estimates for boolean columns containing many NULL values (Andrew Gierth)
   Previously tests like col IS NOT TRUE and col IS NOT FALSE did not properly factor in NULL values when estimating plan costs.
• Prevent pushing down WHERE clauses into unsafe UNION/INTERSECT subqueries (Tom Lane)
   Subqueries of a UNION or INTERSECT that contain set-returning functions or volatile functions in their SELECT lists could be improperly optimized, leading to run-time errors or incorrect query results.
• Fix rare case of “failed to locate grouping columns” planner failure (Tom Lane)
• Improve view dumping code’s handling of dropped columns in referenced tables (Tom Lane)
• Properly record index comments created using UNIQUE and PRIMARY KEY syntax (Andres Freund)
   This fixes a parallel pg_restore failure.
Appendix E. Release Notes

- Fix `REINDEX TABLE` and `REINDEX DATABASE` to properly revalidate constraints and mark invalidated indexes as valid (Noah Misch).
  `REINDEX INDEX` has always worked properly.
- Fix possible deadlock during concurrent `CREATE INDEX CONCURRENTLY` operations (Tom Lane).
- Fix `regexp_matches()` handling of zero-length matches (Jeevan Chalke).
  Previously, zero-length matches like '^' could return too many matches.
- Fix crash for overly-complex regular expressions (Heikki Linnakangas).
- Fix regular expression match failures for back references combined with non-greedy quantifiers (Jeevan Chalke).
- Prevent `CREATE FUNCTION` from checking `SET` variables unless function body checking is enabled (Tom Lane).
- Allow `ALTER DEFAULT PRIVILEGES` to operate on schemas without requiring `CREATE` permission (Tom Lane).
- Loosen restriction on keywords used in queries (Tom Lane).
  Specifically, lessen keyword restrictions for role names, language names, `EXPLAIN` and `COPY` options, and `SET` values. This allows `COPY ... (FORMAT BINARY)` to work as expected; previously `BINARY` needed to be quoted.
- Fix `pgp_pub_decrypt()` so it works for secret keys with passwords (Marko Kreen).
- Remove rare inaccurate warning during vacuum of index-less tables (Heikki Linnakangas).
- Ensure that `VACUUM ANALYZE` still runs the `ANALYZE` phase if its attempt to truncate the file is cancelled due to lock conflicts (Kevin Grittner).
- Avoid possible failure when performing transaction control commands (e.g. `ROLLBACK`) in prepared queries (Tom Lane).
- Ensure that floating-point data input accepts standard spellings of “infinity” on all platforms (Tom Lane).
  The C99 standard says that allowable spellings are `inf`, `+inf`, `-inf`, `infinity`, `+infinity`, and `-infinity`. Make sure we recognize these even if the platform’s `strtod` function doesn’t.
- Expand ability to compare rows to records and arrays (Rafal Rzepecki, Tom Lane).
- Update time zone data files to tzdata release 2013d for DST law changes in Israel, Morocco, Palestine, and Paraguay. Also, historical zone data corrections for Macquarie Island.

E.136. Release 9.0.13

Release date: 2013-04-04

This release contains a variety of fixes from 9.0.12. For information about new features in the 9.0 major release, see Section E.149.
E.136.1. Migration to Version 9.0.13

A dump/restore is not required for those running 9.0.X.

However, this release corrects several errors in management of GiST indexes. After installing this update, it is advisable to **REINDEX** any GiST indexes that meet one or more of the conditions described below.

Also, if you are upgrading from a version earlier than 9.0.6, see Section E.143.

E.136.2. Changes

- **Fix insecure parsing of server command-line switches** (Mitsumasa Kondo, Kyotaro Horiguchi)
  
  A connection request containing a database name that begins with “-” could be crafted to damage or destroy files within the server’s data directory, even if the request is eventually rejected. (CVE-2013-1899)

- **Reset OpenSSL randomness state in each postmaster child process** (Marko Kreen)
  
  This avoids a scenario wherein random numbers generated by `contrib/pgcrypto` functions might be relatively easy for another database user to guess. The risk is only significant when the postmaster is configured with `ssl = on` but most connections don’t use SSL encryption. (CVE-2013-1900)

- **Fix GiST indexes to not use “fuzzy” geometric comparisons when it’s not appropriate to do so** (Alexander Korotkov)
  
  The core geometric types perform comparisons using “fuzzy” equality, but `gist_box_same` must do exact comparisons, else GiST indexes using it might become inconsistent. After installing this update, users should **REINDEX** any GiST indexes on `box`, `polygon`, `circle`, or `point` columns, since all of these use `gist_box_same`.

- **Fix erroneous range-union and penalty logic in GiST indexes** that use `contrib/btree_gist` for variable-width data types, that is `text`, `bytea`, `bit`, and `numeric` columns (Tom Lane)
  
  These errors could result in inconsistent indexes in which some keys that are present would not be found by searches, and also in useless index bloat. Users are advised to **REINDEX** such indexes after installing this update.

- **Fix bugs in GiST page splitting code for multi-column indexes** (Tom Lane)
  
  These errors could result in inconsistent indexes in which some keys that are present would not be found by searches, and also in indexes that are unnecessarily inefficient to search. Users are advised to **REINDEX** multi-column GiST indexes after installing this update.

- **Fix `gist_point_consistent` to handle fuzziness consistently** (Alexander Korotkov)
  
  Index scans on GiST indexes on `point` columns would sometimes yield results different from a sequential scan, because `gist_point_consistent` disagreed with the underlying operator code about whether to do comparisons exactly or fuzzily.

- **Fix buffer leak in WAL replay** (Heikki Linnakangas)
  
  This bug could result in “incorrect local pin count” errors during replay, making recovery impossible.

- **Fix race condition in `DELETE RETURNING`** (Tom Lane)
Under the right circumstances, DELETE RETURNING could attempt to fetch data from a shared buffer that the current process no longer has any pin on. If some other process changed the buffer meanwhile, this would lead to garbage RETURNING output, or even a crash.

- Fix infinite-loop risk in regular expression compilation (Tom Lane, Don Porter)
- Fix potential null-pointer dereference in regular expression compilation (Tom Lane)
- Fix to_char() to use ASCII-only case-folding rules where appropriate (Tom Lane)
  This fixes misbehavior of some template patterns that should be locale-independent, but mishandled “ı” and “ü” in Turkish locales.
- Fix unwanted rejection of timestamp 1999-12-31 24:00:00 (Tom Lane)
- Fix logic error when a single transaction does UNLISTEN then LISTEN (Tom Lane)
  The session wound up not listening for notify events at all, though it surely should listen in this case.
- Remove useless “picksplit doesn’t support secondary split” log messages (Josh Hansen, Tom Lane)
  This message seems to have been added in expectation of code that was never written, and probably never will be, since GiST’s default handling of secondary splits is actually pretty good. So stop nagging end users about it.
- Fix possible failure to send a session’s last few transaction commit/abort counts to the statistics collector (Tom Lane)
- Eliminate memory leaks in PL/Perl’s spi_prepare() function (Alex Hunsaker, Tom Lane)
- Fix pg_dumpall to handle database names containing “=” correctly (Heikki Linnakangas)
- Avoid crash in pg_dump when an incorrect connection string is given (Heikki Linnakangas)
- Ignore invalid indexes in pg_dump and pg_upgrade (Michael Paquier, Bruce Momjian)
  Dumping invalid indexes can cause problems at restore time, for example if the reason the index creation failed was because it tried to enforce a uniqueness condition not satisfied by the table’s data. Also, if the index creation is in fact still in progress, it seems reasonable to consider it to be an uncommitted DDL change, which pg_dump wouldn’t be expected to dump anyway. pg_upgrade now also skips invalid indexes rather than failing.
- Fix contrib/pg_trgm’s similarity() function to return zero for trigram-less strings (Tom Lane)
  Previously it returned NaN due to internal division by zero.
- Update time zone data files to tzdata release 2013b for DST law changes in Chile, Haiti, Morocco, Paraguay, and some Russian areas. Also, historical zone data corrections for numerous places.
  Also, update the time zone abbreviation files for recent changes in Russia and elsewhere: CHOT, GET, IRKT, KGT, KRAT, MAGT, MAWT, MSK, NOVT, OMT, TKT, VLAT, WST, YAKT, YEK. VOLT (Europe/Volgograd) and MIST (Antarctica/Macquarie) are added to the default abbreviations list.

E.137. Release 9.0.12

Release date: 2013-02-07
This release contains a variety of fixes from 9.0.11. For information about new features in the 9.0 major release, see Section E.149.

### E.137.1. Migration to Version 9.0.12

A dump/restore is not required for those running 9.0.X.

However, if you are upgrading from a version earlier than 9.0.6, see Section E.143.

### E.137.2. Changes

- **Prevent execution of `enum_recv` from SQL (Tom Lane)**
  The function was misdeclared, allowing a simple SQL command to crash the server. In principle an attacker might be able to use it to examine the contents of server memory. Our thanks to Sumit Soni (via Secunia SVCRP) for reporting this issue. (CVE-2013-0255)

- **Fix multiple problems in detection of when a consistent database state has been reached during WAL replay (Fujii Masao, Heikki Linnakangas, Simon Riggs, Andres Freund)**

- **Update minimum recovery point when truncating a relation file (Heikki Linnakangas)**
  Once data has been discarded, it’s no longer safe to stop recovery at an earlier point in the timeline.

- **Fix missing cancellations in hot standby mode (Noah Misch, Simon Riggs)**
  The need to cancel conflicting hot-standby queries would sometimes be missed, allowing those queries to see inconsistent data.

- **Fix SQL grammar to allow subscripting or field selection from a sub-SELECT result (Tom Lane)**

- **Fix performance problems with autovacuum truncation in busy workloads (Jan Wieck)**
  Truncation of empty pages at the end of a table requires exclusive lock, but autovacuum was coded to fail (and release the table lock) when there are conflicting lock requests. Under load, it is easily possible that truncation would never occur, resulting in table bloat. Fix by performing a partial truncation, releasing the lock, then attempting to re-acquire the lock and continue. This fix also greatly reduces the average time before autovacuum releases the lock after a conflicting request arrives.

- **Protect against race conditions when scanning `pg_tablespace` (Stephen Frost, Tom Lane)**

- **Prevent DROP OWNED from trying to drop whole databases or tablespaces (Álvaro Herrera)**
  For safety, ownership of these objects must be reassigned, not dropped.

- **Fix error in `vacuum_freeze_table_age` implementation (Andres Freund)**
  In installations that have existed for more than `vacuum_freeze_min_age` transactions, this mistake prevented autovacuum from using partial-table scans, so that a full-table scan would always happen instead.

- **Prevent misbehavior when a RowExpr or XmlExpr is parse-analyzed twice (Andres Freund, Tom Lane)**
This mistake could be user-visible in contexts such as `CREATE TABLE LIKE INCLUDING INDEXES`.

- Improve defenses against integer overflow in hashtable sizing calculations (Jeff Davis)
- Reject out-of-range dates in `to_date()` (Hitoshi Harada)
- Ensure that non-ASCII prompt strings are translated to the correct code page on Windows (Alexander Law, Noah Misch)
  
  This bug affected psql and some other client programs.

- Fix possible crash in psql’s `\?` command when not connected to a database (Meng Qingzhong)
- Fix `pg_upgrade` to deal with invalid indexes safely (Bruce Momjian)
- Fix one-byte buffer overrun in libpq’s `PQprintTuples` (Xi Wang)
  
  This ancient function is not used anywhere by PostgreSQL itself, but it might still be used by some client code.

- Make ecpglib use translated messages properly (Chen Huajun)
- Properly install `ecpg_compat` and `pgtypes` libraries on MSVC (Jiang Guiqing)
- Include our version of `isinf()` in `libecpg` if it’s not provided by the system (Jiang Guiqing)
- Rearrange configure’s tests for supplied functions so it is not fooled by bogus exports from `libedit/libreadline` (Christoph Berg)
- Ensure Windows build number increases over time (Magnus Hagander)
- Make `pgxs` build executables with the right `.exe` suffix when cross-compiling for Windows (Zoltan Boszormenyi)
- Add new timezone abbreviation `FET` (Tom Lane)
  
  This is now used in some eastern-European time zones.

### E.138. Release 9.0.11

**Release date:** 2012-12-06

This release contains a variety of fixes from 9.0.10. For information about new features in the 9.0 major release, see Section E.149.

### E.138.1. Migration to Version 9.0.11

A dump/restore is not required for those running 9.0.X.

However, if you are upgrading from a version earlier than 9.0.6, see Section E.143.

### E.138.2. Changes

- Fix multiple bugs associated with `CREATE INDEX CONCURRENTLY` (Andres Freund, Tom Lane)
Appendix E. Release Notes

Fix `CREATE INDEX CONCURRENTLY` to use in-place updates when changing the state of an index’s `pg_index` row. This prevents race conditions that could cause concurrent sessions to miss updating the target index, thus resulting in corrupt concurrently-created indexes.

Also, fix various other operations to ensure that they ignore invalid indexes resulting from a failed `CREATE INDEX CONCURRENTLY` command. The most important of these is `VACUUM`, because an auto-vacuum could easily be launched on the table before corrective action can be taken to fix or remove the invalid index.

- Fix buffer locking during WAL replay (Tom Lane)
  The WAL replay code was insufficiently careful about locking buffers when replaying WAL records that affect more than one page. This could result in hot standby queries transiently seeing inconsistent states, resulting in wrong answers or unexpected failures.

- Fix an error in WAL generation logic for GIN indexes (Tom Lane)
  This could result in index corruption, if a torn-page failure occurred.

- Properly remove startup process’s virtual XID lock when promoting a hot standby server to normal running (Simon Riggs)
  This oversight could prevent subsequent execution of certain operations such as `CREATE INDEX CONCURRENTLY`.

- Avoid bogus “out-of-sequence timeline ID” errors in standby mode (Heikki Linnakangas)

- Prevent the postmaster from launching new child processes after it’s received a shutdown signal (Tom Lane)
  This mistake could result in shutdown taking longer than it should, or even never completing at all without additional user action.

- Avoid corruption of internal hash tables when out of memory (Hitoshi Harada)

- Fix planning of non-strict equivalence clauses above outer joins (Tom Lane)
  The planner could derive incorrect constraints from a clause equating a non-strict construct to something else, for example `WHERE COALESCE(foo, 0) = 0` when `foo` is coming from the nullable side of an outer join.

- Improve planner’s ability to prove exclusion constraints from equivalence classes (Tom Lane)

- Fix partial-row matching in hashed subplans to handle cross-type cases correctly (Tom Lane)
  This affects multicolumn `NOT IN` subplans, such as `WHERE (a, b) NOT IN (SELECT x, y FROM ...)` when for instance `b` and `y` are `int4` and `int8` respectively. This mistake led to wrong answers or crashes depending on the specific datatypes involved.

- Acquire buffer lock when re-fetching the old tuple for an `AFTER ROW UPDATE/DELETE` trigger (Andres Freund)
  In very unusual circumstances, this oversight could result in passing incorrect data to the precheck logic for a foreign-key enforcement trigger. That could result in a crash, or in an incorrect decision about whether to fire the trigger.

- Fix `ALTER COLUMN TYPE` to handle inherited check constraints properly (Pavan Deolasee)
  This worked correctly in pre-8.4 releases, and now works correctly in 8.4 and later.

- Fix `REASSIGN OWNED` to handle grants on tablespaces (Álvaro Herrera)

2871
• Ignore incorrect `pg_attribute` entries for system columns for views (Tom Lane)
  Views do not have any system columns. However, we forgot to remove such entries when converting a table to a view. That’s fixed properly for 9.3 and later, but in previous branches we need to defend against existing mis-converted views.

• Fix rule printing to dump `INSERT INTO table DEFAULT VALUES` correctly (Tom Lane)

• Guard against stack overflow when there are too many `UNION/INTERSECT/EXCEPT` clauses in a query (Tom Lane)

• Prevent platform-dependent failures when dividing the minimum possible integer value by -1 (Xi Wang, Tom Lane)

• Fix possible access past end of string in date parsing (Hitoshi Harada)

• Fix failure to advance XID epoch if XID wraparound happens during a checkpoint and `wal_level` is `hot_standby` (Tom Lane, Andres Freund)
  While this mistake had no particular impact on PostgreSQL itself, it was bad for applications that rely on `txid_current()` and related functions: the TXID value would appear to go backwards.

• Produce an understandable error message if the length of the path name for a Unix-domain socket exceeds the platform-specific limit (Tom Lane, Andrew Dunstan)
  Formerly, this would result in something quite unhelpful, such as “Non-recoverable failure in name resolution”.

• Fix memory leaks when sending composite column values to the client (Tom Lane)

• Make `pg_ctl` more robust about reading the `postmaster.pid` file (Heikki Linnakangas)
  Fix race conditions and possible file descriptor leakage.

• Fix possible crash in psql if incorrectly-encoded data is presented and the `client_encoding` setting is a client-only encoding, such as SJIS (Jiang Guiqing)

• Fix bugs in the `restore.sql` script emitted by `pg_dump` in `tar` output format (Tom Lane)
  The script would fail outright on tables whose names include upper-case characters. Also, make the script capable of restoring data in `--inserts` mode as well as the regular `COPY` mode.

• Fix `pg_restore` to accept POSIX-conformant `tar` files (Brian Weaver, Tom Lane)
  The original coding of `pg_dump`’s `tar` output mode produced files that are not fully conformant with the POSIX standard. This has been corrected for version 9.3. This patch updates previous branches so that they will accept both the incorrect and the corrected formats, in hopes of avoiding compatibility problems when 9.3 comes out.

• Fix `pg_resetxlog` to locate `postmaster.pid` correctly when given a relative path to the data directory (Tom Lane)
  This mistake could lead to `pg_resetxlog` not noticing that there is an active postmaster using the data directory.

• Fix `libpq`’s `lo_import()` and `lo_export()` functions to report file I/O errors properly (Tom Lane)

• Fix `ecpg`’s processing of nested structure pointer variables (Muhammad Usama)

• Fix `ecpg`’s `ecpg_get_data` function to handle arrays properly (Michael Meskes)
- Make contrib/pageinspect's `btree` page inspection functions take buffer locks while examining pages (Tom Lane)
- Fix pgxs support for building loadable modules on AIX (Tom Lane)
  Building modules outside the original source tree didn’t work on AIX.
- Update time zone data files to tZdata release 2012j for DST law changes in Cuba, Israel, Jordan, Libya, Palestine, Western Samoa, and portions of Brazil.

**E.139. Release 9.0.10**

**Release date:** 2012-09-24

This release contains a variety of fixes from 9.0.9. For information about new features in the 9.0 major release, see Section E.149.

**E.139.1. Migration to Version 9.0.10**

A dump/restore is not required for those running 9.0.X.

However, if you are upgrading from a version earlier than 9.0.6, see Section E.143.

**E.139.2. Changes**

- Fix planner’s assignment of executor parameters, and fix executor’s rescan logic for CTE plan nodes (Tom Lane)
  These errors could result in wrong answers from queries that scan the same `WITH` subquery multiple times.
- Improve page-splitting decisions in GiST indexes (Alexander Korotkov, Robert Haas, Tom Lane)
  Multi-column GiST indexes might suffer unexpected bloat due to this error.
- Fix cascading privilege revoke to stop if privileges are still held (Tom Lane)
  If we revoke a grant option from some role $X$, but $X$ still holds that option via a grant from someone else, we should not recursively revoke the corresponding privilege from role(s) $Y$ that $X$ had granted it to.
- Improve error messages for Hot Standby misconfiguration errors (Gurjeet Singh)
- Fix handling of `SIGFPE` when PL/Perl is in use (Andres Freund)
  Perl resets the process’s `SIGFPE` handler to `SIG_IGN`, which could result in crashes later on. Restore the normal Postgres signal handler after initializing PL/Perl.
- Prevent PL/Perl from crashing if a recursive PL/Perl function is redefined while being executed (Tom Lane)
- Work around possible misoptimization in PL/Perl (Tom Lane)
Some Linux distributions contain an incorrect version of `pthread.h` that results in incorrect compiled code in PL/Perl, leading to crashes if a PL/Perl function calls another one that throws an error.

- Fix `pg_upgrade`’s handling of line endings on Windows (Andrew Dunstan)
  Previously, `pg_upgrade` might add or remove carriage returns in places such as function bodies.
- On Windows, make `pg_upgrade` use backslash path separators in the scripts it emits (Andrew Dunstan)
- Update time zone data files to tzdata release 2012f for DST law changes in Fiji

### E.140. Release 9.0.9

**Release date:** 2012-08-17

This release contains a variety of fixes from 9.0.8. For information about new features in the 9.0 major release, see Section E.149.

### E.140.1. Migration to Version 9.0.9

A dump/restore is not required for those running 9.0.X.

However, if you are upgrading from a version earlier than 9.0.6, see Section E.143.

### E.140.2. Changes

- Prevent access to external files/URLs via XML entity references (Noah Misch, Tom Lane)
  `xml_parse()` would attempt to fetch external files or URLs as needed to resolve DTD and entity references in an XML value, thus allowing unprivileged database users to attempt to fetch data with the privileges of the database server. While the external data wouldn’t get returned directly to the user, portions of it could be exposed in error messages if the data didn’t parse as valid XML; and in any case the mere ability to check existence of a file might be useful to an attacker. (CVE-2012-3489)
- Prevent access to external files/URLs via `contrib/xml2`’s `xslt_process()` (Peter Eisentraut)
  libxml2 offers the ability to read and write both files and URLs through stylesheet commands, thus allowing unprivileged database users to both read and write data with the privileges of the database server. Disable that through proper use of libxml2’s security options. (CVE-2012-3488)
  Also, remove `xslt_process()`’s ability to fetch documents and stylesheets from external files/URLs. While this was a documented “feature”, it was long regarded as a bad idea. The fix for CVE-2012-3489 broke that capability, and rather than expend effort on trying to fix it, we’re just going to summarily remove it.
- Prevent too-early recycling of btree index pages (Noah Misch)
  When we allowed read-only transactions to skip assigning XIDs, we introduced the possibility that a deleted btree page could be recycled while a read-only transaction was still in flight to it. This would
result in incorrect index search results. The probability of such an error occurring in the field seems very low because of the timing requirements, but nonetheless it should be fixed.

- Fix crash-safety bug with newly-created-or-reset sequences (Tom Lane)

If `ALTER SEQUENCE` was executed on a freshly created or reset sequence, and then precisely one `nextval()` call was made on it, and then the server crashed, WAL replay would restore the sequence to a state in which it appeared that no `nextval()` had been done, thus allowing the first sequence value to be returned again by the next `nextval()` call. In particular this could manifest for serial columns, since creation of a serial column’s sequence includes an `ALTER SEQUENCE OWNED BY` step.

- Fix `txid_current()` to report the correct epoch when not in hot standby (Heikki Linnakangas)

This fixes a regression introduced in the previous minor release.

- Fix bug in startup of Hot Standby when a master transaction has many subtransactions (Andres Freund)

This mistake led to failures reported as “out-of-order XID insertion in KnownAssignedXids”.

- Ensure the `backup_label` file is fsync’d after `pg_start_backup()` (Dave Kerr)

- Fix timeout handling in walsender processes (Tom Lane)

WAL sender background processes neglected to establish a SIGALRM handler, meaning they would wait forever in some corner cases where a timeout ought to happen.

- Back-patch 9.1 improvement to compress the fsync request queue (Robert Haas)

This improves performance during checkpoints. The 9.1 change has now seen enough field testing to seem safe to back-patch.

- Fix `LISTEN/NOTIFY` to cope better with I/O problems, such as out of disk space (Tom Lane)

After a write failure, all subsequent attempts to send more `NOTIFY` messages would fail with messages like “Could not read from file "pg_notify/nnnn" at offset nnnnn: Success”.

- Only allow autovacuum to be auto-canceled by a directly blocked process (Tom Lane)

The original coding could allow inconsistent behavior in some cases; in particular, an autovacuum could get canceled after less than `deadlock_timeout` grace period.

- Improve logging of autovacuum cancels (Robert Haas)

- Fix log collector so that `log_truncate_on_rotation` works during the very first log rotation after server start (Tom Lane)

- Fix `WITH` attached to a nested set operation (UNION/INTERSECT/EXCEPT) (Tom Lane)

- Ensure that a whole-row reference to a subquery doesn’t include any extra `GROUP BY` or `ORDER BY` columns (Tom Lane)

- Disallow copying whole-row references in `CHECK` constraints and index definitions during `CREATE TABLE` (Tom Lane)

This situation can arise in `CREATE TABLE with LIKE or INHERITS`. The copied whole-row variable was incorrectly labeled with the row type of the original table not the new one. Rejecting the case seems reasonable for `LIKE`, since the row types might well diverge later. For `INHERITS` we should ideally allow it, with an implicit coercion to the parent table’s row type; but that will require more work than seems safe to back-patch.

- Fix memory leak in `ARRAY(SELECT . . .)` subqueries (Heikki Linnakangas, Tom Lane)
• Fix extraction of common prefixes from regular expressions (Tom Lane)

The code could get confused by quantified parenthesized subexpressions, such as `^(foo)?bar`. This would lead to incorrect index optimization of searches for such patterns.

• Fix bugs with parsing signed `hh:mm` and `hh:mm:ss` fields in interval constants (Amit Kapila, Tom Lane)

• Use Postgres’ encoding conversion functions, not Python’s, when converting a Python Unicode string to the server encoding in PL/Python (Jan Urbanski)

   This avoids some corner-case problems, notably that Python doesn’t support all the encodings Postgres does. A notable functional change is that if the server encoding is SQL_ASCII, you will get the UTF-8 representation of the string; formerly, any non-ASCII characters in the string would result in an error.

• Fix mapping of PostgreSQL encodings to Python encodings in PL/Python (Jan Urbanski)

• Report errors properly in contrib/xml2’s `xslt_process()` (Tom Lane)

• Update time zone data files to tzdata release 2012e for DST law changes in Morocco and Tokelau

E.141. Release 9.0.8

Release date: 2012-06-04

This release contains a variety of fixes from 9.0.7. For information about new features in the 9.0 major release, see Section E.149.

E.141.1. Migration to Version 9.0.8

A dump/restore is not required for those running 9.0.X.

However, if you are upgrading from a version earlier than 9.0.6, see Section E.143.

E.141.2. Changes

• Fix incorrect password transformation in contrib/pgcrypto’s DES `crypt()` function (Solar Designer)

   If a password string contained the byte value 0x80, the remainder of the password was ignored, causing the password to be much weaker than it appeared. With this fix, the rest of the string is properly included in the DES hash. Any stored password values that are affected by this bug will thus no longer match, so the stored values may need to be updated. (CVE-2012-2143)

• Ignore `SECURITY DEFINER` and `SET` attributes for a procedural language’s call handler (Tom Lane)

   Applying such attributes to a call handler could crash the server. (CVE-2012-2655)

• Allow numeric timezone offsets in `timestamp` input to be up to 16 hours away from UTC (Tom Lane)
Appendix E. Release Notes

Some historical time zones have offsets larger than 15 hours, the previous limit. This could result in dumped data values being rejected during reload.

- Fix timestamp conversion to cope when the given time is exactly the last DST transition time for the current timezone (Tom Lane)

  This oversight has been there a long time, but was not noticed previously because most DST-using zones are presumed to have an indefinite sequence of future DST transitions.

- Fix text to name and char to name casts to perform string truncation correctly in multibyte encodings (Karl Schnaitter)

- Fix memory copying bug in to_tsquery() (Heikki Linnakangas)

- Ensure txid_current() reports the correct epoch when executed in hot standby (Simon Riggs)

- Fix planner’s handling of outer PlaceHolderVars within subqueries (Tom Lane)

  This bug concerns sub-SELECTs that reference variables coming from the nullable side of an outer join of the surrounding query. In 9.1, queries affected by this bug would fail with “ERROR: Upper-level PlaceHolderVar found where not expected”. But in 9.0 and 8.4, you’d silently get possibly-wrong answers, since the value transmitted into the subquery wouldn’t go to null when it should.

- Fix slow session startup when pg_attribute is very large (Tom Lane)

  If pg_attribute exceeds one-fourth of shared_buffers, cache rebuilding code that is sometimes needed during session start would trigger the synchronized-scan logic, causing it to take many times longer than normal. The problem was particularly acute if many new sessions were starting at once.

- Ensure sequential scans check for query cancel reasonably often (Merlin Moncure)

  A scan encountering many consecutive pages that contain no live tuples would not respond to interrupts meanwhile.

- Ensure the Windows implementation of PGSemaphoreLock() clears ImmediateInterruptOK before returning (Tom Lane)

  This oversight meant that a query-cancel interrupt received later in the same query could be accepted at an unsafe time, with unpredictable but not good consequences.

- Show whole-row variables safely when printing views or rules (Abbas Butt, Tom Lane)

  Corner cases involving ambiguous names (that is, the name could be either a table or column name of the query) were printed in an ambiguous way, risking that the view or rule would be interpreted differently after dump and reload. Avoid the ambiguous case by attaching a no-op cast.

- Fix COPY FROM to properly handle null marker strings that correspond to invalid encoding (Tom Lane)

  A null marker string such as E'\0' should work, and did work in the past, but the case got broken in 8.4.

- Ensure autovacuum worker processes perform stack depth checking properly (Heikki Linnakangas)

  Previously, infinite recursion in a function invoked by auto-Analyze could crash worker processes.

- Fix logging collector to not lose log coherency under high load (Andrew Dunstan)

  The collector previously could fail to reassemble large messages if it got too busy.

- Fix logging collector to ensure it will restart file rotation after receiving SIGHUP (Tom Lane)

- Fix WAL replay logic for GIN indexes to not fail if the index was subsequently dropped (Tom Lane)
• Fix memory leak in PL/pgSQL’s \texttt{RETURN NEXT} command (Joe Conway)
• Fix PL/pgSQL’s \texttt{GET DIAGNOSTICS} command when the target is the function’s first variable (Tom Lane)
• Fix potential access off the end of memory in \texttt{psql’s} expanded display (\texttt{\textbackslash x}) mode (Peter Eisentraut)
• Fix several performance problems in \texttt{pg_dump} when the database contains many objects (Jeff Janes, Tom Lane)
  \texttt{pg_dump} could get very slow if the database contained many schemas, or if many objects are in dependency loops, or if there are many owned sequences.
• Fix \texttt{pg_upgrade} for the case that a database stored in a non-default tablespace contains a table in the cluster’s default tablespace (Bruce Momjian)
• In \texttt{ecpg}, fix rare memory leaks and possible overwrite of one byte after the \texttt{sqlca_t} structure (Peter Eisentraut)
• Fix \texttt{contrib/dblink’s} \texttt{dblink_exec()} to not leak temporary database connections upon error (Tom Lane)
• Fix \texttt{contrib/dblink} to report the correct connection name in error messages (Kyotaro Horiguchi)
• Fix \texttt{contrib/vacuumlo} to use multiple transactions when dropping many large objects (Tim Lewis, Robert Haas, Tom Lane)
  This change avoids exceeding \texttt{max_locks_per_transaction} when many objects need to be dropped. The behavior can be adjusted with the new \texttt{-l} (limit) option.
• Update time zone data files to \texttt{tzdata} release 2012c for DST law changes in Antarctica, Armenia, Chile, Cuba, Falkland Islands, Gaza, Haiti, Hebron, Morocco, Syria, and Tokelau Islands; also historical corrections for Canada.

\section*{E.142. Release 9.0.7}
\textbf{Release date:} 2012-02-27

This release contains a variety of fixes from 9.0.6. For information about new features in the 9.0 major release, see Section E.149.

\subsection*{E.142.1. Migration to Version 9.0.7}
A dump/restore is not required for those running 9.0.X.

However, if you are upgrading from a version earlier than 9.0.6, see Section E.143.

\subsection*{E.142.2. Changes}

• Require execute permission on the trigger function for \texttt{CREATE TRIGGER} (Robert Haas)
This missing check could allow another user to execute a trigger function with forged input data, by installing it on a table he owns. This is only of significance for trigger functions marked `SECURITY DEFINER`, since otherwise trigger functions run as the table owner anyway. (CVE-2012-0866)

- **Remove arbitrary limitation on length of common name in SSL certificates** (Heikki Linnakangas)
  Both libpq and the server truncated the common name extracted from an SSL certificate at 32 bytes. Normally this would cause nothing worse than an unexpected verification failure, but there are some rather-implausible scenarios in which it might allow one certificate holder to impersonate another. The victim would have to have a common name exactly 32 bytes long, and the attacker would have to persuade a trusted CA to issue a certificate in which the common name has that string as a prefix. Impersonating a server would also require some additional exploit to redirect client connections. (CVE-2012-0867)

- **Convert newlines to spaces in names written in pg_dump comments** (Robert Haas)
  pg_dump was incautious about sanitizing object names that are emitted within SQL comments in its output script. A name containing a newline would at least render the script syntactically incorrect. Maliciously crafted object names could present a SQL injection risk when the script is reloaded. (CVE-2012-0868)

- **Fix btree index corruption from insertions concurrent with vacuuming** (Tom Lane)
  An index page split caused by an insertion could sometimes cause a concurrently-running `VACUUM` to miss removing index entries that it should remove. After the corresponding table rows are removed, the dangling index entries would cause errors (such as “could not read block N in file ...”) or worse, silently wrong query results after unrelated rows are re-inserted at the now-free table locations. This bug has been present since release 8.2, but occurs so infrequently that it was not diagnosed until now. If you have reason to suspect that it has happened in your database, reindexing the affected index will fix things.

- **Fix transient zeroing of shared buffers during WAL replay** (Tom Lane)
  The replay logic would sometimes zero and refill a shared buffer, so that the contents were transiently invalid. In hot standby mode this can result in a query that’s executing in parallel seeing garbage data. Various symptoms could result from that, but the most common one seems to be “invalid memory alloc request size”.

- **Fix postmaster to attempt restart after a hot-standby crash** (Tom Lane)
  A logic error caused the postmaster to terminate, rather than attempt to restart the cluster, if any backend process crashed in hot standby mode.

- **Fix `CLUSTER/VACUUM FULL` handling of toast values owned by recently-updated rows** (Tom Lane)
  This oversight could lead to “duplicate key value violates unique constraint” errors being reported against the toast table’s index during one of these commands.

- **Update per-column permissions, not only per-table permissions, when changing table owner** (Tom Lane)
  Failure to do this meant that any previously granted column permissions were still shown as having been granted by the old owner. This meant that neither the new owner nor a superuser could revoke the now-untraceable-to-table-owner permissions.

- **Support foreign data wrappers and foreign servers in `REASSIGN OWNED`** (Alvaro Herrera)
Appendix E. Release Notes

This command failed with “unexpected classid” errors if it needed to change the ownership of any such objects.

- Allow non-existent values for some settings in ALTER USER/DATABASE SET (Heikki Linnakangas)
  
  Allow default_text_search_config, default_tablespace, and temp_tablespaces to be set to names that are not known. This is because they might be known in another database where the setting is intended to be used, or for the tablespace cases because the tablespace might not be created yet. The same issue was previously recognized for search_path, and these settings now act like that one.

- Avoid crashing when we have problems deleting table files post-commit (Tom Lane)
  
  Dropping a table should lead to deleting the underlying disk files only after the transaction commits. In event of failure then (for instance, because of wrong file permissions) the code is supposed to just emit a warning message and go on, since it’s too late to abort the transaction. This logic got broken as of release 8.4, causing such situations to result in a PANIC and an unrestartable database.

- Recover from errors occurring during WAL replay of DROP TABLESPACE (Tom Lane)
  
  Replay will attempt to remove the tablespace’s directories, but there are various reasons why this might fail (for example, incorrect ownership or permissions on those directories). Formerly the replay code would panic, rendering the database unrestartable without manual intervention. It seems better to log the problem and continue, since the only consequence of failure to remove the directories is some wasted disk space.

- Fix race condition in logging AccessExclusiveLocks for hot standby (Simon Riggs)
  
  Sometimes a lock would be logged as being held by “transaction zero”. This is at least known to produce assertion failures on slave servers, and might be the cause of more serious problems.

- Track the OID counter correctly during WAL replay, even when it wraps around (Tom Lane)
  
  Previously the OID counter would remain stuck at a high value until the system exited replay mode. The practical consequences of that are usually nil, but there are scenarios wherein a standby server that’s been promoted to master might take a long time to advance the OID counter to a reasonable value once values are needed.

- Prevent emitting misleading “consistent recovery state reached” log message at the beginning of crash recovery (Heikki Linnakangas)

- Fix initial value of pg_stat_replication.replay_location (Fujii Masao)
  
  Previously, the value shown would be wrong until at least one WAL record had been replayed.

- Fix regular expression back-references with * attached (Tom Lane)
  
  Rather than enforcing an exact string match, the code would effectively accept any string that satisfies the pattern sub-expression referenced by the back-reference symbol.
  
  A similar problem still afflicts back-references that are embedded in a larger quantified expression, rather than being the immediate subject of the quantifier. This will be addressed in a future PostgreSQL release.

- Fix recently-introduced memory leak in processing of inet/cidr values (Heikki Linnakangas)
  
  A patch in the December 2011 releases of PostgreSQL caused memory leakage in these operations, which could be significant in scenarios such as building a btree index on such a column.

- Fix dangling pointer after CREATE TABLE AS/SELECT INTO in a SQL-language function (Tom Lane)
In most cases this only led to an assertion failure in assert-enabled builds, but worse consequences seem possible.

- Avoid double close of file handle in syslogger on Windows (MauMau)
  Ordinarily this error was invisible, but it would cause an exception when running on a debug version of Windows.

- Fix I/O-conversion-related memory leaks in plpgsql (Andres Freund, Jan Urbanski, Tom Lane)
  Certain operations would leak memory until the end of the current function.

- Improve pg_dump’s handling of inherited table columns (Tom Lane)
  pg_dump mishandled situations where a child column has a different default expression than its parent column. If the default is textually identical to the parent’s default, but not actually the same (for instance, because of schema search path differences) it would not be recognized as different, so that after dump and restore the child would be allowed to inherit the parent’s default. Child columns that are NOT NULL where their parent is not could also be restored subtly incorrectly.

- Fix pg_restore’s direct-to-database mode for INSERT-style table data (Tom Lane)
  Direct-to-database restores from archive files made with --inserts or --column-inserts options fail when using pg_restore from a release dated September or December 2011, as a result of an oversight in a fix for another problem. The archive file itself is not at fault, and text-mode output is okay.

- Allow pg_upgrade to process tables containing regclass columns (Bruce Momjian)
  Since pg_upgrade now takes care to preserve pg_class OIDs, there was no longer any reason for this restriction.

- Make libpq ignore ENOTDIR errors when looking for an SSL client certificate file (Magnus Hagander)
  This allows SSL connections to be established, though without a certificate, even when the user’s home directory is set to something like /dev/null.

- Fix some more field alignment issues in ecpg’s SQLDA area (Zoltan Boszormenyi)

- Allow AT option in ecpg DEALLOCATE statements (Michael Meskes)
  The infrastructure to support this has been there for awhile, but through an oversight there was still an error check rejecting the case.

- Do not use the variable name when defining a varchar structure in ecpg (Michael Meskes)

- Fix contrib/auto_explain’s JSON output mode to produce valid JSON (Andrew Dunstan)
  The output used brackets at the top level, when it should have used braces.

- Fix error in contrib/intarray’s int[] & int[] operator (Guillaume Lelarge)
  If the smallest integer the two input arrays have in common is 1, and there are smaller values in either array, then 1 would be incorrectly omitted from the result.

- Fix error detection in contrib/pgcrypto’s encrypt_iv() and decrypt_iv() (Marko Kreen)
  These functions failed to report certain types of invalid-input errors, and would instead return random garbage values for incorrect input.

- Fix one-byte buffer overrun in contrib/test_parser (Paul Guyot)
The code would try to read one more byte than it should, which would crash in corner cases. Since `contrib/test_parser` is only example code, this is not a security issue in itself, but bad example code is still bad.

- Use `__sync_lock_test_and_set()` for spinlocks on ARM, if available (Martin Pitt)
  
  This function replaces our previous use of the `SWPB` instruction, which is deprecated and not available on ARMv6 and later. Reports suggest that the old code doesn’t fail in an obvious way on recent ARM boards, but simply doesn’t interlock concurrent accesses, leading to bizarre failures in multiprocess operation.

- Use `-fexcess-precision=standard` option when building with gcc versions that accept it (Andrew Dunstan)
  
  This prevents assorted scenarios wherein recent versions of gcc will produce creative results.

- Allow use of threaded Python on FreeBSD (Chris Rees)
  
  Our configure script previously believed that this combination wouldn’t work; but FreeBSD fixed the problem, so remove that error check.

### E.143. Release 9.0.6

**Release date:** 2011-12-05

This release contains a variety of fixes from 9.0.5. For information about new features in the 9.0 major release, see Section E.149.

#### E.143.1. Migration to Version 9.0.6

A dump/restore is not required for those running 9.0.X.

However, a longstanding error was discovered in the definition of the `information_schema.referential_constraints` view. If you rely on correct results from that view, you should replace its definition as explained in the first changelog item below.

Also, if you are upgrading from a version earlier than 9.0.4, see Section E.145.

#### E.143.2. Changes

- Fix bugs in `information_schema.referential_constraints` view (Tom Lane)

  This view was being insufficiently careful about matching the foreign-key constraint to the depended-on primary or unique key constraint. That could result in failure to show a foreign key constraint at all, or showing it multiple times, or claiming that it depends on a different constraint than the one it really does.

  Since the view definition is installed by `initdb`, merely upgrading will not fix the problem. If you need to fix this in an existing installation, you can (as a superuser) drop the `information_schema` schema.
Appendix E. Release Notes

then re-create it by sourcing `SHAREDIR/information_schema.sql`. (Run `pg_config --sharedir` if you’re uncertain where `SHAREDIR` is.) This must be repeated in each database to be fixed.

- Fix possible crash during UPDATE or DELETE that joins to the output of a scalar-returning function (Tom Lane)
  
  A crash could only occur if the target row had been concurrently updated, so this problem surfaced only intermittently.

- Fix incorrect replay of WAL records for GIN index updates (Tom Lane)
  
  This could result in transiently failing to find index entries after a crash, or on a hot-standby server. The problem would be repaired by the next VACUUM of the index, however.

- Fix TOAST-related data corruption during CREATE TABLE dest AS SELECT * FROM src or INSERT INTO dest SELECT * FROM src (Tom Lane)
  
  If a table has been modified by ALTER TABLE ADD COLUMN, attempts to copy its data verbatim to another table could produce corrupt results in certain corner cases. The problem can only manifest in this precise form in 8.4 and later, but we patched earlier versions as well in case there are other code paths that could trigger the same bug.

- Fix possible failures during hot standby startup (Simon Riggs)

- Start hot standby faster when initial snapshot is incomplete (Simon Riggs)

- Fix race condition during toast table access from stale syscache entries (Tom Lane)
  
  The typical symptom was transient errors like “missing chunk number 0 for toast value NNNNN in pg_toast_2619”, where the cited toast table would always belong to a system catalog.

- Track dependencies of functions on items used in parameter default expressions (Tom Lane)
  
  Previously, a referenced object could be dropped without having dropped or modified the function, leading to misbehavior when the function was used. Note that merely installing this update will not fix the missing dependency entries; to do that, you’d need to CREATE OR REPLACE each such function afterwards. If you have functions whose defaults depend on non-built-in objects, doing so is recommended.

- Allow inlining of set-returning SQL functions with multiple OUT parameters (Tom Lane)

- Don’t trust deferred-unique indexes for join removal (Tom Lane and Marti Raudsepp)
  
  A deferred uniqueness constraint might not hold intra-transaction, so assuming that it does could give incorrect query results.

- Make DatumGetInetP() unpack inet datums that have a 1-byte header, and add a new macro, DatumGetInetPP(), that does not (Heikki Linnakangas)
  
  This change affects no core code, but might prevent crashes in add-on code that expects DatumGetInetP() to produce an unpacked datum as per usual convention.

- Improve locale support in money type’s input and output (Tom Lane)
  
  Aside from not supporting all standard `lc_monetary` formatting options, the input and output functions were inconsistent, meaning there were locales in which dumped money values could not be re-read.

- Don’t let transform_null_equals affect CASE foo WHEN NULL ... constructs (Heikki Linnakangas)
Appendix E. Release Notes

**transform_null_equals** is only supposed to affect `foo = NULL` expressions written directly by the user, not equality checks generated internally by this form of **CASE**.

- Change foreign-key trigger creation order to better support self-referential foreign keys (Tom Lane)
  
  For a cascading foreign key that references its own table, a row update will fire both the **ON UPDATE** trigger and the **CHECK** trigger as one event. The **ON UPDATE** trigger must execute first, else the **CHECK** will check a non-final state of the row and possibly throw an inappropriate error. However, the firing order of these triggers is determined by their names, which generally sort in creation order since the triggers have auto-generated names following the convention “RI_ConstraintTrigger_NNNN”. A proper fix would require modifying that convention, which we will do in 9.2, but it seems risky to change it in existing releases. So this patch just changes the creation order of the triggers. Users encountering this type of error should drop and re-create the foreign key constraint to get its triggers into the right order.

- Avoid floating-point underflow while tracking buffer allocation rate (Greg Matthews)
  
  While harmless in itself, on certain platforms this would result in annoying kernel log messages.

- Preserve configuration file name and line number values when starting child processes under Windows (Tom Lane)
  
  Formerly, these would not be displayed correctly in the **pg_settings** view.

- Fix incorrect field alignment in ecpg’s SQLDA area (Zoltan Boszormenyi)

- Preserve blank lines within commands in psql’s command history (Robert Haas)
  
  The former behavior could cause problems if an empty line was removed from within a string literal, for example.

- Fix **pg_dump** to dump user-defined casts between auto-generated types, such as table rowtypes (Tom Lane)

- Assorted fixes for **pg_upgrade** (Bruce Momjian)
  
  Handle exclusion constraints correctly, avoid failures on Windows, don’t complain about mismatched toast table names in 8.4 databases.

- Use the preferred version of xsubpp to build PL/Perl, not necessarily the operating system’s main copy (David Wheeler and Alex Hunsaker)

- Fix incorrect coding in **contrib/dict_int** and **contrib/dict_xsyn** (Tom Lane)
  
  Some functions incorrectly assumed that memory returned by **palloc()** is guaranteed zeroed.

- Fix assorted errors in **contrib/unaccent**’s configuration file parsing (Tom Lane)

- Honor query cancel interrupts promptly in **pgstatindex()** (Robert Haas)

- Fix incorrect quoting of log file name in Mac OS X start script (Sidar Lopez)

- Ensure VPATH builds properly install all server header files (Peter Eisentraut)

- Shorten file names reported in verbose error messages (Peter Eisentraut)
  
  Regular builds have always reported just the name of the C file containing the error message call, but VPATH builds formerly reported an absolute path name.

- Fix interpretation of Windows timezone names for Central America (Tom Lane)
Map “Central America Standard Time” to CST, not CSTCDT, because DST is generally not observed anywhere in Central America.

- Update time zone data files to tzdata release 2011n for DST law changes in Brazil, Cuba, Fiji, Palestine, Russia, and Samoa; also historical corrections for Alaska and British East Africa.

**E.144. Release 9.0.5**

**Release date:** 2011-09-26

This release contains a variety of fixes from 9.0.4. For information about new features in the 9.0 major release, see Section E.149.

**E.144.1. Migration to Version 9.0.5**

A dump/restore is not required for those running 9.0.X.

However, if you are upgrading from a version earlier than 9.0.4, see Section E.145.

**E.144.2. Changes**

- **Fix catalog cache invalidation after a VACUUM FULL or CLUSTER on a system catalog (Tom Lane)**
  In some cases the relocation of a system catalog row to another place would not be recognized by concurrent server processes, allowing catalog corruption to occur if they then tried to update that row. The worst-case outcome could be as bad as complete loss of a table.

- **Fix incorrect order of operations during sinval reset processing, and ensure that TOAST OIDs are preserved in system catalogs (Tom Lane)**
  These mistakes could lead to transient failures after a VACUUM FULL or CLUSTER on a system catalog.

- **Fix bugs in indexing of in-doubt HOT-updated tuples (Tom Lane)**
  These bugs could result in index corruption after reindexing a system catalog. They are not believed to affect user indexes.

- **Fix multiple bugs in GiST index page split processing (Heikki Linnakangas)**
  The probability of occurrence was low, but these could lead to index corruption.

- **Fix possible buffer overrun in tsvector_concat() (Tom Lane)**
  The function could underestimate the amount of memory needed for its result, leading to server crashes.

- **Fix crash in xml_recv when processing a “standalone” parameter (Tom Lane)**

- **Make pg_options_to_table return NULL for an option with no value (Tom Lane)**
  Previously such cases would result in a server crash.

- **Avoid possibly accessing off the end of memory in ANALYZE and in SJIS-2004 encoding conversion (Noah Misch)**
This fixes some very-low-probability server crash scenarios.

- Protect `pg_stat_reset_shared()` against NULL input (Magnus Hagander)
- Fix possible failure when a recovery conflict deadlock is detected within a sub-transaction (Tom Lane)
- Avoid spurious conflicts while recycling btree index pages during hot standby (Noah Misch, Simon Riggs)
- Shut down WAL receiver if it’s still running at end of recovery (Heikki Linnakangas)
  The postmaster formerly panicked in this situation, but it’s actually a legitimate case.
- Fix race condition in relcache init file invalidation (Tom Lane)
  There was a window wherein a new backend process could read a stale init file but miss the inval messages that would tell it the data is stale. The result would be bizarre failures in catalog accesses, typically “could not read block 0 in file ...” later during startup.
- Fix memory leak at end of a GiST index scan (Tom Lane)
  Commands that perform many separate GiST index scans, such as verification of a new GiST-based exclusion constraint on a table already containing many rows, could transiently require large amounts of memory due to this leak.
- Fix memory leak when encoding conversion has to be done on incoming command strings and `LISTEN` is active (Tom Lane)
- Fix incorrect memory accounting (leading to possible memory bloat) in tuplestores supporting holdable cursors and plpgsql’s `RETURN NEXT` command (Tom Lane)
- Fix trigger `WHEN` conditions when both `BEFORE` and `AFTER` triggers exist (Tom Lane)
  Evaluation of `WHEN` conditions for `AFTER ROW UPDATE` triggers could crash if there had been a `BEFORE ROW trigger fired for the same update.`
- Fix performance problem when constructing a large, lossy bitmap (Tom Lane)
- Fix join selectivity estimation for unique columns (Tom Lane)
  This fixes an erroneous planner heuristic that could lead to poor estimates of the result size of a join.
- Fix nested `PlaceholderVar` expressions that appear only in sub-select target lists (Tom Lane)
  This mistake could result in outputs of an outer join incorrectly appearing as NULL.
- Allow the planner to assume that empty parent tables really are empty (Tom Lane)
  Normally an empty table is assumed to have a certain minimum size for planning purposes; but this heuristic seems to do more harm than good for the parent table of an inheritance hierarchy, which often is permanently empty.
- Allow nested `EXISTS` queries to be optimized properly (Tom Lane)
- Fix array- and path-creating functions to ensure padding bytes are zeroes (Tom Lane)
  This avoids some situations where the planner will think that semantically-equal constants are not equal, resulting in poor optimization.
- Fix `EXPLAIN` to handle gating Result nodes within inner-indexscan subplans (Tom Lane)
  The usual symptom of this oversight was “bogus varno” errors.
- Fix btree preprocessing of `indexedcol IS NULL` conditions (Dean Rasheed)
Appendix E. Release Notes

Such a condition is unsatisfiable if combined with any other type of btree-indexable condition on the same index column. The case was handled incorrectly in 9.0.0 and later, leading to query output where there should be none.

- Work around gcc 4.6.0 bug that breaks WAL replay (Tom Lane)
  This could lead to loss of committed transactions after a server crash.

- Fix dump bug for VALUES in a view (Tom Lane)

- Disallow SELECT FOR UPDATE/SHARE on sequences (Tom Lane)
  This operation doesn’t work as expected and can lead to failures.

- Fix VACUUM so that it always updates pg_class.reltuples/relpages (Tom Lane)
  This fixes some scenarios where autovacuum could make increasingly poor decisions about when to vacuum tables.

- Defend against integer overflow when computing size of a hash table (Tom Lane)

- Fix cases where CLUSTER might attempt to access already-removed TOAST data (Tom Lane)

- Fix premature timeout failures during initial authentication transaction (Tom Lane)

- Fix portability bugs in use of credentials control messages for “peer” authentication (Tom Lane)

- Fix SSPI login when multiple roundtrips are required (Ahmed Shinwari, Magnus Hagander)
  The typical symptom of this problem was “The function requested is not supported” errors during SSPI login.

- Fix failure when adding a new variable of a custom variable class to postgresql.conf (Tom Lane)

- Throw an error if pg_hba.conf contains hostssl but SSL is disabled (Tom Lane)
  This was concluded to be more user-friendly than the previous behavior of silently ignoring such lines.

- Fix failure when DROP OWNED BY attempts to remove default privileges on sequences (Shigeru Hanada)

- Fix typo in pg_srand48 seed initialization (Andres Freund)
  This led to failure to use all bits of the provided seed. This function is not used on most platforms (only those without srand), and the potential security exposure from a less-random-than-expected seed seems minimal in any case.

- Avoid integer overflow when the sum of LIMIT and OFFSET values exceeds 2^63 (Heikki Linnakangas)

- Add overflow checks to int4 and int8 versions of generate_series() (Robert Haas)

- Fix trailing-zero removal in to_char() (Marti Raudsepp)
  In a format with FM and no digit positions after the decimal point, zeroes to the left of the decimal point could be removed incorrectly.

- Fix pg_size_pretty() to avoid overflow for inputs close to 2^63 (Tom Lane)

- Weaken plpgsql’s check for typmod matching in record values (Tom Lane)
  An overly enthusiastic check could lead to discarding length modifiers that should have been kept.

- Correctly handle quotes in locale names during initdb (Heikki Linnakangas)
  The case can arise with some Windows locales, such as “People’s Republic of China”.

2887
In pg_upgrade, avoid dumping orphaned temporary tables (Bruce Momjian)
This prevents situations wherein table OID assignments could get out of sync between old and new installations.

Fix pg_upgrade to preserve toast tables’ relfrozenxids during an upgrade from 8.3 (Bruce Momjian)
Failure to do this could lead to pg_clog files being removed too soon after the upgrade.

In pg_upgrade, fix the -l (log) option to work on Windows (Bruce Momjian)

In pg_ctl, support silent mode for service registrations on Windows (MauMau)

Fix psql’s counting of script file line numbers during COPY from a different file (Tom Lane)

Fix pg_restore’s direct-to-database mode for standard_conforming_strings (Tom Lane)
pg_restore could emit incorrect commands when restoring directly to a database server from an archive file that had been made with standard_conforming_strings set to on.

Be more user-friendly about unsupported cases for parallel pg_restore (Tom Lane)
This change ensures that such cases are detected and reported before any restore actions have been taken.

Fix write-past-buffer-end and memory leak in libpq’s LDAP service lookup code (Albe Laurenz)

In libpq, avoid failures when using nonblocking I/O and an SSL connection (Martin Pihlak, Tom Lane)

Improve libpq’s handling of failures during connection startup (Tom Lane)
In particular, the response to a server report of fork() failure during SSL connection startup is now saner.

Improve libpq’s error reporting for SSL failures (Tom Lane)

Fix PQsetvalue() to avoid possible crash when adding a new tuple to a PGresult originally obtained from a server query (Andrew Chernow)

Make ecpglib write double values with 15 digits precision (Akira Kurosawa)

In ecpglib, be sure LC_NUMERIC setting is restored after an error (Michael Meskes)

Apply upstream fix for blowfish signed-character bug (CVE-2011-2483) (Tom Lane)
contrib/pg_crypto’s blowfish encryption code could give wrong results on platforms where char is signed (which is most), leading to encrypted passwords being weaker than they should be.

Fix memory leak in contrib/seg (Heikki Linnakangas)

Fix pgstatindex() to give consistent results for empty indexes (Tom Lane)

Allow building with perl 5.14 (Alex Hunsaker)

Fix assorted issues with build and install file paths containing spaces (Tom Lane)

Update time zone data files to tzdata release 2011i for DST law changes in Canada, Egypt, Russia, Samoa, and South Sudan.
E.145. Release 9.0.4

Release date: 2011-04-18

This release contains a variety of fixes from 9.0.3. For information about new features in the 9.0 major release, see Section E.149.

E.145.1. Migration to Version 9.0.4

A dump/restore is not required for those running 9.0.X. However, if your installation was upgraded from a previous major release by running pg_upgrade, you should take action to prevent possible data loss due to a now-fixed bug in pg_upgrade. The recommended solution is to run VACUUM FREEZE on all TOAST tables. More information is available at http://wiki.postgresql.org/wiki/20110408pg_upgrade_fix.

E.145.2. Changes

• Fix pg_upgrade's handling of TOAST tables (Bruce Momjian)

  The pg_class.relrofzenxid value for TOAST tables was not correctly copied into the new installation during pg_upgrade. This could later result in pg_clog files being discarded while they were still needed to validate tuples in the TOAST tables, leading to “could not access status of transaction” failures.

  This error poses a significant risk of data loss for installations that have been upgraded with pg_upgrade. This patch corrects the problem for future uses of pg_upgrade, but does not in itself cure the issue in installations that have been processed with a buggy version of pg_upgrade.

• Suppress incorrect “PD_ALL_VISIBLE flag was incorrectly set” warning (Heikki Linnakangas)

  VACUUM would sometimes issue this warning in cases that are actually valid.

• Use better SQLSTATE error codes for hot standby conflict cases (Tatsuo Ishii and Simon Riggs)

  All retryable conflict errors now have an error code that indicates that a retry is possible. Also, session closure due to the database being dropped on the master is now reported as ERRCODE_DATABASE_DROPPED, rather than ERRCODE_ADMIN_SHUTDOWN, so that connection poolers can handle the situation correctly.

• Prevent intermittent hang in interactions of startup process with bgwriter process (Simon Riggs)

  This affected recovery in non-hot-standby cases.

• Disallow including a composite type in itself (Tom Lane)

  This prevents scenarios wherein the server could recurse infinitely while processing the composite type. While there are some possible uses for such a structure, they don’t seem compelling enough to justify the effort required to make sure it always works safely.

• Avoid potential deadlock during catalog cache initialization (Nikhil Sontakke)

In some cases the cache loading code would acquire share lock on a system index before locking the index’s catalog. This could deadlock against processes trying to acquire exclusive locks in the other, more standard order.

- Fix dangling-pointer problem in `BEFORE ROW UPDATE` trigger handling when there was a concurrent update to the target tuple (Tom Lane)

This bug has been observed to result in intermittent “cannot extract system attribute from virtual tuple” failures while trying to do `UPDATE RETURNING ctid`. There is a very small probability of more serious errors, such as generating incorrect index entries for the updated tuple.

- Disallow `DROP TABLE` when there are pending deferred trigger events for the table (Tom Lane)

Formerly the `DROP` would go through, leading to “could not open relation with OID nnn” errors when the triggers were eventually fired.

- Allow “replication” as a user name in `pg_hba.conf` (Andrew Dunstan)

“replication” is special in the database name column, but it was mistakenly also treated as special in the user name column.

- Prevent crash triggered by constant-false WHERE conditions during GEQO optimization (Tom Lane)

- Improve planner’s handling of semi-join and anti-join cases (Tom Lane)

- Fix handling of `SELECT FOR UPDATE` in a sub-SELECT (Tom Lane)

  This bug typically led to “cannot extract system attribute from virtual tuple” errors.

- Fix selectivity estimation for text search to account for NULLs (Jesper Krogh)

- Fix `get_actual_variable_range()` to support hypothetical indexes injected by an index adviser plugin (Gurjeet Singh)

- Fix PL/Python memory leak involving array slices (Daniel Popowich)

- Allow `libpq`’s SSL initialization to succeed when user’s home directory is unavailable (Tom Lane)

  If the SSL mode is such that a root certificate file is not required, there is no need to fail. This change restores the behavior to what it was in pre-9.0 releases.

- Fix `libpq` to return a useful error message for errors detected in `conninfo_array_parse` (Joseph Adams)

  A typo caused the library to return NULL, rather than the `PGconn` structure containing the error message, to the application.

- Fix ecpg preprocessor’s handling of float constants (Heikki Linnakangas)

- Fix parallel `pg_restore` to handle comments on POST_DATA items correctly (Arnd Hannemann)

- Fix `pg_restore` to cope with long lines (over 1KB) in TOC files (Tom Lane)

- Put in more safeguards against crashing due to division-by-zero with overly enthusiastic compiler optimization (Aurelien Jarno)

- Support use of `dlopen()` in FreeBSD and OpenBSD on MIPS (Tom Lane)

  There was a hard-wired assumption that this system function was not available on MIPS hardware on these systems. Use a compile-time test instead, since more recent versions have it.

- Fix compilation failures on HP-UX (Heikki Linnakangas)
Appendix E. Release Notes

• Avoid crash when trying to write to the Windows console very early in process startup (Rushabh Lathia)
• Support building with MinGW 64 bit compiler for Windows (Andrew Dunstan)
• Fix version-incompatibility problem with libintl on Windows (Hiroshi Inoue)
• Fix usage of xcopy in Windows build scripts to work correctly under Windows 7 (Andrew Dunstan)
  This affects the build scripts only, not installation or usage.
• Fix path separator used by pg_regress on Cygwin (Andrew Dunstan)
• Update time zone data files to tzdata release 2011f for DST law changes in Chile, Cuba, Falkland Islands, Morocco, Samoa, and Turkey; also historical corrections for South Australia, Alaska, and Hawaii.

E.146. Release 9.0.3

Release date: 2011-01-31

This release contains a variety of fixes from 9.0.2. For information about new features in the 9.0 major release, see Section E.149.

E.146.1. Migration to Version 9.0.3

A dump/restore is not required for those running 9.0.X.

E.146.2. Changes

• Before exiting walreceiver, ensure all the received WAL is fsync’d to disk (Heikki Linnakangas)
  Otherwise the standby server could replay some un-synced WAL, conceivably leading to data corruption if the system crashes just at that point.
• Avoid excess fsync activity in walreceiver (Heikki Linnakangas)
• Make ALTER TABLE revalidate uniqueness and exclusion constraints when needed (Noah Misch)
  This was broken in 9.0 by a change that was intended to suppress revalidation during VACUUM FULL and CLUSTER, but unintentionally affected ALTER TABLE as well.
• Fix EvalPlanQual for UPDATE of an inheritance tree in which the tables are not all alike (Tom Lane)
  Any variation in the table row types (including dropped columns present in only some child tables) would confuse the EvalPlanQual code, leading to misbehavior or even crashes. Since EvalPlanQual is only executed during concurrent updates to the same row, the problem was only seen intermittently.
• Avoid failures when EXPLAIN tries to display a simple-form CASE expression (Tom Lane)
  If the CASE’s test expression was a constant, the planner could simplify the CASE into a form that confused the expression-display code, resulting in “unexpected CASE WHEN clause” errors.
• Fix assignment to an array slice that is before the existing range of subscripts (Tom Lane)
Appendix E. Release Notes

If there was a gap between the newly added subscripts and the first pre-existing subscript, the code miscalculated how many entries needed to be copied from the old array’s null bitmap, potentially leading to data corruption or crash.

- Avoid unexpected conversion overflow in planner for very distant date values (Tom Lane)
  The date type supports a wider range of dates than can be represented by the timestamp types, but the planner assumed it could always convert a date to timestamp with impunity.

- Fix PL/Python crash when an array contains null entries (Alex Hunsaker)

- Remove ecpg's fixed length limit for constants defining an array dimension (Michael Meskes)

- Fix erroneous parsing of tsquery values containing ... & !(subexpression) | ... (Tom Lane)
  Queries containing this combination of operators were not executed correctly. The same error existed in contrib/intarray's query_int type and contrib/ltree's ltxtquery type.

- Fix buffer overrun in contrib/intarray's input function for the query_int type (Apple)
  This bug is a security risk since the function’s return address could be overwritten. Thanks to Apple Inc’s security team for reporting this issue and supplying the fix. (CVE-2010-4015)

- Fix bug in contrib/seg's GiST picksplit algorithm (Alexander Korotkov)
  This could result in considerable inefficiency, though not actually incorrect answers, in a GiST index on a seg column. If you have such an index, consider REINDEXing it after installing this update. (This is identical to the bug that was fixed in contrib/cube in the previous update.)

E.147. Release 9.0.2

Release date: 2010-12-16

This release contains a variety of fixes from 9.0.1. For information about new features in the 9.0 major release, see Section E.149.

E.147.1. Migration to Version 9.0.2

A dump/restore is not required for those running 9.0.X.

E.147.2. Changes

- Force the default wal_sync_method to be fdatasync on Linux (Tom Lane, Marti Raudsepp)
  The default on Linux has actually been fdatasync for many years, but recent kernel changes caused PostgreSQL to choose open_datasync instead. This choice did not result in any performance improvement, and caused outright failures on certain filesystems, notably ext4 with the data=journal mount option.

- Fix “too many KnownAssignedXids” error during Hot Standby replay (Heikki Linnakangas)
• Fix race condition in lock acquisition during Hot Standby (Simon Riggs)
• Avoid unnecessary conflicts during Hot Standby (Simon Riggs)
  This fixes some cases where replay was considered to conflict with standby queries (causing delay of
  replay or possibly cancellation of the queries), but there was no real conflict.
• Fix assorted bugs in WAL replay logic for GIN indexes (Tom Lane)
  This could result in “bad buffer id: 0” failures or corruption of index contents during replication.
• Fix recovery from base backup when the starting checkpoint WAL record is not in the same WAL
  segment as its redo point (Jeff Davis)
• Fix corner-case bug when streaming replication is enabled immediately after creating the master
  database cluster (Heikki Linnakangas)
• Fix persistent slowdown of autovacuum workers when multiple workers remain active for a long time
  (Tom Lane)
  The effective vacuum_cost_limit for an autovacuum worker could drop to nearly zero if it processed
  enough tables, causing it to run extremely slowly.
• Fix long-term memory leak in autovacuum launcher (Alvaro Herrera)
• Avoid failure when trying to report an impending transaction wraparound condition from outside a
  transaction (Tom Lane)
  This oversight prevented recovery after transaction wraparound got too close, because database startup
  processing would fail.
• Add support for detecting register-stack overrun on IA64 (Tom Lane)
  The IA64 architecture has two hardware stacks. Full prevention of stack-overflow failures requires
  checking both.
• Add a check for stack overflow in copyObject() (Tom Lane)
  Certain code paths could crash due to stack overflow given a sufficiently complex query.
• Fix detection of page splits in temporary GiST indexes (Heikki Linnakangas)
  It is possible to have a “concurrent” page split in a temporary index, if for example there is an open
  cursor scanning the index when an insertion is done. GiST failed to detect this case and hence could
  deliver wrong results when execution of the cursor continued.
• Fix error checking during early connection processing (Tom Lane)
  The check for too many child processes was skipped in some cases, possibly leading to postmaster
  crash when attempting to add the new child process to fixed-size arrays.
• Improve efficiency of window functions (Tom Lane)
  Certain cases where a large number of tuples needed to be read in advance, but work_mem was large
  enough to allow them all to be held in memory, were unexpectedly slow. percent_rank(),
  cume_dist() and ntile() in particular were subject to this problem.
• Avoid memory leakage while ANALYZE’ing complex index expressions (Tom Lane)
• Ensure an index that uses a whole-row Var still depends on its table (Tom Lane)
  An index declared like create index i on t (foo(t.*)) would not automatically get dropped
  when its table was dropped.
Appendix E. Release Notes

- Add missing support in DROP OWNED BY for removing foreign data wrapper/server privileges belonging to a user (Heikki Linnakangas)
- Do not “inline” a SQL function with multiple OUT parameters (Tom Lane)
  This avoids a possible crash due to loss of information about the expected result rowtype.
- Fix crash when inline-ing a set-returning function whose argument list contains a reference to an inlineable user function (Tom Lane)
- Behave correctly if ORDER BY, LIMIT, FOR UPDATE, or WITH is attached to the VALUES part of INSERT ... VALUES (Tom Lane)
- Make the OFF keyword unreserved (Heikki Linnakangas)
  This prevents problems with using off as a variable name in PL/pgSQL. That worked before 9.0, but was now broken because PL/pgSQL now treats all core reserved words as reserved.
- Fix constant-folding of COALESCE() expressions (Tom Lane)
  The planner would sometimes attempt to evaluate sub-expressions that in fact could never be reached, possibly leading to unexpected errors.
- Fix “could not find pathkey item to sort” planner failure with comparison of whole-row Vars (Tom Lane)
- Fix postmaster crash when connection acceptance (accept() or one of the calls made immediately after it) fails, and the postmaster was compiled with GSSAPI support (Alexander Chernikov)
- Retry after receiving an invalid response packet from a RADIUS authentication server (Magnus Hagander)
  This fixes a low-risk potential denial of service condition.
- Fix missed unlink of temporary files when log_temp_files is active (Tom Lane)
  If an error occurred while attempting to emit the log message, the unlink was not done, resulting in accumulation of temp files.
- Add print functionality for InhRelation nodes (Tom Lane)
  This avoids a failure when debug_print_parse is enabled and certain types of query are executed.
- Fix incorrect calculation of distance from a point to a horizontal line segment (Tom Lane)
  This bug affected several different geometric distance-measurement operators.
- Fix incorrect calculation of transaction status in ecpg (Itagaki Takahiro)
- Fix errors in psql’s Unicode-escape support (Tom Lane)
- Speed up parallel pg_restore when the archive contains many large objects (blobs) (Tom Lane)
- Fix PL/pgSQL’s handling of “simple” expressions to not fail in recursion or error-recovery cases (Tom Lane)
- Fix PL/pgSQL’s error reporting for no-such-column cases (Tom Lane)
  As of 9.0, it would sometimes report “missing FROM-clause entry for table foo” when “record foo has no field bar” would be more appropriate.
- Fix PL/Python to honor typmod (i.e., length or precision restrictions) when assigning to tuple fields (Tom Lane)
Appendix E. Release Notes

This fixes a regression from 8.4.

• Fix PL/Python’s handling of set-returning functions (Jan Urbanski)
  Attempts to call SPI functions within the iterator generating a set result would fail.

• Fix bug in contrib/cube’s GiST picksplit algorithm (Alexander Korotkov)
  This could result in considerable inefficiency, though not actually incorrect answers, in a GiST index
  on a cube column. If you have such an index, consider REINDEXing it after installing this update.

• Don’t emit “identifier will be truncated” notices in contrib/dblink except when creating new con-
  nections (Itagaki Takahiro)

• Fix potential coredump on missing public key in contrib/pgcrypto (Marti Raudsepp)

• Fix buffer overrun in contrib/pg_upgrade (Hernan Gonzalez)

• Fix memory leak in contrib/xml2’s XPath query functions (Tom Lane)

• Update time zone data files to tzdata release 2010o for DST law changes in Fiji and Samoa; also
  historical corrections for Hong Kong.

E.148. Release 9.0.1

Release date: 2010-10-04

This release contains a variety of fixes from 9.0.0. For information about new features in the 9.0 major
release, see Section E.149.

E.148.1. Migration to Version 9.0.1

A dump/restore is not required for those running 9.0.X.

E.148.2. Changes

• Use a separate interpreter for each calling SQL userid in PL/Perl and PL/Tcl (Tom Lane)
  This change prevents security problems that can be caused by subverting Perl or Tcl code that will be
  executed later in the same session under another SQL user identity (for example, within a SECURITY
  DEFINER function). Most scripting languages offer numerous ways that that might be done, such as
  redefining standard functions or operators called by the target function. Without this change, any SQL
  user with Perl or Tcl language usage rights can do essentially anything with the SQL privileges of the
  target function’s owner.

  The cost of this change is that intentional communication among Perl and Tcl functions becomes more
difficult. To provide an escape hatch, PL/PerlU and PL/TclU functions continue to use only one inter-
preter per session. This is not considered a security issue since all such functions execute at the trust
level of a database superuser already.
It is likely that third-party procedural languages that claim to offer trusted execution have similar security issues. We advise contacting the authors of any PL you are depending on for security-critical purposes.

Our thanks to Tim Bunce for pointing out this issue (CVE-2010-3433).

- Improve `pg_get_expr()` security fix so that the function can still be used on the output of a sub-select (Tom Lane)
- Fix incorrect placement of placeholder evaluation (Tom Lane)
  This bug could result in query outputs being non-null when they should be null, in cases where the inner side of an outer join is a sub-select with non-strict expressions in its output list.
- Fix join removal’s handling of placeholder expressions (Tom Lane)
- Fix possible duplicate scans of `UNION ALL` member relations (Tom Lane)
- Prevent infinite loop in `ProcessIncomingNotify()` after unlistening (Jeff Davis)
- Prevent `show_session_authorization()` from crashing within autovacuum processes (Tom Lane)
- Re-allow input of Julian dates prior to 0001-01-01 AD (Tom Lane)
  Input such as `'J100000'::date` worked before 8.4, but was unintentionally broken by added error-checking.
- Make `psql` recognize `DISCARD ALL` as a command that should not be encased in a transaction block in autocommit-off mode (Itagaki Takahiro)
- Update build infrastructure and documentation to reflect the source code repository’s move from CVS to Git (Magnus Hagander and others)

### E.149. Release 9.0

**Release date:** 2010-09-20

#### E.149.1. Overview

This release of PostgreSQL adds features that have been requested for years, such as easy-to-use replication, a mass permission-changing facility, and anonymous code blocks. While past major releases have been conservative in their scope, this release shows a bold new desire to provide facilities that new and existing users of PostgreSQL will embrace. This has all been done with few incompatibilities. Major enhancements include:

- **Built-in replication based on log shipping.** This advance consists of two features: Streaming Replication, allowing continuous archive (WAL) files to be streamed over a network connection to a standby server, and Hot Standby, allowing continuous archive standby servers to execute read-only queries. The net effect is to support a single master with multiple read-only slave servers.

- **Easier database object permissions management.** `GRANT/REVOKE IN SCHEMA` supports mass permissions changes on existing objects, while `ALTER DEFAULT PRIVILEGES` allows control of privileges for objects created in the future. Large objects (BLOBs) now support permissions management as well.
• Broadly enhanced stored procedure support. The `DO` statement supports ad-hoc or “anonymous” code blocks. Functions can now be called using named parameters. PL/pgSQL is now installed by default, and PL/Perl and PL/Python have been enhanced in several ways, including support for Python3.

• Full support for 64-bit Windows.

• More advanced reporting queries, including additional windowing options (`PRECEDING` and `FOLLOWING`) and the ability to control the order in which values are fed to aggregate functions.

• New trigger features, including SQL-standard-compliant per-column triggers and conditional trigger execution.

• Deferrable unique constraints. Mass updates to unique keys are now possible without trickery.

• Exclusion constraints. These provide a generalized version of unique constraints, allowing enforcement of complex conditions.

• New and enhanced security features, including RADIUS authentication, LDAP authentication improvements, and a new contrib module `passwordcheck` for testing password strength.

• New high-performance implementation of the `LISTEN/NOTIFY` feature. Pending events are now stored in a memory-based queue rather than a table. Also, a “payload” string can be sent with each event, rather than transmitting just an event name as before.

• New implementation of `VACUUM FULL`. This command now rewrites the entire table and indexes, rather than moving individual rows to compact space. It is substantially faster in most cases, and no longer results in index bloat.

• New contrib module `pg_upgrade` to support in-place upgrades from 8.3 or 8.4 to 9.0.

• Multiple performance enhancements for specific types of queries, including elimination of unnecessary joins. This helps optimize some automatically-generated queries, such as those produced by object-relational mappers (ORMs).

• `EXPLAIN` enhancements. The output is now available in JSON, XML, or YAML format, and includes buffer utilization and other data not previously available.

• `hstore` improvements, including new functions and greater data capacity.

The above items are explained in more detail in the sections below.

**E.149.2. Migration to Version 9.0**

A dump/restore using `pg_dump`, or use of `pg_upgrade`, is required for those wishing to migrate data from any previous release.

Version 9.0 contains a number of changes that selectively break backwards compatibility in order to support new features and code quality improvements. In particular, users who make extensive use of PL/pgSQL, Point-In-Time Recovery (PITR), or Warm Standby should test their applications because of slight user-visible changes in those areas. Observe the following incompatibilities:

**E.149.2.1. Server Settings**

• Remove server parameter `add_missing_from`, which was defaulted to off for many years (Tom Lane)
Appendix E. Release Notes

• Remove server parameter `regex_flavor`, which was defaulted to `advanced` for many years (Tom Lane)

• `archive_mode` now only affects `archive_command`; a new setting, `wal_level`, affects the contents of the write-ahead log (Heikki Linnakangas)

• `log_temp_files` now uses default file size units of kilobytes (Robert Haas)

E.149.2.2. Queries

• When querying a parent table, do not do any separate permission checks on child tables scanned as part of the query (Peter Eisentraut)

  The SQL standard specifies this behavior, and it is also much more convenient in practice than the former behavior of checking permissions on each child as well as the parent.

E.149.2.3. Data Types

• `bytea` output now appears in hex format by default (Peter Eisentraut)

  The server parameter `bytea_output` can be used to select the traditional output format if needed for compatibility.

• Array input now considers only plain ASCII whitespace characters to be potentially ignorable; it will never ignore non-ASCII characters, even if they are whitespace according to some locales (Tom Lane)

  This avoids some corner cases where array values could be interpreted differently depending on the server's locale settings.

• Improve standards compliance of `SIMILAR TO` patterns and SQL-style `substring()` patterns (Tom Lane)

  This includes treating `?` and `{...}` as pattern metacharacters, while they were simple literal characters before; that corresponds to new features added in SQL:2008. Also, `^` and `$` are now treated as simple literal characters; formerly they were treated as metacharacters, as if the pattern were following POSIX rather than SQL rules. Also, in SQL-standard `substring()`, use of parentheses for nesting no longer interferes with capturing of a substring. Also, processing of bracket expressions (character classes) is now more standards-compliant.

• Reject negative length values in 3-parameter `substring()` for bit strings, per the SQL standard (Tom Lane)

• Make `date_trunc` truncate rather than round when reducing precision of fractional seconds (Tom Lane)

  The code always acted this way for integer-based dates/times. Now float-based dates/times behave similarly.
Appendix E. Release Notes

E.149.2.4. Object Renaming

- Tighten enforcement of column name consistency during RENAME when a child table inherits the same column from multiple unrelated parents (KaiGai Kohei)

- No longer automatically rename indexes and index columns when the underlying table columns are renamed (Tom Lane)

    Administrators can still rename such indexes and columns manually. This change will require an update of the JDBC driver, and possibly other drivers, so that unique indexes are correctly recognized after a rename.

- CREATE OR REPLACE FUNCTION can no longer change the declared names of function parameters (Pavel Stehule)

    In order to avoid creating ambiguity in named-parameter calls, it is no longer allowed to change the aliases for input parameters in the declaration of an existing function (although names can still be assigned to previously unnamed parameters). You now have to DROP and recreate the function to do that.

E.149.2.5. PL/pgSQL

- PL/pgSQL now throws an error if a variable name conflicts with a column name used in a query (Tom Lane)

    The former behavior was to bind ambiguous names to PL/pgSQL variables in preference to query columns, which often resulted in surprising misbehavior. Throwing an error allows easy detection of ambiguous situations. Although it’s recommended that functions encountering this type of error be modified to remove the conflict, the old behavior can be restored if necessary via the configuration parameter plpgsql.variable_conflict, or via the per-function option #variable_conflict.

- PL/pgSQL no longer allows variable names that match certain SQL reserved words (Tom Lane)

    This is a consequence of aligning the PL/pgSQL parser to match the core SQL parser more closely. If necessary, variable names can be double-quoted to avoid this restriction.

- PL/pgSQL now requires columns of composite results to match the expected type modifier as well as base type (Pavel Stehule, Tom Lane)

    For example, if a column of the result type is declared as NUMERIC(30,2), it is no longer acceptable to return a NUMERIC of some other precision in that column. Previous versions neglected to check the type modifier and would thus allow result rows that didn’t actually conform to the declared restrictions.

- PL/pgSQL now treats selection into composite fields more consistently (Tom Lane)

    Formerly, a statement like SELECT ... INTO rec.fld FROM ... was treated as a scalar assignment even if the record field fld was of composite type. Now it is treated as a record assignment, the same as when the INTO target is a regular variable of composite type. So the values to be assigned to the field’s subfields should be written as separate columns of the SELECT list, not as a ROW(...) construct as in previous versions.

    If you need to do this in a way that will work in both 9.0 and previous releases, you can write something like rec.fld := ROW(...) FROM ....
• Remove PL/pgSQL’s `RENAME` declaration (Tom Lane)

Instead of `RENAME`, use `ALIAS`, which can now create an alias for any variable, not only dollar sign parameter names (such as `$1`) as before.

### E.149.2.6. Other Incompatibilities

• Deprecate use of `=>` as an operator name (Robert Haas)

Future versions of PostgreSQL will probably reject this operator name entirely, in order to support the SQL-standard notation for named function parameters. For the moment, it is still allowed, but a warning is emitted when such an operator is defined.

• Remove support for platforms that don’t have a working 64-bit integer data type (Tom Lane)

It is believed all still-supported platforms have working 64-bit integer data types.

### E.149.3. Changes

Version 9.0 has an unprecedented number of new major features, and over 200 enhancements, improvements, new commands, new functions, and other changes.

#### E.149.3.1. Server

##### E.149.3.1.1. Continuous Archiving and Streaming Replication

PostgreSQL’s existing standby-server capability has been expanded both to support read-only queries on standby servers and to greatly reduce the lag between master and standby servers. For many users, this will be a useful and low-administration form of replication, either for high availability or for horizontal scalability.

• Allow a standby server to accept read-only queries (Simon Riggs, Heikki Linnakangas)

This feature is called Hot Standby. There are new `postgresql.conf` and `recovery.conf` settings to control this feature, as well as extensive documentation.

• Allow write-ahead log (WAL) data to be streamed to a standby server (Fujii Masao, Heikki Linnakangas)

This feature is called Streaming Replication. Previously WAL data could be sent to standby servers only in units of entire WAL files (normally 16 megabytes each). Streaming Replication eliminates this inefficiency and allows updates on the master to be propagated to standby servers with very little delay. There are new `postgresql.conf` and `recovery.conf` settings to control this feature, as well as extensive documentation.

• Add `pg_last_xlog_receive_location()` and `pg_last_xlog_replay_location()`, which can be used to monitor standby server WAL activity (Simon Riggs, Fujii Masao, Heikki Linnakangas)
Appendix E. Release Notes

E.149.3.1.2. Performance

• Allow per-tablespace values to be set for sequential and random page cost estimates (seq_page_cost/random_page_cost) via ALTER TABLESPACE ... SET/RESET (Robert Haas)
• Improve performance and reliability of EvalPlanQual rechecks in join queries (Tom Lane)
  UPDATE, DELETE, and SELECT FOR UPDATE/SHARE queries that involve joins will now behave much better when encountering freshly-updated rows.
• Improve performance of TRUNCATE when the table was created or truncated earlier in the same transaction (Tom Lane)
• Improve performance of finding inheritance child tables (Tom Lane)

E.149.3.1.3. Optimizer

• Remove unnecessary outer joins (Robert Haas)
  Outer joins where the inner side is unique and not referenced above the join are unnecessary and are therefore now removed. This will accelerate many automatically generated queries, such as those created by object-relational mappers (ORMs).
• Allow IS NOT NULL restrictions to use indexes (Tom Lane)
  This is particularly useful for finding MAX() / MIN() values in indexes that contain many null values.
• Improve the optimizer’s choices about when to use materialize nodes, and when to use sorting versus hashing for DISTINCT (Tom Lane)
• Improve the optimizer’s equivalence detection for expressions involving boolean <> operators (Tom Lane)

E.149.3.1.4. GEQO

• Use the same random seed every time GEQO plans a query (Andres Freund)
  While the Genetic Query Optimizer (GEQO) still selects random plans, it now always selects the same random plans for identical queries, thus giving more consistent performance. You can modify geqo_seed to experiment with alternative plans.
• Improve GEQO plan selection (Tom Lane)
  This avoids the rare error “failed to make a valid plan”, and should also improve planning speed.

E.149.3.1.5. Optimizer Statistics

• Improve ANALYZE to support inheritance-tree statistics (Tom Lane)
  This is particularly useful for partitioned tables. However, autovacuum does not yet automatically re-analyze parent tables when child tables change.
• Improve autovacuum’s detection of when re-analyze is necessary (Tom Lane)
Appendix E. Release Notes

- Improve optimizer’s estimation for greater/less-than comparisons (Tom Lane)

  When looking up statistics for greater/less-than comparisons, if the comparison value is in the first or last histogram bucket, use an index (if available) to fetch the current actual column minimum or maximum. This greatly improves the accuracy of estimates for comparison values near the ends of the data range, particularly if the range is constantly changing due to addition of new data.

- Allow setting of number-of-distinct-values statistics using ALTER TABLE (Robert Haas)

  This allows users to override the estimated number or percentage of distinct values for a column. This statistic is normally computed by ANALYZE, but the estimate can be poor, especially on tables with very large numbers of rows.

E.149.3.1.6. Authentication

- Add support for RADIUS (Remote Authentication Dial In User Service) authentication (Magnus Hagander)

- Allow LDAP (Lightweight Directory Access Protocol) authentication to operate in “search/bind” mode (Robert Fleming, Magnus Hagander)

  This allows the user to be looked up first, then the system uses the DN (Distinguished Name) returned for that user.

- Add samehost and samenet designations to pg_hba.conf (Stef Walter)

  These match the server’s IP address and subnet address respectively.

- Pass trusted SSL root certificate names to the client so the client can return an appropriate client certificate (Craig Ringer)

E.149.3.1.7. Monitoring

- Add the ability for clients to set an application name, which is displayed in pg_stat_activity (Dave Page)

  This allows administrators to characterize database traffic and troubleshoot problems by source application.

- Add a SQLSTATE option (\se) to log_line_prefix (Guillaume Smet)

  This allows users to compile statistics on errors and messages by error code number.

- Write to the Windows event log in UTF16 encoding (Itagaki Takahiro)

  Now there is true multilingual support for PostgreSQL log messages on Windows.

E.149.3.1.8. Statistics Counters

- Add pg_stat_reset_shared('bgwriter') to reset the cluster-wide shared statistics for the background writer (Greg Smith)
Appendix E. Release Notes

- Add `pg_stat_reset_single_table_counters()` and `pg_stat_reset_single_function_counters()` to allow resetting the statistics counters for individual tables and functions (Magnus Hagander)

E.149.3.1.9. Server Settings

- Allow setting of configuration parameters based on database/role combinations (Alvaro Herrera)
  Previously only per-database and per-role settings were possible, not combinations. All role and database settings are now stored in the new `pg_db_role_setting` system catalog. A new `psql \drds` shows these settings. The legacy system views `pg_roles`, `pg_shadow`, and `pg_user` do not show combination settings, and therefore no longer completely represent the configuration for a user or database.

- Add server parameter `bonjour`, which controls whether a Bonjour-enabled server advertises itself via Bonjour (Tom Lane)
  The default is off, meaning it does not advertise. This allows packagers to distribute Bonjour-enabled builds without worrying that individual users might not want the feature.

- Add server parameter `enable_material`, which controls the use of materialize nodes in the optimizer (Robert Haas)
  The default is on. When off, the optimizer will not add materialize nodes purely for performance reasons, though they will still be used when necessary for correctness.

- Change server parameter `log_temp_files` to use default file size units of kilobytes (Robert Haas)
  Previously this setting was interpreted in bytes if no units were specified.

- Log changes of parameter values when `postgresql.conf` is reloaded (Peter Eisentraut)
  This lets administrators and security staff audit changes of database settings, and is also very convenient for checking the effects of `postgresql.conf` edits.

- Properly enforce superuser permissions for custom server parameters (Tom Lane)
  Non-superusers can no longer issue `ALTER ROLE/DATABASE SET` for parameters that are not currently known to the server. This allows the server to correctly check that superuser-only parameters are only set by superusers. Previously, the `SET` would be allowed and then ignored at session start, making superuser-only custom parameters much less useful than they should be.

E.149.3.2. Queries

- Perform `SELECT FOR UPDATE/SHARE` processing after applying `LIMIT`, so the number of rows returned is always predictable (Tom Lane)
  Previously, changes made by concurrent transactions could cause a `SELECT FOR UPDATE` to unexpectedly return fewer rows than specified by its `LIMIT`. `FOR UPDATE` in combination with `ORDER BY` can still produce surprising results, but that can be corrected by placing `FOR UPDATE` in a subquery.

- Allow mixing of traditional and SQL-standard `LIMIT/OFFSET` syntax (Tom Lane)
• Extend the supported frame options in window functions (Hitoshi Harada)

Frames can now start with CURRENT ROW, and the ROWS \( n \) PRECEDING/FOLLOWING options are now supported.

• Make SELECT INTO and CREATE TABLE AS return row counts to the client in their command tags (Boszormenyi Zoltan)

This can save an entire round-trip to the client, allowing result counts and pagination to be calculated without an additional COUNT query.

E.149.3.2.1. Unicode Strings

• Support Unicode surrogate pairs (dual 16-bit representation) in \( \texttt{U} \& \) strings and identifiers (Peter Eisen- traут)
• Support Unicode escapes in \( \texttt{E'} \ldots \texttt{E'} \) strings (Marko Kreen)

E.149.3.3. Object Manipulation

• Speed up CREATE DATABASE by deferring flushes to disk (Andres Freund, Greg Stark)

• Allow comments on columns of tables, views, and composite types only, not other relation types such as indexes and TOAST tables (Tom Lane)

• Allow the creation of enumerated types containing no values (Bruce Momjian)

• Let values of columns having storage type MAIN remain on the main heap page unless the row cannot fit on a page (Kevin Grittner)

Previously MAIN values were forced out to TOAST tables until the row size was less than one-quarter of the page size.

E.149.3.3.1. ALTER TABLE

• Implement IF EXISTS for ALTER TABLE DROP COLUMN and ALTER TABLE DROP CONSTRAINT (Andres Freund)

• Allow ALTER TABLE commands that rewrite tables to skip WAL logging (Itagaki Takahiro)

Such operations either produce a new copy of the table or are rolled back, so WAL archiving can be skipped, unless running in continuous archiving mode. This reduces I/O overhead and improves performance.

• Fix failure of ALTER TABLE table ADD COLUMN col serial when done by non-owner of table (Tom Lane)
**E.149.3.3.2. CREATE TABLE**

- Add support for copying **COMMENTS** and **STORAGE settings** in `CREATE TABLE ... LIKE` commands (Itagaki Takahiro)
- Add a shortcut for copying all properties in `CREATE TABLE ... LIKE` commands (Itagaki Takahiro)
- Add the SQL-standard `CREATE TABLE ... OF type` command (Peter Eisentraut)
  
  This allows creation of a table that matches an existing composite type. Additional constraints and defaults can be specified in the command.

**E.149.3.3.3. Constraints**

- Add deferrable unique constraints (Dean Rasheed)
  
  This allows mass updates, such as `UPDATE tab SET col = col + 1`, to work reliably on columns that have unique indexes or are marked as primary keys. If the constraint is specified as `DEFERRABLE` it will be checked at the end of the statement, rather than after each row is updated. The constraint check can also be deferred until the end of the current transaction, allowing such updates to be spread over multiple SQL commands.
- Add exclusion constraints (Jeff Davis)
  
  Exclusion constraints generalize uniqueness constraints by allowing arbitrary comparison operators, not just equality. They are created with the `CREATE TABLE CONSTRAINT ... EXCLUDE` clause. The most common use of exclusion constraints is to specify that column entries must not overlap, rather than simply not be equal. This is useful for time periods and other ranges, as well as arrays. This feature enhances checking of data integrity for many calendaring, time-management, and scientific applications.
- Improve uniqueness-constraint violation error messages to report the values causing the failure (Itagaki Takahiro)
  
  For example, a uniqueness constraint violation might now report `Key (x)=(2) already exists`.

**E.149.3.3.4. Object Permissions**

- Add the ability to make mass permission changes across a whole schema using the new `GRANT/REVOKE IN SCHEMA` clause (Petr Jelinek)
  
  This simplifies management of object permissions and makes it easier to utilize database roles for application data security.
- Add `ALTER DEFAULT PRIVILEGES` command to control privileges of objects created later (Petr Jelinek)
  
  This greatly simplifies the assignment of object privileges in a complex database application. Default privileges can be set for tables, views, sequences, and functions. Defaults may be assigned on a per-schema basis, or database-wide.
- Add the ability to control large object (BLOB) permissions with `GRANT/REVOKE` (KaiGai Kohei)
Formerly, any database user could read or modify any large object. Read and write permissions can now be granted and revoked per large object, and the ownership of large objects is tracked.

### E.149.3.4. Utility Operations

- **Make** `LISTEN`*/NOTIFY* store pending events in a memory queue, rather than in a system table (Joachim Wieland)
  
  This substantially improves performance, while retaining the existing features of transactional support and guaranteed delivery.

- **Allow** `NOTIFY` to pass an optional “payload” string to listeners (Joachim Wieland)
  
  This greatly improves the usefulness of `LISTEN`/*NOTIFY* as a general-purpose event queue system.

- **Allow** `CLUSTER` on all per-database system catalogs (Tom Lane)
  
  Shared catalogs still cannot be clustered.

#### E.149.3.4.1. COPY

- **Accept** `COPY ... CSV FORCE QUOTE *` (Itagaki Takahiro)
  
  Now `*` can be used as shorthand for “all columns” in the `FORCE QUOTE` clause.

- **Add new** `COPY` syntax that allows options to be specified inside parentheses (Robert Haas, Emmanuel Cecchet)
  
  This allows greater flexibility for future `COPY` options. The old syntax is still supported, but only for pre-existing options.

#### E.149.3.4.2. EXPLAIN

- **Allow** `EXPLAIN` to output in XML, JSON, or YAML format (Robert Haas, Greg Sabino Mullane)
  
  The new output formats are easily machine-readable, supporting the development of new tools for analysis of `EXPLAIN` output.

- **Add new** `BUFFERS` option to report query buffer usage during `EXPLAIN ANALYZE` (Itagaki Takahiro)
  
  This allows better query profiling for individual queries. Buffer usage is no longer reported in the output for `log_statement_stats` and related settings.

- **Add hash usage information to** `EXPLAIN` output (Robert Haas)

- **Add new** `EXPLAIN` syntax that allows options to be specified inside parentheses (Robert Haas)
  
  This allows greater flexibility for future `EXPLAIN` options. The old syntax is still supported, but only for pre-existing options.
E.149.3.4.3. VACUUM

- Change VACUUM FULL to rewrite the entire table and rebuild its indexes, rather than moving individual rows around to compact space (Itagaki Takahiro, Tom Lane)

  The previous method was usually slower and caused index bloat. Note that the new method will use more disk space transiently during VACUUM FULL; potentially as much as twice the space normally occupied by the table and its indexes.

- Add new VACUUM syntax that allows options to be specified inside parentheses (Itagaki Takahiro)

  This allows greater flexibility for future VACUUM options. The old syntax is still supported, but only for pre-existing options.

E.149.3.4.4. Indexes

- Allow an index to be named automatically by omitting the index name in CREATE INDEX (Tom Lane)

- By default, multicolumn indexes are now named after all their columns; and index expression columns are now named based on their expressions (Tom Lane)

- Reindexing shared system catalogs is now fully transactional and crash-safe (Tom Lane)

  Formerly, reindexing a shared index was only allowed in standalone mode, and a crash during the operation could leave the index in worse condition than it was before.

- Add point_ops operator class for GiST (Teodor Sigaev)

  This feature permits GiST indexing of point columns. The index can be used for several types of queries such as point <@ polygon (point is in polygon). This should make many PostGIS queries faster.

- Use red-black binary trees for GIN index creation (Teodor Sigaev)

  Red-black trees are self-balancing. This avoids slowdowns in cases where the input is in nonrandom order.

E.149.3.5. Data Types

- Allow bytea values to be written in hex notation (Peter Eisentraut)

  The server parameter bytea_output controls whether hex or traditional format is used for bytea output. Libpq's PQescapeByteaConn() function automatically uses the hex format when connected to PostgreSQL 9.0 or newer servers. However, pre-9.0 libpq versions will not correctly process hex format from newer servers.

  The new hex format will be directly compatible with more applications that use binary data, allowing them to store and retrieve it without extra conversion. It is also significantly faster to read and write than the traditional format.

- Allow server parameter extra_float_digits to be increased to 3 (Tom Lane)
The previous maximum `extra_float_digits` setting was 2. There are cases where 3 digits are needed to dump and restore `float4` values exactly. `pg_dump` will now use the setting of 3 when dumping from a server that allows it.

- Tighten input checking for `int2vector` values (Caleb Welton)

### E.149.3.5.1 Full Text Search

- Add prefix support in `synonym` dictionaries (Teodor Sigaev)
- Add `filtering` dictionaries (Teodor Sigaev)
  Filtering dictionaries allow tokens to be modified then passed to subsequent dictionaries.
- Allow underscores in email-address tokens (Teodor Sigaev)
- Use more standards-compliant rules for parsing URL tokens (Tom Lane)

### E.149.3.6 Functions

- Allow function calls to supply parameter names and match them to named parameters in the function definition (Pavel Stehule)
  For example, if a function is defined to take parameters `a` and `b`, it can be called with `func(a := 7, b := 12)` or `func(b := 12, a := 7)`.
- Support locale-specific regular expression processing with UTF-8 server encoding (Tom Lane)
  Locale-specific regular expression functionality includes case-insensitive matching and locale-specific character classes. Previously, these features worked correctly for non-ASCII characters only if the database used a single-byte server encoding (such as `LATIN1`). They will still misbehave in multi-byte encodings other than UTF-8.
- Add support for scientific notation in `to_char()` (EEEE specification) (Pavel Stehule, Brendan Jurd)
- Make `to_char()` honor `FM` (fill mode) in `Y`, `YY`, and `YYY` specifications (Bruce Momjian, Tom Lane)
  It was already honored by `YYYY`.
- Fix `to_char()` to output localized numeric and monetary strings in the correct encoding on Windows (Hiroshi Inoue, Itagaki Takahiro, Bruce Momjian)
- Correct calculations of “overlaps” and “contains” operations for polygons (Teodor Sigaev)
  The polygon `&&` (overlaps) operator formerly just checked to see if the two polygons’ bounding boxes overlapped. It now does a more correct check. The polygon `@@` and `<@` (contains/contained by) operators formerly checked to see if one polygon’s vertexes were all contained in the other; this can wrongly report “true” for some non-convex polygons. Now they check that all line segments of one polygon are contained in the other.

### E.149.3.6.1 Aggregates

- Allow aggregate functions to use `ORDER BY` (Andrew Gierth)
Appendix E. Release Notes

For example, this is now supported: `array_agg(a ORDER BY b)`. This is useful with aggregates for which the order of input values is significant, and eliminates the need to use a nonstandard subquery to determine the ordering.

- Multi-argument aggregate functions can now use `DISTINCT` (Andrew Gierth)
- Add the `string_agg()` aggregate function to combine values into a single string (Pavel Stehule)
- Aggregate functions that are called with `DISTINCT` are now passed NULL values if the aggregate transition function is not marked as `STRICT` (Andrew Gierth)
  
  For example, `agg(DISTINCT x)` might pass a NULL `x` value to `agg()`. This is more consistent with the behavior in non-`DISTINCT` cases.

**E.149.3.6.2. Bit Strings**

- Add `get_bit()` and `set_bit()` functions for bit strings, mirroring those for `bytea` (Leonardo F)
- Implement `OVERLAY()` (replace) for bit strings and `bytea` (Leonardo F)

**E.149.3.6.3. Object Information Functions**

- Add `pg_table_size()` and `pg_indexes_size()` to provide a more user-friendly interface to the `pg_relation_size()` function (Bernd Helmle)
- Add `has_sequence_privilege()` for sequence permission checking (Abhijit Menon-Sen)
- Update the `information_schema` views to conform to SQL:2008 (Peter Eisentraut)
- Make the `information_schema` views correctly display maximum octet lengths for `char` and `varchar` columns (Peter Eisentraut)
- Speed up `information_schema` privilege views (Joachim Wieland)

**E.149.3.6.4. Function and Trigger Creation**

- Support execution of anonymous code blocks using the `DO` statement (Petr Jelinek, Joshua Tolley, Hannu Valtonen)

  This allows execution of server-side code without the need to create and delete a temporary function definition. Code can be executed in any language for which the user has permissions to define a function.

- Implement SQL-standard-compliant per-column triggers (Itagaki Takahiro)

  Such triggers are fired only when the specified column(s) are affected by the query, e.g. appear in an `UPDATE`’s `SET` list.

- Add the `WHEN` clause to `CREATE TRIGGER` to allow control over whether a trigger is fired (Itagaki Takahiro)

  While the same type of check can always be performed inside the trigger, doing it in an external `WHEN` clause can have performance benefits.
E.149.3.7. Server-Side Languages

- Add the `OR REPLACE` clause to `CREATE LANGUAGE` (Tom Lane)
  This is helpful to optionally install a language if it does not already exist, and is particularly helpful now that PL/pgSQL is installed by default.

E.149.3.7.1. PL/pgSQL Server-Side Language

- Install PL/pgSQL by default (Bruce Momjian)
  The language can still be removed from a particular database if the administrator has security or performance concerns about making it available.

- Improve handling of cases where PL/pgSQL variable names conflict with identifiers used in queries within a function (Tom Lane)
  The default behavior is now to throw an error when there is a conflict, so as to avoid surprising behaviors. This can be modified, via the configuration parameter `plpgsql.variable_conflict` or the per-function option `#variable_conflict`, to allow either the variable or the query-supplied column to be used. In any case PL/pgSQL will no longer attempt to substitute variables in places where they would not be syntactically valid.

- Make PL/pgSQL use the main lexer, rather than its own version (Tom Lane)
  This ensures accurate tracking of the main system’s behavior for details such as string escaping. Some user-visible details, such as the set of keywords considered reserved in PL/pgSQL, have changed in consequence.

- Avoid throwing an unnecessary error for an invalid record reference (Tom Lane)
  An error is now thrown only if the reference is actually fetched, rather than whenever the enclosing expression is reached. For example, many people have tried to do this in triggers:

```sql
if TG_OP = 'INSERT' and NEW.col1 = ... then
```

This will now actually work as expected.

- Improve PL/pgSQL’s ability to handle row types with dropped columns (Pavel Stehule)

- Allow input parameters to be assigned values within PL/pgSQL functions (Steve Prentice)
  Formerly, input parameters were treated as being declared `CONST`, so the function’s code could not change their values. This restriction has been removed to simplify porting of functions from other DBMSes that do not impose the equivalent restriction. An input parameter now acts like a local variable initialized to the passed-in value.

- Improve error location reporting in PL/pgSQL (Tom Lane)

- Add `count` and `ALL` options to `MOVE FORWARD/BACKWARD` in PL/pgSQL (Pavel Stehule)

- Allow PL/pgSQL’s `WHERE CURRENT OF` to use a cursor variable (Tom Lane)

- Allow PL/pgSQL’s `OPEN cursor FOR EXECUTE` to use parameters (Pavel Stehule, Itagaki Takahiro)
  This is accomplished with a new `USING` clause.
E.149.3.7.2. PL/Perl Server-Side Language

- Add new PL/Perl functions: `quote_literal()`, `quote_nullable()`, `quote_ident()`, `encode_bytea()`, `decode_bytea()`, `looks_like_number()`, `encode_array_literal()`, `encode_array_constructor()` (Tim Bunce)

- Add server parameter `plperl.on_init` to specify a PL/Perl initialization function (Tim Bunce)
  `plperl.on_plperl_init` and `plperl.on_plperlu_init` are also available for initialization that is specific to the trusted or untrusted language respectively.

- Support `END` blocks in PL/Perl (Tim Bunce)
  `END` blocks do not currently allow database access.

- Allow `use strict` in PL/Perl (Tim Bunce)
  Perl `strict` checks can also be globally enabled with the new server parameter `plperl.use_strict`.

- Allow `require` in PL/Perl (Tim Bunce)
  This basically tests to see if the module is loaded, and if not, generates an error. It will not allow loading of modules that the administrator has not preloaded via the initialization parameters.

- Allow `use feature` in PL/Perl if Perl version 5.10 or later is used (Tim Bunce)

- Verify that PL/Perl return values are valid in the server encoding (Andrew Dunstan)

E.149.3.7.3. PL/Python Server-Side Language

- Add Unicode support in PL/Python (Peter Eisentraut)
  Strings are automatically converted from/to the server encoding as necessary.

- Improve `bytea` support in PL/Python (Caleb Welton)
  `Bytea` values passed into PL/Python are now represented as binary, rather than the PostgreSQL `bytea` text format. `Bytea` values containing null bytes are now also output properly from PL/Python. Passing of boolean, integer, and float values was also improved.

- Support arrays as parameters and return values in PL/Python (Peter Eisentraut)

- Improve mapping of SQL domains to Python types (Peter Eisentraut)

- Add Python 3 support to PL/Python (Peter Eisentraut)
  The new server-side language is called `plpython3u`. This cannot be used in the same session with the Python 2 server-side language.

- Improve error location and exception reporting in PL/Python (Peter Eisentraut)

E.149.3.8. Client Applications

- Add an `--analyze-only` option to `vacuumdb`, to analyze without vacuuming (Bruce Momjian)
E.149.3.8.1. psql

- Add support for quoting/escaping the values of psql variables as SQL strings or identifiers (Pavel Stehule, Robert Haas)
  
  For example, `:var` will produce the value of `var` quoted and properly escaped as a literal string, while `:"var"` will produce its value quoted and escaped as an identifier.

- Ignore a leading UTF-8-encoded Unicode byte-order marker in script files read by psql (Itagaki Takahiro)
  
  This is enabled when the client encoding is UTF-8. It improves compatibility with certain editors, mostly on Windows, that insist on inserting such markers.

- Fix `psql --file -` to properly honor `--single-transaction` (Bruce Momjian)

- Avoid overwriting of psql’s command-line history when two psql sessions are run concurrently (Tom Lane)

- Improve psql’s command-line history when two psql sessions are run concurrently (Tom Lane)

- Show `\timing` output when it is enabled, regardless of “quiet” mode (Peter Eisentraut)

E.149.3.8.1.1. psql Display

- Improve display of wrapped columns in psql (Roger Leigh)
  
  This behavior is now the default. The previous formatting is available by using `\pset linestyle old-ascii`.

- Allow psql to use fancy Unicode line-drawing characters via `\pset linestyle unicode` (Roger Leigh)

E.149.3.8.1.2. psql \d Commands

- Make `\d` show child tables that inherit from the specified parent (Damien Clochard)
  
  `\d` shows only the number of child tables, while `\d+` shows the names of all child tables.

- Show definitions of index columns in `\d index_name` (Khee Chin)
  
  The definition is useful for expression indexes.

- Show a view’s defining query only in `\d+`, not in `\d` (Peter Eisentraut)
  
  Always including the query was deemed overly verbose.

E.149.3.8.2. pg_dump

- Make `pg_dump/pg_restore --clean` also remove large objects (Itagaki Takahiro)

- Fix `pg_dump` to properly dump large objects when `standard_conforming_strings` is enabled (Tom Lane)
The previous coding could fail when dumping to an archive file and then generating script output from `pg_restore`.

- `pg_restore` now emits large-object data in hex format when generating script output (Tom Lane)
  
  This could cause compatibility problems if the script is then loaded into a pre-9.0 server. To work around that, restore directly to the server, instead.

- Allow `pg_dump` to dump comments attached to columns of composite types (Taro Minowa (Higepon))

- Make `pg_dump --verbose` output the `pg_dump` and server versions in text output mode (Jim Cox, Tom Lane)

  These were already provided in custom output mode.

- `pg_restore` now complains if any command-line arguments remain after the switches and optional file name (Tom Lane)

  Previously, it silently ignored any such arguments.

---

**E.149.3.8.3. pg_ctl**

- Allow `pg_ctl` to be used safely to start the postmaster during a system reboot (Tom Lane)

  Previously, `pg_ctl`'s parent process could have been mistakenly identified as a running postmaster based on a stale postmaster lock file, resulting in a transient failure to start the database.

- Give `pg_ctl` the ability to initialize the database (by invoking initdb) (Zdenek Kotala)

---

**E.149.3.9. Development Tools**

**E.149.3.9.1. libpq**

- Add new `libpq` functions `PQconnectdbParams()` and `PQconnectStartParams()` (Guillaume Lelarge)

  These functions are similar to `PQconnectdb()` and `PQconnectStart()` except that they accept a null-terminated array of connection options, rather than requiring all options to be provided in a single string.

- Add `libpq` functions `PQescapeLiteral()` and `PQescapeIdentifier()` (Robert Haas)

  These functions return appropriately quoted and escaped SQL string literals and identifiers. The caller is not required to pre-allocate the string result, as is required by `PQescapeStringConn()`.

- Add support for a per-user service file (`.pg_service.conf`), which is checked before the site-wide service file (Peter Eisentraut)

- Properly report an error if the specified `libpq` service cannot be found (Peter Eisentraut)

- Add TCP keepalive settings in `libpq` (Tollef Fog Heen, Fujii Masao, Robert Haas)

  Keepalive settings were already supported on the server end of TCP connections.
Appendix E. Release Notes

- Avoid extra system calls to block and unblock SIGPIPE in libpq, on platforms that offer alternative methods (Jeremy Kerr)
- When a .pgpass-supplied password fails, mention where the password came from in the error message (Bruce Momjian)
- Load all SSL certificates given in the client certificate file (Tom Lane)
  This improves support for indirectly-signed SSL certificates.

**E.149.3.9.2. ecpg**

- Add SQLDA (SQL Descriptor Area) support to ecpg (Boszormenyi Zoltan)
- Add the DESCRIBE [OUTPUT] statement to ecpg (Boszormenyi Zoltan)
- Add an ECPGTransactionStatus function to return the current transaction status (Bernd Helmle)
- Add the string data type in ecpg Informix-compatibility mode (Boszormenyi Zoltan)
- Allow ecpg to use new and old variable names without restriction (Michael Meskes)
- Allow ecpg to use variable names in free() (Michael Meskes)
- Make ecpg_dynamic_type() return zero for non-SQL3 data types (Michael Meskes)
  Previously it returned the negative of the data type OID. This could be confused with valid type OIDs, however.
- Support long long types on platforms that already have 64-bit long (Michael Meskes)

**E.149.3.9.2.1. ecpg Cursors**

- Add out-of-scope cursor support in ecpg’s native mode (Boszormenyi Zoltan)
  This allows DECLARE to use variables that are not in scope when OPEN is called. This facility already existed in ecpg’s Informix-compatibility mode.
- Allow dynamic cursor names in ecpg (Boszormenyi Zoltan)
- Allow ecpg to use noise words FROM and IN in FETCH and MOVE (Boszormenyi Zoltan)

**E.149.3.10. Build Options**

- Enable client thread safety by default (Bruce Momjian)
  The thread-safety option can be disabled with configure --disable-thread-safety.
- Add support for controlling the Linux out-of-memory killer (Alex Hunsaker, Tom Lane)
  Now that /proc/self/oom_adj allows disabling of the Linux out-of-memory (OOM) killer, it’s recommendable to disable OOM kills for the postmaster. It may then be desirable to re-enable OOM kills for the postmaster’s child processes. The new compile-time option LINUX_OOM_ADJ allows the killer to be reactivated for child processes.
E.149.3.10.1. Makefiles

- New Makefile targets `world`, `install-world`, and `installcheck-world` (Andrew Dunstan)
  These are similar to the existing `all`, `install`, and `installcheck` targets, but they also build the HTML documentation, build and test `contrib`, and test server-side languages and `ecpg`.
- Add data and documentation installation location control to PGXS Makefiles (Mark Cave-Ayland)
- Add Makefile rules to build the PostgreSQL documentation as a single HTML file or as a single plaintext file (Peter Eisentraut, Bruce Momjian)

E.149.3.10.2. Windows

- Support compiling on 64-bit Windows and running in 64-bit mode (Tsutomu Yamada, Magnus Hagander)
  This allows for large shared memory sizes on Windows.
- Support server builds using Visual Studio 2008 (Magnus Hagander)

E.149.3.11. Source Code

- Distribute prebuilt documentation in a subdirectory tree, rather than as tar archive files inside the distribution tarball (Peter Eisentraut)
  For example, the prebuilt HTML documentation is now in `doc/src/sgml/html/`; the manual pages are packaged similarly.
- Make the server’s lexer reentrant (Tom Lane)
  This was needed for use of the lexer by PL/pgSQL.
- Improve speed of memory allocation (Tom Lane, Greg Stark)
- User-defined constraint triggers now have entries in `pg_constraint` as well as `pg_trigger` (Tom Lane)
  Because of this change, `pg_constraint.pgconstrname` is now redundant and has been removed.
- Add system catalog columns `pg_constraint.conindid` and `pg_trigger.tgconstrindid` to better document the use of indexes for constraint enforcement (Tom Lane)
- Allow multiple conditions to be communicated to backends using a single operating system signal (Fujii Masao)
  This allows new features to be added without a platform-specific constraint on the number of signal conditions.
- Improve source code test coverage, including `contrib`, PL/Python, and PL/Perl (Peter Eisentraut, Andrew Dunstan)
- Remove the use of flat files for system table bootstrapping (Tom Lane, Alvaro Herrera)
Appendix E. Release Notes

This improves performance when using many roles or databases, and eliminates some possible failure conditions.

- Automatically generate the initial contents of pg_attribute for “bootstrapped” catalogs (John Naylor)
  This greatly simplifies changes to these catalogs.

- Split the processing of INSERT/UPDATE/DELETE operations out of execMain.c (Marko Tiikkaja)
  Updates are now executed in a separate ModifyTable node. This change is necessary infrastructure for future improvements.

- Simplify translation of psql’s SQL help text (Peter Eisentraut)

- Reduce the lengths of some file names so that all file paths in the distribution tarball are less than 100 characters (Tom Lane)
  Some decompression programs have problems with longer file paths.

- Add a new ERRCODE_INVALID_PASSWORD SQLSTATE error code (Bruce Momjian)

- With authors’ permissions, remove the few remaining personal source code copyright notices (Bruce Momjian)
  The personal copyright notices were insignificant but the community occasionally had to answer questions about them.

- Add new documentation section about running PostgreSQL in non-durable mode to improve performance (Bruce Momjian)

- Restructure the HTML documentation Makefile rules to make their dependency checks work correctly, avoiding unnecessary rebuilds (Peter Eisentraut)

- Use DocBook XSL stylesheets for man page building, rather than Docbook2X (Peter Eisentraut)
  This changes the set of tools needed to build the man pages.

- Improve PL/Perl code structure (Tim Bunce)

- Improve error context reports in PL/Perl (Alexey Klyukin)

E.149.3.11.1. New Build Requirements

Note that these requirements do not apply when building from a distribution tarball, since tarballs include the files that these programs are used to build.

- Require Autoconf 2.63 to build configure (Peter Eisentraut)

- Require Flex 2.5.31 or later to build from a CVS checkout (Tom Lane)

- Require Perl version 5.8 or later to build from a CVS checkout (John Naylor, Andrew Dunstan)

E.149.3.11.2. Portability

- Use a more modern API for Bonjour (Tom Lane)
  Bonjour support now requires OS X 10.3 or later. The older API has been deprecated by Apple.
• Add spinlock support for the SuperH architecture (Nobuhiro Iwamatsu)
• Allow non-GCC compilers to use inline functions if they support them (Kurt Harriman)
• Remove support for platforms that don’t have a working 64-bit integer data type (Tom Lane)
• Restructure use of LDFLAGS to be more consistent across platforms (Tom Lane)

LDFLAGS is now used for linking both executables and shared libraries, and we add on LDFLAGS_EX when linking executables, or LDFLAGS_SL when linking shared libraries.

E.149.3.11.3. Server Programming

• Make backend header files safe to include in C++ (Kurt Harriman, Peter Eisentraut)

These changes remove keyword conflicts that previously made C++ usage difficult in backend code. However, there are still other complexities when using C++ for backend functions. extern "C" { } is still necessary in appropriate places, and memory management and error handling are still problematic.

• Add AggCheckCallContext() for use in detecting if a C function is being called as an aggregate (Hitoshi Harada)

• Change calling convention for SearchSysCache() and related functions to avoid hard-wiring the maximum number of cache keys (Robert Haas)

Existing calls will still work for the moment, but can be expected to break in 9.1 or later if not converted to the new style.

• Require calls of fastgetattr() and heap_getattr() backend macros to provide a non-NULL fourth argument (Robert Haas)

• Custom typanalyze functions should no longer rely on VacAttrStats.attr to determine the type of data they will be passed (Tom Lane)

This was changed to allow collection of statistics on index columns for which the storage type is different from the underlying column data type. There are new fields that tell the actual datatype being analyzed.

E.149.3.11.4. Server Hooks

• Add parser hooks for processing ColumnRef and ParamRef nodes (Tom Lane)

• Add a ProcessUtility hook so loadable modules can control utility commands (Itagaki Takahiro)

E.149.3.11.5. Binary Upgrade Support

• Add contrib/pg_upgrade to support in-place upgrades (Bruce Momjian)

This avoids the requirement of dumping/reloading the database when upgrading to a new major release of PostgreSQL, thus reducing downtime by orders of magnitude. It supports upgrades to 9.0 from PostgreSQL 8.3 and 8.4.

• Add support for preserving relation relfilenode values during binary upgrades (Bruce Momjian)
• Add support for preserving pg_type and pg_enum OIDs during binary upgrades (Bruce Momjian)
• Move data files within tablespaces into PostgreSQL-version-specific subdirectories (Bruce Momjian)
  This simplifies binary upgrades.

E.149.3.12. Contrib

• Add multithreading option (-j) to contrib/pgbench (Itagaki Takahiro)
  This allows multiple CPUs to be used by pgbench, reducing the risk of pgbench itself becoming the test bottleneck.
• Add \shell and \setshell meta commands to contrib/pgbench (Michael Paquier)
• New features for contrib/dict_xsyn (Sergey Karpov)
  The new options are matchorig, matchsynonyms, and keepsynonyms.
• Add full text dictionary contrib/unaccent (Teodor Sigaev)
  This filtering dictionary removes accents from letters, which makes full-text searches over multiple languages much easier.
• Add dblink_get_notify() to contrib/dblink (Marcus Kempe)
  This allows asynchronous notifications in dblink.
• Improve contrib/dblink’s handling of dropped columns (Tom Lane)
  This affects dblink_build_sql_insert() and related functions. These functions now number columns according to logical not physical column numbers.
• Greatly increase contrib/hstore’s data length limit, and add B-tree and hash support so GROUP BY and DISTINCT operations are possible on hstore columns (Andrew Gierth)
  New functions and operators were also added. These improvements make hstore a full-function key-value store embedded in PostgreSQL.
• Add contrib/passwordcheck to support site-specific password strength policies (Laurenz Albe)
  The source code of this module should be modified to implement site-specific password policies.
• Add contrib/pg_archivecleanup tool (Simon Riggs)
  This is designed to be used in the archive_cleanup_command server parameter, to remove no-longer-needed archive files.
• Add query text to contrib/auto_explain output (Andrew Dunstan)
• Add buffer access counters to contrib/pg_stat_statements (Itagaki Takahiro)
• Update contrib/start-scripts/linux to use /proc/self/oom_adj to disable the Linux out-of-memory (OOM) killer (Alex Hunsaker, Tom Lane)
Appendix E. Release Notes

E.150. Release 8.4.22

Release date: 2014-07-24

This release contains a variety of fixes from 8.4.21. For information about new features in the 8.4 major release, see Section E.172.

This is expected to be the last PostgreSQL release in the 8.4.X series. Users are encouraged to update to a newer release branch soon.

E.150.1. Migration to Version 8.4.22

A dump/restore is not required for those running 8.4.X.

However, this release corrects an index corruption problem in some GiST indexes. See the first changelog entry below to find out whether your installation has been affected and what steps you should take if so.

Also, if you are upgrading from a version earlier than 8.4.19, see Section E.153.

E.150.2. Changes

- Correctly initialize padding bytes in contrib/btree_gist indexes on bit columns (Heikki Linnakangas)
  This error could result in incorrect query results due to values that should compare equal not being seen as equal. Users with GiST indexes on bit or bit varying columns should REINDEX those indexes after installing this update.

- Protect against torn pages when deleting GIN list pages (Heikki Linnakangas)
  This fix prevents possible index corruption if a system crash occurs while the page update is being written to disk.

- Fix possibly-incorrect cache invalidation during nested calls to ReceiveSharedInvalidMessages (Andres Freund)

- Don’t assume a subquery’s output is unique if there’s a set-returning function in its targetlist (David Rowley)
  This oversight could lead to misoptimization of constructs like WHERE x IN (SELECT y, generate_series(1,10) FROM t GROUP BY y).

- Fix failure to detoast fields in composite elements of structured types (Tom Lane)
  This corrects cases where TOAST pointers could be copied into other tables without being dereferenced. If the original data is later deleted, it would lead to errors like “missing chunk number 0 for toast value ...” when the now-dangling pointer is used.

- Fix “record type has not been registered” failures with whole-row references to the output of Append plan nodes (Tom Lane)

- Fix possible crash when invoking a user-defined function while rewinding a cursor (Tom Lane)

- Fix query-lifespan memory leak while evaluating the arguments for a function in FROM (Tom Lane)
Appendix E. Release Notes

- Fix session-lifespan memory leaks in regular-expression processing (Tom Lane, Arthur O’Dwyer, Greg Stark)
- Fix data encoding error in `hungarian.stop` (Tom Lane)
- Fix liveness checks for rows that were inserted in the current transaction and then deleted by a now-rolled-back subtransaction (Andres Freund)
  
  This could cause problems (at least spurious warnings, and at worst an infinite loop) if `CREATE INDEX` or `CLUSTER` were done later in the same transaction.

- Clear `pg_stat_activity.xact_start` during `PREPARE TRANSACTION` (Andres Freund)
  
  After the `PREPARE`, the originating session is no longer in a transaction, so it should not continue to display a transaction start time.

- Fix `REASSIGN OWNED` to not fail for text search objects (Álvaro Herrera)

- Block signals during postmaster startup (Tom Lane)
  
  This ensures that the postmaster will properly clean up after itself if, for example, it receives SIGINT while still starting up.

- Secure Unix-domain sockets of temporary postmasters started during `make check` (Noah Misch)
  
  Any local user able to access the socket file could connect as the server’s bootstrap superuser, then proceed to execute arbitrary code as the operating-system user running the test, as we previously noted in CVE-2014-0067. This change defends against that risk by placing the server’s socket in a temporary, mode 0700 subdirectory of `/tmp`. The hazard remains however on platforms where Unix sockets are not supported, notably Windows, because then the temporary postmaster must accept local TCP connections.

  A useful side effect of this change is to simplify `make check` testing in builds that override `DEFAULT_PGSOCKET_DIR`. Popular non-default values like `/var/run/postgresql` are often not writable by the build user, requiring workarounds that will no longer be necessary.

- On Windows, allow new sessions to absorb values of PGC_BACKEND parameters (such as `log_connections`) from the configuration file (Amit Kapila)
  
  Previously, if such a parameter were changed in the file post-startup, the change would have no effect.

- Properly quote executable path names on Windows (Nikhil Deshpande)
  
  This oversight could cause initdb and `pg_upgrade` to fail on Windows, if the installation path contained both spaces and @ signs.

- Fix linking of `libpython` on OS X (Tom Lane)
  
  The method we previously used can fail with the Python library supplied by Xcode 5.0 and later.

- Avoid buffer bloat in `libpq` when the server consistently sends data faster than the client can absorb it (Shin-ichi Morita, Tom Lane)
  
  `libpq` could be coerced into enlarging its input buffer until it runs out of memory (which would be reported misleadingly as “lost synchronization with server”). Under ordinary circumstances it’s quite far-fetched that data could be continuously transmitted more quickly than the `recv()` loop can absorb it, but this has been observed when the client is artificially slowed by scheduler constraints.

- Ensure that LDAP lookup attempts in `libpq` time out as intended (Laurenz Albe)

- Fix `pg_restore`’s processing of old-style large object comments (Tom Lane)
A direct-to-database restore from an archive file generated by a pre-9.0 version of pg_dump would usually fail if the archive contained more than a few comments for large objects.

- In `contrib/pgcrypto` functions, ensure sensitive information is cleared from stack variables before returning (Marko Kreen)
- In `contrib/uuid-ossp`, cache the state of the OSSP UUID library across calls (Tom Lane)
  This improves the efficiency of UUID generation and reduces the amount of entropy drawn from `/dev/urandom`, on platforms that have that.
- Update time zone data files to `tzdata` release 2014e for DST law changes in Crimea, Egypt, and Morocco.

E.151. Release 8.4.21

**Release date:** 2014-03-20

This release contains a variety of fixes from 8.4.20. For information about new features in the 8.4 major release, see Section E.172.

The PostgreSQL community will stop releasing updates for the 8.4.X release series in July 2014. Users are encouraged to update to a newer release branch soon.

E.151.1. Migration to Version 8.4.21

A dump/restore is not required for those running 8.4.X.

However, if you are upgrading from a version earlier than 8.4.19, see Section E.153.

E.151.2. Changes

- Restore GIN metapages unconditionally to avoid torn-page risk (Heikki Linnakangas)
  Although this oversight could theoretically result in a corrupted index, it is unlikely to have caused any problems in practice, since the active part of a GIN metapage is smaller than a standard 512-byte disk sector.
- Allow regular-expression operators to be terminated early by query cancel requests (Tom Lane)
  This prevents scenarios wherein a pathological regular expression could lock up a server process uninterruptibly for a long time.
- Remove incorrect code that tried to allow `OVERLAPS` with single-element row arguments (Joshua Yanovski)
  This code never worked correctly, and since the case is neither specified by the SQL standard nor documented, it seemed better to remove it than fix it.
- Avoid getting more than `AccessShareLock` when de-parsing a rule or view (Dean Rasheed)
This oversight resulted in `pg_dump` unexpectedly acquiring RowExclusiveLock locks on tables mentioned as the targets of `INSERT/UPDATE/DELETE` commands in rules. While usually harmless, that could interfere with concurrent transactions that tried to acquire, for example, ShareLock on those tables.

- Prevent interrupts while reporting non-ERROR messages (Tom Lane)
  This guards against rare server-process freezeups due to recursive entry to `syslog()`, and perhaps other related problems.
- Update time zone data files to tzdata release 2014a for DST law changes in Fiji and Turkey, plus historical changes in Israel and Ukraine.

**E.152. Release 8.4.20**

**Release date:** 2014-02-20

This release contains a variety of fixes from 8.4.19. For information about new features in the 8.4 major release, see Section E.172.

The PostgreSQL community will stop releasing updates for the 8.4.X release series in July 2014. Users are encouraged to update to a newer release branch soon.

**E.152.1. Migration to Version 8.4.20**

A dump/restore is not required for those running 8.4.X.

However, if you are upgrading from a version earlier than 8.4.19, see Section E.153.

**E.152.2. Changes**

- Shore up `GRANT ... WITH ADMIN OPTION` restrictions (Noah Misch)
  Granting a role without `ADMIN OPTION` is supposed to prevent the grantee from adding or removing members from the granted role, but this restriction was easily bypassed by doing `SET ROLE` first. The security impact is mostly that a role member can revoke the access of others, contrary to the wishes of his grantor. Unapproved role member additions are a lesser concern, since an uncooperative role member could provide most of his rights to others anyway by creating views or `SECURITY DEFINER` functions. (CVE-2014-0060)

- Prevent privilege escalation via manual calls to PL validator functions (Andres Freund)
  The primary role of PL validator functions is to be called implicitly during `CREATE FUNCTION`, but they are also normal SQL functions that a user can call explicitly. Calling a validator on a function actually written in some other language was not checked for and could be exploited for privilege-escalation purposes. The fix involves adding a call to a privilege-checking function in each validator function. Non-core procedural languages will also need to make this change to their own validator functions, if any. (CVE-2014-0061)

- Avoid multiple name lookups during table and index DDL (Robert Haas, Andres Freund)
If the name lookups come to different conclusions due to concurrent activity, we might perform some parts of the DDL on a different table than other parts. At least in the case of CREATE INDEX, this can be used to cause the permissions checks to be performed against a different table than the index creation, allowing for a privilege escalation attack. (CVE-2014-0062)

- Prevent buffer overrun with long datetime strings (Noah Misch)
  The MAXDATELEN constant was too small for the longest possible value of type interval, allowing a buffer overrun in interval_out(). Although the datetime input functions were more careful about avoiding buffer overrun, the limit was short enough to cause them to reject some valid inputs, such as input containing a very long timezone name. The ecpg library contained these vulnerabilities along with some of its own. (CVE-2014-0063)

- Prevent buffer overrun due to integer overflow in size calculations (Noah Misch, Heikki Linnakangas)
  Several functions, mostly type input functions, calculated an allocation size without checking for overflow. If overflow did occur, a too-small buffer would be allocated and then written past. (CVE-2014-0064)

- Prevent overruns of fixed-size buffers (Peter Eisentraut, Jozef Mlich)
  Use strlcpy() and related functions to provide a clear guarantee that fixed-size buffers are not overrun. Unlike the preceding items, it is unclear whether these cases really represent live issues, since in most cases there appear to be previous constraints on the size of the input string. Nonetheless it seems prudent to silence all Coverity warnings of this type. (CVE-2014-0065)

- Avoid crashing if crypt() returns NULL (Honza Horak, Bruce Momjian)
  There are relatively few scenarios in which crypt() could return NULL, but contrib/chkpass would crash if it did. One practical case in which this could be an issue is if libc is configured to refuse to execute unapproved hashing algorithms (e.g., “FIPS mode”). (CVE-2014-0066)

- Document risks of make check in the regression testing instructions (Noah Misch, Tom Lane)
  Since the temporary server started by make check uses “trust” authentication, another user on the same machine could connect to it as database superuser, and then potentially exploit the privileges of the operating-system user who started the tests. A future release will probably incorporate changes in the testing procedure to prevent this risk, but some public discussion is needed first. So for the moment, just warn people against using make check when there are untrusted users on the same machine. (CVE-2014-0067)

- Fix possible mis-replay of WAL records when some segments of a relation aren’t full size (Greg Stark, Tom Lane)
  The WAL update could be applied to the wrong page, potentially many pages past where it should have been. Aside from corrupting data, this error has been observed to result in significant “bloat” of standby servers compared to their masters, due to updates being applied far beyond where the end-of-file should have been. This failure mode does not appear to be a significant risk during crash recovery, only when initially synchronizing a standby created from a base backup taken from a quickly-changing master.

- Ensure that insertions into non-leaf GIN index pages write a full-page WAL record when appropriate (Heikki Linnakangas)
  The previous coding risked index corruption in the event of a partial-page write during a system crash.

- Fix race conditions during server process exit (Robert Haas)
  Ensure that signal handlers don’t attempt to use the process’s MyProc pointer after it’s no longer valid.
Appendix E. Release Notes

- Fix unsafe references to `errno` within error reporting logic (Christian Kruse)
  
  This would typically lead to odd behaviors such as missing or inappropriate `HINT` fields.

- Fix possible crashes from using `ereport()` too early during server startup (Tom Lane)
  
  The principal case we’ve seen in the field is a crash if the server is started in a directory it doesn’t have permission to read.

- Clear retry flags properly in OpenSSL socket write function (Alexander Kukushkin)
  
  This omission could result in a server lockup after unexpected loss of an SSL-encrypted connection.

- Fix length checking for Unicode identifiers (`U"..."` syntax) containing escapes (Tom Lane)
  
  A spurious truncation warning would be printed for such identifiers if the escaped form of the identifier was too long, but the identifier actually didn’t need truncation after de-escaping.

- Fix possible crash due to invalid plan for nested sub-selects, such as `WHERE (... x IN (SELECT ...) ...) IN (SELECT ...)` (Tom Lane)

- Ensure that `ANALYZE` creates statistics for a table column even when all the values in it are “too wide” (Tom Lane)
  
  `ANALYZE` intentionally omits very wide values from its histogram and most-common-values calculations, but it neglected to do something sane in the case that all the sampled entries are too wide.

- In `ALTER TABLE ... SET TABLESPACE`, allow the database’s default tablespace to be used without a permissions check (Stephen Frost)
  
  `CREATE TABLE` has always allowed such usage, but `ALTER TABLE` didn’t get the memo.

- Fix “cannot accept a set” error when some arms of a `CASE` return a set and others don’t (Tom Lane)

- Fix checks for all-zero client addresses in `pgstat` functions (Kevin Grittner)

- Fix possible misclassification of multibyte characters by the text search parser (Tom Lane)
  
  Non-ASCII characters could be misclassified when using C locale with a multibyte encoding. On Cygwin, non-C locales could fail as well.

- Fix possible misbehavior in `plainto_tsquery()` (Heikki Linnakangas)
  
  Use `memmove()` not `memcpy()` for copying overlapping memory regions. There have been no field reports of this actually causing trouble, but it’s certainly risky.

- Accept `SHIFT_JIS` as an encoding name for locale checking purposes (Tatsuo Ishii)

- Fix misbehavior of `PQhost()` on Windows (Fujii Masao)
  
  It should return `localhost` if no host has been specified.

- Improve error handling in `libpq` and `psql` for failures during `COPY` to `STDOUT/FROM STDIN` (Tom Lane)
  
  In particular this fixes an infinite loop that could occur in 9.2 and up if the server connection was lost during `COPY` from `STDIN`. Variants of that scenario might be possible in older versions, or with other client applications.

- Fix misaligned descriptors in `ecpg` (MauMau)

- In `ecpg`, handle lack of a hostname in the connection parameters properly (Michael Meskes)

- Fix performance regression in `contrib/dblink` connection startup (Joe Conway)
Avoid an unnecessary round trip when client and server encodings match.

- In contrib/isn, fix incorrect calculation of the check digit for ISMN values (Fabien Coelho)
- Ensure client-code-only installation procedure works as documented (Peter Eisentraut)
- In Mingw and Cygwin builds, install the libpq DLL in the bin directory (Andrew Dunstan)

  This duplicates what the MSVC build has long done. It should fix problems with programs like psql failing to start because they can’t find the DLL.

- Don’t generate plain-text HISTORY and src/test/regress/README files anymore (Tom Lane)

  These text files duplicated the main HTML and PDF documentation formats. The trouble involved in maintaining them greatly outweighs the likely audience for plain-text format. Distribution tarballs will still contain files by these names, but they’ll just be stubs directing the reader to consult the main documentation. The plain-text INSTALL file will still be maintained, as there is arguably a use-case for that.

- Update time zone data files to tzdata release 2013i for DST law changes in Jordan and historical changes in Cuba.

  In addition, the zones Asia/Riyadh87, Asia/Riyadh88, and Asia/Riyadh89 have been removed, as they are no longer maintained by IANA, and never represented actual civil timekeeping practice.

E.153. Release 8.4.19

Release date: 2013-12-05

This release contains a variety of fixes from 8.4.18. For information about new features in the 8.4 major release, see Section E.172.

E.153.1. Migration to Version 8.4.19

A dump/restore is not required for those running 8.4.X.

However, this release corrects a potential data corruption issue. See the first changelog entry below to find out whether your installation has been affected and what steps you can take if so.

Also, if you are upgrading from a version earlier than 8.4.17, see Section E.155.

E.153.2. Changes

- Fix VACUUM’s tests to see whether it can update relfrozenxid (Andres Freund)

  In some cases VACUUM (either manual or autovacuum) could incorrectly advance a table’s relfrozenxid value, allowing tuples to escape freezing, causing those rows to become invisible once $2^{31}$ transactions have elapsed. The probability of data loss is fairly low since multiple incorrect advancements would need to happen before actual loss occurs, but it’s not zero. Users upgrading from release 8.4.8 or earlier are not affected, but all later versions contain the bug.
The issue can be ameliorated by, after upgrading, vacuuming all tables in all databases while having `vacuum_freeze_table_age` set to zero. This will fix any latent corruption but will not be able to fix all pre-existing data errors. However, an installation can be presumed safe after performing this vacuuming if it has executed fewer than \(2^{31}\) update transactions in its lifetime (check this with `SELECT txid_current() < 2^{31}`).

- Fix race condition in GIN index posting tree page deletion (Heikki Linnakangas)
  This could lead to transient wrong answers or query failures.

- Avoid flattening a subquery whose `SELECT` list contains a volatile function wrapped inside a sub-`SELECT` (Tom Lane)
  This avoids unexpected results due to extra evaluations of the volatile function.

- Fix planner’s processing of non-simple-variable subquery outputs nested within outer joins (Tom Lane)
  This error could lead to incorrect plans for queries involving multiple levels of subqueries within `JOIN` syntax.

- Fix premature deletion of temporary files (Andres Freund)

- Fix possible read past end of memory in rule printing (Peter Eisentraut)

- Fix array slicing of `int2vector` and `oidvector` values (Tom Lane)
  Expressions of this kind are now implicitly promoted to regular `int2` or `oid` arrays.

- Fix incorrect behaviors when using a SQL-standard, simple GMT offset timezone (Tom Lane)
  In some cases, the system would use the simple GMT offset value when it should have used the regular timezone setting that had prevailed before the simple offset was selected. This change also causes the `timeofday` function to honor the simple GMT offset zone.

- Prevent possible misbehavior when logging translations of Windows error codes (Tom Lane)

- Properly quote generated command lines in `pg_ctl` (Naoya Anzai and Tom Lane)
  This fix applies only to Windows.

- Fix `pg_dumpall` to work when a source database sets `default_transaction_read_only` via `ALTER DATABASE SET` (Kevin Grittner)
  Previously, the generated script would fail during restore.

- Fix `ecpg`’s processing of lists of variables declared `varchar` (Zoltán Böszörményi)

- Make `contrib/lo` defend against incorrect trigger definitions (Marc Cousin)

- Update time zone data files to `tzdata` release 2013h for DST law changes in Argentina, Brazil, Jordan, Libya, Liechtenstein, Morocco, and Palestine. Also, new timezone abbreviations WIB, WIT, WITA for Indonesia.

**E.154. Release 8.4.18**

**Release date:** 2013-10-10
Appendix E. Release Notes

This release contains a variety of fixes from 8.4.17. For information about new features in the 8.4 major release, see Section E.172.

E.154.1. Migration to Version 8.4.18

A dump/restore is not required for those running 8.4.X. However, if you are upgrading from a version earlier than 8.4.17, see Section E.155.

E.154.2. Changes

- Prevent corruption of multi-byte characters when attempting to case-fold identifiers (Andrew Dunstan)
  PostgreSQL case-folds non-ASCII characters only when using a single-byte server encoding.
- Fix memory leak caused by lo_open() failure (Heikki Linnakangas)
- Fix memory overcommit bug when work_mem is using more than 24GB of memory (Stephen Frost)
- Fix deadlock bug in libpq when using SSL (Stephen Frost)
- Properly compute row estimates for boolean columns containing many NULL values (Andrew Gierth)
  Previously tests like col IS NOT TRUE and col IS NOT FALSE did not properly factor in NULL values when estimating plan costs.
- Prevent pushing down WHERE clauses into unsafe UNION/INTERSECT subqueries (Tom Lane)
  Subqueries of a UNION or INTERSECT that contain set-returning functions or volatile functions in their SELECT lists could be improperly optimized, leading to run-time errors or incorrect query results.
- Fix rare case of “failed to locate grouping columns” planner failure (Tom Lane)
- Improve view dumping code’s handling of dropped columns in referenced tables (Tom Lane)
- Fix possible deadlock during concurrent CREATE INDEX CONCURRENTLY operations (Tom Lane)
- Fix regexp_matches() handling of zero-length matches (Jeevan Chalke)
  Previously, zero-length matches like '^' could return too many matches.
- Fix crash for overly-complex regular expressions (Heikki Linnakangas)
- Fix regular expression match failures for back references combined with non-greedy quantifiers (Jeevan Chalke)
- Prevent CREATE FUNCTION from checking SET variables unless function body checking is enabled (Tom Lane)
- Fix pgp_pub_decrypt() so it works for secret keys with passwords (Marko Kreen)
- Remove rare inaccurate warning during vacuum of index-less tables (Heikki Linnakangas)
- Avoid possible failure when performing transaction control commands (e.g ROLLBACK) in prepared queries (Tom Lane)
- Ensure that floating-point data input accepts standard spellings of “infinity” on all platforms (Tom Lane)
The C99 standard says that allowable spellings are inf, +inf, -inf, infinity, +infinity, and -infinity. Make sure we recognize these even if the platform’s `strtod` function doesn’t.

- Expand ability to compare rows to records and arrays (Rafal Rzepecki, Tom Lane)
- Update time zone data files to tzdata release 2013d for DST law changes in Israel, Morocco, Palestine, and Paraguay. Also, historical zone data corrections for Macquarie Island.

### E.155. Release 8.4.17

**Release date:** 2013-04-04

This release contains a variety of fixes from 8.4.16. For information about new features in the 8.4 major release, see Section E.172.

### E.155.1. Migration to Version 8.4.17

A dump/restore is not required for those running 8.4.X.

However, this release corrects several errors in management of GiST indexes. After installing this update, it is advisable to `REINDEX` any GiST indexes that meet one or more of the conditions described below. Also, if you are upgrading from a version earlier than 8.4.10, see Section E.162.

### E.155.2. Changes

- Reset OpenSSL randomness state in each postmaster child process (Marko Kreen)

  This avoids a scenario wherein random numbers generated by `contrib/pgcrypto` functions might be relatively easy for another database user to guess. The risk is only significant when the postmaster is configured with `ssl = on` but most connections don’t use SSL encryption. (CVE-2013-1900)

- Fix GiST indexes to not use “fuzzy” geometric comparisons when it’s not appropriate to do so (Alexander Korotkov)

  The core geometric types perform comparisons using “fuzzy” equality, but `gist_box_same` must do exact comparisons, else GiST indexes using it might become inconsistent. After installing this update, users should `REINDEX` any GiST indexes on `box`, `polygon`, `circle`, or `point` columns, since all of these use `gist_box_same`.

- Fix erroneous range-union and penalty logic in GiST indexes that use `contrib/btree_gist` for variable-width data types, that is `text`, `bytea`, `bit`, and `numeric` columns (Tom Lane)

  These errors could result in inconsistent indexes in which some keys that are present would not be found by searches, and also in useless index bloat. Users are advised to `REINDEX` such indexes after installing this update.

- Fix bugs in GiST page splitting code for multi-column indexes (Tom Lane)
These errors could result in inconsistent indexes in which some keys that are present would not be found by searches, and also in indexes that are unnecessarily inefficient to search. Users are advised to REINDEX multi-column GiST indexes after installing this update.

- Fix infinite-loop risk in regular expression compilation (Tom Lane, Don Porter)
- Fix potential null-pointer dereference in regular expression compilation (Tom Lane)
- Fix to_char() to use ASCII-only case-folding rules where appropriate (Tom Lane)
  This fixes misbehavior of some template patterns that should be locale-independent, but mishandled “ı” and “İ” in Turkish locales.
- Fix unwanted rejection of timestamp 1999-12-31 24:00:00 (Tom Lane)
- Remove useless “picksplit doesn’t support secondary split” log messages (Josh Hansen, Tom Lane)
  This message seems to have been added in expectation of code that was never written, and probably never will be, since GiST’s default handling of secondary splits is actually pretty good. So stop nagging end users about it.
- Fix possible failure to send a session’s last few transaction commit/abort counts to the statistics collector (Tom Lane)
- Eliminate memory leaks in PL/Perl’s spi_prepare() function (Alex Hunsaker, Tom Lane)
- Fix pg_dumpall to handle database names containing “=” correctly (Heikki Linnakangas)
- Avoid crash in pg_dump when an incorrect connection string is given (Heikki Linnakangas)
- Ignore invalid indexes in pg_dump (Michael Paquier)
  Dumping invalid indexes can cause problems at restore time, for example if the reason the index creation failed was because it tried to enforce a uniqueness condition not satisfied by the table’s data. Also, if the index creation is in fact still in progress, it seems reasonable to consider it to be an uncommitted DDL change, which pg_dump wouldn’t be expected to dump anyway.
- Fix contrib/pg_trgm’s similarity() function to return zero for trigram-less strings (Tom Lane)
  Previously it returned NaN due to internal division by zero.
- Update time zone data files to tzdata release 2013b for DST law changes in Chile, Haiti, Morocco, Paraguay, and some Russian areas. Also, historical zone data corrections for numerous places.
  Also, update the time zone abbreviation files for recent changes in Russia and elsewhere: CHOT, GET, IRKT, KGT, KRAT, MAGT, MAWT, MSK, NOVT, OMST, TKT, VLAT, WST, YAKT, YEKТ now follow their current meanings, and VOLТ (Europe/Volgograd) and MIST (Antarctica/Macquarie) are added to the default abbreviations list.

E.156. Release 8.4.16

Release date: 2013-02-07

This release contains a variety of fixes from 8.4.15. For information about new features in the 8.4 major release, see Section E.172.
E.156.1. Migration to Version 8.4.16

A dump/restore is not required for those running 8.4.X.
However, if you are upgrading from a version earlier than 8.4.10, see Section E.162.

E.156.2. Changes

• Prevent execution of \texttt{enum\_recv} from SQL (Tom Lane)
  The function was misdeclared, allowing a simple SQL command to crash the server. In principle an attacker might be able to use it to examine the contents of server memory. Our thanks to Sumit Soni (via Secunia SVCRP) for reporting this issue. (CVE-2013-0255)

• Update minimum recovery point when truncating a relation file (Heikki Linnakangas)
  Once data has been discarded, it’s no longer safe to stop recovery at an earlier point in the timeline.

• Fix SQL grammar to allow subscripting or field selection from a sub-SELECT result (Tom Lane)

• Protect against race conditions when scanning \texttt{pg\_tablespace} (Stephen Frost, Tom Lane)
  \texttt{CREATE DATABASE} and \texttt{DROP DATABASE} could misbehave if there were concurrent updates of \texttt{pg\_tablespace} entries.

• Prevent \texttt{DROP OWNED} from trying to drop whole databases or tablespaces (Álvaro Herrera)
  For safety, ownership of these objects must be reassigned, not dropped.

• Fix error in \texttt{vacuum\_freeze\_table\_age} implementation (Andres Freund)
  In installations that have existed for more than \texttt{vacuum\_freeze\_min\_age} transactions, this mistake prevented autovacuum from using partial-table scans, so that a full-table scan would always happen instead.

• Prevent misbehavior when a \texttt{RowExpr} or \texttt{XmlExpr} is parse-analyzed twice (Andres Freund, Tom Lane)
  This mistake could be user-visible in contexts such as \texttt{CREATE TABLE LIKE INCLUDING INDEXES}.

• Improve defenses against integer overflow in hashtable sizing calculations (Jeff Davis)

• Reject out-of-range dates in \texttt{to\_date()} (Hitoshi Harada)

• Ensure that non-ASCII prompt strings are translated to the correct code page on Windows (Alexander Law, Noah Misch)
  This bug affected \texttt{psql} and some other client programs.

• Fix possible crash in \texttt{psql}'s \texttt{\?} command when not connected to a database (Meng Qingzhong)

• Fix one-byte buffer overrun in \texttt{libpq}'s \texttt{PQprintTuples} (Xi Wang)
  This ancient function is not used anywhere by PostgreSQL itself, but it might still be used by some client code.

• Make \texttt{ecpglib} use translated messages properly (Chen Huajun)

• Properly install \texttt{ecpg\_compat} and \texttt{pgtypes} libraries on MSVC (Jiang Guiqing)
• Rearrange configure’s tests for supplied functions so it is not fooled by bogus exports from libedit/libreadline (Christoph Berg)
• Ensure Windows build number increases over time (Magnus Hagander)
• Make pgxs build executables with the right .exe suffix when cross-compiling for Windows (Zoltan Boszormenyi)
• Add new timezone abbreviation FET (Tom Lane)
  This is now used in some eastern-European time zones.

E.157. Release 8.4.15

Release date: 2012-12-06
This release contains a variety of fixes from 8.4.14. For information about new features in the 8.4 major release, see Section E.172.

E.157.1. Migration to Version 8.4.15
A dump/restore is not required for those running 8.4.X.
However, if you are upgrading from a version earlier than 8.4.10, see Section E.162.

E.157.2. Changes

• Fix multiple bugs associated with CREATE INDEX CONCURRENTLY (Andres Freund, Tom Lane)
  Fix CREATE INDEX CONCURRENTLY to use in-place updates when changing the state of an index’s pg_index row. This prevents race conditions that could cause concurrent sessions to miss updating the target index, thus resulting in corrupt concurrently-created indexes.
  Also, fix various other operations to ensure that they ignore invalid indexes resulting from a failed CREATE INDEX CONCURRENTLY command. The most important of these is VACUUM, because an auto-vacuum could easily be launched on the table before corrective action can be taken to fix or remove the invalid index.
• Avoid corruption of internal hash tables when out of memory (Hitoshi Harada)
• Fix planning of non-strict equivalence clauses above outer joins (Tom Lane)
  The planner could derive incorrect constraints from a clause equating a non-strict construct to something else, for example WHERE COALESCE(foo, 0) = 0 when foo is coming from the nullable side of an outer join.
• Improve planner’s ability to prove exclusion constraints from equivalence classes (Tom Lane)
• Fix partial-row matching in hashed subplans to handle cross-type cases correctly (Tom Lane)
This affects multicolumn \texttt{NOT IN} subplans, such as \texttt{WHERE (a, b) NOT IN (SELECT x, y FROM ...)} when for instance \(b\) and \(y\) are \texttt{int4} and \texttt{int8} respectively. This mistake led to wrong answers or crashes depending on the specific datatypes involved.

- Acquire buffer lock when re-fetching the old tuple for an \texttt{AFTER ROW UPDATE/DELETE} trigger (Andres Freund)

In very unusual circumstances, this oversight could result in passing incorrect data to the precheck logic for a foreign-key enforcement trigger. That could result in a crash, or in an incorrect decision about whether to fire the trigger.

- Fix \texttt{ALTER COLUMN TYPE} to handle inherited check constraints properly (Pavan Deolasee)

This worked correctly in pre-8.4 releases, and now works correctly in 8.4 and later.

- Fix \texttt{REASSIGN OWNED} to handle grants on tablespaces (Alvaro Herrera)

- Ignore incorrect \texttt{pg_attribute} entries for system columns for views (Tom Lane)

Views do not have any system columns. However, we forgot to remove such entries when converting a table to a view. That’s fixed properly for 9.3 and later, but in previous branches we need to defend against existing mis-converted views.

- Fix rule printing to dump \texttt{INSERT INTO \textit{table} DEFAULT VALUES} correctly (Tom Lane)

- Guard against stack overflow when there are too many \texttt{UNION/INTERSECT/EXCEPT} clauses in a query (Tom Lane)

- Prevent platform-dependent failures when dividing the minimum possible integer value by \(-1\) (Xi Wang, Tom Lane)

- Fix possible access past end of string in date parsing (Hitoshi Harada)

- Produce an understandable error message if the length of the path name for a Unix-domain socket exceeds the platform-specific limit (Tom Lane, Andrew Dunstan)

Formerly, this would result in something quite unhelpful, such as “Non-recoverable failure in name resolution”.

- Fix memory leaks when sending composite column values to the client (Tom Lane)

- Make \texttt{pg_ctl} more robust about reading the \texttt{postmaster.pid} file (Heikki Linnakangas)

Fix race conditions and possible file descriptor leakage.

- Fix possible crash in \texttt{psql} if incorrectly-encoded data is presented and the \texttt{client_encoding} setting is a client-only encoding, such as SJIS (Jiang Guiqing)

- Fix bugs in the \texttt{restore.sql} script emitted by \texttt{pg_dump} in \texttt{tar} output format (Tom Lane)

The script would fail outright on tables whose names include upper-case characters. Also, make the script capable of restoring data in \texttt{--inserts} mode as well as the regular \texttt{COPY} mode.

- Fix \texttt{pg_restore} to accept POSIX-conformant \texttt{tar} files (Brian Weaver, Tom Lane)

The original coding of \texttt{pg_dump}’s \texttt{tar} output mode produced files that are not fully conformant with the POSIX standard. This has been corrected for version 9.3. This patch updates previous branches so that they will accept both the incorrect and the corrected formats, in hopes of avoiding compatibility problems when 9.3 comes out.
Appendix E. Release Notes

- Fix pg_resetxlog to locate postmaster.pid correctly when given a relative path to the data directory (Tom Lane)
  This mistake could lead to pg_resetxlog not noticing that there is an active postmaster using the data directory.
- Fix libpq’s lo_import() and lo_export() functions to report I/O errors properly (Tom Lane)
- Fix ecpg’s processing of nested structure pointer variables (Muhammad Usama)
- Make contrib/pageinspect’s btree page inspection functions take buffer locks while examining pages (Tom Lane)
- Fix pgxs support for building loadable modules on AIX (Tom Lane)
  Building modules outside the original source tree didn’t work on AIX.
- Update time zone data files to tzdata release 2012j for DST law changes in Cuba, Israel, Jordan, Libya, Palestine, Western Samoa, and portions of Brazil.

E.158. Release 8.4.14

Release date: 2012-09-24
This release contains a variety of fixes from 8.4.13. For information about new features in the 8.4 major release, see Section E.172.

E.158.1. Migration to Version 8.4.14
A dump/restore is not required for those running 8.4.X.
However, if you are upgrading from a version earlier than 8.4.10, see Section E.162.

E.158.2. Changes

- Fix planner’s assignment of executor parameters, and fix executor’s rescan logic for CTE plan nodes (Tom Lane)
  These errors could result in wrong answers from queries that scan the same WITH subquery multiple times.
- Improve page-splitting decisions in GiST indexes (Alexander Korotkov, Robert Haas, Tom Lane)
  Multi-column GiST indexes might suffer unexpected bloat due to this error.
- Fix cascading privilege revoke to stop if privileges are still held (Tom Lane)
  If we revoke a grant option from some role X, but X still holds that option via a grant from someone else, we should not recursively revoke the corresponding privilege from role(s) Y that X had granted it to.
- Fix handling of SIGFPE when PL/Perl is in use (Andres Freund)
Perl resets the process’s SIGFPE handler to SIG_IGN, which could result in crashes later on. Restore the normal Postgres signal handler after initializing PL/Perl.

- Prevent PL/Perl from crashing if a recursive PL/Perl function is redefined while being executed (Tom Lane)
- Work around possible misoptimization in PL/Perl (Tom Lane)
  
  Some Linux distributions contain an incorrect version of pthread.h that results in incorrect compiled code in PL/Perl, leading to crashes if a PL/Perl function calls another one that throws an error.
- Update time zone data files to tzdata release 2012f for DST law changes in Fiji

**E.159. Release 8.4.13**

**Release date:** 2012-08-17

This release contains a variety of fixes from 8.4.12. For information about new features in the 8.4 major release, see Section E.172.

**E.159.1. Migration to Version 8.4.13**

A dump/restore is not required for those running 8.4.X.

However, if you are upgrading from a version earlier than 8.4.10, see Section E.162.

**E.159.2. Changes**

- Prevent access to external files/URLs via XML entity references (Noah Misch, Tom Lane)
  
  xml_parse() would attempt to fetch external files or URLs as needed to resolve DTD and entity references in an XML value, thus allowing unprivileged database users to attempt to fetch data with the privileges of the database server. While the external data wouldn’t get returned directly to the user, portions of it could be exposed in error messages if the data didn’t parse as valid XML; and in any case the mere ability to check existence of a file might be useful to an attacker. (CVE-2012-3489)

- Prevent access to external files/URLs via contrib/xml2’s xslt_process() (Peter Eisentraut)
  
  libxslt offers the ability to read and write both files and URLs through stylesheet commands, thus allowing unprivileged database users to both read and write data with the privileges of the database server. Disable that through proper use of libxslt’s security options. (CVE-2012-3488)

  Also, remove xslt_process()'s ability to fetch documents and stylesheets from external files/URLs. While this was a documented “feature”, it was long regarded as a bad idea. The fix for CVE-2012-3489 broke that capability, and rather than expend effort on trying to fix it, we’re just going to summarily remove it.

- Prevent too-early recycling of btree index pages (Noah Misch)
Appendix E. Release Notes

When we allowed read-only transactions to skip assigning XIDs, we introduced the possibility that a deleted btree page could be recycled while a read-only transaction was still in flight to it. This would result in incorrect index search results. The probability of such an error occurring in the field seems very low because of the timing requirements, but nonetheless it should be fixed.

• Fix crash-safety bug with newly-created-or-reset sequences (Tom Lane)

    If ALTER SEQUENCE was executed on a freshly created or reset sequence, and then precisely one
    nextval() call was made on it, and then the server crashed, WAL replay would restore the sequence
    to a state in which it appeared that no nextval() had been done, thus allowing the first sequence value
    to be returned again by the next nextval() call. In particular this could manifest for serial columns,
    since creation of a serial column’s sequence includes an ALTER SEQUENCE OWNED BY step.

• Ensure the backup_label file is fsync’d after pg_start_backup() (Dave Kerr)

• Back-patch 9.1 improvement to compress the fsync request queue (Robert Haas)

    This improves performance during checkpoints. The 9.1 change has now seen enough field testing to
    seem safe to back-patch.

• Only allow autovacuum to be auto-canceled by a directly blocked process (Tom Lane)

    The original coding could allow inconsistent behavior in some cases; in particular, an autovacuum could
    get canceled after less than deadlock_timeout grace period.

• Improve logging of autovacuum cancels (Robert Haas)

• Fix log collector so that log_truncate_on_rotation works during the very first log rotation after
  server start (Tom Lane)

• Fix WITH attached to a nested set operation (UNION/INTERSECT/EXCEPT) (Tom Lane)

• Ensure that a whole-row reference to a subquery doesn’t include any extra GROUP BY or ORDER BY
  columns (Tom Lane)

•Disallow copying whole-row references in CHECK constraints and index definitions during CREATE
  TABLE (Tom Lane)

    This situation can arise in CREATE TABLE with LIKE or INHERITS. The copied whole-row variable
    was incorrectly labeled with the row type of the original table not the new one. Rejecting the case
    seems reasonable for LIKE, since the row types might well diverge later. For INHERITS we should
    ideally allow it, with an implicit coercion to the parent table’s row type; but that will require more work
    than seems safe to back-patch.

• Fix memory leak in ARRAY(SELECT ...) subqueries (Heikki Linnakangas, Tom Lane)

• Fix extraction of common prefixes from regular expressions (Tom Lane)

    The code could get confused by quantified parenthesized subexpressions, such as ^(foo)?bar. This
    would lead to incorrect index optimization of searches for such patterns.

• Fix bugs with parsing signed hh:mm and hh:mm:ss fields in interval constants (Amit Kapila, Tom
  Lane)

• Report errors properly in contrib/xml2’s xslt_process() (Tom Lane)

• Update time zone data files to tzdata release 2012e for DST law changes in Morocco and Tokelau
E.160. Release 8.4.12

Release date: 2012-06-04

This release contains a variety of fixes from 8.4.11. For information about new features in the 8.4 major release, see Section E.172.

E.160.1. Migration to Version 8.4.12

A dump/restore is not required for those running 8.4.X.

However, if you are upgrading from a version earlier than 8.4.10, see Section E.162.

E.160.2. Changes

• Fix incorrect password transformation in contrib/pgcrypto’s DES crypt() function (Solar Designer)
  If a password string contained the byte value 0x80, the remainder of the password was ignored, causing the password to be much weaker than it appeared. With this fix, the rest of the string is properly included in the DES hash. Any stored password values that are affected by this bug will thus no longer match, so the stored values may need to be updated. (CVE-2012-2143)

• Ignore SECURITY DEFINER and SET attributes for a procedural language’s call handler (Tom Lane)
  Applying such attributes to a call handler could crash the server. (CVE-2012-2655)

• Allow numeric timezone offsets in timestamp input to be up to 16 hours away from UTC (Tom Lane)
  Some historical time zones have offsets larger than 15 hours, the previous limit. This could result in dumped data values being rejected during reload.

• Fix timestamp conversion to cope when the given time is exactly the last DST transition time for the current timezone (Tom Lane)
  This oversight has been there a long time, but was not noticed previously because most DST-using zones are presumed to have an indefinite sequence of future DST transitions.

• Fix text to name and char to name casts to perform string truncation correctly in multibyte encodings (Karl Schnaitter)

• Fix memory copying bug in to_tsquery() (Heikki Linnakangas)

• Fix planner’s handling of outer PlaceHolderVars within subqueries (Tom Lane)
  This bug concerns sub-SELECTs that reference variables coming from the nullable side of an outer join of the surrounding query. In 9.1, queries affected by this bug would fail with “ERROR: Upper-level PlaceHolderVar found where not expected”. But in 9.0 and 8.4, you’d silently get possibly-wrong answers, since the value transmitted into the subquery wouldn’t go to null when it should.

• Fix slow session startup when pg_attribute is very large (Tom Lane)
Appendix E. Release Notes

If `pg_attribute` exceeds one-fourth of `shared_buffers`, cache rebuilding code that is sometimes needed during session start would trigger the synchronized-scan logic, causing it to take many times longer than normal. The problem was particularly acute if many new sessions were starting at once.

- Ensure sequential scans check for query cancel reasonably often (Merlin Moncure)
  A scan encountering many consecutive pages that contain no live tuples would not respond to interrupts meanwhile.

- Ensure the Windows implementation of `PGSemaphoreLock()` clears `ImmediateInterruptOK` before returning (Tom Lane)
  This oversight meant that a query-cancel interrupt received later in the same query could be accepted at an unsafe time, with unpredictable but not good consequences.

- Show whole-row variables safely when printing views or rules (Abbas Butt, Tom Lane)
  Corner cases involving ambiguous names (that is, the name could be either a table or column name of the query) were printed in an ambiguous way, risking that the view or rule would be interpreted differently after dump and reload. Avoid the ambiguous case by attaching a no-op cast.

- Fix `COPY FROM` to properly handle null marker strings that correspond to invalid encoding (Tom Lane)
  A null marker string such as `E'\0'` should work, and did work in the past, but the case got broken in 8.4.

- Ensure autovacuum worker processes perform stack depth checking properly (Heikki Linnakangas)
  Previously, infinite recursion in a function invoked by `auto-Analyze` could crash worker processes.

- Fix logging collector to not lose log coherency under high load (Andrew Dunstan)
  The collector previously could fail to reassemble large messages if it got too busy.

- Fix logging collector to ensure it will restart file rotation after receiving SIGHUP (Tom Lane)

- Fix `WAL replay logic for GIN indexes to not fail if the index was subsequently dropped (Tom Lane)`

- Fix memory leak in PL/pgSQL’s `RETURN NEXT` command (Joe Conway)

- Fix PL/pgSQL’s `GET DIAGNOSTICS` command when the target is the function’s first variable (Tom Lane)

- Fix potential access off the end of memory in `psql`’s expanded display (`\x`) mode (Peter Eisentraut)

- Fix several performance problems in `pg_dump` when the database contains many objects (Jeff Janes, Tom Lane)
  `pg_dump` could get very slow if the database contained many schemas, or if many objects are in dependency loops, or if there are many owned sequences.

- Fix `contrib/dblink`’s `dblink_exec()` to not leak temporary database connections upon error (Tom Lane)

- Fix `contrib/dblink` to report the correct connection name in error messages (Kyotaro Horiguchi)

- Update time zone data files to tzdata release 2012c for DST law changes in Antarctica, Armenia, Chile, Cuba, Falkland Islands, Gaza, Haiti, Hebron, Morocco, Syria, and Tokelau Islands; also historical corrections for Canada.
Appendix E. Release Notes

E.161. Release 8.4.11

Release date: 2012-02-27

This release contains a variety of fixes from 8.4.10. For information about new features in the 8.4 major release, see Section E.172.

E.161.1. Migration to Version 8.4.11

A dump/restore is not required for those running 8.4.X.

However, if you are upgrading from a version earlier than 8.4.10, see Section E.162.

E.161.2. Changes

- Require execute permission on the trigger function for CREATE TRIGGER (Robert Haas)
  This missing check could allow another user to execute a trigger function with forged input data, by installing it on a table he owns. This is only of significance for trigger functions marked SECURITY DEFINER, since otherwise trigger functions run as the table owner anyway. (CVE-2012-0866)

- Remove arbitrary limitation on length of common name in SSL certificates (Heikki Linnakangas)
  Both libpq and the server truncated the common name extracted from an SSL certificate at 32 bytes. Normally this would cause nothing worse than an unexpected verification failure, but there are some rather-implausible scenarios in which it might allow one certificate holder to impersonate another. The victim would have to have a common name exactly 32 bytes long, and the attacker would have to persuade a trusted CA to issue a certificate in which the common name has that string as a prefix. Impersonating a server would also require some additional exploit to redirect client connections. (CVE-2012-0867)

- Convert newlines to spaces in names written in pg_dump comments (Robert Haas)
  pg_dump was incautious about sanitizing object names that are emitted within SQL comments in its output script. A name containing a newline would at least render the script syntactically incorrect. Maliciously crafted object names could present a SQL injection risk when the script is reloaded. (CVE-2012-0868)

- Fix btree index corruption from insertions concurrent with vacuuming (Tom Lane)
  An index page split caused by an insertion could sometimes cause a concurrently-running VACUUM to miss removing index entries that it should remove. After the corresponding table rows are removed, the dangling index entries would cause errors (such as “could not read block N in file ...”) or worse, silently wrong query results after unrelated rows are re-inserted at the now-free table locations. This bug has been present since release 8.2, but occurs so infrequently that it was not diagnosed until now. If you have reason to suspect that it has happened in your database, reindexing the affected index will fix things.

- Update per-column permissions, not only per-table permissions, when changing table owner (Tom Lane)
Appendix E. Release Notes

Failure to do this meant that any previously granted column permissions were still shown as having been granted by the old owner. This meant that neither the new owner nor a superuser could revoke the now-untraceable-to-table-owner permissions.

- Allow non-existent values for some settings in `ALTER USER/DATABASE SET` (Heikki Linnakangas)
  Allow `default_text_search_config`, `default_tablespace`, and `temp_tablespaces` to be set to names that are not known. This is because they might be known in another database where the setting is intended to be used, or for the tablespace cases because the tablespace might not be created yet. The same issue was previously recognized for `search_path`, and these settings now act like that one.

- Avoid crashing when we have problems deleting table files post-commit (Tom Lane)
  Dropping a table should lead to deleting the underlying disk files only after the transaction commits. In event of failure then (for instance, because of wrong file permissions) the code is supposed to just emit a warning message and go on, since it’s too late to abort the transaction. This logic got broken as of release 8.4, causing such situations to result in a PANIC and an unrestartable database.

- Track the OID counter correctly during WAL replay, even when it wraps around (Tom Lane)
  Previously the OID counter would remain stuck at a high value until the system exited replay mode. The practical consequences of that are usually nil, but there are scenarios wherein a standby server that’s been promoted to master might take a long time to advance the OID counter to a reasonable value once values are needed.

- Fix regular expression back-references with `*` attached (Tom Lane)
  Rather than enforcing an exact string match, the code would effectively accept any string that satisfies the pattern sub-expression referenced by the back-reference symbol. A similar problem still afflicts back-references that are embedded in a larger quantified expression, rather than being the immediate subject of the quantifier. This will be addressed in a future PostgreSQL release.

- Fix recently-introduced memory leak in processing of `inet/cidr` values (Heikki Linnakangas)
  A patch in the December 2011 releases of PostgreSQL caused memory leakage in these operations, which could be significant in scenarios such as building a btree index on such a column.

- Fix dangling pointer after `CREATE TABLE AS/SELECT INTO` in a SQL-language function (Tom Lane)
  In most cases this only led to an assertion failure in assert-enabled builds, but worse consequences seem possible.

- Avoid double close of file handle in syslogger on Windows (MauMau)
  Ordinarily this error was invisible, but it would cause an exception when running on a debug version of Windows.

- Fix I/O-conversion-related memory leaks in `plpgsql` (Andres Freund, Jan Urbanski, Tom Lane)
  Certain operations would leak memory until the end of the current function.

- Improve `pg_dump`’s handling of inherited table columns (Tom Lane)
  `pg_dump` mishandled situations where a child column has a different default expression than its parent column. If the default is textually identical to the parent’s default, but not actually the same (for instance, because of schema search path differences) it would not be recognized as different, so that after dump
Appendix E. Release Notes

and restore the child would be allowed to inherit the parent’s default. Child columns that are NOT NULL where their parent is not could also be restored subtly incorrectly.

• Fix pg_restore’s direct-to-database mode for INSERT-style table data (Tom Lane)
  Direct-to-database restores from archive files made with --inserts or --column-inserts options fail when using pg_restore from a release dated September or December 2011, as a result of an oversight in a fix for another problem. The archive file itself is not at fault, and text-mode output is okay.

• Allow AT option in ecpg DEALLOCATE statements (Michael Meskes)
  The infrastructure to support this has been there for awhile, but through an oversight there was still an error check rejecting the case.

• Fix error in contrib/intarray’s int[] & int[] operator (Guillaume Lelarge)
  If the smallest integer the two input arrays have in common is 1, and there are smaller values in either array, then 1 would be incorrectly omitted from the result.

• Fix error detection in contrib/pgcrypto’s encrypt_iv() and decrypt_iv() (Marko Kreen)
  These functions failed to report certain types of invalid-input errors, and would instead return random garbage values for incorrect input.

• Fix one-byte buffer overrun in contrib/test_parser (Paul Guyot)
  The code would try to read one more byte than it should, which would crash in corner cases. Since contrib/test_parser is only example code, this is not a security issue in itself, but bad example code is still bad.

• Use __sync_lock_test_and_set() for spinlocks on ARM, if available (Martin Pitt)
  This function replaces our previous use of the SWPB instruction, which is deprecated and not available on ARMv6 and later. Reports suggest that the old code doesn’t fail in an obvious way on recent ARM boards, but simply doesn’t interlock concurrent accesses, leading to bizarre failures in multiprocess operation.

• Use -fexcess-precision=standard option when building with gcc versions that accept it (Andrew Dunstan)
  This prevents assorted scenarios wherein recent versions of gcc will produce creative results.

• Allow use of threaded Python on FreeBSD (Chris Rees)
  Our configure script previously believed that this combination wouldn’t work; but FreeBSD fixed the problem, so remove that error check.

E.162. Release 8.4.10

Release date: 2011-12-05

This release contains a variety of fixes from 8.4.9. For information about new features in the 8.4 major release, see Section E.172.
E.162.1. Migration to Version 8.4.10

A dump/restore is not required for those running 8.4.X.

However, a longstanding error was discovered in the definition of the `information_schema.referential_constraints` view. If you rely on correct results from that view, you should replace its definition as explained in the first changelog item below.

Also, if you are upgrading from a version earlier than 8.4.8, see Section E.164.

E.162.2. Changes

- **Fix bugs in `information_schema.referential_constraints` view (Tom Lane)**
  This view was being insufficiently careful about matching the foreign-key constraint to the depended-on primary or unique key constraint. That could result in failure to show a foreign key constraint at all, or showing it multiple times, or claiming that it depends on a different constraint than the one it really does.

  Since the view definition is installed by initdb, merely upgrading will not fix the problem. If you need to fix this in an existing installation, you can (as a superuser) drop the `information_schema` schema then re-create it by sourcing `SHAREDIR/information_schema.sql`. (Run `pg_config --sharedir` if you're uncertain where `SHAREDIR` is.) This must be repeated in each database to be fixed.

- **Fix incorrect replay of WAL records for GIN index updates (Tom Lane)**
  This could result in transiently failing to find index entries after a crash, or on a hot-standby server. The problem would be repaired by the next `VACUUM` of the index, however.

- **Fix TOAST-related data corruption during `CREATE TABLE dest AS SELECT * FROM src` or `INSERT INTO dest SELECT * FROM src` (Tom Lane)**
  If a table has been modified by `ALTER TABLE ADD COLUMN`, attempts to copy its data verbatim to another table could produce corrupt results in certain corner cases. The problem can only manifest in this precise form in 8.4 and later, but we patched earlier versions as well in case there are other code paths that could trigger the same bug.

- **Fix race condition during toast table access from stale syscache entries (Tom Lane)**
  The typical symptom was transient errors like “missing chunk number 0 for toast value 000000 in `pg_toast_2619`”, where the cited toast table would always belong to a system catalog.

- **Track dependencies of functions on items used in parameter default expressions (Tom Lane)**
  Previously, a referenced object could be dropped without having dropped or modified the function, leading to misbehavior when the function was used. Note that merely installing this update will not fix the missing dependency entries; to do that, you’d need to `CREATE OR REPLACE` each such function afterwards. If you have functions whose defaults depend on non-built-in objects, doing so is recommended.

- **Allow inlining of set-returning SQL functions with multiple OUT parameters (Tom Lane)**

- **Make `DatumGetInetP()` unpack inet datums that have a 1-byte header, and add a new macro, `DatumGetInetPP()`, that does not (Heikki Linnakangas)**
Appendix E. Release Notes

This change affects no core code, but might prevent crashes in add-on code that expects `DatumGetInetP()` to produce an unpacked datum as per usual convention.

- **Improve locale support in money type’s input and output (Tom Lane)**
  Aside from not supporting all standard `lc_monetary` formatting options, the input and output functions were inconsistent, meaning there were locales in which dumped `money` values could not be re-read.

- **Don’t let `transform_null_equals` affect `CASE foo WHEN NULL ...` constructs (Heikki Linnakangas)**
  `transform_null_equals` is only supposed to affect `foo = NULL` expressions written directly by the user, not equality checks generated internally by this form of `CASE`.

- **Change foreign-key trigger creation order to better support self-referential foreign keys (Tom Lane)**
  For a cascading foreign key that references its own table, a row update will fire both the `ON UPDATE` trigger and the `CHECK` trigger as one event. The `ON UPDATE` trigger must execute first, else the `CHECK` will check a non-final state of the row and possibly throw an inappropriate error. However, the firing order of these triggers is determined by their names, which generally sort in creation order since the triggers have auto-generated names following the convention “RI_ConstraintTrigger_NNNN”. A proper fix would require modifying that convention, which we will do in 9.2, but it seems risky to change it in existing releases. So this patch just changes the creation order of the triggers. Users encountering this type of error should drop and re-create the foreign key constraint to get its triggers into the right order.

- **Avoid floating-point underflow while tracking buffer allocation rate (Greg Matthews)**
  While harmless in itself, on certain platforms this would result in annoying kernel log messages.

- **Preserve configuration file name and line number values when starting child processes under Windows (Tom Lane)**
  Formerly, these would not be displayed correctly in the `pg_settings` view.

- **Preserve blank lines within commands in `psql`’s command history (Robert Haas)**
  The former behavior could cause problems if an empty line was removed from within a string literal, for example.

- **Fix pg_dump to dump user-defined casts between auto-generated types, such as table rowtypes (Tom Lane)**

- **Use the preferred version of `xsubpp` to build PL/Perl, not necessarily the operating system’s main copy (David Wheeler and Alex Hunsaker)**

- **Fix incorrect coding in `contrib/dict_int` and `contrib/dict_xsyn` (Tom Lane)**
  Some functions incorrectly assumed that memory returned by `palloc()` is guaranteed zeroed.

- **Honor query cancel interrupts promptly in `pgstatindex()` (Robert Haas)**

- **Ensure `VPATH` builds properly install all server header files (Peter Eisentraut)**

- **Shorten file names reported in verbose error messages (Peter Eisentraut)**
  Regular builds have always reported just the name of the C file containing the error message call, but `VPATH` builds formerly reported an absolute path name.

- **Fix interpretation of Windows timezone names for Central America (Tom Lane)**

2942
Map “Central America Standard Time” to **CST6**, not **CST6CDT**, because DST is generally not observed anywhere in Central America.

- Update time zone data files to tzdata release 2011n for DST law changes in Brazil, Cuba, Fiji, Palestine, Russia, and Samoa; also historical corrections for Alaska and British East Africa.

**E.163. Release 8.4.9**

**Release date:** 2011-09-26

This release contains a variety of fixes from 8.4.8. For information about new features in the 8.4 major release, see Section E.172.

**E.163.1. Migration to Version 8.4.9**

A dump/restore is not required for those running 8.4.X.

However, if you are upgrading from a version earlier than 8.4.8, see Section E.164.

**E.163.2. Changes**

- Fix bugs in indexing of in-doubt HOT-updated tuples (Tom Lane)
  These bugs could result in index corruption after reindexing a system catalog. They are not believed to affect user indexes.

- Fix multiple bugs in GiST index page split processing (Heikki Linnakangas)
  The probability of occurrence was low, but these could lead to index corruption.

- Fix possible buffer overrun in `tsvector_concat()` (Tom Lane)
  The function could underestimate the amount of memory needed for its result, leading to server crashes.

- Fix crash in `xml_recv` when processing a “standalone” parameter (Tom Lane)

- Make `pg_options_to_table` return NULL for an option with no value (Tom Lane)
  Previously such cases would result in a server crash.

- Avoid possibly accessing off the end of memory in `ANALYZE` and in SJIS-2004 encoding conversion (Noah Misch)
  This fixes some very-low-probability server crash scenarios.

- Prevent intermittent hang in interactions of startup process with bgwriter process (Simon Riggs)
  This affected recovery in non-hot-standby cases.

- Fix race condition in relcache init file invalidation (Tom Lane)
There was a window wherein a new backend process could read a stale init file but miss the inval messages that would tell it the data is stale. The result would be bizarre failures in catalog accesses, typically “could not read block 0 in file ...” later during startup.

- Fix memory leak at end of a GiST index scan (Tom Lane)
  Commands that perform many separate GiST index scans, such as verification of a new GiST-based exclusion constraint on a table already containing many rows, could transiently require large amounts of memory due to this leak.
- Fix incorrect memory accounting (leading to possible memory bloat) in tuplestores supporting holdable cursors and plpgsql’s `RETURN NEXT` command (Tom Lane)
- Fix performance problem when constructing a large, lossy bitmap (Tom Lane)
- Fix join selectivity estimation for unique columns (Tom Lane)
  This fixes an erroneous planner heuristic that could lead to poor estimates of the result size of a join.
- Fix nested PlaceHolderVar expressions that appear only in sub-select target lists (Tom Lane)
  This mistake could result in outputs of an outer join incorrectly appearing as NULL.
- Allow nested `EXISTS` queries to be optimized properly (Tom Lane)
- Fix array- and path-creating functions to ensure padding bytes are zeroes (Tom Lane)
  This avoids some situations where the planner will think that semantically-equal constants are not equal, resulting in poor optimization.
- Fix `EXPLAIN` to handle gating Result nodes within inner-indexscan subplans (Tom Lane)
  The usual symptom of this oversight was “bogus varno” errors.
- Work around gcc 4.6.0 bug that breaks WAL replay (Tom Lane)
  This could lead to loss of committed transactions after a server crash.
- Fix dump bug for `VALUES` in a view (Tom Lane)
- Disallow `SELECT FOR UPDATE/SHARE` on sequences (Tom Lane)
  This operation doesn’t work as expected and can lead to failures.
- Fix `VACUUM` so that it always updates `pg_class.relpages` (Tom Lane)
  This fixes some scenarios where autovacuum could make increasingly poor decisions about when to vacuum tables.
- Defend against integer overflow when computing size of a hash table (Tom Lane)
- Fix cases where `CLUSTER` might attempt to access already-removed TOAST data (Tom Lane)
- Fix portability bugs in use of credentials control messages for “peer” authentication (Tom Lane)
- Fix SSPI login when multiple roundtrips are required (Ahmed Shinwari, Magnus Hagander)
  The typical symptom of this problem was “The function requested is not supported” errors during SSPI login.
- Throw an error if `pg_hba.conf` contains `hostssl` but SSL is disabled (Tom Lane)
  This was concluded to be more user-friendly than the previous behavior of silently ignoring such lines.
- Fix typo in `pg_srand48` seed initialization (Andres Freund)
Appendix E. Release Notes

This led to failure to use all bits of the provided seed. This function is not used on most platforms (only those without `srandom`), and the potential security exposure from a less-random-than-expected seed seems minimal in any case.

- Avoid integer overflow when the sum of `LIMIT` and `OFFSET` values exceeds $2^{63}$ (Heikki Linnakangas)
- Add overflow checks to `int4` and `int8` versions of `generate_series()` (Robert Haas)
- Fix trailing-zero removal in `to_char()` (Marti Raudsepp)
  In a format with `FM` and no digit positions after the decimal point, zeroes to the left of the decimal point could be removed incorrectly.
- Fix `pg_size_pretty()` to avoid overflow for inputs close to $2^{63}$ (Tom Lane)
- Weaken plpgsql’s check for typmod matching in record values (Tom Lane)
  An overly enthusiastic check could lead to discarding length modifiers that should have been kept.
- Correctly handle quotes in locale names during initdb (Heikki Linnakangas)
  The case can arise with some Windows locales, such as “People’s Republic of China”.
- Fix `pg_upgrade` to preserve toast tables’ `relfrozenxids` during an upgrade from 8.3 (Bruce Momjian)
  Failure to do this could lead to `pg_clog` files being removed too soon after the upgrade.
- In `pg_ctl`, support silent mode for service registrations on Windows (MauMau)
- Fix `psql`’s counting of script file line numbers during `COPY` from a different file (Tom Lane)
- Fix `pg_restore`’s direct-to-database mode for `standard_conforming_strings` (Tom Lane)
  `pg_restore` could emit incorrect commands when restoring directly to a database server from an archive file that had been made with `standard_conforming_strings` set to `on`.
- Be more user-friendly about unsupported cases for parallel `pg_restore` (Tom Lane)
  This change ensures that such cases are detected and reported before any restore actions have been taken.
- Fix write-past-buffer-end and memory leak in libpq’s LDAP service lookup code (Albe Laurenz)
- In libpq, avoid failures when using nonblocking I/O and an SSL connection (Martin Pihlak, Tom Lane)
- Improve libpq’s handling of failures during connection startup (Tom Lane)
  In particular, the response to a server report of `fork()` failure during SSL connection startup is now saner.
- Improve libpq’s error reporting for SSL failures (Tom Lane)
- Fix `PQsetvalue()` to avoid possible crash when adding a new tuple to a `PGresult` originally obtained from a server query (Andrew Chernow)
- Make `ecpglib` write `double` values with 15 digits precision (Akira Kurosawa)
- In `ecpglib`, be sure `LC_NUMERIC` setting is restored after an error (Michael Meskes)
- Apply upstream fix for blowfish signed-character bug (CVE-2011-2483) (Tom Lane)
  `contrib/pg_crypto`’s blowfish encryption code could give wrong results on platforms where `char` is signed (which is most), leading to encrypted passwords being weaker than they should be.
- Fix memory leak in `contrib/seg` (Heikki Linnakangas)
Appendix E. Release Notes

• Fix pgstatindex() to give consistent results for empty indexes (Tom Lane)
• Allow building with perl 5.14 (Alex Hunsaker)
• Update configure script’s method for probing existence of system functions (Tom Lane)
  The version of autoconf we used in 8.3 and 8.2 could be fooled by compilers that perform link-time optimization.
• Fix assorted issues with build and install file paths containing spaces (Tom Lane)
• Update time zone data files to tzdata release 2011i for DST law changes in Canada, Egypt, Russia, Samoa, and South Sudan.

E.164. Release 8.4.8

Release date: 2011-04-18

This release contains a variety of fixes from 8.4.7. For information about new features in the 8.4 major release, see Section E.172.

E.164.1. Migration to Version 8.4.8

A dump/restore is not required for those running 8.4.X.

However, if your installation was upgraded from a previous major release by running pg_upgrade, you should take action to prevent possible data loss due to a now-fixed bug in pg_upgrade. The recommended solution is to run VACUUM FREEZE on all TOAST tables. More information is available at http://wiki.postgresql.org/wiki/20110408pg_upgrade_fix.

Also, if you are upgrading from a version earlier than 8.4.2, see Section E.170.

E.164.2. Changes

• Fix pg_upgrade’s handling of TOAST tables (Bruce Momjian)
  The pg_class.relrofzenxid value for TOAST tables was not correctly copied into the new installation during pg_upgrade. This could later result in pg_clog files being discarded while they were still needed to validate tuples in the TOAST tables, leading to “could not access status of transaction” failures.
  This error poses a significant risk of data loss for installations that have been upgraded with pg_upgrade. This patch corrects the problem for future uses of pg_upgrade, but does not in itself cure the issue in installations that have been processed with a buggy version of pg_upgrade.
• Suppress incorrect “PD_ALL_VISIBLE flag was incorrectly set” warning (Heikki Linnakangas)
  VACUUM would sometimes issue this warning in cases that are actually valid.

Appendix E. Release Notes

- Disallow including a composite type in itself (Tom Lane)
  This prevents scenarios wherein the server could recurse infinitely while processing the composite type. While there are some possible uses for such a structure, they don’t seem compelling enough to justify the effort required to make sure it always works safely.

- Avoid potential deadlock during catalog cache initialization (Nikhil Sontakke)
  In some cases the cache loading code would acquire share lock on a system index before locking the index’s catalog. This could deadlock against processes trying to acquire exclusive locks in the other, more standard order.

- Fix dangling-pointer problem in BEFORE ROW UPDATE trigger handling when there was a concurrent update to the target tuple (Tom Lane)
  This bug has been observed to result in intermittent “cannot extract system attribute from virtual tuple” failures while trying to do UPDATE RETURNING ctid. There is a very small probability of more serious errors, such as generating incorrect index entries for the updated tuple.

- Disallow DROP TABLE when there are pending deferred trigger events for the table (Tom Lane)
  Formerly the DROP would go through, leading to “could not open relation with OID nnn” errors when the triggers were eventually fired.

- Prevent crash triggered by constant-false WHERE conditions during GEQO optimization (Tom Lane)

- Improve planner’s handling of semi-join and anti-join cases (Tom Lane)

- Fix selectivity estimation for text search to account for NULLs (Jesper Krogh)

- Improve PL/pgSQL’s ability to handle row types with dropped columns (Pavel Stehule)
  This is a back-patch of fixes previously made in 9.0.

- Fix PL/Python memory leak involving array slices (Daniel Popowich)

- Fix pg_restore to cope with long lines (over 1KB) in TOC files (Tom Lane)

- Put in more safeguards against crashing due to division-by-zero with overly enthusiastic compiler optimization (Aurelien Jarno)

- Support use of dlopen() in FreeBSD and OpenBSD on MIPS (Tom Lane)
  There was a hard-wired assumption that this system function was not available on MIPS hardware on these systems. Use a compile-time test instead, since more recent versions have it.

- Fix compilation failures on HP-UX (Heikki Linnakangas)

- Fix version-incompatibility problem with libintl on Windows (Hiroshi Inoue)

- Fix usage of xcopy in Windows build scripts to work correctly under Windows 7 (Andrew Dunstan)
  This affects the build scripts only, not installation or usage.

- Fix path separator used by pg_regress on Cygwin (Andrew Dunstan)

- Update time zone data files to tzdata release 2011f for DST law changes in Chile, Cuba, Falkland Islands, Morocco, Samoa, and Turkey; also historical corrections for South Australia, Alaska, and Hawaii.
Appendix E. Release Notes

E.165. Release 8.4.7

Release date: 2011-01-31

This release contains a variety of fixes from 8.4.6. For information about new features in the 8.4 major release, see Section E.172.

E.165.1. Migration to Version 8.4.7

A dump/restore is not required for those running 8.4.X. However, if you are upgrading from a version earlier than 8.4.2, see Section E.170.

E.165.2. Changes

- Avoid failures when EXPLAIN tries to display a simple-form CASE expression (Tom Lane)
  If the CASE’s test expression was a constant, the planner could simplify the CASE into a form that confused the expression-display code, resulting in “unexpected CASE WHEN clause” errors.

- Fix assignment to an array slice that is before the existing range of subscripts (Tom Lane)
  If there was a gap between the newly added subscripts and the first pre-existing subscript, the code mis-calculated how many entries needed to be copied from the old array’s null bitmap, potentially leading to data corruption or crash.

- Avoid unexpected conversion overflow in planner for very distant date values (Tom Lane)
  The date type supports a wider range of dates than can be represented by the timestamp types, but the planner assumed it could always convert a date to timestamp with impunity.

- Fix pg_restore’s text output for large objects (BLOBs) when standard_conforming_strings is on (Tom Lane)
  Although restoring directly to a database worked correctly, string escaping was incorrect if pg_restore was asked for SQL text output and standard_conforming_strings had been enabled in the source database.

- Fix erroneous parsing of tsquery values containing ... & !(subexpression) | ... (Tom Lane)
  Queries containing this combination of operators were not executed correctly. The same error existed in contrib/intarray’s query_int type and contrib/ltree’s ltxtquery type.

- Fix buffer overrun in contrib/intarray’s input function for the query_int type (Apple)
  This bug is a security risk since the function’s return address could be overwritten. Thanks to Apple Inc’s security team for reporting this issue and supplying the fix. (CVE-2010-4015)

- Fix bug in contrib/seg’s GiST picksplit algorithm (Alexander Korotkov)
  This could result in considerable inefficiency, though not actually incorrect answers, in a GiST index on a seg column. If you have such an index, consider REINDEXing it after installing this update. (This is identical to the bug that was fixed in contrib/cube in the previous update.)
E.166. Release 8.4.6

Release date: 2010-12-16

This release contains a variety of fixes from 8.4.5. For information about new features in the 8.4 major release, see Section E.172.

E.166.1. Migration to Version 8.4.6

A dump/restore is not required for those running 8.4.X. However, if you are upgrading from a version earlier than 8.4.2, see Section E.170.

E.166.2. Changes

- Force the default wal_sync_method to be fdatasync on Linux (Tom Lane, Marti Raudsepp)
  The default on Linux has actually been fdatasync for many years, but recent kernel changes caused PostgreSQL to choose open_datasync instead. This choice did not result in any performance improvement, and caused outright failures on certain filesystems, notably ext4 with the data=journal mount option.
- Fix assorted bugs in WAL replay logic for GIN indexes (Tom Lane)
  This could result in “bad buffer id: 0” failures or corruption of index contents during replication.
- Fix recovery from base backup when the starting checkpoint WAL record is not in the same WAL segment as its redo point (Jeff Davis)
- Fix persistent slowdown of autovacuum workers when multiple workers remain active for a long time (Tom Lane)
  The effective vacuum_cost_limit for an autovacuum worker could drop to nearly zero if it processed enough tables, causing it to run extremely slowly.
- Add support for detecting register-stack overrun on IA64 (Tom Lane)
  The IA64 architecture has two hardware stacks. Full prevention of stack-overrun failures requires checking both.
- Add a check for stack overflow in copyObject() (Tom Lane)
  Certain code paths could crash due to stack overflow given a sufficiently complex query.
- Fix detection of page splits in temporary GiST indexes (Heikki Linnakangas)
  It is possible to have a “concurrent” page split in a temporary index, if for example there is an open cursor scanning the index when an insertion is done. GiST failed to detect this case and hence could deliver wrong results when execution of the cursor continued.
- Fix error checking during early connection processing (Tom Lane)
  The check for too many child processes was skipped in some cases, possibly leading to postmaster crash when attempting to add the new child process to fixed-size arrays.
- Improve efficiency of window functions (Tom Lane)
Appendix E. Release Notes

Certain cases where a large number of tuples needed to be read in advance, but `work_mem` was large enough to allow them all to be held in memory, were unexpectedly slow. `percent_rank()`, `cume_dist()` and `ntile()` in particular were subject to this problem.

- Avoid memory leakage while `ANALYZE`ing complex index expressions (Tom Lane)
- Ensure an index that uses a whole-row Var still depends on its table (Tom Lane)
  
  An index declared like `create index i on t (foo(t.*)` would not automatically get dropped when its table was dropped.
- Do not “inline” a SQL function with multiple `OUT` parameters (Tom Lane)
  
  This avoids a possible crash due to loss of information about the expected result rowtype.
- Behave correctly if `ORDER BY`, `LIMIT`, `FOR UPDATE`, or `WITH` is attached to the `VALUES` part of `INSERT ... VALUES` (Tom Lane)
- Fix constant-folding of `COALESCE()` expressions (Tom Lane)
  
  The planner would sometimes attempt to evaluate sub-expressions that in fact could never be reached, possibly leading to unexpected errors.
- Fix postmaster crash when connection acceptance (`accept()` or one of the calls made immediately after it) fails, and the postmaster was compiled with GSSAPI support (Alexander Chernikov)
- Fix missed unlink of temporary files when `log_temp_files` is active (Tom Lane)
  
  If an error occurred while attempting to emit the log message, the unlink was not done, resulting in accumulation of temp files.
- Add print functionality for `InhRelation` nodes (Tom Lane)
  
  This avoids a failure when `debug_print_parse` is enabled and certain types of query are executed.
- Fix incorrect calculation of distance from a point to a horizontal line segment (Tom Lane)
  
  This bug affected several different geometric distance-measurement operators.
- Fix incorrect calculation of transaction status in `ecpg` (Itagaki Takahiro)
- Fix `PL/pgSQL`’s handling of “simple” expressions to not fail in recursion or error-recovery cases (Tom Lane)
- Fix `PL/Python`’s handling of set-returning functions (Jan Urbanski)
  
  Attempts to call SPI functions within the iterator generating a set result would fail.
- Fix bug in `contrib/cube`’s GiST picksplit algorithm (Alexander Korotkov)
  
  This could result in considerable inefficiency, though not actually incorrect answers, in a GiST index on a `cube` column. If you have such an index, consider `REINDEX`ing it after installing this update.
- Don’t emit “identifier will be truncated” notices in `contrib/dblink` except when creating new connections (Itagaki Takahiro)
- Fix potential coredump on missing public key in `contrib/pgcrypto` (Marti Raudsepp)
- Fix memory leak in `contrib/xml2`’s XPath query functions (Tom Lane)
- Update time zone data files to `tzdata` release 2010o for DST law changes in Fiji and Samoa; also historical corrections for Hong Kong.
Appendix E. Release Notes

E.167. Release 8.4.5

Release date: 2010-10-04
This release contains a variety of fixes from 8.4.4. For information about new features in the 8.4 major release, see Section E.172.

E.167.1. Migration to Version 8.4.5
A dump/restore is not required for those running 8.4.X. However, if you are upgrading from a version earlier than 8.4.2, see Section E.170.

E.167.2. Changes

• Use a separate interpreter for each calling SQL userid in PL/Perl and PL/Tcl (Tom Lane)
  This change prevents security problems that can be caused by subverting Perl or Tcl code that will be executed later in the same session under another SQL user identity (for example, within a SECURITY DEFINER function). Most scripting languages offer numerous ways that that might be done, such as redefining standard functions or operators called by the target function. Without this change, any SQL user with Perl or Tcl language usage rights can do essentially anything with the SQL privileges of the target function’s owner.
  The cost of this change is that intentional communication among Perl and Tcl functions becomes more difficult. To provide an escape hatch, PL/PerlU and PL/TclU functions continue to use only one interpreter per session. This is not considered a security issue since all such functions execute at the trust level of a database superuser already.
  It is likely that third-party procedural languages that claim to offer trusted execution have similar security issues. We advise contacting the authors of any PL you are depending on for security-critical purposes.
  Our thanks to Tim Bunce for pointing out this issue (CVE-2010-3433).

• Prevent possible crashes in pg_get_expr() by disallowing it from being called with an argument that is not one of the system catalog columns it’s intended to be used with (Heikki Linnakangas, Tom Lane)

• Treat exit code 128 (ERROR_WAIT_NO_CHILDREN) as non-fatal on Windows (Magnus Hagander)
  Under high load, Windows processes will sometimes fail at startup with this error code. Formerly the postmaster treated this as a panic condition and restarted the whole database, but that seems to be an overreaction.

• Fix incorrect placement of placeholder evaluation (Tom Lane)
  This bug could result in query outputs being non-null when they should be null, in cases where the inner side of an outer join is a sub-select with non-strict expressions in its output list.

• Fix possible duplicate scans of UNION ALL member relations (Tom Lane)

• Fix “cannot handle unplanned sub-select” error (Tom Lane)
This occurred when a sub-select contains a join alias reference that expands into an expression containing another sub-select.

- Fix mishandling of whole-row Vars that reference a view or sub-select and appear within a nested sub-select (Tom Lane)
- Fix mishandling of cross-type IN comparisons (Tom Lane)
  This could result in failures if the planner tried to implement an IN join with a sort-then-unique-then-plain-join plan.
- Fix computation of ANALYZE statistics for tsvector columns (Jan Urbanski)
  The original coding could produce incorrect statistics, leading to poor plan choices later.
- Improve planner’s estimate of memory used by array_agg(), string_agg(), and similar aggregate functions (Hitoshi Harada)
  The previous drastic underestimate could lead to out-of-memory failures due to inappropriate choice of a hash-aggregation plan.
- Fix failure to mark cached plans as transient (Tom Lane)
  If a plan is prepared while CREATE INDEX CONCURRENTLY is in progress for one of the referenced tables, it is supposed to be re-planned once the index is ready for use. This was not happening reliably.
- Reduce PANIC to ERROR in some occasionally-reported btree failure cases, and provide additional detail in the resulting error messages (Tom Lane)
  This should improve the system’s robustness with corrupted indexes.
- Fix incorrect search logic for partial-match queries with GIN indexes (Tom Lane)
  Cases involving AND/OR combination of several GIN index conditions didn’t always give the right answer, and were sometimes much slower than necessary.
- Prevent show_session_authorization() from crashing within autovacuum processes (Tom Lane)
- Defend against functions returning setof record where not all the returned rows are actually of the same rowtype (Tom Lane)
- Fix possible corruption of pending trigger event lists during subtransaction rollback (Tom Lane)
  This could lead to a crash or incorrect firing of triggers.
- Fix possible failure when hashing a pass-by-reference function result (Tao Ma, Tom Lane)
- Improve merge join’s handling of NULLs in the join columns (Tom Lane)
  A merge join can now stop entirely upon reaching the first NULL, if the sort order is such that NULLs sort high.
- Take care to fsync the contents of lockfiles (both postmaster.pid and the socket lockfile) while writing them (Tom Lane)
  This omission could result in corrupted lockfile contents if the machine crashes shortly after postmaster start. That could in turn prevent subsequent attempts to start the postmaster from succeeding, until the lockfile is manually removed.
- Avoid recursion while assigning XIDs to heavily-nested subtransactions (Andres Freund, Robert Haas)
  The original coding could result in a crash if there was limited stack space.
Appendix E. Release Notes

- Avoid holding open old WAL segments in the walwriter process (Magnus Hagander, Heikki Linnakan-gas)
  The previous coding would prevent removal of no-longer-needed segments.
- Fix log_line_prefix's %i escape, which could produce junk early in backend startup (Tom Lane)
- Prevent misinterpretation of partially-specified relation options for TOAST tables (Itagaki Takahiro)
  In particular, fillfactor would be read as zero if any other reloption had been set for the table, leading to serious bloat.
- Fix inheritance count tracking in ALTER TABLE ... ADD CONSTRAINT (Robert Haas)
- Fix possible data corruption in ALTER TABLE ... SET TABLESPACE when archiving is enabled (Jeff Davis)
- Allow CREATE DATABASE and ALTER DATABASE ... SET TABLESPACE to be interrupted by query-cancel (Guillaume Lelarge)
- Improve CREATE INDEX's checking of whether proposed index expressions are immutable (Tom Lane)
- Fix REASSIGN OWNED to handle operator classes and families (Asko Tiidumaa)
- Fix possible core dump when comparing two empty tsquery values (Tom Lane)
- Fix LIKE's handling of patterns containing % followed by _ (Tom Lane)
  We've fixed this before, but there were still some incorrectly-handled cases.
- Re-allow input of Julian dates prior to 0001-01-01 AD (Tom Lane)
  Input such as ‘J100000’::date worked before 8.4, but was unintentionally broken by added error-checking.
- Fix PL/pgSQL to throw an error, not crash, if a cursor is closed within a FOR loop that is iterating over that cursor (Heikki Linnakangas)
- In PL/Python, defend against null pointer results from PyCObject_AsVoidPtr and PyCObject_FromVoidPtr (Peter Eisentraut)
- In libpq, fix full SSL certificate verification for the case where both host and hostaddr are specified (Tom Lane)
- Make psql recognize DISCARD ALL as a command that should not be encased in a transaction block in autocommit-off mode (Itagaki Takahiro)
- Fix some issues in pg_dump's handling of SQL/MED objects (Tom Lane)
  Notably, pg_dump would always fail if run by a non-superuser, which was not intended.
- Improve pg_dump and pg_restore's handling of non-seekable archive files (Tom Lane, Robert Haas)
  This is important for proper functioning of parallel restore.
- Improve parallel pg_restore's ability to cope with selective restore (-L option) (Tom Lane)
  The original code tended to fail if the -L file commanded a non-default restore ordering.
- Fix ecpg to process data from RETURNING clauses correctly (Michael Meskes)
- Fix some memory leaks in ecpg (Zoltan Boszormenyi)
- Improve contrib/dblink's handling of tables containing dropped columns (Tom Lane)
Appendix E. Release Notes

- Fix connection leak after “duplicate connection name” errors in contrib/dblink (Itagaki Takahiro)
- Fix contrib/dblink to handle connection names longer than 62 bytes correctly (Itagaki Takahiro)
- Add hstore(text, text) function to contrib/hstore (Robert Haas)
  This function is the recommended substitute for the now-deprecated => operator. It was back-patched so that future-proofed code can be used with older server versions. Note that the patch will be effective only after contrib/hstore is installed or reinstalled in a particular database. Users might prefer to execute the CREATE FUNCTION command by hand, instead.
- Update build infrastructure and documentation to reflect the source code repository’s move from CVS to Git (Magnus Hagander and others)
- Update time zone data files to tzdata release 2010l for DST law changes in Egypt and Palestine; also historical corrections for Finland.
  This change also adds new names for two Micronesian timezones: Pacific/Chuuk is now preferred over Pacific/Truk (and the preferred abbreviation is CHUT not TRUT) and Pacific/Pohnpei is preferred over Pacific/Ponape.
- Make Windows’ “N. Central Asia Standard Time” timezone map to Asia/Novosibirsk, not Asia/Almaty (Magnus Hagander)
  Microsoft changed the DST behavior of this zone in the timezone update from KB976098. Asia/Novosibirsk is a better match to its new behavior.

E.168. Release 8.4.4

Release date: 2010-05-17

This release contains a variety of fixes from 8.4.3. For information about new features in the 8.4 major release, see Section E.172.

E.168.1. Migration to Version 8.4.4

A dump/restore is not required for those running 8.4.X. However, if you are upgrading from a version earlier than 8.4.2, see Section E.170.

E.168.2. Changes

- Enforce restrictions in plperl using an opmask applied to the whole interpreter, instead of using Safe.pm (Tim Bunce, Andrew Dunstan)
  Recent developments have convinced us that Safe.pm is too insecure to rely on for making plperl trustable. This change removes use of Safe.pm altogether, in favor of using a separate interpreter with an opcode mask that is always applied. Pleasant side effects of the change include that it is now possible to use Perl’s strict pragma in a natural way in plperl, and that Perl’s $a and $b variables work as expected in sort routines, and that function compilation is significantly faster. (CVE-2010-1169)
• Prevent PL/Tcl from executing untrustworthy code from `pltcl_modules` (Tom)

PL/Tcl’s feature for autoloading Tcl code from a database table could be exploited for trojan-horse attacks, because there was no restriction on who could create or insert into that table. This change disables the feature unless `pltcl_modules` is owned by a superuser. (However, the permissions on the table are not checked, so installations that really need a less-than-secure modules table can still grant suitable privileges to trusted non-superusers.) Also, prevent loading code into the unrestricted “normal” Tcl interpreter unless we are really going to execute a `pltclu` function. (CVE-2010-1170)

• Fix data corruption during WAL replay of `ALTER ... SET TABLESPACE` (Tom)

When `archive_mode` is on, `ALTER ... SET TABLESPACE` generates a WAL record whose replay logic was incorrect. It could write the data to the wrong place, leading to possibly-unrecoverable data corruption. Data corruption would be observed on standby slaves, and could occur on the master as well if a database crash and recovery occurred after committing the `ALTER` and before the next checkpoint.

• Fix possible crash if a cache reset message is received during rebuild of a relcache entry (Heikki)

This error was introduced in 8.4.3 while fixing a related failure.

• Apply per-function GUC settings while running the language validator for the function (Itagaki Takahiro)

This avoids failures if the function’s code is invalid without the setting; an example is that SQL functions may not parse if the `search_path` is not correct.

• Do constraint exclusion for inherited UPDATE and DELETE target tables when `constraint_exclusion = partition` (Tom)

Due to an oversight, this setting previously only caused constraint exclusion to be checked in SELECT commands.

• Do not allow an unprivileged user to reset superuser-only parameter settings (Alvaro)

Previously, if an unprivileged user ran `ALTER USER ... RESET ALL` for himself, or `ALTER DATABASE ... RESET ALL` for a database he owns, this would remove all special parameter settings for the user or database, even ones that are only supposed to be changeable by a superuser. Now, the `ALTER` will only remove the parameters that the user has permission to change.

• Avoid possible crash during backend shutdown if shutdown occurs when a CONTEXT addition would be made to log entries (Tom)

In some cases the context-printing function would fail because the current transaction had already been rolled back when it came time to print a log message.

• Fix erroneous handling of `%r` parameter in `recovery_end_command` (Heikki)

The value always came out zero.

• Ensure the archiver process responds to changes in `archive_command` as soon as possible (Tom)

• Fix pl/pgsql’s `CASE` statement to not fail when the case expression is a query that returns no rows (Tom)

• Update pl/perl’s `ppport.h` for modern Perl versions (Andrew)

• Fix assorted memory leaks in pl/python (Andreas Freund, Tom)

• Handle empty-string connect parameters properly in ecpg (Michael)

• Prevent infinite recursion in psql when expanding a variable that refers to itself (Tom)
Appendix E. Release Notes

- Fix psql's `\copy` to not add spaces around a dot within `\copy (select ...)` (Tom)
  
  Addition of spaces around the decimal point in a numeric literal would result in a syntax error.

- Avoid formatting failure in psql when running in a locale context that doesn’t match the `client_encoding` (Tom)

- Fix unnecessary “GIN indexes do not support whole-index scans” errors for unsatisfiable queries using `contrib/intarray` operators (Tom)

- Ensure that `contrib/pgstattuple` functions respond to cancel interrupts promptly (Tatsuhito Kashiwara)

- Make server startup deal properly with the case that `shmget()` returns `EINVAL` for an existing shared memory segment (Tom)
  
  This behavior has been observed on BSD-derived kernels including OS X. It resulted in an entirely misleading startup failure complaining that the shared memory request size was too large.

- Avoid possible crashes in syslogger process on Windows (Heikki)

- Deal more robustly with incomplete time zone information in the Windows registry (Magnus)

- Update the set of known Windows time zone names (Magnus)

- Update time zone data files to tzdata release 2010j for DST law changes in Argentina, Australian Antarctic, Bangladesh, Mexico, Morocco, Pakistan, Palestine, Russia, Syria, Tunisia; also historical corrections for Taiwan.
  
  Also, add `PKST` (Pakistan Summer Time) to the default set of timezone abbreviations.

## E.169. Release 8.4.3

**Release date:** 2010-03-15

This release contains a variety of fixes from 8.4.2. For information about new features in the 8.4 major release, see Section E.172.

### E.169.1. Migration to Version 8.4.3

A dump/restore is not required for those running 8.4.X. However, if you are upgrading from a version earlier than 8.4.2, see Section E.170.

### E.169.2. Changes

- Add new configuration parameter `ssl_renegotiation_limit` to control how often we do session key renegotiation for an SSL connection (Magnus)
  
  This can be set to zero to disable renegotiation completely, which may be required if a broken SSL library is used. In particular, some vendors are shipping stopgap patches for CVE-2009-3555 that cause renegotiation attempts to fail.
• Fix possible deadlock during backend startup (Tom)
• Fix possible crashes due to not handling errors during relcache reload cleanly (Tom)
• Fix possible crash due to use of dangling pointer to a cached plan (Tatsuo)
• Fix possible crash due to overenthusiastic invalidation of cached plan for ROLLBACK (Tom)
• Fix possible crashes when trying to recover from a failure in subtransaction start (Tom)
• Fix server memory leak associated with use of savepoints and a client encoding different from server’s encoding (Tom)
• Fix incorrect WAL data emitted during end-of-recovery cleanup of a GIST index page split (Yoichi Hirai)
  This would result in index corruption, or even more likely an error during WAL replay, if we were unlucky enough to crash during end-of-recovery cleanup after having completed an incomplete GIST insertion.
• Fix bug in WAL redo cleanup method for GIN indexes (Heikki)
• Fix incorrect comparison of scan key in GIN index search (Teodor)
• Make substring() for bit types treat any negative length as meaning “all the rest of the string” (Tom)
  The previous coding treated only -1 that way, and would produce an invalid result value for other negative values, possibly leading to a crash (CVE-2010-0442).
• Fix integer-to-bit-string conversions to handle the first fractional byte correctly when the output bit width is wider than the given integer by something other than a multiple of 8 bits (Tom)
• Fix some cases of pathologically slow regular expression matching (Tom)
• Fix bug occurring when trying to inline a SQL function that returns a set of a composite type that contains dropped columns (Tom)
• Fix bug with trying to update a field of an element of a composite-type array column (Tom)
• Avoid failure when EXPLAIN has to print a FieldStore or assignment ArrayRef expression (Tom)
  These cases can arise now that EXPLAIN VERBOSE tries to print plan node target lists.
• Avoid an unnecessary coercion failure in some cases where an undecorated literal string appears in a subquery within UNION/INTERSECT/EXCEPT (Tom)
  This fixes a regression for some cases that worked before 8.4.
• Avoid undesirable rowtype compatibility check failures in some cases where a whole-row Var has a rowtype that contains dropped columns (Tom)
• Fix the STOP WAL LOCATION entry in backup history files to report the next WAL segment’s name when the end location is exactly at a segment boundary (Itagaki Takahiro)
• Always pass the catalog ID to an option validator function specified in CREATE FOREIGN DATA WRAPPER (Martin Pihlak)
• Fix some more cases of temporary-file leakage (Heikki)
  This corrects a problem introduced in the previous minor release. One case that failed is when a plpgsql function returning set is called within another function’s exception handler.
Appendix E. Release Notes

- Add support for doing **FULL JOIN ON FALSE** (Tom)
  This prevents a regression from pre-8.4 releases for some queries that can now be simplified to a constant-false join condition.

- Improve constraint exclusion processing of boolean-variable cases, in particular make it possible to exclude a partition that has a “bool_column = false” constraint (Tom)

- Prevent treating an **INOUT** cast as representing binary compatibility (Heikki)

- Include column name in the message when warning about inability to grant or revoke column-level privileges (Stephen Frost)
  This is more useful than before and helps to prevent confusion when a **REVOKE** generates multiple messages, which formerly appeared to be duplicates.

- When reading **pg_hba.conf** and related files, do not treat @something as a file inclusion request if the @ appears inside quote marks; also, never treat @ by itself as a file inclusion request (Tom)
  This prevents erratic behavior if a role or database name starts with @. If you need to include a file whose path name contains spaces, you can still do so, but you must write @"/path to/file" rather than putting the quotes around the whole construct.

- Prevent infinite loop on some platforms if a directory is named as an inclusion target in **pg_hba.conf** and related files (Tom)

- Fix possible infinite loop if **SSL_read** or **SSL_write** fails without setting **errno** (Tom)
  This is reportedly possible with some Windows versions of openssl.

- Disallow GSSAPI authentication on local connections, since it requires a hostname to function correctly (Magnus)

- Protect ecpg against applications freeing strings unexpectedly (Michael)

- Make ecpg report the proper SQLSTATE if the connection disappears (Michael)

- Fix translation of cell contents in psql \d output (Heikki)

- Fix **psql**’s numericlocale option to not format strings it shouldn’t in latex and troff output formats (Heikki)

- Fix a small per-query memory leak in psql (Tom)

- Make psql return the correct exit status (3) when **ON_ERROR_STOP** and **--single-transaction** are both specified and an error occurs during the implied **COMMIT** (Bruce)

- Fix **pg_dump**’s output of permissions for foreign servers (Heikki)

- Fix possible crash in parallel pg_restore due to out-of-range dependency IDs (Tom)

- Fix plpgsql failure in one case where a composite column is set to NULL (Tom)

- Fix possible failure when calling PL/Perl functions from PL/PerlU or vice versa (Tim Bunce)

- Add **volatile** markings in PL/Python to avoid possible compiler-specific misbehavior (Zdenek Kotala)

- Ensure PL/Tcl initializes the Tcl interpreter fully (Tom)
  The only known symptom of this oversight is that the Tcl **clock** command misbehaves if using Tcl 8.5 or later.
Appendix E. Release Notes

• Prevent ExecutorEnd from being run on portals created within a failed transaction or subtransaction (Tom)

  This is known to cause issues when using contrib/auto_explain.

• Prevent crash in contrib/dblink when too many key columns are specified to a dblink_build_sql_* function (Rushabh Lathia, Joe Conway)

• Allow zero-dimensional arrays in contrib/ltree operations (Tom)

  This case was formerly rejected as an error, but it’s more convenient to treat it the same as a zero-element array. In particular this avoids unnecessary failures when an ltree operation is applied to the result of ARRAY(SELECT ...) and the sub-select returns no rows.

• Fix assorted crashes in contrib/xml2 caused by sloppy memory management (Tom)

• Make building of contrib/xml2 more robust on Windows (Andrew)

• Fix race condition in Windows signal handling (Radu Ilie)

  One known symptom of this bug is that rows in pg_listener could be dropped under heavy load.

• Make the configure script report failure if the C compiler does not provide a working 64-bit integer datatype (Tom)

  This case has been broken for some time, and no longer seems worth supporting, so just reject it at configure time instead.

• Update time zone data files to tzdata release 2010e for DST law changes in Bangladesh, Chile, Fiji, Mexico, Paraguay, Samoa.

E.170. Release 8.4.2

Release date: 2009-12-14

This release contains a variety of fixes from 8.4.1. For information about new features in the 8.4 major release, see Section E.172.

E.170.1. Migration to Version 8.4.2

A dump/restore is not required for those running 8.4.X. However, if you have any hash indexes, you should REINDEX them after updating to 8.4.2, to repair possible damage.

E.170.2. Changes

• Protect against indirect security threats caused by index functions changing session-local state (Gurjeet Singh, Tom)

  This change prevents allegedly-immutable index functions from possibly subverting a superuser’s session (CVE-2009-4136).
Appendix E. Release Notes

- Reject SSL certificates containing an embedded null byte in the common name (CN) field (Magnus)
  This prevents unintended matching of a certificate to a server or client name during SSL validation (CVE-2009-4034).
- Fix hash index corruption (Tom)
  The 8.4 change that made hash indexes keep entries sorted by hash value failed to update the bucket splitting and compaction routines to preserve the ordering. So application of either of those operations could lead to permanent corruption of an index, in the sense that searches might fail to find entries that are present. To deal with this, it is recommended to REINDEX any hash indexes you may have after installing this update.
- Fix possible crash during backend-startup-time cache initialization (Tom)
- Avoid crash on empty thesaurus dictionary (Tom)
- Prevent signals from interrupting VACUUM at unsafe times (Alvaro)
  This fix prevents a PANIC if a VACUUM FULL is canceled after it’s already committed its tuple movements, as well as transient errors if a plain VACUUM is interrupted after having truncated the table.
- Fix possible crash due to integer overflow in hash table size calculation (Tom)
  This could occur with extremely large planner estimates for the size of a hashjoin’s result.
- Fix crash if a DROP is attempted on an internally-dependent object (Tom)
- Fix very rare crash in inet/cidr comparisons (Chris Mikkelson)
- Ensure that shared tuple-level locks held by prepared transactions are not ignored (Heikki)
- Fix premature drop of temporary files used for a cursor that is accessed within a subtransaction (Heikki)
- Fix memory leak in syslogger process when rotating to a new CSV logfile (Tom)
- Fix Windows permission-downgrade logic (Jesse Morris)
  This fixes some cases where the database failed to start on Windows, often with misleading error messages such as “could not locate matching postgres executable”.
- Make FOR UPDATE/SHARE in the primary query not propagate into WITH queries (Tom)
  For example, in
  ```sql
  WITH w AS (SELECT * FROM foo) SELECT * FROM w, bar ... FOR UPDATE
  the FOR UPDATE will now affect bar but not foo. This is more useful and consistent than the original 8.4 behavior, which tried to propagate FOR UPDATE into the WITH query but always failed due to assorted implementation restrictions. It also follows the design rule that WITH queries are executed as if independent of the main query.
  ```
- Fix bug with a WITH RECURSIVE query immediately inside another one (Tom)
- Fix concurrency bug in hash indexes (Tom)
  Concurrent insertions could cause index scans to transiently report wrong results.
- Fix incorrect logic for GiST index page splits, when the split depends on a non-first column of the index (Paul Ramsey)
- Fix wrong search results for a multi-column GIN index with fastupdate enabled (Teodor)
Appendix E. Release Notes

- Fix bugs in WAL entry creation for GIN indexes (Tom)
  These bugs were masked when `full_page_writes` was on, but with it off a WAL replay failure was certain if a crash occurred before the next checkpoint.

- Don’t error out if recycling or removing an old WAL file fails at the end of checkpoint (Heikki)
  It’s better to treat the problem as non-fatal and allow the checkpoint to complete. Future checkpoints will retry the removal. Such problems are not expected in normal operation, but have been seen to be caused by misdesigned Windows anti-virus and backup software.

- Ensure WAL files aren’t repeatedly archived on Windows (Heikki)
  This is another symptom that could happen if some other process interfered with deletion of a no-longer-needed file.

- Fix PAM password processing to be more robust (Tom)
  The previous code is known to fail with the combination of the Linux `pam_krb5` PAM module with Microsoft Active Directory as the domain controller. It might have problems elsewhere too, since it was making unjustified assumptions about what arguments the PAM stack would pass to it.

- Raise the maximum authentication token (Kerberos ticket) size in GSSAPI and SSPI authentication methods (Ian Turner)
  While the old 2000-byte limit was more than enough for Unix Kerberos implementations, tickets issued by Windows Domain Controllers can be much larger.

- Ensure that domain constraints are enforced in constructs like `ARRAY[...]:domain`, where the domain is over an array type (Heikki)

- Fix foreign-key logic for some cases involving composite-type columns as foreign keys (Tom)

- Ensure that a cursor’s snapshot is not modified after it is created (Alvaro)
  This could lead to a cursor delivering wrong results if later operations in the same transaction modify the data the cursor is supposed to return.

- Fix `CREATE TABLE` to properly merge default expressions coming from different inheritance parent tables (Tom)
  This used to work but was broken in 8.4.

- Re-enable collection of access statistics for sequences (Akira Kurosawa)
  This used to work but was broken in 8.3.

- Fix processing of ownership dependencies during `CREATE OR REPLACE FUNCTION` (Tom)

- Fix incorrect handling of `WHERE x=x` conditions (Tom)
  In some cases these could get ignored as redundant, but they aren’t — they’re equivalent to `x IS NOT NULL`.

- Fix incorrect plan construction when using hash aggregation to implement `DISTINCT` for textually identical volatile expressions (Tom)

- Fix Assert failure for a volatile `SELECT DISTINCT ON` expression (Tom)

- Fix `ts_stat()` to not fail on an empty `tsvector` value (Tom)

- Make text search parser accept underscores in XML attributes (Peter)
Appendix E. Release Notes

- Fix encoding handling in xml binary input (Heikki)
  If the XML header doesn’t specify an encoding, we now assume UTF-8 by default; the previous handling was inconsistent.

- Fix bug with calling plperl from plperlu or vice versa (Tom)
  An error exit from the inner function could result in crashes due to failure to re-select the correct Perl interpreter for the outer function.

- Fix session-lifespan memory leak when a PL/Perl function is redefined (Tom)

- Ensure that Perl arrays are properly converted to PostgreSQL arrays when returned by a set-returning PL/Perl function (Andrew Dunstan, Abhijit Menon-Sen)
  This worked correctly already for non-set-returning functions.

- Fix rare crash in exception processing in PL/Python (Peter)

- Fix ecpg problem with comments in DECLARE CURSOR statements (Michael)

- Fix ecpg to not treat recently-added keywords as reserved words (Tom)
  This affected the keywords CALLED, CATALOG, DEFINER, ENUM, FOLLOWING, INVOKER, OPTIONS, PARTITION, PRECEDING, RANGE, SECURITY, SERVER, UNBOUNDED, and WRAPPER.

- Re-allow regular expression special characters in psql’s \df function name parameter (Tom)

- In contrib/fuzzystrmatch, correct the calculation of levenshtein distances with non-default costs (Marcin Mank)

- In contrib/pg_standby, disable triggering failover with a signal on Windows (Fujii Masao)
  This never did anything useful, because Windows doesn’t have Unix-style signals, but recent changes made it actually crash.

- Put FREEZE and VERBOSE options in the right order in the VACUUM command that contrib/vacuumdb produces (Heikki)

- Fix possible leak of connections when contrib/dblink encounters an error (Tatsuhito Kasahara)

- Ensure psql’s flex module is compiled with the correct system header definitions (Tom)
  This fixes build failures on platforms where --enable-largefile causes incompatible changes in the generated code.

- Make the postmaster ignore any application_name parameter in connection request packets, to improve compatibility with future libpq versions (Tom)

- Update the timezone abbreviation files to match current reality (Joachim Wieland)
  This includes adding IDT to the default timezone abbreviation set.

- Update time zone data files to tzdata release 2009s for DST law changes in Antarctica, Argentina, Bangladesh, Fiji, Novokuznetsk, Pakistan, Palestine, Samoa, Syria; also historical corrections for Hong Kong.
E.171. Release 8.4.1

Release date: 2009-09-09

This release contains a variety of fixes from 8.4. For information about new features in the 8.4 major release, see Section E.172.

E.171.1. Migration to Version 8.4.1

A dump/restore is not required for those running 8.4.X.

E.171.2. Changes

- Fix WAL page header initialization at the end of archive recovery (Heikki)
  This could lead to failure to process the WAL in a subsequent archive recovery.
- Fix “cannot make new WAL entries during recovery” error (Tom)
- Fix problem that could make expired rows visible after a crash (Tom)
  This bug involved a page status bit potentially not being set correctly after a server crash.
- Disallow **RESET ROLE** and **RESET SESSION AUTHORIZATION** inside security-definer functions (Tom, Heikki)
  This covers a case that was missed in the previous patch that disallowed **SET ROLE** and **SET SESSION AUTHORIZATION** inside security-definer functions. (See CVE-2007-6600)
- Make **LOAD** of an already-loaded loadable module into a no-op (Tom)
  Formerly, **LOAD** would attempt to unload and re-load the module, but this is unsafe and not all that useful.
- Make window function **PARTITION BY** and **ORDER BY** items always be interpreted as simple expressions (Tom)
  In 8.4.0 these lists were parsed following the rules used for top-level **GROUP BY** and **ORDER BY** lists. But this was not correct per the SQL standard, and it led to possible circularity.
- Fix several errors in planning of semi-joins (Tom)
  These led to wrong query results in some cases where **IN** or **EXISTS** was used together with another join.
- Fix handling of whole-row references to subqueries that are within an outer join (Tom)
  An example is **SELECT COUNT(ss.*) FROM ... LEFT JOIN (SELECT ...) ss ON ...**. Here, **ss.* would be treated as ROW(NULL,NULL,...)** for null-extended join rows, which is not the same as a simple NULL. Now it is treated as a simple NULL.
- Fix Windows shared-memory allocation code (Tsutomu Yamada, Magnus)
  This bug led to the often-reported “could not reattach to shared memory” error message.
- Fix locale handling with pprperl (Heikki)
This bug could cause the server’s locale setting to change when a plperl function is called, leading to
data corruption.

- Fix handling of reloptions to ensure setting one option doesn’t force default values for others (Itagaki
  Takahiro)
- Ensure that a “fast shutdown” request will forcibly terminate open sessions, even if a “smart shutdown”
  was already in progress (Fujii Masao)
- Avoid memory leak for `array_agg()` in GROUP BY queries (Tom)
- Treat `to_char(..., 'TH')` as an uppercase ordinal suffix with ‘HH’/’HH12’ (Heikki)
  It was previously handled as ‘th’ (lowercase).
- Include the fractional part in the result of `EXTRACT(second)` and `EXTRACT(milliseconds)` for
  time and time with time zone inputs (Tom)
  This has always worked for floating-point datetime configurations, but was broken in the integer date-
time code.
- Fix overflow for INTERVAL ‘x ms’ when x is more than 2 million and integer datetimes are in use
  (Alex Hunsaker)
- Improve performance when processing toasted values in index scans (Tom)
  This is particularly useful for PostGIS5.
- Fix a typo that disabled `commit_delay` (Jeff Janes)
- Output early-startup messages to `postmaster.log` if the server is started in silent mode (Tom)
  Previously such error messages were discarded, leading to difficulty in debugging.
- Remove translated FAQs (Peter)
  They are now on the wiki6. The main FAQ was moved to the wiki some time ago.
- Fix `pg_ctl` to not go into an infinite loop if `postgresql.conf` is empty (Jeff Davis)
- Fix several errors in `pg_dump`’s `--binary-upgrade` mode (Bruce, Tom)
  `pg_dump --binary-upgrade` is used by `pg_migrator`.
- Fix `contrib/xml2`’s `xslt_process()` to properly handle the maximum number of parameters
  (twenty) (Tom)
- Improve robustness of `libpq`’s code to recover from errors during `COPY FROM STDIN` (Tom)
- Avoid including conflicting readline and editline header files when both libraries are installed (Zdenek
  Kotala)
- Work around gcc bug that causes “floating-point exception” instead of “division by zero” on some
  platforms (Tom)
- Update time zone data files to `tzdata` release 2009l for DST law changes in Bangladesh, Egypt, Mauri-
tius.

5. http://postgis.net/
E.172. Release 8.4

Release date: 2009-07-01

E.172.1. Overview

After many years of development, PostgreSQL has become feature-complete in many areas. This release shows a targeted approach to adding features (e.g., authentication, monitoring, space reuse), and adds capabilities defined in the later SQL standards. The major areas of enhancement are:

- Windowing Functions
- Common Table Expressions and Recursive Queries
- Default and variadic parameters for functions
- Parallel Restore
- Column Permissions
- Per-database locale settings
- Improved hash indexes
- Improved join performance for `EXISTS` and `NOT EXISTS` queries
- Easier-to-use Warm Standby
- Automatic sizing of the Free Space Map
- Visibility Map (greatly reduces vacuum overhead for slowly-changing tables)
- Version-aware psql (backslash commands work against older servers)
- Support SSL certificates for user authentication
- Per-function runtime statistics
- Easy editing of functions in psql
- New contrib modules: `pg_stat_statements`, `auto_explain`, `citext`, `btree_gin`

The above items are explained in more detail in the sections below.

E.172.2. Migration to Version 8.4

A dump/restore using `pg_dump` is required for those wishing to migrate data from any previous release. Observe the following incompatibilities:

E.172.2.1. General

- Use 64-bit integer datetimes by default (Neil Conway)
  
  Previously this was selected by `configure`'s `--enable-integer-datetimes` option. To retain the old behavior, build with `--disable-integer-datetimes`.
Appendix E. Release Notes

• Remove ipcclean utility command (Bruce)
  The utility only worked on a few platforms. Users should use their operating system tools instead.

E.172.2.2. Server Settings

• Change default setting for log_min_messages to warning (previously it was notice) to reduce log file volume (Tom)
• Change default setting for max_prepared_transactions to zero (previously it was 5) (Tom)
• Make debug_print_parse, debug_print_rewritten, and debug_print_plan output appear at LOG message level, not DEBUG1 as formerly (Tom)
• Make debug.pretty_print default to on (Tom)
• Remove explain.pretty_print parameter (no longer needed) (Tom)
• Make log_temp_files settable by superusers only, like other logging options (Simon Riggs)
• Remove automatic appending of the epoch timestamp when no % escapes are present in log_filename (Robert Haas)
  This change was made because some users wanted a fixed log filename, for use with an external log rotation tool.
• Remove log_restartpoints from recovery.conf; instead use log_checkpoints (Simon)
• Remove krb_realm and krb_server_hostname; these are now set in pg_hba.conf instead (Magnus)
• There are also significant changes in pg_hba.conf, as described below.

E.172.2.3. Queries

• Change TRUNCATE and LOCK to apply to child tables of the specified table(s) (Peter)
  These commands now accept an ONLY option that prevents processing child tables; this option must be used if the old behavior is needed.
• SELECT DISTINCT and UNION/INTERSECT/EXCEPT no longer always produce sorted output (Tom)
  Previously, these types of queries always removed duplicate rows by means of Sort/Unique processing (i.e., sort then remove adjacent duplicates). Now they can be implemented by hashing, which will not produce sorted output. If an application relied on the output being in sorted order, the recommended fix is to add an ORDER BY clause. As a short-term workaround, the previous behavior can be restored by disabling enable_hashagg, but that is a very performance-expensive fix. SELECT DISTINCT ON never uses hashing, however, so its behavior is unchanged.
• Force child tables to inherit CHECK constraints from parents (Alex Hunsaker, Nikhil Sontakke, Tom)
  Formerly it was possible to drop such a constraint from a child table, allowing rows that violate the constraint to be visible when scanning the parent table. This was deemed inconsistent, as well as contrary to SQL standard.
Appendix E. Release Notes

- Disallow negative `LIMIT` or `OFFSET` values, rather than treating them as zero (Simon)
- Disallow `LOCK TABLE` outside a transaction block (Tom)
  Such an operation is useless because the lock would be released immediately.
- Sequences now contain an additional `start_value` column (Zoltan Boszormenyi)
  This supports `ALTER SEQUENCE ... RESTART`.

### E.172.2.4. Functions and Operators

- Make numeric zero raised to a fractional power return 0, rather than throwing an error, and make numeric zero raised to the zero power return 1, rather than error (Bruce)
  This matches the longstanding `float8` behavior.
- Allow unary minus of floating-point values to produce minus zero (Tom)
  The changed behavior is more IEEE-standard compliant.
- Throw an error if an escape character is the last character in a `LIKE` pattern (i.e., it has nothing to escape) (Tom)
  Previously, such an escape character was silently ignored, thus possibly masking application logic errors.
- Remove `~=` and `~<>~` operators formerly used for `LIKE` index comparisons (Tom)
  Pattern indexes now use the regular equality operator.
- `xpath()` now passes its arguments to libxml without any changes (Andrew)
  This means that the XML argument must be a well-formed XML document. The previous coding attempted to allow XML fragments, but it did not work well.
- `makeelement()` format attribute values just like content values (Peter)
  Previously, attribute values were formatted according to the normal SQL output behavior, which is sometimes at odds with XML rules.
- Rewrite memory management for libxml-using functions (Tom)
  This change should avoid some compatibility problems with use of libxml in PL/Perl and other add-on code.
- Adopt a faster algorithm for hash functions (Kenneth Marshall, based on work of Bob Jenkins)
  Many of the built-in hash functions now deliver different results on little-endian and big-endian platforms.

#### E.172.2.4.1. Temporal Functions and Operators

- `DateStyle` no longer controls `interval` output formatting; instead there is a new variable `IntervalStyle` (Ron Mayer)
- Improve consistency of handling of fractional seconds in `timestamp` and `interval` output (Ron Mayer)
Appendix E. Release Notes

This may result in displaying a different number of fractional digits than before, or rounding instead of truncating.

- Make `to_char()`’s localized month/day names depend on `LC_TIME`, not `LC_MESSAGES` (Euler Taveira de Oliveira)
- Cause `to_date()` and `to_timestamp()` to more consistently report errors for invalid input (Brendan Jurd)
  Previous versions would often ignore or silently misread input that did not match the format string. Such cases will now result in an error.
- Fix `to_timestamp()` to not require upper/lower case matching for meridian (AM/PM) and era (BC/AD) format designations (Brendan Jurd)
  For example, input value `ad` now matches the format string `AD`.

E.172.3. Changes

Below you will find a detailed account of the changes between PostgreSQL 8.4 and the previous major release.

E.172.3.1. Performance

- Improve optimizer statistics calculations (Jan Urbanski, Tom)
  In particular, estimates for full-text-search operators are greatly improved.
- Allow `SELECT DISTINCT` and `UNION/INTERSECT/EXCEPT` to use hashing (Tom)
  This means that these types of queries no longer automatically produce sorted output.
- Create explicit concepts of semi-joins and anti-joins (Tom)
  This work formalizes our previous ad-hoc treatment of `IN (SELECT ...)` clauses, and extends it to `EXISTS` and `NOT EXISTS` clauses. It should result in significantly better planning of `EXISTS` and `NOT EXISTS` queries. In general, logically equivalent `IN` and `EXISTS` clauses should now have similar performance, whereas previously `IN` often won.
- Improve optimization of sub-selects beneath outer joins (Tom)
  Formerly, a sub-select or view could not be optimized very well if it appeared within the nullable side of an outer join and contained non-strict expressions (for instance, constants) in its result list.
- Improve the performance of `text_position()` and related functions by using Boyer-Moore-Horspool searching (David Rowley)
  This is particularly helpful for long search patterns.
- Reduce I/O load of writing the statistics collection file by writing the file only when requested (Martin Pihlak)
- Improve performance for bulk inserts (Robert Haas, Simon)
Appendix E. Release Notes

• Increase the default value of `default_statistics_target` from 10 to 100 (Greg Sabino Mullane, Tom)
  The maximum value was also increased from 1000 to 10000.

• Perform `constraint_exclusion` checking by default in queries involving inheritance or `UNION ALL` (Tom)
  A new `constraint_exclusion` setting, `partition`, was added to specify this behavior.

• Allow I/O read-ahead for bitmap index scans (Greg Stark)
  The amount of read-ahead is controlled by `effective_io_concurrency`. This feature is available only if the kernel has `posix_fadvise()` support.

• Inline simple set-returning SQL functions in `FROM` clauses (Richard Rowell)

• Improve performance of multi-batch hash joins by providing a special case for join key values that are especially common in the outer relation (Bryce Cutt, Ramon Lawrence)

• Reduce volume of temporary data in multi-batch hash joins by suppressing “physical tlist” optimization (Michael Henderson, Ramon Lawrence)

• Avoid waiting for idle-in-transaction sessions during `CREATE INDEX CONCURRENTLY` (Simon)

• Improve performance of shared cache invalidation (Tom)

E.172.3.2. Server

E.172.3.2.1. Settings

• Convert many `postgresql.conf` settings to enumerated values so that `pg_settings` can display the valid values (Magnus)

• Add `cursor_tuple_fraction` parameter to control the fraction of a cursor’s rows that the planner assumes will be fetched (Robert Hell)

• Allow underscores in the names of custom variable classes in `postgresql.conf` (Tom)

E.172.3.2.2. Authentication and security

• Remove support for the (insecure) `crypt` authentication method (Magnus)
  This effectively obsoletes pre-PostgreSQL 7.2 client libraries, as there is no longer any non-plaintext password method that they can use.

• Support regular expressions in `pg_ident.conf` (Magnus)

• Allow Kerberos/GSSAPI parameters to be changed without restarting the postmaster (Magnus)

• Support SSL certificate chains in server certificate file (Andrew Gierth)
  Including the full certificate chain makes the client able to verify the certificate without having all intermediate CA certificates present in the local store, which is often the case for commercial CAs.
• Report appropriate error message for combination of MD5 authentication and db_user_namespace enabled (Bruce)

E.172.3.2.3. pg_hba.conf

• Change all authentication options to use name=value syntax (Magnus)
  This makes incompatible changes to the ldap, pam and ident authentication methods. All pg_hba.conf entries with these methods need to be rewritten using the new format.
• Remove the ident sameuser option, instead making that behavior the default if no usermap is specified (Magnus)
• Allow a usermap parameter for all external authentication methods (Magnus)
  Previously a usermap was only supported for ident authentication.
• Add clientcert option to control requesting of a client certificate (Magnus)
  Previously this was controlled by the presence of a root certificate file in the server’s data directory.
• Add cert authentication method to allow user authentication via SSL certificates (Magnus)
  Previously SSL certificates could only verify that the client had access to a certificate, not authenticate a user.
• Allow krb5, gssapi and sspi realm and krb5 host settings to be specified in pg_hba.conf (Magnus)
  These override the settings in postgresql.conf.
• Add include_realm parameter for krb5, gssapi, and sspi methods (Magnus)
  This allows identical usernames from different realms to be authenticated as different database users using usermaps.
• Parse pg_hba.conf fully when it is loaded, so that errors are reported immediately (Magnus)
  Previously, most errors in the file wouldn’t be detected until clients tried to connect, so an erroneous file could render the system unusable. With the new behavior, if an error is detected during reload then the bad file is rejected and the postmaster continues to use its old copy.
• Show all parsing errors in pg_hba.conf instead of aborting after the first one (Selena Deckelmann)
• Support ident authentication over Unix-domain sockets on Solaris (Garick Hamlin)

E.172.3.2.4. Continuous Archiving

• Provide an option to pg_start_backup() to force its implied checkpoint to finish as quickly as possible (Tom)
  The default behavior avoids excess I/O consumption, but that is pointless if no concurrent query activity is going on.
• Make pg_stop_backup() wait for modified WAL files to be archived (Simon)
  This guarantees that the backup is valid at the time pg_stop_backup() completes.
• When archiving is enabled, rotate the last WAL segment at shutdown so that all transactions can be archived immediately (Guillaume Smet, Heikki)

• Delay “smart” shutdown while a continuous archiving base backup is in progress (Laurenz Albe)

• Cancel a continuous archiving base backup if “fast” shutdown is requested (Laurenz Albe)

• Allow recovery.conf boolean variables to take the same range of string values as postgresql.conf boolean variables (Bruce)

E.172.3.2.5. Monitoring

• Add pg_conf_load_time() to report when the PostgreSQL configuration files were last loaded (George Gensure)

• Add pg_terminate_backend() to safely terminate a backend (the SIGTERM signal works also) (Tom, Bruce)

  While it’s always been possible to SIGTERM a single backend, this was previously considered unsupported; and testing of the case found some bugs that are now fixed.

• Add ability to track user-defined functions’ call counts and runtimes (Martin Pihlak)

  Function statistics appear in a new system view, pg_stat_user_functions. Tracking is controlled by the new parameter track_functions.

• Allow specification of the maximum query string size in pg_stat_activity via new track_activity_query_size parameter (Thomas Lee)

• Increase the maximum line length sent to syslog, in hopes of improving performance (Tom)

• Add read-only configuration variables segment_size, wal_block_size, and wal_segment_size (Bernd Helmle)

• When reporting a deadlock, report the text of all queries involved in the deadlock to the server log (Itagaki Takahiro)

• Add pg_stat_get_activity(pid) function to return information about a specific process id (Magnus)

• Allow the location of the server’s statistics file to be specified via stats_temp_directory (Magnus)

  This allows the statistics file to be placed in a RAM-resident directory to reduce I/O requirements. On startup/shutdown, the file is copied to its traditional location ($PGDATA/global/) so it is preserved across restarts.

E.172.3.3. Queries

• Add support for WINDOW functions (Hitoshi Harada)

• Add support for WITH clauses (CTEs), including WITH RECURSIVE (Yoshiyuki Asaba, Tatsuo Ishii, Tom)

• Add TABLE command (Peter)
TABLE tablename is a SQL standard short-hand for SELECT * FROM tablename.

- Allow AS to be optional when specifying a SELECT (or RETURNING) column output label (Hiroshi Saito)

  This works so long as the column label is not any PostgreSQL keyword; otherwise AS is still needed.

- Support set-returning functions in SELECT result lists even for functions that return their result via a tuplestore (Tom)

  In particular, this means that functions written in PL/pgSQL and other PL languages can now be called this way.

- Support set-returning functions in the output of aggregation and grouping queries (Tom)

- Allow SELECT FOR UPDATE/SHARE to work on inheritance trees (Tom)

- Add infrastructure for SQL/MED (Martin Pihlak, Peter)

  There are no remote or external SQL/MED capabilities yet, but this change provides a standardized and future-proof system for managing connection information for modules like dblink and plproxy.

- Invalidate cached plans when referenced schemas, functions, operators, or operator classes are modified (Martin Pihlak, Tom)

  This improves the system’s ability to respond to on-the-fly DDL changes.

- Allow comparison of composite types and allow arrays of anonymous composite types (Tom)

  This allows constructs such as row(1, 1.1) = any (array[row(7, 7.7), row(1, 1.0)]). This is particularly useful in recursive queries.

- Add support for Unicode string literal and identifier specifications using code points, e.g. U's‘d\0061t\+000061’ (Peter)

- Reject \000 in string literals and COPY data (Tom)

  Previously, this was accepted but had the effect of terminating the string contents.

- Improve the parser’s ability to report error locations (Tom)

  An error location is now reported for many semantic errors, such as mismatched datatypes, that previously could not be localized.

**E.172.3.3.1. TRUNCATE**

- Support statement-level ON TRUNCATE triggers (Simon)

- Add RESTART/CONTINUE IDENTITY options for TRUNCATE TABLE (Zoltan Boszormenyi)

  The start value of a sequence can be changed by ALTER SEQUENCE START WITH.

- Allow TRUNCATE tab1, tab1 to succeed (Bruce)

- Add a separate TRUNCATE permission (Robert Haas)

**E.172.3.3.2. EXPLAIN**

- Make EXPLAIN VERSESE show the output columns of each plan node (Tom)
Previously EXPLAIN VERBOSE output an internal representation of the query plan. (That behavior is now available via debug_print_plan.)

- Make EXPLAIN identify subplans and initplans with individual labels (Tom)
- Make EXPLAIN honor debug_print_plan (Tom)
- Allow EXPLAIN on CREATE TABLE AS (Peter)

### E.172.3.3. LIMIT/OFFSET

- Allow sub-selects in LIMIT and OFFSET (Tom)
- Add SQL-standard syntax for LIMIT/OFFSET capabilities (Peter)
  
  To wit, OFFSET num (ROW|ROWS) FETCH {FIRST|NEXT} [num] (ROW|ROWS) ONLY.

### E.172.3.4. Object Manipulation

- Add support for column-level privileges (Stephen Frost, KaiGai Kohei)
- Refactor multi-object DROP operations to reduce the need for CASCADE (Alex Hunsaker)
  
  For example, if table B has a dependency on table A, the command DROP TABLE A, B no longer requires the CASCADE option.
- Fix various problems with concurrent DROP commands by ensuring that locks are taken before we begin to drop dependencies of an object (Tom)
- Improve reporting of dependencies during DROP commands (Tom)
- Add WITH [NO] DATA clause to CREATE TABLE AS, per the SQL standard (Peter, Tom)
- Add support for user-defined I/O conversion casts (Heikki)
- Allow CREATE AGGREGATE to use an internal transition datatype (Tom)
- Add LIKE clause to CREATE TYPE (Tom)
  
  This simplifies creation of data types that use the same internal representation as an existing type.
- Allow specification of the type category and “preferred” status for user-defined base types (Tom)
  
  This allows more control over the coercion behavior of user-defined types.
- Allow CREATE OR REPLACE VIEW to add columns to the end of a view (Robert Haas)

### E.172.3.4.1. ALTER

- Add ALTER TYPE RENAME (Petr Jelinek)
- Add ALTER SEQUENCE ... RESTART (with no parameter) to reset a sequence to its initial value (Zoltan Boszormenyi)
- Modify the ALTER TABLE syntax to allow all reasonable combinations for tables, indexes, sequences, and views (Tom)
This change allows the following new syntaxes:

- `ALTER SEQUENCE OWNER TO`
- `ALTER VIEW ALTER COLUMN SET/DROP DEFAULT`
- `ALTER VIEW OWNER TO`
- `ALTER VIEW SET SCHEMA`

There is no actual new functionality here, but formerly you had to say `ALTER TABLE` to do these things, which was confusing.

- Add support for the syntax `ALTER TABLE ... ALTER COLUMN ... SET DATA TYPE` (Peter)
  This is SQL-standard syntax for functionality that was already supported.
- Make `ALTER TABLE SET WITHOUT OIDS` rewrite the table to physically remove OID values (Tom)
  Also, add `ALTER TABLE SET WITH OIDS` to rewrite the table to add OIDs.

**E.172.3.4.2. Database Manipulation**

- Improve reporting of `CREATE/DROP/RENAME DATABASE` failure when uncommitted prepared transactions are the cause (Tom)
- Make `LC_COLLATE` and `LC_CTYPE` into per-database settings (Radek Strnad, Heikki)
  This makes collation similar to encoding, which was always configurable per database.
- Improve checks that the database encoding, collation (LC_COLLATE), and character classes (LC_CTYPE) match (Heikki, Tom)
  Note in particular that a new database’s encoding and locale settings can be changed only when copying from `template0`. This prevents possibly copying data that doesn’t match the settings.
- Add `ALTER DATABASE SET TABLESPACE` to move a database to a new tablespace (Guillaume Lelarge, Bernd Helmle)

**E.172.3.5. Utility Operations**

- Add a `VERBOSE` option to the `CLUSTER` command and `clusterdb` (Jim Cox)
- Decrease memory requirements for recording pending trigger events (Tom)

**E.172.3.5.1. Indexes**

- Dramatically improve the speed of building and accessing hash indexes (Tom Raney, Shreya Bhargava)
  This allows hash indexes to be sometimes faster than btree indexes. However, hash indexes are still not crash-safe.
- Make hash indexes store only the hash code, not the full value of the indexed column (Xiao Meng)
  This greatly reduces the size of hash indexes for long indexed values, improving performance.
• Implement fast update option for GIN indexes (Teodor, Oleg)
  This option greatly improves update speed at a small penalty in search speed.
• xxx_pattern_ops indexes can now be used for simple equality comparisons, not only for LIKE (Tom)

E.172.3.5.2. Full Text Indexes

• Remove the requirement to use @@ when doing GIN weighted lookups on full text indexes (Tom, Teodor)
  The normal @ text search operator can be used instead.
• Add an optimizer selectivity function for @} text search operations (Jan Urbanski)
• Allow prefix matching in full text searches (Teodor Sigaev, Oleg Bartunov)
• Support multi-column GIN indexes (Teodor Sigaev)
• Improve support for Nepali language and Devanagari alphabet (Teodor)

E.172.3.5.3. VACUUM

• Track free space in separate per-relation “fork” files (Heikki)
  Free space discovered by VACUUM is now recorded in *_fsm files, rather than in a fixed-sized shared memory area. The max_fsm_pages and max_fsm_relations settings have been removed, greatly simplifying administration of free space management.
• Add a visibility map to track pages that do not require vacuuming (Heikki)
  This allows VACUUM to avoid scanning all of a table when only a portion of the table needs vacuuming. The visibility map is stored in per-relation “fork” files.
• Add vacuum_freeze_table_age parameter to control when VACUUM should ignore the visibility map and do a full table scan to freeze tuples (Heikki)
• Track transaction snapshots more carefully (Alvaro)
  This improves VACUUM’s ability to reclaim space in the presence of long-running transactions.
• Add ability to specify per-relation autovacuum and TOAST parameters in CREATE TABLE (Alvaro, Euler Taveira de Oliveira)
  Autovacuum options used to be stored in a system table.
• Add --freeze option to vacuumdb (Bruce)

E.172.3.6. Data Types

• Add a CaseSensitive option for text search synonym dictionaries (Simon)
• Improve the precision of NUMERIC division (Tom)
Appendix E. Release Notes

- Add basic arithmetic operators for \texttt{int2} with \texttt{int8} (Tom)
  This eliminates the need for explicit casting in some situations.
- Allow \texttt{UUID} input to accept an optional hyphen after every fourth digit (Robert Haas)
- Allow \texttt{on/off} as input for the boolean data type (Itagaki Takahiro)
- Allow spaces around \texttt{NaN} in the input string for type \texttt{numeric} (Sam Mason)

\textbf{E.172.3.6.1. Temporal Data Types}

- Reject year 0 BC and years 000 and 0000 (Tom)
  Previously these were interpreted as 1 BC. (Note: years 0 and 00 are still assumed to be the year 2000.)
- Include \texttt{SGT} (Singapore time) in the default list of known time zone abbreviations (Tom)
- Support \texttt{infinity} and \texttt{-infinity} as values of type \texttt{date} (Tom)
- Make parsing of \texttt{interval} literals more standard-compliant (Tom, Ron Mayer)
  For example, \texttt{INTERVAL '1' YEAR} now does what it’s supposed to.
- Allow \texttt{interval} fractional-seconds precision to be specified after the \texttt{second} keyword, for SQL standard compliance (Tom)
  Formerly the precision had to be specified after the keyword \texttt{interval}. (For backwards compatibility, this syntax is still supported, though deprecated.) Data type definitions will now be output using the standard format.
- Support the ISO 8601 \texttt{interval} syntax (Ron Mayer, Kevin Grittner)
  For example, \texttt{INTERVAL 'P1Y2M3DT4H5M6.7S'} is now supported.
- Add \texttt{IntervalStyle} parameter which controls how \texttt{interval} values are output (Ron Mayer)
  Valid values are: \texttt{postgres}, \texttt{postgres_verbose}, \texttt{sql_standard}, \texttt{iso_8601}. This setting also controls the handling of negative \texttt{interval} input when only some fields have positive/negative designations.
- Improve consistency of handling of fractional seconds in \texttt{timestamp} and \texttt{interval} output (Ron Mayer)

\textbf{E.172.3.6.2. Arrays}

- Improve the handling of casts applied to \texttt{ARRAY[]} constructs, such as \texttt{ARRAY[...].::integer[]} (Brendan Jurd)
  Formerly PostgreSQL attempted to determine a data type for the \texttt{ARRAY[]} construct without reference to the ensuing cast. This could fail unnecessarily in many cases, in particular when the \texttt{ARRAY[]} construct was empty or contained only ambiguous entries such as \texttt{NULL}. Now the cast is consulted to determine the type that the array elements must be.
- Make SQL-syntax \texttt{ARRAY} dimensions optional to match the SQL standard (Peter)
- Add \texttt{array_ndims()} to return the number of dimensions of an array (Robert Haas)
Appendix E. Release Notes

• Add `array_length()` to return the length of an array for a specified dimension (Jim Nasby, Robert Haas, Peter Eisentraut)

• Add aggregate function `array_agg()`, which returns all aggregated values as a single array (Robert Haas, Jeff Davis, Peter)

• Add `unnest()`, which converts an array to individual row values (Tom)
  This is the opposite of `array_agg()`.

• Add `array_fill()` to create arrays initialized with a value (Pavel Stehule)

• Add `generate_subscripts()` to simplify generating the range of an array’s subscripts (Pavel Stehule)

E.172.3.6.3. Wide-Value Storage (TOAST)

• Consider TOAST compression on values as short as 32 bytes (previously 256 bytes) (Greg Stark)

• Require 25% minimum space savings before using TOAST compression (previously 20% for small values and any-savings-at-all for large values) (Greg)

• Improve TOAST heuristics for rows that have a mix of large and small toastable fields, so that we prefer to push large values out of line and don’t compress small values unnecessarily (Greg, Tom)

E.172.3.7. Functions

• Document that `setseed()` allows values from -1 to 1 (not just 0 to 1), and enforce the valid range (Kris Jurka)

• Add server-side function `lo_import(filename, oid)` (Tatsuo)

• Add `quote_nullable()`, which behaves like `quote_literal()` but returns the string NULL for a null argument (Brendan Jurd)

• Improve full text search `headline()` function to allow extracting several fragments of text (Sushant Sinha)

• Add `suppress_redundant_updates_trigger()` trigger function to avoid overhead for non-data-changing updates (Andrew)

• Add `div(numeric, numeric)` to perform numeric division without rounding (Tom)

• Add `timestamp` and `timestamptz` versions of `generate_series()` (Hitoshi Harada)

E.172.3.7.1. Object Information Functions

• Implement `current_query()` for use by functions that need to know the currently running query (Tomas Doran)

• Add `pg_get_keywords()` to return a list of the parser keywords (Dave Page)

• Add `pg_get_functiondef()` to see a function’s definition (Abhijit Menon-Sen)
Appendix E. Release Notes

- Allow the second argument of `pg_get_expr()` to be zero when deparsing an expression that does not contain variables (Tom)
- Modify `pg_relation_size()` to use `regclass` (Heikki)
  
  ```
  pg_relation_size(data_type_name) no longer works.
  ```
- Add `boot_val` and `reset_val` columns to `pg_settings` output (Greg Smith)
- Add source file name and line number columns to `pg_settings` output for variables set in a configuration file (Magnus, Alvaro)
  
  For security reasons, these columns are only visible to superusers.
- Add support for `CURRENT_CATALOG`, `CURRENT_SCHEMA`, `SET CATALOG`, `SET SCHEMA` (Peter)
  
  These provide SQL-standard syntax for existing features.
- Add `pg_typeof()` which returns the data type of any value (Brendan Jurd)
- Make `version()` return information about whether the server is a 32- or 64-bit binary (Bruce)
- Fix the behavior of information schema columns `is_insertable_into` and `is_updatable` to be consistent (Peter)
- Improve the behavior of information schema `datetime_precision` columns (Peter)
  
  These columns now show zero for `date` columns, and 6 (the default precision) for `time`, `timestamp`, and `interval` without a declared precision, rather than showing null as formerly.
- Convert remaining builtin set-returning functions to use `OUT` parameters (Jaime Casanova)
  
  This makes it possible to call these functions without specifying a column list:
  ```
  pg_show_all_settings(), pg_lock_status(), pg_prepared_xact(),
  pg_prepared_statement(), pg_cursor()
  ```
- Make `pg_*_is_visible()` and `has_*_privilege()` functions return `NULL` for invalid OIDs, rather than reporting an error (Tom)
- Extend `has_*_privilege()` functions to allow inquiring about the OR of multiple privileges in one call (Stephen Frost, Tom)
- Add `has_column_privilege()` and `has_any_column_privilege()` functions (Stephen Frost, Tom)

E.172.3.7.2. Function Creation

- Support variadic functions (functions with a variable number of arguments) (Pavel Stehule)
  
  Only trailing arguments can be optional, and they all must be of the same data type.
- Support default values for function arguments (Pavel Stehule)
- Add `CREATE FUNCTION ... RETURNS TABLE` clause (Pavel Stehule)
- Allow SQL-language functions to return the output of an `INSERT/UPDATE/DELETE RETURNING` clause (Tom)
E.172.3.7.3. PL/pgSQL Server-Side Language

- Support `EXECUTE USING` for easier insertion of data values into a dynamic query string (Pavel Stehule)
- Allow looping over the results of a cursor using a `FOR` loop (Pavel Stehule)
- Support `RETURN QUERY EXECUTE` (Pavel Stehule)
- Improve the `RAISE` command (Pavel Stehule)
  - Support `DETAIL` and `HINT` fields
  - Support specification of the `SQLSTATE` error code
  - Support an exception name parameter
  - Allow `RAISE` without parameters in an exception block to re-throw the current error
- Allow specification of `SQLSTATE` codes in `EXCEPTION` lists (Pavel Stehule)
  This is useful for handling custom `SQLSTATE` codes.
- Support the `CASE` statement (Pavel Stehule)
- Make `RETURN QUERY` set the special `FOUND` and `GET DIAGNOSTICS ROW_COUNT` variables (Pavel Stehule)
- Make `FETCH` and `MOVE` set the `GET DIAGNOSTICS ROW_COUNT` variable (Andrew Gierth)
- Make `EXIT` without a label always exit the innermost loop (Tom)
  Formerly, if there were a `BEGIN` block more closely nested than any loop, it would exit that block instead. The new behavior matches Oracle(TM) and is also what was previously stated by our own documentation.
- Make processing of string literals and nested block comments match the main SQL parser’s processing (Tom)
  In particular, the format string in `RAISE` now works the same as any other string literal, including being subject to `standard_conforming_strings`. This change also fixes other cases in which valid commands would fail when `standard_conforming_strings` is on.
- Avoid memory leakage when the same function is called at varying exception-block nesting depths (Tom)

E.172.3.8. Client Applications

- Fix `pq_ctl restart` to preserve command-line arguments (Bruce)
- Add `-w|--no-password` option that prevents password prompting in all utilities that have a `-W|--password` option (Peter)
- Remove `-q` (quiet) option of `createdb`, `createuser`, `dropdb`, `dropuser` (Peter)
  These options have had no effect since PostgreSQL 8.3.
Appendix E. Release Notes

E.172.3.8.1. `psql`

- Remove verbose startup banner; now just suggest `help` (Joshua Drake)
- Make `help` show common backslash commands (Greg Sabino Mullane)
- Add `\pset format wrapped` mode to wrap output to the screen width, or file/pipe output too if `\pset columns is set` (Bryce Nesbitt)
- Allow all supported spellings of boolean values in `\pset`, rather than just `on` and `off` (Bruce)
  Formerly, any string other than “off” was silently taken to mean `true`. `psql` will now complain about unrecognized spellings (but still take them as `true`).
- Use the pager for wide output (Bruce)
- Require a space between a one-letter backslash command and its first argument (Bernd Helmle)
  This removes a historical source of ambiguity.
- Improve tab completion support for schema-qualified and quoted identifiers (Greg Sabino Mullane)
- Add optional `on/off` argument for `\timing` (David Fetter)
- Display access control rights on multiple lines (Brendan Jurd, Andreas Scherbaum)
- Make `\l` show database access privileges (Andrew Gilligan)
- Make `\l+` show database sizes, if permissions allow (Andrew Gilligan)
- Add the `\ef` command to edit function definitions (Abhijit Menon-Sen)

E.172.3.8.2. `psql \d* commands`

- Make `\d*` commands that do not have a pattern argument show system objects only if the `S` modifier is specified (Greg Sabino Mullane, Bruce)
  The former behavior was inconsistent across different variants of `\d`, and in most cases it provided no easy way to see just user objects.
- Improve `\d*` commands to work with older PostgreSQL server versions (back to 7.4), not only the current server version (Guillaume Lelarge)
- Make `\d` show foreign-key constraints that reference the selected table (Kenneth D’Souza)
- Make `\d` on a sequence show its column values (Euler Taveira de Oliveira)
- Add column storage type and other relation options to the `\d+` display (Gregory Stark, Euler Taveira de Oliveira)
- Show relation size in `\dt+` output (Dickson S. Guedes)
- Show the possible values of `enum` types in `\dT+` (David Fetter)
- Allow `\dc` to accept a wildcard pattern, which matches either datatype involved in the cast (Tom)
- Add a function type column to `\df`’s output, and add options to list only selected types of functions (David Fetter)
- Make `\df` not hide functions that take or return type `cstring` (Tom)
Previously, such functions were hidden because most of them are datatype I/O functions, which were deemed uninteresting. The new policy about hiding system functions by default makes this wart unnecessary.

**E.172.3.8.3. pg_dump**

- Add a `--no-tablespaces` option to `pg_dump`/`pg_dumpall`/`pg_restore` so that dumps can be restored to clusters that have non-matching tablespace layouts (Gavin Roy)
- Remove `-d` and `-D` options from `pg_dump` and `pg_dumpall` (Tom)
  These options were too frequently confused with the option to select a database name in other PostgreSQL client applications. The functionality is still available, but you must now spell out the long option name `--inserts` or `--column-inserts`.
- Remove `-i`/`--ignore-version` option from `pg_dump` and `pg_dumpall` (Tom)
  Use of this option does not throw an error, but it has no effect. This option was removed because the version checks are necessary for safety.
- Disable `statement_timeout` during dump and restore (Joshua Drake)
- Add `pg_dump/pg_dumpall` option `--lock-wait-timeout` (David Gould)
  This allows dumps to fail if unable to acquire a shared lock within the specified amount of time.
- Reorder `pg_dump` `--data-only` output to dump tables referenced by foreign keys before the referencing tables (Tom)
  This allows data loads when foreign keys are already present. If circular references make a safe ordering impossible, a `NOTICE` is issued.
- Allow `pg_dump`, `pg_dumpall`, and `pg_restore` to use a specified role (Benedek László)
- Allow `pg_restore` to use multiple concurrent connections to do the restore (Andrew)
  The number of concurrent connections is controlled by the option `--jobs`. This is supported only for custom-format archives.

**E.172.3.9. Programming Tools**

**E.172.3.9.1. libpq**

- Allow the OID to be specified when importing a large object, via new function `lo_import_with_oid()` (Tatsuo)
- Add "events" support (Andrew Chernow, Merlin Moncure)
  This adds the ability to register callbacks to manage private data associated with `PGconn` and `PGresult` objects.
- Improve error handling to allow the return of multiple error messages as multi-line error reports (Magnus)
Appendix E. Release Notes

- Make PQexecParams() and related functions return PGRES_EMPTY_QUERY for an empty query (Tom)
  They previously returned PGRES_COMMAND_OK.
- Document how to avoid the overhead of WSACleanup() on Windows (Andrew Chernow)
- Do not rely on Kerberos tickets to determine the default database username (Magnus)
  Previously, a Kerberos-capable build of libpq would use the principal name from any available Kerberos
  ticket as default database username, even if the connection wasn’t using Kerberos authentication. This
  was deemed inconsistent and confusing. The default username is now determined the same way with or
  without Kerberos. Note however that the database username must still match the ticket when Kerberos
  authentication is used.

E.172.3.9.2. libpq SSL (Secure Sockets Layer) support

- Fix certificate validation for SSL connections (Magnus)
  libpq now supports verifying both the certificate and the name of the server when making SSL connec-
  tions. If a root certificate is not available to use for verification, SSL connections will fail. The sslmode
  parameter is used to enable certificate verification and set the level of checking. The default is still not
  to do any verification, allowing connections to SSL-enabled servers without requiring a root certificate
  on the client.
- Support wildcard server certificates (Magnus)
  If a certificate CN starts with *, it will be treated as a wildcard when matching the hostname, allowing
  the use of the same certificate for multiple servers.
- Allow the file locations for client certificates to be specified (Mark Woodward, Alvaro, Magnus)
- Add a PQinitOpenSSL function to allow greater control over OpenSSL/libcrypto initialization (An-
  drew Chernow)
- Make libpq unregister its OpenSSL callbacks when no database connections remain open (Bruce, Mag-
  nus, Russell Smith)
  This is required for applications that unload the libpq library, otherwise invalid OpenSSL callbacks will
  remain.

E.172.3.9.3. ecpg

- Add localization support for messages (Euler Taveira de Oliveira)
- ecpg parser is now automatically generated from the server parser (Michael)
  Previously the ecpg parser was hand-maintained.

E.172.3.9.4. Server Programming Interface (SPI)

- Add support for single-use plans with out-of-line parameters (Tom)
- Add new SPI_OK_REWRITTEN return code for SPI_execute() (Heikki)
This is used when a command is rewritten to another type of command.

- Remove unnecessary inclusions from `executor/spi.h` (Tom)

SPI-using modules might need to add some `#include` lines if they were depending on `spi.h` to include things for them.

### E.172.3.10. Build Options

- Update build system to use Autoconf 2.61 (Peter)
- Require GNU bison for source code builds (Peter)
  
  This has effectively been required for several years, but now there is no infrastructure claiming to support other parser tools.
- Add `pg_config --htmldir` option (Peter)
- Pass `float4` by value inside the server (Zoltan Boszormenyi)
  
  Add configure option `--disable-float4-byval` to use the old behavior. External C functions that use old-style (version 0) call convention and pass or return `float4` values will be broken by this change, so you may need the configure option if you have such functions and don’t want to update them.
- Pass `float8, int8, and related datatypes` by value inside the server on 64-bit platforms (Zoltan Boszormenyi)
  
  Add configure option `--disable-float8-byval` to use the old behavior. As above, this change might break old-style external C functions.
- Add configure options `--with-segsize, --with-blocksize, --with-wal-blocksize, --with-wal-segsize` (Zdenek Kotala, Tom)
  
  This simplifies build-time control over several constants that previously could only be changed by editing `pg_config_manual.h`.
- Allow threaded builds on Solaris 2.5 (Bruce)
- Use the system’s `getopt_long()` on Solaris (Zdenek Kotala, Tom)
  
  This makes option processing more consistent with what Solaris users expect.
- Add support for the Sun Studio compiler on Linux (Julius Stroffek)
- Append the major version number to the backend gettext domain, and the `soname` major version number to libraries’ gettext domain (Peter)
  
  This simplifies parallel installations of multiple versions.
- Add support for code coverage testing with gcov (Michelle Caisse)
- Allow out-of-tree builds on Mingw and Cygwin (Richard Evans)
- Fix the use of Mingw as a cross-compiling source platform (Peter)
E.172.3.11. Source Code

- Support 64-bit time zone data files (Heikki)
  This adds support for daylight saving time (DST) calculations beyond the year 2038.
- Deprecate use of platform’s `time_t` data type (Tom)
  Some platforms have migrated to 64-bit `time_t`, some have not, and Windows can’t make up its mind what it’s doing. Define `pg_time_t` to have the same meaning as `time_t`, but always be 64 bits (unless the platform has no 64-bit integer type), and use that type in all module APIs and on-disk data formats.
- Fix bug in handling of the time zone database when cross-compiling (Richard Evans)
- Link backend object files in one step, rather than in stages (Peter)
- Improve gettext support to allow better translation of plurals (Peter)
- Add message translation support to the PL languages (Alvaro, Peter)
- Add more DTrace probes (Robert Lor)
- Enable DTrace support on Mac OS X Leopard and other non-Solaris platforms (Robert Lor)
- Simplify and standardize conversions between C strings and `text` datums, by providing common functions for the purpose (Brendan Jurd, Tom)
- Clean up the `include/catalog/` header files so that frontend programs can include them without including `postgres.h` (Zdenek Kotala)
- Make `name` char-aligned, and suppress zero-padding of `name` entries in indexes (Tom)
- Recover better if dynamically-loaded code executes `exit()` (Tom)
- Add a hook to let plug-ins monitor the executor (Itagaki Takahiro)
- Add a hook to allow the planner’s statistics lookup behavior to be overridden (Simon Riggs)
- Add `shmem_startup_hook()` for custom shared memory requirements (Tom)
- Replace the index access method `amgetmulti` entry point with `amgetbitmap`, and extend the API for `amgettuple` to support run-time determination of operator lossiness (Heikki, Tom, Teodor)
  The API for GIN and GiST opclass consistent functions has been extended as well.
- Add support for partial-match searches in GIN indexes (Teodor Sigaev, Oleg Bartunov)
- Replace `pg_class` column `reltriggers` with boolean `relhastriggers` (Simon)
  Also remove unused `pg_class` columns `relukeys`, `relfkeys`, and `relrefs`.
- Add a `relistemp` column to `pg_class` to ease identification of temporary tables (Tom)
- Move platform FAQs into the main documentation (Peter)
- Prevent parser input files from being built with any conflicts (Peter)
- Add support for the KOI8U (Ukrainian) encoding (Peter)
- Add Japanese message translations (Japan PostgreSQL Users Group)
  This used to be maintained as a separate project.
- Fix problem when setting `LC_MESSAGES` on MSVC-built systems (Hiroshi Inoue, Hiroshi Saito, Magnus)
Appendix E. Release Notes

E.172.3.12. Contrib

- Add contrib/auto_explain to automatically run EXPLAIN on queries exceeding a specified duration (Itagaki Takahiro, Tom)
- Add contrib/btree_gin to allow GIN indexes to handle more datatypes (Oleg, Teodor)
- Add contrib/citext to provide a case-insensitive, multibyte-aware text data type (David Wheeler)
- Add contrib/pg_stat_statements for server-wide tracking of statement execution statistics (Itagaki Takahiro)
- Add duration and query mode options to contrib/pgbench (Itagaki Takahiro)
- Make contrib/pgbench use table names pgbench_accounts, pgbench_branches, pgbench_history, and pgbench_tellers, rather than just accounts, branches, history, and tellers (Tom)
  This is to reduce the risk of accidentally destroying real data by running pgbench.
- Fix contrib/pgstattuple to handle tables and indexes with over 2 billion pages (Tatsuhito Kasahara)
- In contrib/fuzzystrmatch, add a version of the Levenshtein string-distance function that allows the user to specify the costs of insertion, deletion, and substitution (Volkan Yazici)
- Make contrib/ltree support multibyte encodings (laser)
- Enable contrib/dblink to use connection information stored in the SQL/MED catalogs (Joe Conway)
- Improve contrib/dblink’s reporting of errors from the remote server (Joe Conway)
- Make contrib/dblink set client_encoding to match the local database’s encoding (Joe Conway)
  This prevents encoding problems when communicating with a remote database that uses a different encoding.
- Make sure contrib/dblink uses a password supplied by the user, and not accidentally taken from the server’s .pgpass file (Joe Conway)
  This is a minor security enhancement.
- Add fsm_page_contents() to contrib/pageinspect (Heikki)
- Modify get_raw_page() to support free space map (*.fsm) files. Also update contrib/pg_freespacemap.
- Add support for multibyte encodings to contrib/pg_trgm (Teodor)
- Rewrite contrib/intagg to use new functions array_agg() and unnest() (Tom)
- Make contrib/pg_standby recover all available WAL before failover (Fujii Masao, Simon, Heikki)
  To make this work safely, you now need to set the new recovery_end_command option in recovery.conf to clean up the trigger file after failover. pg_standby will no longer remove the trigger file itself.
- contrib/pg_standby’s -l option is now a no-op, because it is unsafe to use a symlink (Simon)
E.173. Release 8.3.23

Release date: 2013-02-07

This release contains a variety of fixes from 8.3.22. For information about new features in the 8.3 major release, see Section E.196.

This is expected to be the last PostgreSQL release in the 8.3.X series. Users are encouraged to update to a newer release branch soon.

E.173.1. Migration to Version 8.3.23

A dump/restore is not required for those running 8.3.X.

However, if you are upgrading from a version earlier than 8.3.17, see Section E.179.

E.173.2. Changes

• Prevent execution of `enum_recv` from SQL (Tom Lane)
  The function was misdeclared, allowing a simple SQL command to crash the server. In principle an attacker might be able to use it to examine the contents of server memory. Our thanks to Sumit Soni (via Secunia SVCRP) for reporting this issue. (CVE-2013-0255)

• Fix SQL grammar to allow subscripting or field selection from a sub-SELECT result (Tom Lane)

• Protect against race conditions when scanning `pg_tablespace` (Stephen Frost, Tom Lane)
  `CREATE DATABASE` and `DROP DATABASE` could misbehave if there were concurrent updates of `pg_tablespace` entries.

• Prevent `DROP OWNED` from trying to drop whole databases or tablespaces (Álvaro Herrera)
  For safety, ownership of these objects must be reassigned, not dropped.

• Prevent misbehavior when a `RowExpr` or `XmlExpr` is parse-analyzed twice (Andres Freund, Tom Lane)
  This mistake could be user-visible in contexts such as `CREATE TABLE LIKE INCLUDING INDEXES`.

• Improve defenses against integer overflow in hashtable sizing calculations (Jeff Davis)

• Ensure that non-ASCII prompt strings are translated to the correct code page on Windows (Alexander Law, Noah Misch)
  This bug affected `psql` and some other client programs.

• Fix possible crash in `psql`’s `\?` command when not connected to a database (Meng Qingzhong)

• Fix one-byte buffer overrun in `libpq`’s `PQprintTuples` (Xi Wang)
  This ancient function is not used anywhere by PostgreSQL itself, but it might still be used by some client code.

• Rearrange configure’s tests for supplied functions so it is not fooled by bogus exports from `libedit/libreadline` (Christoph Berg)

• Ensure Windows build number increases over time (Magnus Hagander)
• Make pgxs build executables with the right .exe suffix when cross-compiling for Windows (Zoltan Boszormenyi)

• Add new timezone abbreviation FET (Tom Lane)
  This is now used in some eastern-European time zones.

E.174. Release 8.3.22

Release date: 2012-12-06

This release contains a variety of fixes from 8.3.21. For information about new features in the 8.3 major release, see Section E.196.

The PostgreSQL community will stop releasing updates for the 8.3.X release series in February 2013. Users are encouraged to update to a newer release branch soon.

E.174.1. Migration to Version 8.3.22

A dump/restore is not required for those running 8.3.X.

However, if you are upgrading from a version earlier than 8.3.17, see Section E.179.

E.174.2. Changes

• Fix multiple bugs associated with CREATE INDEX CONCURRENTLY (Andres Freund, Tom Lane)
  Fix CREATE INDEX CONCURRENTLY to use in-place updates when changing the state of an index’s pg_index row. This prevents race conditions that could cause concurrent sessions to miss updating the target index, thus resulting in corrupt concurrently-created indexes.
  Also, fix various other operations to ensure that they ignore invalid indexes resulting from a failed CREATE INDEX CONCURRENTLY command. The most important of these is VACUUM, because an auto-vacuum could easily be launched on the table before corrective action can be taken to fix or remove the invalid index.

• Avoid corruption of internal hash tables when out of memory (Hitoshi Harada)

• Fix planning of non-strict equivalence clauses above outer joins (Tom Lane)
  The planner could derive incorrect constraints from a clause equating a non-strict construct to something else, for example WHERE COALESCE(foo, 0) = 0 when foo is coming from the nullable side of an outer join.

• Improve planner’s ability to prove exclusion constraints from equivalence classes (Tom Lane)

• Fix partial-row matching in hashed subplans to handle cross-type cases correctly (Tom Lane)
  This affects multicolumn NOT IN subplans, such as WHERE (a, b) NOT IN (SELECT x, y FROM ...) when for instance b and y are int4 and int8 respectively. This mistake led to wrong answers or crashes depending on the specific datatypes involved.
Appendix E. Release Notes

- Acquire buffer lock when re-fetching the old tuple for an `AFTER ROW UPDATE/DELETE` trigger (Andres Freund)
  
  In very unusual circumstances, this oversight could result in passing incorrect data to the precheck logic for a foreign-key enforcement trigger. That could result in a crash, or in an incorrect decision about whether to fire the trigger.

- Fix `REASSIGN OWNED` to handle grants on tablespaces (Álvaro Herrera)

- Ignore incorrect `pg_attribute` entries for system columns for views (Tom Lane)
  
  Views do not have any system columns. However, we forgot to remove such entries when converting a table to a view. That’s fixed properly for 9.3 and later, but in previous branches we need to defend against existing mis-converted views.

- Fix rule printing to dump `INSERT INTO` table `DEFAULT VALUES` correctly (Tom Lane)

- Guard against stack overflow when there are too many `UNION/INTERSECT/EXCEPT` clauses in a query (Tom Lane)

- Prevent platform-dependent failures when dividing the minimum possible integer value by -1 (Xi Wang, Tom Lane)

- Fix possible access past end of string in date parsing (Hitoshi Harada)

- Produce an understandable error message if the length of the path name for a Unix-domain socket exceeds the platform-specific limit (Tom Lane, Andrew Dunstan)
  
  Formerly, this would result in something quite unhelpful, such as “Non-recoverable failure in name resolution”.

- Fix memory leaks when sending composite column values to the client (Tom Lane)

- Make `pg_cwl` more robust about reading the `postmaster.pid` file (Heikki Linnakangas)
  
  Fix race conditions and possible file descriptor leakage.

- Fix possible crash in `psql` if incorrectly-encoded data is presented and the `client_encoding` setting is a client-only encoding, such as SJIS (Jiang Guiqing)

- Fix bugs in the `restore.sql` script emitted by `pg_dump` in `tar` output format (Tom Lane)
  
  The script would fail outright on tables whose names include upper-case characters. Also, make the script capable of restoring data in `--inserts` mode as well as the regular `COPY` mode.

- Fix `pg_restore` to accept POSIX-conformant `tar` files (Brian Weaver, Tom Lane)
  
  The original coding of `pg_dump`’s `tar` output mode produced files that are not fully conformant with the POSIX standard. This has been corrected for version 9.3. This patch updates previous branches so that they will accept both the incorrect and the corrected formats, in hopes of avoiding compatibility problems when 9.3 comes out.

- Fix `pg_resetxlog` to locate `postmaster.pid` correctly when given a relative path to the data directory (Tom Lane)
  
  This mistake could lead to `pg_resetxlog` not noticing that there is an active postmaster using the data directory.

- Fix `libpq`’s `lo_import()` and `lo_export()` functions to report file I/O errors properly (Tom Lane)

- Fix `ecpg`’s processing of nested structure pointer variables (Muhammad Usama)
Appendix E. Release Notes

- Make contrib/pageinspect’s btree page inspection functions take buffer locks while examining pages (Tom Lane)
- Fix pgxs support for building loadable modules on AIX (Tom Lane)
  Building modules outside the original source tree didn’t work on AIX.
- Update time zone data files to tzdata release 2012j for DST law changes in Cuba, Israel, Jordan, Libya, Palestine, Western Samoa, and portions of Brazil.

E.175. Release 8.3.21

**Release date:** 2012-09-24

This release contains a variety of fixes from 8.3.20. For information about new features in the 8.3 major release, see Section E.196.

The PostgreSQL community will stop releasing updates for the 8.3.X release series in February 2013. Users are encouraged to update to a newer release branch soon.

E.175.1. Migration to Version 8.3.21

A dump/restore is not required for those running 8.3.X.

However, if you are upgrading from a version earlier than 8.3.17, see Section E.179.

E.175.2. Changes

- Improve page-splitting decisions in GiST indexes (Alexander Korotkov, Robert Haas, Tom Lane)
  Multi-column GiST indexes might suffer unexpected bloat due to this error.
- Fix cascading privilege revoke to stop if privileges are still held (Tom Lane)
  If we revoke a grant option from some role \( x \), but \( x \) still holds that option via a grant from someone else, we should not recursively revoke the corresponding privilege from role(s) \( y \) that \( x \) had granted it to.
- Fix handling of SIGFPE when PL/Perl is in use (Andres Freund)
  Perl resets the process’s SIGFPE handler to SIG_IGN, which could result in crashes later on. Restore the normal Postgres signal handler after initializing PL/Perl.
- Prevent PL/Perl from crashing if a recursive PL/Perl function is redefined while being executed (Tom Lane)
- Work around possible misoptimization in PL/Perl (Tom Lane)
  Some Linux distributions contain an incorrect version of pthread.h that results in incorrect compiled code in PL/Perl, leading to crashes if a PL/Perl function calls another one that throws an error.
- Update time zone data files to tzdata release 2012f for DST law changes in Fiji
Appendix E. Release Notes

E.176. Release 8.3.20

Release date: 2012-08-17

This release contains a variety of fixes from 8.3.19. For information about new features in the 8.3 major release, see Section E.196.

The PostgreSQL community will stop releasing updates for the 8.3.X release series in February 2013. Users are encouraged to update to a newer release branch soon.

E.176.1. Migration to Version 8.3.20

A dump/restore is not required for those running 8.3.X.

However, if you are upgrading from a version earlier than 8.3.17, see Section E.179.

E.176.2. Changes

• Prevent access to external files/URLs via XML entity references (Noah Misch, Tom Lane)

xml_parse() would attempt to fetch external files or URLs as needed to resolve DTD and entity references in an XML value, thus allowing unprivileged database users to attempt to fetch data with the privileges of the database server. While the external data wouldn’t get returned directly to the user, portions of it could be exposed in error messages if the data didn’t parse as valid XML; and in any case the mere ability to check existence of a file might be useful to an attacker. (CVE-2012-3489)

• Prevent access to external files/URLs via contrib/xml2’s xslt_process() (Peter Eisentraut)

libxslt offers the ability to read and write both files and URLs through stylesheet commands, thus allowing unprivileged database users to both read and write data with the privileges of the database server. Disable that through proper use of libxslt’s security options. (CVE-2012-3488)

Also, remove xslt_process()’s ability to fetch documents and stylesheets from external files/URLs. While this was a documented “feature”, it was long regarded as a bad idea. The fix for CVE-2012-3489 broke that capability, and rather than expend effort on trying to fix it, we’re just going to summarily remove it.

• Prevent too-early recycling of btree index pages (Noah Misch)

When we allowed read-only transactions to skip assigning XIDs, we introduced the possibility that a deleted btree page could be recycled while a read-only transaction was still in flight to it. This would result in incorrect index search results. The probability of such an error occurring in the field seems very low because of the timing requirements, but nonetheless it should be fixed.

• Fix crash-safety bug with newly-created-or-reset sequences (Tom Lane)

If ALTER SEQUENCE was executed on a freshly created or reset sequence, and then precisely one nextval() call was made on it, and then the server crashed, WAL replay would restore the sequence to a state in which it appeared that no nextval() had been done, thus allowing the first sequence value to be returned again by the next nextval() call. In particular this could manifest for serial columns, since creation of a serial column’s sequence includes an ALTER SEQUENCE OWNED BY step.

• Ensure the backup_label file is fsync’d after pg_start_backup() (Dave Kerr)
Appendix E. Release Notes

- Back-patch 9.1 improvement to compress the fsync request queue (Robert Haas)
  This improves performance during checkpoints. The 9.1 change has now seen enough field testing to seem safe to back-patch.
- Only allow autovacuum to be auto-canceled by a directly blocked process (Tom Lane)
  The original coding could allow inconsistent behavior in some cases; in particular, an autovacuum could get canceled after less than deadlock_timeout grace period.
- Improve logging of autovacuum cancels (Robert Haas)
- Fix log collector so that log_truncate_on_rotation works during the very first log rotation after server start (Tom Lane)
- Ensure that a whole-row reference to a subquery doesn’t include any extra GROUP BY or ORDER BY columns (Tom Lane)
- Disallow copying whole-row references in CHECK constraints and index definitions during CREATE TABLE (Tom Lane)
  This situation can arise in CREATE TABLE with LIKE or INHERITS. The copied whole-row variable was incorrectly labeled with the row type of the original table not the new one. Rejecting the case seems reasonable for LIKE, since the row types might well diverge later. For INHERITS we should ideally allow it, with an implicit coercion to the parent table’s row type; but that will require more work than seems safe to back-patch.
- Fix memory leak in ARRAYS(SELECT ...) subqueries (Heikki Linnakangas, Tom Lane)
- Fix extraction of common prefixes from regular expressions (Tom Lane)
  The code could get confused by quantified parenthesized subexpressions, such as ^{foo}?bar. This would lead to incorrect index optimization of searches for such patterns.
- Report errors properly in contrib/xml2’s xslt_process() (Tom Lane)
- Update time zone data files to tzdata release 2012e for DST law changes in Morocco and Tokelau

E.177. Release 8.3.19

Release date: 2012-06-04
This release contains a variety of fixes from 8.3.18. For information about new features in the 8.3 major release, see Section E.196.

E.177.1. Migration to Version 8.3.19

A dump/restore is not required for those running 8.3.X.
However, if you are upgrading from a version earlier than 8.3.17, see Section E.179.
E.177.2. Changes

- **Fix incorrect password transformation in contrib/pgcrypto's DES crypt() function (Solar Designer)**
  
  If a password string contained the byte value 0x80, the remainder of the password was ignored, causing the password to be much weaker than it appeared. With this fix, the rest of the string is properly included in the DES hash. Any stored password values that are affected by this bug will thus no longer match, so the stored values may need to be updated. (CVE-2012-2143)

- **Ignore SECURITY DEFINER and SET attributes for a procedural language's call handler (Tom Lane)**
  
  Applying such attributes to a call handler could crash the server. (CVE-2012-2655)

- **Allow numeric timezone offsets in timestamp input to be up to 16 hours away from UTC (Tom Lane)**
  
  Some historical time zones have offsets larger than 15 hours, the previous limit. This could result in dumped data values being rejected during reload.

- **Fix timestamp conversion to cope when the given time is exactly the last DST transition time for the current timezone (Tom Lane)**
  
  This oversight has been there a long time, but was not noticed previously because most DST-using zones are presumed to have an indefinite sequence of future DST transitions.

- **Fix text to name and char to name casts to perform string truncation correctly in multibyte encodings (Karl Schnaitter)**

- **Fix memory copying bug in to_tsquery() (Heikki Linnakangas)**

- **Fix slow session startup when pg_attribute is very large (Tom Lane)**
  
  If pg_attribute exceeds one-fourth of shared_buffers, cache rebuilding code that is sometimes needed during session start would trigger the synchronized-scan logic, causing it to take many times longer than normal. The problem was particularly acute if many new sessions were starting at once.

- **Ensure sequential scans check for query cancel reasonably often (Merlin Moncure)**
  
  A scan encountering many consecutive pages that contain no live tuples would not respond to interrupts meanwhile.

- **Ensure the Windows implementation of PGSemaphoreLock() clears ImmediateInterruptOK before returning (Tom Lane)**
  
  This oversight meant that a query-cancel interrupt received later in the same query could be accepted at an unsafe time, with unpredictable but not good consequences.

- **Show whole-row variables safely when printing views or rules (Abbas Butt, Tom Lane)**
  
  Corner cases involving ambiguous names (that is, the name could be either a table or column name of the query) were printed in an ambiguous way, risking that the view or rule would be interpreted differently after dump and reload. Avoid the ambiguous case by attaching a no-op cast.

- **Ensure autovacuum worker processes perform stack depth checking properly (Heikki Linnakangas)**
  
  Previously, infinite recursion in a function invoked by auto-Analyze could crash worker processes.

- **Fix logging collector to not lose log coherency under high load (Andrew Dunstan)**
  
  The collector previously could fail to reassemble large messages if it got too busy.
• Fix logging collector to ensure it will restart file rotation after receiving SIGHUP (Tom Lane)
• Fix PL/pgSQL's GET DIAGNOSTICS command when the target is the function’s first variable (Tom Lane)
• Fix several performance problems in pg_dump when the database contains many objects (Jeff Janes, Tom Lane)
  pg_dump could get very slow if the database contained many schemas, or if many objects are in dependency loops, or if there are many owned sequences.
• Fix contrib/dblink's dblink_exec() to not leak temporary database connections upon error (Tom Lane)
• Update time zone data files to tzdata release 2012c for DST law changes in Antarctica, Armenia, Chile, Cuba, Falkland Islands, Gaza, Haiti, Hebron, Morocco, Syria, and Tokelau Islands; also historical corrections for Canada.

E.178. Release 8.3.18

Release date: 2012-02-27
This release contains a variety of fixes from 8.3.17. For information about new features in the 8.3 major release, see Section E.196.

E.178.1. Migration to Version 8.3.18
A dump/restore is not required for those running 8.3.X.
However, if you are upgrading from a version earlier than 8.3.17, see Section E.179.

E.178.2. Changes

• Require execute permission on the trigger function for CREATE TRIGGER (Robert Haas)
  This missing check could allow another user to execute a trigger function with forged input data, by installing it on a table he owns. This is only of significance for trigger functions marked SECURITY DEFINER, since otherwise trigger functions run as the table owner anyway. (CVE-2012-0866)
• Convert newlines to spaces in names written in pg_dump comments (Robert Haas)
  pg_dump was incautious about sanitizing object names that are emitted within SQL comments in its output script. A name containing a newline would at least render the script syntactically incorrect. Maliciously crafted object names could present a SQL injection risk when the script is reloaded. (CVE-2012-0868)
• Fix btree index corruption from insertions concurrent with vacuuming (Tom Lane)
  An index page split caused by an insertion could sometimes cause a concurrently-running VACUUM to miss removing index entries that it should remove. After the corresponding table rows are removed,
the dangling index entries would cause errors (such as “could not read block N in file ...”) or worse, silently wrong query results after unrelated rows are re-inserted at the now-free table locations. This bug has been present since release 8.2, but occurs so infrequently that it was not diagnosed until now. If you have reason to suspect that it has happened in your database, reindexing the affected index will fix things.

- Allow non-existent values for some settings in ALTER USER/DATABASE SET (Heikki Linnakangas)
  Allow default_text_search_config, default_tablespace, and temp_tablespaces to be set to names that are not known. This is because they might be known in another database where the setting is intended to be used, or for the tablespace cases because the tablespace might not be created yet. The same issue was previously recognized for search_path, and these settings now act like that one.

- Track the OID counter correctly during WAL replay, even when it wraps around (Tom Lane)
  Previously the OID counter would remain stuck at a high value until the system exited replay mode. The practical consequences of that are usually nil, but there are scenarios wherein a standby server that's been promoted to master might take a long time to advance the OID counter to a reasonable value once values are needed.

- Fix regular expression back-references with * attached (Tom Lane)
  Rather than enforcing an exact string match, the code would effectively accept any string that satisfies the pattern sub-expression referenced by the back-reference symbol.
  A similar problem still afflicts back-references that are embedded in a larger quantified expression, rather than being the immediate subject of the quantifier. This will be addressed in a future PostgreSQL release.

- Fix recently-introduced memory leak in processing of inet/cidr values (Heikki Linnakangas)
  A patch in the December 2011 releases of PostgreSQL caused memory leakage in these operations, which could be significant in scenarios such as building a btree index on such a column.

- Avoid double close of file handle in syslogger on Windows (MauMau)
  Ordinarily this error was invisible, but it would cause an exception when running on a debug version of Windows.

- Fix I/O-conversion-related memory leaks in plpgsql (Andres Freund, Jan Urbanski, Tom Lane)
  Certain operations would leak memory until the end of the current function.

- Improve pg_dump’s handling of inherited table columns (Tom Lane)
  pg_dump mishandled situations where a child column has a different default expression than its parent column. If the default is textually identical to the parent’s default, but not actually the same (for instance, because of schema search path differences) it would not be recognized as different, so that after dump and restore the child would be allowed to inherit the parent’s default. Child columns that are NOT NULL where their parent is not could also be restored subtly incorrectly.

- Fix pg_restore’s direct-to-database mode for INSERT-style table data (Tom Lane)
  Direct-to-database restores from archive files made with --inserts or --column-inserts options fail when using pg_restore from a release dated September or December 2011, as a result of an oversight in a fix for another problem. The archive file itself is not at fault, and text-mode output is okay.

- Fix error in contrib/intarray’s int[] & int[] operator (Guillaume Lelarge)
If the smallest integer the two input arrays have in common is 1, and there are smaller values in either array, then 1 would be incorrectly omitted from the result.

- Fix error detection in contrib/pgcrypto’s encrypt_iv() and decrypt_iv() (Marko Kreen)
  These functions failed to report certain types of invalid-input errors, and would instead return random garbage values for incorrect input.

- Fix one-byte buffer overrun in contrib/test_parser (Paul Guyot)
  The code would try to read one more byte than it should, which would crash in corner cases. Since contrib/test_parser is only example code, this is not a security issue in itself, but bad example code is still bad.

- Use __sync_lock_test_and_set() for spinlocks on ARM, if available (Martin Pitt)
  This function replaces our previous use of the SWPB instruction, which is deprecated and not available on ARMv6 and later. Reports suggest that the old code doesn’t fail in an obvious way on recent ARM boards, but simply doesn’t interlock concurrent accesses, leading to bizarre failures in multiprocess operation.

- Use -fexcess-precision=standard option when building with gcc versions that accept it (Andrew Dunstan)
  This prevents assorted scenarios wherein recent versions of gcc will produce creative results.

- Allow use of threaded Python on FreeBSD (Chris Rees)
  Our configure script previously believed that this combination wouldn’t work; but FreeBSD fixed the problem, so remove that error check.

---

**E.179. Release 8.3.17**

**Release date:** 2011-12-05

This release contains a variety of fixes from 8.3.16. For information about new features in the 8.3 major release, see Section E.196.

**E.179.1. Migration to Version 8.3.17**

A dump/restore is not required for those running 8.3.X.

However, a longstanding error was discovered in the definition of the information_schema.referential_constraints view. If you rely on correct results from that view, you should replace its definition as explained in the first changelog item below.

Also, if you are upgrading from a version earlier than 8.3.8, see Section E.188.

**E.179.2. Changes**

- Fix bugs in information_schema.referential_constraints view (Tom Lane)
This view was being insufficiently careful about matching the foreign-key constraint to the depended-on primary or unique key constraint. That could result in failure to show a foreign key constraint at all, or showing it multiple times, or claiming that it depends on a different constraint than the one it really does.

Since the view definition is installed by initdb, merely upgrading will not fix the problem. If you need to fix this in an existing installation, you can (as a superuser) drop the information_schema schema then re-create it by sourcing $SHAREDIR/information_schema.sql. (Run pg_config --sharedir if you’re uncertain where $SHAREDIR is.) This must be repeated in each database to be fixed.

• Fix TOAST-related data corruption during CREATE TABLE dest AS SELECT * FROM src or INSERT INTO dest SELECT * FROM src (Tom Lane)

If a table has been modified by ALTER TABLE ADD COLUMN, attempts to copy its data verbatim to another table could produce corrupt results in certain corner cases. The problem can only manifest in this precise form in 8.4 and later, but we patched earlier versions as well in case there are other code paths that could trigger the same bug.

• Fix race condition during toast table access from stale syscache entries (Tom Lane)

The typical symptom was transient errors like “missing chunk number 0 for toast value NNNNN in pg_toast_2619”, where the cited toast table would always belong to a system catalog.

• Make DatumGetInetP() unpack inet datums that have a 1-byte header, and add a new macro, DatumGetInetPP(), that does not (Heikki Linnakangas)

This change affects no core code, but might prevent crashes in add-on code that expects DatumGetInetP() to produce an unpacked datum as per usual convention.

• Improve locale support in money type’s input and output (Tom Lane)

Aside from not supporting all standard $lc_monetary formatting options, the input and output functions were inconsistent, meaning there were locales in which dumped money values could not be re-read.

• Don’t let transform_null_equals affect CASE foo WHEN NULL ... constructs (Heikki Linnakangas)

transform_null_equals is only supposed to affect foo = NULL expressions written directly by the user, not equality checks generated internally by this form of CASE.

• Change foreign-key trigger creation order to better support self-referential foreign keys (Tom Lane)

For a cascading foreign key that references its own table, a row update will fire both the ON UPDATE trigger and the CHECK trigger as one event. The ON UPDATE trigger must execute first, else the CHECK will check a non-final state of the row and possibly throw an inappropriate error. However, the firing order of these triggers is determined by their names, which generally sort in creation order since the triggers have auto-generated names following the convention “RI_ConstraintTrigger_NNNNN”. A proper fix would require modifying that convention, which we will do in 9.2, but it seems risky to change it in existing releases. So this patch just changes the creation order of the triggers. Users encountering this type of error should drop and re-create the foreign key constraint to get its triggers into the right order.

• Avoid floating-point underflow while tracking buffer allocation rate (Greg Matthews)

While harmless in itself, on certain platforms this would result in annoying kernel log messages.

• Preserve blank lines within commands in psql’s command history (Robert Haas)
The former behavior could cause problems if an empty line was removed from within a string literal, for example.

- Fix pg_dump to dump user-defined casts between auto-generated types, such as table rowtypes (Tom Lane)
- Use the preferred version of xsubpp to build PL/Perl, not necessarily the operating system’s main copy (David Wheeler and Alex Hunsaker)
- Fix incorrect coding in contrib/dict_int and contrib/dict_xsyn (Tom Lane)
  Some functions incorrectly assumed that memory returned by palloc() is guaranteed zeroed.
- Honor query cancel interrupts promptly in pgstatindex() (Robert Haas)
- Ensure VPATH builds properly install all server header files (Peter Eisentraut)
- Shorten file names reported in verbose error messages (Peter Eisentraut)
  Regular builds have always reported just the name of the C file containing the error message call, but VPATH builds formerly reported an absolute path name.
- Fix interpretation of Windows timezone names for Central America (Tom Lane)
  Map “Central America Standard Time” to CST6, not CST6CDT, because DST is generally not observed anywhere in Central America.
- Update time zone data files to tzdata release 2011n for DST law changes in Brazil, Cuba, Fiji, Palestine, Russia, and Samoa; also historical corrections for Alaska and British East Africa.

E.180. Release 8.3.16

Release date: 2011-09-26

This release contains a variety of fixes from 8.3.15. For information about new features in the 8.3 major release, see Section E.196.

E.180.1. Migration to Version 8.3.16

A dump/restore is not required for those running 8.3.X. However, if you are upgrading from a version earlier than 8.3.8, see Section E.188.

E.180.2. Changes

- Fix bugs in indexing of in-doubt HOT-updated tuples (Tom Lane)
  These bugs could result in index corruption after reindexing a system catalog. They are not believed to affect user indexes.
- Fix multiple bugs in GiST index page split processing (Heikki Linnakangas)
  The probability of occurrence was low, but these could lead to index corruption.
• Fix possible buffer overrun in `tsvector_concat()` (Tom Lane)
  The function could underestimate the amount of memory needed for its result, leading to server crashes.

• Fix crash in `xml_recv` when processing a “standalone” parameter (Tom Lane)

• Avoid possibly accessing off the end of memory in `ANALYZE` and in SJIS-2004 encoding conversion (Noah Misch)
  This fixes some very-low-probability server crash scenarios.

• Fix race condition in relcache init file invalidation (Tom Lane)
  There was a window wherein a new backend process could read a stale init file but miss the inval messages that would tell it the data is stale. The result would be bizarre failures in catalog accesses, typically “could not read block 0 in file ...” later during startup.

• Fix memory leak at end of a GiST index scan (Tom Lane)
  Commands that perform many separate GiST index scans, such as verification of a new GiST-based exclusion constraint on a table already containing many rows, could transiently require large amounts of memory due to this leak.

• Fix performance problem when constructing a large, lossy bitmap (Tom Lane)

• Fix array- and path-creating functions to ensure padding bytes are zeroes (Tom Lane)
  This avoids some situations where the planner will think that semantically-equal constants are not equal, resulting in poor optimization.

• Work around gcc 4.6.0 bug that breaks WAL replay (Tom Lane)
  This could lead to loss of committed transactions after a server crash.

• Fix dump bug for `VALUES` in a view (Tom Lane)

• Disallow `SELECT FOR UPDATE/SHARE` on sequences (Tom Lane)
  This operation doesn’t work as expected and can lead to failures.

• Defend against integer overflow when computing size of a hash table (Tom Lane)

• Fix cases where `CLUSTER` might attempt to access already-removed TOAST data (Tom Lane)

• Fix portability bugs in use of credentials control messages for “peer” authentication (Tom Lane)

• Fix SSPI login when multiple roundtrips are required (Ahmed Shinwari, Magnus Hagander)
  The typical symptom of this problem was “The function requested is not supported” errors during SSPI login.

• Fix typo in `pg_srand48` seed initialization (Andres Freund)
  This led to failure to use all bits of the provided seed. This function is not used on most platforms (only those without `srandom`), and the potential security exposure from a less-random-than-expected seed seems minimal in any case.

• Avoid integer overflow when the sum of `LIMIT` and `OFFSET` values exceeds 2^63 (Heikki Linnakangas)

• Add overflow checks to `int4` and `int8` versions of `generate_series()` (Robert Haas)

• Fix trailing-zero removal in `to_char()` (Marti Raudsepp)
In a format with FM and no digit positions after the decimal point, zeroes to the left of the decimal point could be removed incorrectly.

- Fix `pg_size_pretty()` to avoid overflow for inputs close to \(2^{63}\) (Tom Lane)
- In `pg_ctl`, support silent mode for service registrations on Windows (MauMau)
- Fix `psql`'s counting of script file line numbers during `COPY` from a different file (Tom Lane)
- Fix `pg_restore`'s direct-to-database mode for `standard_conforming_strings` (Tom Lane)
  `pg_restore` could emit incorrect commands when restoring directly to a database server from an archive file that had been made with `standard_conforming_strings` set to on.
- Fix write-past-buffer-end and memory leak in libpq's LDAP service lookup code (Albe Laurenz)
- In `libpq`, avoid failures when using nonblocking I/O and an SSL connection (Martin Pihlak, Tom Lane)
- Improve `libpq`'s handling of failures during connection startup (Tom Lane)
  In particular, the response to a server report of `fork()` failure during SSL connection startup is now saner.
- Improve `libpq`'s error reporting for SSL failures (Tom Lane)
- Make `ecpglib` write `double` values with 15 digits precision (Akira Kurosawa)
- In `ecpglib`, be sure `LC_NUMERIC` setting is restored after an error (Michael Meskes)
- Apply upstream fix for blowfish signed-character bug (CVE-2011-2483) (Tom Lane)
  `contrib/pg_crypto`'s blowfish encryption code could give wrong results on platforms where `char` is signed (which is most), leading to encrypted passwords being weaker than they should be.
- Fix memory leak in `contrib/seg` (Heikki Linnakangas)
- Fix `pgstatindex()` to give consistent results for empty indexes (Tom Lane)
- Allow building with perl 5.14 (Alex Hunsaker)
- Update configure script’s method for probing existence of system functions (Tom Lane)
  The version of autoconf we used in 8.3 and 8.2 could be fooled by compilers that perform link-time optimization.
- Fix assorted issues with build and install file paths containing spaces (Tom Lane)
- Update time zone data files to `tzdata release 2011i` for DST law changes in Canada, Egypt, Russia, Samoa, and South Sudan.

**E.181. Release 8.3.15**

**Release date:** 2011-04-18

This release contains a variety of fixes from 8.3.14. For information about new features in the 8.3 major release, see Section E.196.
E.181.1. Migration to Version 8.3.15

A dump/restore is not required for those running 8.3.X. However, if you are upgrading from a version earlier than 8.3.8, see Section E.188.

E.181.2. Changes

- Disallow including a composite type in itself (Tom Lane)
  This prevents scenarios wherein the server could recurse infinitely while processing the composite type. While there are some possible uses for such a structure, they don’t seem compelling enough to justify the effort required to make sure it always works safely.

- Avoid potential deadlock during catalog cache initialization (Nikhil Sontakke)
  In some cases the cache loading code would acquire share lock on a system index before locking the index’s catalog. This could deadlock against processes trying to acquire exclusive locks in the other, more standard order.

- Fix dangling-pointer problem in BEFORE ROW UPDATE trigger handling when there was a concurrent update to the target tuple (Tom Lane)
  This bug has been observed to result in intermittent “cannot extract system attribute from virtual tuple” failures while trying to do UPDATE RETURNING ctid. There is a very small probability of more serious errors, such as generating incorrect index entries for the updated tuple.

- Disallow DROP TABLE when there are pending deferred trigger events for the table (Tom Lane)
  Formerly the DROP would go through, leading to “could not open relation with OID nnn” errors when the triggers were eventually fired.

- Fix PL/Python memory leak involving array slices (Daniel Popowich)

- Fix pg_restore to cope with long lines (over 1KB) in TOC files (Tom Lane)

- Put in more safeguards against crashing due to division-by-zero with overly enthusiastic compiler optimization (Aurelien Jarno)

- Support use of dlopen() in FreeBSD and OpenBSD on MIPS (Tom Lane)
  There was a hard-wired assumption that this system function was not available on MIPS hardware on these systems. Use a compile-time test instead, since more recent versions have it.

- Fix compilation failures on HP-UX (Heikki Linnakangas)

- Fix version-incompatibility problem with libintl on Windows (Hiroshi Inoue)

- Fix usage of xcopy in Windows build scripts to work correctly under Windows 7 (Andrew Dunstan)
  This affects the build scripts only, not installation or usage.

- Fix path separator used by pg_regress on Cygwin (Andrew Dunstan)

- Update time zone data files to tzdata release 2011f for DST law changes in Chile, Cuba, Falkland Islands, Morocco, Samoa, and Turkey; also historical corrections for South Australia, Alaska, and Hawaii.
Appendix E. Release Notes

E.182. Release 8.3.14

Release date: 2011-01-31

This release contains a variety of fixes from 8.3.13. For information about new features in the 8.3 major release, see Section E.196.

E.182.1. Migration to Version 8.3.14

A dump/restore is not required for those running 8.3.X. However, if you are upgrading from a version earlier than 8.3.8, see Section E.188.

E.182.2. Changes

- Avoid failures when EXPLAIN tries to display a simple-form CASE expression (Tom Lane)
  If the CASE’s test expression was a constant, the planner could simplify the CASE into a form that confused the expression-display code, resulting in “unexpected CASE WHEN clause” errors.

- Fix assignment to an array slice that is before the existing range of subscripts (Tom Lane)
  If there was a gap between the newly added subscripts and the first pre-existing subscript, the code mis-calculated how many entries needed to be copied from the old array’s null bitmap, potentially leading to data corruption or crash.

- Avoid unexpected conversion overflow in planner for very distant date values (Tom Lane)
  The date type supports a wider range of dates than can be represented by the timestamp types, but the planner assumed it could always convert a date to timestamp with impunity.

- Fix pg_restore’s text output for large objects (BLOBs) when standard_conforming_strings is on (Tom Lane)
  Although restoring directly to a database worked correctly, string escaping was incorrect if pg_restore was asked for SQL text output and standard_conforming_strings had been enabled in the source database.

- Fix erroneous parsing of tsquery values containing ... & !(subexpression) | ... (Tom Lane)
  Queries containing this combination of operators were not executed correctly. The same error existed in contrib/intarray’s query_int type and contrib/ltree’s ltxtquery type.

- Fix buffer overrun in contrib/intarray’s input function for the query_int type (Apple)
  This bug is a security risk since the function’s return address could be overwritten. Thanks to Apple Inc’s security team for reporting this issue and supplying the fix. (CVE-2010-4015)

- Fix bug in contrib/seg’s GiST picksplit algorithm (Alexander Korotkov)
  This could result in considerable inefficiency, though not actually incorrect answers, in a GiST index on a seg column. If you have such an index, consider REINDEXing it after installing this update. (This is identical to the bug that was fixed in contrib/cube in the previous update.)
E.183. Release 8.3.13

Release date: 2010-12-16

This release contains a variety of fixes from 8.3.12. For information about new features in the 8.3 major release, see Section E.196.

E.183.1. Migration to Version 8.3.13

A dump/restore is not required for those running 8.3.X. However, if you are upgrading from a version earlier than 8.3.8, see Section E.188.

E.183.2. Changes

- Force the default wal_sync_method to be fdatasync on Linux (Tom Lane, Marti Raudsepp)
  
  The default on Linux has actually been fdatasync for many years, but recent kernel changes caused PostgreSQL to choose open_dataasync instead. This choice did not result in any performance improvement, and caused outright failures on certain filesystems, notably ext4 with the data=journal mount option.

- Fix assorted bugs in WAL replay logic for GIN indexes (Tom Lane)
  
  This could result in “bad buffer id: 0” failures or corruption of index contents during replication.

- Fix recovery from base backup when the starting checkpoint WAL record is not in the same WAL segment as its redo point (Jeff Davis)

- Fix persistent slowdown of autovacuum workers when multiple workers remain active for a long time (Tom Lane)
  
  The effective vacuum_cost_limit for an autovacuum worker could drop to nearly zero if it processed enough tables, causing it to run extremely slowly.

- Add support for detecting register-stack overrun on IA64 (Tom Lane)
  
  The IA64 architecture has two hardware stacks. Full prevention of stack-overrun failures requires checking both.

- Add a check for stack overflow in copyObject() (Tom Lane)
  
  Certain code paths could crash due to stack overflow given a sufficiently complex query.

- Fix detection of page splits in temporary GiST indexes (Heikki Linnakangas)
  
  It is possible to have a “concurrent” page split in a temporary index, if for example there is an open cursor scanning the index when an insertion is done. GiST failed to detect this case and hence could deliver wrong results when execution of the cursor continued.

- Avoid memory leakage while ANALYZE’ing complex index expressions (Tom Lane)

- Ensure an index that uses a whole-row Var still depends on its table (Tom Lane)
  
  An index declared like create index i on t (foo(t.*) would not automatically get dropped when its table was dropped.
Appendix E. Release Notes

• Do not “inline” a SQL function with multiple OUT parameters (Tom Lane)
  This avoids a possible crash due to loss of information about the expected result rowtype.

• Behave correctly if ORDER BY, LIMIT, FOR UPDATE, or WITH is attached to the VALUES part of
  INSERT ... VALUES (Tom Lane)

• Fix constant-folding of COALESCE() expressions (Tom Lane)
  The planner would sometimes attempt to evaluate sub-expressions that in fact could never be reached,
  possibly leading to unexpected errors.

• Fix postmaster crash when connection acceptance (accept() or one of the calls made immediately
  after it) fails, and the postmaster was compiled with GSSAPI support (Alexander Chernikov)

• Fix missed unlink of temporary files when log_temp_files is active (Tom Lane)
  If an error occurred while attempting to emit the log message, the unlink was not done, resulting in
  accumulation of temp files.

• Add print functionality for InhRelation nodes (Tom Lane)
  This avoids a failure when debug_print_parse is enabled and certain types of query are executed.

• Fix incorrect calculation of distance from a point to a horizontal line segment (Tom Lane)
  This bug affected several different geometric distance-measurement operators.

• Fix PL/pgSQL’s handling of “simple” expressions to not fail in recursion or error-recovery cases (Tom
  Lane)

• Fix PL/Python’s handling of set-returning functions (Jan Urbanski)
  Attempts to call SPI functions within the iterator generating a set result would fail.

• Fix bug in contrib/cube’s GiST picksplit algorithm (Alexander Korotkov)
  This could result in considerable inefficiency, though not actually incorrect answers, in a GiST index
  on a cube column. If you have such an index, consider REINDEXing it after installing this update.

• Don’t emit “identifier will be truncated” notices in contrib/dblink except when creating new con-
  nections (Itagaki Takahiro)

• Fix potential coredump on missing public key in contrib/pgcrypto (Marti Raudsepp)

• Fix memory leak in contrib/xml2’s XPath query functions (Tom Lane)

• Update time zone data files to tzdata release 2010o for DST law changes in Fiji and Samoa; also
  historical corrections for Hong Kong.

E.184. Release 8.3.12

Release date: 2010-10-04

This release contains a variety of fixes from 8.3.11. For information about new features in the 8.3 major
release, see Section E.196.
E.184.1. Migration to Version 8.3.12

A dump/restore is not required for those running 8.3.X. However, if you are upgrading from a version earlier than 8.3.8, see Section E.188.

E.184.2. Changes

- Use a separate interpreter for each calling SQL userid in PL/Perl and PL/Tcl (Tom Lane)

  This change prevents security problems that can be caused by subverting Perl or Tcl code that will be executed later in the same session under another SQL user identity (for example, within a SECURITY DEFINER function). Most scripting languages offer numerous ways that that might be done, such as redefining standard functions or operators called by the target function. Without this change, any SQL user with Perl or Tcl language usage rights can do essentially anything with the SQL privileges of the target function’s owner.

  The cost of this change is that intentional communication among Perl and Tcl functions becomes more difficult. To provide an escape hatch, PL/PerlU and PL/TclU functions continue to use only one interpreter per session. This is not considered a security issue since all such functions execute at the trust level of a database superuser already.

  It is likely that third-party procedural languages that claim to offer trusted execution have similar security issues. We advise contacting the authors of any PL you are depending on for security-critical purposes.

  Our thanks to Tim Bunce for pointing out this issue (CVE-2010-3433).

- Prevent possible crashes in pg_get_expr() by disallowing it from being called with an argument that is not one of the system catalog columns it’s intended to be used with (Heikki Linnakangas, Tom Lane)

- Treat exit code 128 (ERROR_WAIT_NO_CHILDREN) as non-fatal on Windows (Magnus Hagander)

  Under high load, Windows processes will sometimes fail at startup with this error code. Formerly the postmaster treated this as a panic condition and restarted the whole database, but that seems to be an overreaction.

- Fix incorrect usage of non-strict OR join clauses in Append index scans (Tom Lane)

  This is a back-patch of an 8.4 fix that was missed in the 8.3 branch. This corrects an error introduced in 8.3.8 that could cause incorrect results for outer joins when the inner relation is an inheritance tree or UNION ALL subquery.

- Fix possible duplicate scans of UNION ALL member relations (Tom Lane)

- Fix “cannot handle unplanned sub-select” error (Tom Lane)

  This occurred when a sub-select contains a join alias reference that expands into an expression containing another sub-select.

- Fix failure to mark cached plans as transient (Tom Lane)

  If a plan is prepared while CREATE INDEX CONCURRENTLY is in progress for one of the referenced tables, it is supposed to be re-planned once the index is ready for use. This was not happening reliably.
Appendix E. Release Notes

- Reduce PANIC to ERROR in some occasionally-reported btree failure cases, and provide additional detail in the resulting error messages (Tom Lane)
  This should improve the system’s robustness with corrupted indexes.
- Prevent show_session_authorization() from crashing within autovacuum processes (Tom Lane)
- Defend against functions returning setof record where not all the returned rows are actually of the same rowtype (Tom Lane)
- Fix possible failure when hashing a pass-by-reference function result (Tao Ma, Tom Lane)
- Improve merge join’s handling of NULLs in the join columns (Tom Lane)
  A merge join can now stop entirely upon reaching the first NULL, if the sort order is such that NULLs sort high.
- Take care to fsync the contents of lockfiles (both postmaster.pid and the socket lockfile) while writing them (Tom Lane)
  This omission could result in corrupted lockfile contents if the machine crashes shortly after postmaster start. That could in turn prevent subsequent attempts to start the postmaster from succeeding, until the lockfile is manually removed.
- Avoid recursion while assigning XIDs to heavily-nested subtransactions (Andres Freund, Robert Haas)
  The original coding could result in a crash if there was limited stack space.
- Avoid holding open old WAL segments in the walwriter process (Magnus Hagander, Heikki Linnakan-gas)
  The previous coding would prevent removal of no-longer-needed segments.
- Fix log_line_prefix’s %i escape, which could produce junk early in backend startup (Tom Lane)
- Fix possible data corruption in ALTER TABLE ... SET TABLESPACE when archiving is enabled (Jeff Davis)
- Allow CREATE DATABASE and ALTER DATABASE ... SET TABLESPACE to be interrupted by query-cancel (Guillaume Lelarge)
- Fix REASSIGN OWNED to handle operator classes and families (Asko Tiidumaa)
- Fix possible core dump when comparing two empty tsquery values (Tom Lane)
- Fix LIKE’s handling of patterns containing % followed by _ (Tom Lane)
  We’ve fixed this before, but there were still some incorrectly-handled cases.
- In PL/Python, defend against null pointer results from PyObject_AsVoidPtr and PyObject_FromVoidPtr (Peter Eisentraut)
- Make psql recognize DISCARD ALL as a command that should not be encased in a transaction block in autocommit-off mode (Itagaki Takahiro)
- Fix ecpg to process data from RETURNING clauses correctly (Michael Meskes)
- Improve contrib/dblink’s handling of tables containing dropped columns (Tom Lane)
- Fix connection leak after “duplicate connection name” errors in contrib/dblink (Itagaki Takahiro)
- Fix contrib/dblink to handle connection names longer than 62 bytes correctly (Itagaki Takahiro)
- Add hstore(text, text) function to contrib/hstore (Robert Haas)
This function is the recommended substitute for the now-deprecated => operator. It was back-patched so that future-proofed code can be used with older server versions. Note that the patch will be effective only after contrib/hstore is installed or reinstalled in a particular database. Users might prefer to execute the CREATE FUNCTION command by hand, instead.

• Update build infrastructure and documentation to reflect the source code repository’s move from CVS to Git (Magnus Hagander and others)

• Update time zone data files to tzdata release 2010l for DST law changes in Egypt and Palestine; also historical corrections for Finland.

This change also adds new names for two Micronesian timezones: Pacific/Chuuk is now preferred over Pacific/Truk (and the preferred abbreviation is CHUT not TRUT) and Pacific/Pohnpei is preferred over Pacific/Ponape.

• Make Windows’ “N. Central Asia Standard Time” timezone map to Asia/Novosibirsk, not Asia/Almaty (Magnus Hagander)

Microsoft changed the DST behavior of this zone in the timezone update from KB976098. Asia/Novosibirsk is a better match to its new behavior.

E.185. Release 8.3.11

Release date: 2010-05-17

This release contains a variety of fixes from 8.3.10. For information about new features in the 8.3 major release, see Section E.196.

E.185.1. Migration to Version 8.3.11

A dump/restore is not required for those running 8.3.X. However, if you are upgrading from a version earlier than 8.3.8, see Section E.188.

E.185.2. Changes

• Enforce restrictions in plperl using an opmask applied to the whole interpreter, instead of using Safe.pm (Tim Bunce, Andrew Dunstan)

Recent developments have convinced us that Safe.pm is too insecure to rely on for making plperl trustable. This change removes use of Safe.pm altogether, in favor of using a separate interpreter with an opcode mask that is always applied. Pleasant side effects of the change include that it is now possible to use Perl’s strict pragma in a natural way in plperl, and that Perl’s $a and $b variables work as expected in sort routines, and that function compilation is significantly faster. (CVE-2010-1169)

• Prevent PL/Tcl from executing untrustworthy code from pltcl_modules (Tom)

PL/Tcl’s feature for autoloading Tcl code from a database table could be exploited for trojan-horse attacks, because there was no restriction on who could create or insert into that table. This change
Appendix E. Release Notes

disables the feature unless pltcl_modules is owned by a superuser. (However, the permissions on the
table are not checked, so installations that really need a less-than-secure modules table can still grant
suitable privileges to trusted non-superusers.) Also, prevent loading code into the unrestricted “normal”
Tcl interpreter unless we are really going to execute a pltcl function. (CVE-2010-1170)

- Fix possible crash if a cache reset message is received during rebuild of a relcache entry (Heikki)
  This error was introduced in 8.3.10 while fixing a related failure.
- Apply per-function GUC settings while running the language validator for the function (Itagaki
  Takahiro)
  This avoids failures if the function’s code is invalid without the setting; an example is that SQL functions
  may not parse if the search_path is not correct.
- Do not allow an unprivileged user to reset superuser-only parameter settings (Alvaro)
  Previously, if an unprivileged user ran ALTER USER ... RESET ALL for himself, or ALTER
  DATABASE ... RESET ALL for a database he owns, this would remove all special parameter settings
  for the user or database, even ones that are only supposed to be changeable by a superuser. Now, the
  ALTER will only remove the parameters that the user has permission to change.
- Avoid possible crash during backend shutdown if shutdown occurs when a CONTEXT addition would be
  made to log entries (Tom)
  In some cases the context-printing function would fail because the current transaction had already been
  rolled back when it came time to print a log message.
- Ensure the archiver process responds to changes in archive_command as soon as possible (Tom)
- Update pl/perl’s ppport.h for modern Perl versions (Andrew)
- Fix assorted memory leaks in pl/python (Andreas Freund, Tom)
- Prevent infinite recursion in psql when expanding a variable that refers to itself (Tom)
- Fix psql’s \copy to not add spaces around a dot within \copy (select ... (Tom)
  Addition of spaces around the decimal point in a numeric literal would result in a syntax error.
- Fix unnecessary “GIN indexes do not support whole-index scans” errors for unsatisfiable queries using
  contrib/intarray operators (Tom)
- Ensure that contrib/pgstattuple functions respond to cancel interrupts promptly (Tatsuhito Kasa-
hara)
- Make server startup deal properly with the case that shmget() returns EINVAL for an existing shared
  memory segment (Tom)
  This behavior has been observed on BSD-derived kernels including OS X. It resulted in an entirely-
  misleading startup failure complaining that the shared memory request size was too large.
- Avoid possible crashes in syslogger process on Windows (Heikki)
- Deal more robustly with incomplete time zone information in the Windows registry (Magnus)
- Update the set of known Windows time zone names (Magnus)
- Update time zone data files to tzdata release 2010j for DST law changes in Argentina, Australian
  Antarctic, Bangladesh, Mexico, Morocco, Pakistan, Palestine, Russia, Syria, Tunisia; also historical
  corrections for Taiwan.
Also, add **PKST** (Pakistan Summer Time) to the default set of timezone abbreviations.

### E.186. Release 8.3.10

**Release date:** 2010-03-15

This release contains a variety of fixes from 8.3.9. For information about new features in the 8.3 major release, see Section E.196.

### E.186.1. Migration to Version 8.3.10

A dump/restore is not required for those running 8.3.X. However, if you are upgrading from a version earlier than 8.3.8, see Section E.188.

### E.186.2. Changes

- Add new configuration parameter `ssl_renegotiation_limit` to control how often we do session key renegotiation for an SSL connection (Magnus)
  
  This can be set to zero to disable renegotiation completely, which may be required if a broken SSL library is used. In particular, some vendors are shipping stopgap patches for CVE-2009-3555 that cause renegotiation attempts to fail.

- Fix possible deadlock during backend startup (Tom)

- Fix possible crashes due to not handling errors during relcache reload cleanly (Tom)

- Fix possible crash due to use of dangling pointer to a cached plan (Tatsuo)

- Fix possible crashes when trying to recover from a failure in subtransaction start (Tom)

- Fix server memory leak associated with use of savepoints and a client encoding different from server’s encoding (Tom)

- Fix incorrect WAL data emitted during end-of-recovery cleanup of a GIST index page split (Yoichi Hirai)

  This would result in index corruption, or even more likely an error during WAL replay, if we were unlucky enough to crash during end-of-recovery cleanup after having completed an incomplete GIST insertion.

- Make `substring()` for **bit** types treat any negative length as meaning “all the rest of the string” (Tom)

  The previous coding treated only `-1` that way, and would produce an invalid result value for other negative values, possibly leading to a crash (CVE-2010-0442).

- Fix integer-to-bit-string conversions to handle the first fractional byte correctly when the output bit width is wider than the given integer by something other than a multiple of 8 bits (Tom)

- Fix some cases of pathologically slow regular expression matching (Tom)
Appendix E. Release Notes

- Fix assorted crashes in XML processing caused by sloppy memory management (Tom)
  
  This is a back-patch of changes first applied in 8.4. The 8.3 code was known buggy, but the new code was sufficiently different to not want to back-patch it until it had gotten some field testing.

- Fix bug with trying to update a field of an element of a composite-type array column (Tom)

- Fix the STOP WAL LOCATION entry in backup history files to report the next WAL segment’s name when the end location is exactly at a segment boundary (Itagaki Takahiro)

- Fix some more cases of temporary-file leakage (Heikki)

  This corrects a problem introduced in the previous minor release. One case that failed is when a plpgsql function returning set is called within another function’s exception handler.

- Improve constraint exclusion processing of boolean-variable cases, in particular make it possible to exclude a partition that has a “bool_column = false” constraint (Tom)

- When reading pg_hba.conf and related files, do not treat @something as a file inclusion request if the @ appears inside quote marks; also, never treat @ by itself as a file inclusion request (Tom)

  This prevents erratic behavior if a role or database name starts with @. If you need to include a file whose path name contains spaces, you can still do so, but you must write @"/path to/file" rather than putting the quotes around the whole construct.

- Prevent infinite loop on some platforms if a directory is named as an inclusion target in pg_hba.conf and related files (Tom)

- Fix possible infinite loop if SSL_read or SSL_write fails without setting errno (Tom)

  This is reportedly possible with some Windows versions of openssl.

- Disallow GSSAPI authentication on local connections, since it requires a hostname to function correctly (Magnus)

- Make ecpg report the proper SQLSTATE if the connection disappears (Michael)

- Fix psq1’s numericlocale option to not format strings it shouldn’t in latex and troff output formats (Heikki)

- Make psq1 return the correct exit status (3) when ON_ERROR_STOP and --single-transaction are both specified and an error occurs during the implied COMMIT (Bruce)

- Fix plpgsql failure in one case where a composite column is set to NULL (Tom)

- Fix possible failure when calling PL/Perl functions from PL/PerlU or vice versa (Tim Bunce)

- Add volatile markings in PL/Python to avoid possible compiler-specific misbehavior (Zdenek Kotala)

- Ensure PL/Tcl initializes the Tcl interpreter fully (Tom)

  The only known symptom of this oversight is that the Tcl clock command misbehaves if using Tcl 8.5 or later.

- Prevent crash in contrib/dblink when too many key columns are specified to a dblink_build_sql_* function (Rushabh Lathia, Joe Conway)

- Allow zero-dimensional arrays in contrib/ltree operations (Tom)
This case was formerly rejected as an error, but it’s more convenient to treat it the same as a zero-element array. In particular this avoids unnecessary failures when an ltree operation is applied to the result of `ARRAY(SELECT ...)` and the sub-select returns no rows.

- Fix assorted crashes in `contrib/xml2` caused by sloppy memory management (Tom)
- Make building of `contrib/xml2` more robust on Windows (Andrew)
- Fix race condition in Windows signal handling (Radu Ilie)
  One known symptom of this bug is that rows in `pg_listener` could be dropped under heavy load.
- Update time zone data files to tzdata release 2010e for DST law changes in Bangladesh, Chile, Fiji, Mexico, Paraguay, Samoa.

**E.187. Release 8.3.9**

**Release date:** 2009-12-14

This release contains a variety of fixes from 8.3.8. For information about new features in the 8.3 major release, see Section E.196.

**E.187.1. Migration to Version 8.3.9**

A dump/restore is not required for those running 8.3.X. However, if you are upgrading from a version earlier than 8.3.8, see Section E.188.

**E.187.2. Changes**

- Protect against indirect security threats caused by index functions changing session-local state (Gurjeet Singh, Tom)
  This change prevents allegedly-immutable index functions from possibly subverting a superuser’s session (CVE-2009-4136).
- Reject SSL certificates containing an embedded null byte in the common name (CN) field (Magnus)
  This prevents unintended matching of a certificate to a server or client name during SSL validation (CVE-2009-4034).
- Fix possible crash during backend-startup-time cache initialization (Tom)
- Avoid crash on empty thesaurus dictionary (Tom)
- Prevent signals from interrupting `VACUUM` at unsafe times (Alvaro)
  This fix prevents a PANIC if a `VACUUM FULL` is canceled after it’s already committed its tuple movements, as well as transient errors if a plain `VACUUM` is interrupted after having truncated the table.
- Fix possible crash due to integer overflow in hash table size calculation (Tom)
  This could occur with extremely large planner estimates for the size of a hashjoin’s result.
Appendix E. Release Notes

- Fix very rare crash in inet/cidr comparisons (Chris Mikkelson)
- Ensure that shared tuple-level locks held by prepared transactions are not ignored (Heikki)
- Fix premature drop of temporary files used for a cursor that is accessed within a subtransaction (Heikki)
- Fix memory leak in syslogger process when rotating to a new CSV logfile (Tom)
- Fix Windows permission-downgrade logic (Jesse Morris)
  This fixes some cases where the database failed to start on Windows, often with misleading error messages such as “could not locate matching postgres executable”.
- Fix incorrect logic for GiST index page splits, when the split depends on a non-first column of the index (Paul Ramsey)
- Don’t error out if recycling or removing an old WAL file fails at the end of checkpoint (Heikki)
  It’s better to treat the problem as non-fatal and allow the checkpoint to complete. Future checkpoints will retry the removal. Such problems are not expected in normal operation, but have been seen to be caused by misedigned Windows anti-virus and backup software.
- Ensure WAL files aren’t repeatedly archived on Windows (Heikki)
  This is another symptom that could happen if some other process interfered with deletion of a no-longer-needed file.
- Fix PAM password processing to be more robust (Tom)
  The previous code is known to fail with the combination of the Linux pam_krb5 PAM module with Microsoft Active Directory as the domain controller. It might have problems elsewhere too, since it was making unjustified assumptions about what arguments the PAM stack would pass to it.
- Raise the maximum authentication token (Kerberos ticket) size in GSSAPI and SSPI authentication methods (Ian Turner)
  While the old 2000-byte limit was more than enough for Unix Kerberos implementations, tickets issued by Windows Domain Controllers can be much larger.
- Re-enable collection of access statistics for sequences (Akira Kurosawa)
  This used to work but was broken in 8.3.
- Fix processing of ownership dependencies during CREATE OR REPLACE FUNCTION (Tom)
- Fix incorrect handling of WHERE x=x conditions (Tom)
  In some cases these could get ignored as redundant, but they aren’t — they’re equivalent to x IS NOT NULL.
- Make text search parser accept underscores in XML attributes (Peter)
- Fix encoding handling in xml binary input (Heikki)
  If the XML header doesn’t specify an encoding, we now assume UTF-8 by default; the previous handling was inconsistent.
- Fix bug with calling plperl from plperlu or vice versa (Tom)
  An error exit from the inner function could result in crashes due to failure to re-select the correct Perl interpreter for the outer function.
- Fix session-lifespan memory leak when a PL/Perl function is redefined (Tom)
• Ensure that Perl arrays are properly converted to PostgreSQL arrays when returned by a set-returning PL/Perl function (Andrew Dunstan, Abhijit Menon-Sen)
  This worked correctly already for non-set-returning functions.
• Fix rare crash in exception processing in PL/Python (Peter)
• In contrib/pg_standby, disable triggering failover with a signal on Windows (Fujii Masao)
  This never did anything useful, because Windows doesn’t have Unix-style signals, but recent changes made it actually crash.
• Ensure psql’s flex module is compiled with the correct system header definitions (Tom)
  This fixes build failures on platforms where --enable-largefile causes incompatible changes in the generated code.
• Make the postmaster ignore any application_name parameter in connection request packets, to improve compatibility with future libpq versions (Tom)
• Update the timezone abbreviation files to match current reality (Joachim Wieland)
  This includes adding IDT and SGT to the default timezone abbreviation set.
• Update time zone data files to tzdata release 2009s for DST law changes in Antarctica, Argentina, Bangladesh, Fiji, Novokuznetsk, Pakistan, Palestine, Samoa, Syria; also historical corrections for Hong Kong.

E.188. Release 8.3.8

Release date: 2009-09-09
This release contains a variety of fixes from 8.3.7. For information about new features in the 8.3 major release, see Section E.196.

E.188.1. Migration to Version 8.3.8

A dump/restore is not required for those running 8.3.X. However, if you have any hash indexes on interval columns, you must REINDEX them after updating to 8.3.8. Also, if you are upgrading from a version earlier than 8.3.5, see Section E.191.

E.188.2. Changes

• Fix Windows shared-memory allocation code (Tsutomu Yamada, Magnus)
  This bug led to the often-reported “could not reattach to shared memory” error message.
• Force WAL segment switch during pg_start_backup() (Heikki)
  This avoids corner cases that could render a base backup unusable.
Appendix E. Release Notes

- Disallow \texttt{RESET ROLE} and \texttt{RESET SESSION AUTHORIZATION} inside security-definer functions (Tom, Heikki)
  
  This covers a case that was missed in the previous patch that disallowed \texttt{SET ROLE} and \texttt{SET SESSION AUTHORIZATION} inside security-definer functions. (See CVE-2007-6600)

- Make \texttt{LOAD} of an already-loaded loadable module into a no-op (Tom)

  Formerly, \texttt{LOAD} would attempt to unload and re-load the module, but this is unsafe and not all that useful.

- Disallow empty passwords during LDAP authentication (Magnus)

- Fix handling of sub-SELECTs appearing in the arguments of an outer-level aggregate function (Tom)

- Fix bugs associated with fetching a whole-row value from the output of a Sort or Materialize plan node (Tom)

- Prevent \texttt{synchronize_seqscans} from changing the results of scrollable and \texttt{WITH HOLD} cursors (Tom)

- Revert planner change that disabled partial-index and constraint exclusion optimizations when there were more than 100 clauses in an AND or OR list (Tom)

- Fix hash calculation for data type \texttt{interval} (Tom)

  This corrects wrong results for hash joins on interval values. It also changes the contents of hash indexes on interval columns. If you have any such indexes, you must \texttt{REINDEX} them after updating.

- Treat \texttt{to_char(..., 'TH')} as an uppercase ordinal suffix with 'HH'/''HH12' (Heikki)

  It was previously handled as 'th' (lowercase).

- Fix overflow for \texttt{INTERVAL 'x ms'} when \texttt{x} is more than 2 million and integer datetimes are in use (Alex Hunsaker)

- Fix calculation of distance between a point and a line segment (Tom)

  This led to incorrect results from a number of geometric operators.

- Fix \texttt{money} data type to work in locales where currency amounts have no fractional digits, e.g. Japan (Itagaki Takahiro)

- Fix \texttt{LIKE} for case where pattern contains \texttt{%_} (Tom)

- Properly round datetime input like \texttt{00:12:57.999999999999999999999999999999999} (Tom)

- Fix memory leaks in XML operations (Tom)

- Fix poor choice of page split point in GiST R-tree operator classes (Teodor)

- Ensure that a "fast shutdown" request will forcibly terminate open sessions, even if a "smart shutdown" was already in progress (Fujii Masao)

- Avoid performance degradation in bulk inserts into GIN indexes when the input values are (nearly) in sorted order (Tom)

- Correctly enforce NOT NULL domain constraints in some contexts in PL/pgSQL (Tom)

- Fix portability issues in plperl initialization (Andrew Dunstan)

- Fix \texttt{pg_ctl} to not go into an infinite loop if \texttt{postgresql.conf} is empty (Jeff Davis)

- Improve \texttt{pg_dump}'s efficiency when there are many large objects (Tamas Vincze)
• Use SIGUSR1, not SIGQUIT, as the failover signal for pg_standby (Heikki)
• Make pg_standby's maxretries option behave as documented (Fujii Masao)
• Make contrib/hstore throw an error when a key or value is too long to fit in its data structure, rather than silently truncating it (Andrew Gierth)
• Fix contrib/xml2's xslt_process() to properly handle the maximum number of parameters (twenty) (Tom)
• Improve robustness of libpq’s code to recover from errors during COPY FROM STDIN (Tom)
• Avoid including conflicting readline and editline header files when both libraries are installed (Zdenek Kotala)
• Update time zone data files to tzdata release 2009l for DST law changes in Bangladesh, Egypt, Jordan, Pakistan, Argentina/San_Luis, Cuba, Jordan (historical correction only), Mauritius, Morocco, Palestine, Syria, Tunisia.

E.189. Release 8.3.7

Release date: 2009-03-16
This release contains a variety of fixes from 8.3.6. For information about new features in the 8.3 major release, see Section E.196.

E.189.1. Migration to Version 8.3.7
A dump/restore is not required for those running 8.3.X. However, if you are upgrading from a version earlier than 8.3.5, see Section E.191.

E.189.2. Changes

• Prevent error recursion crashes when encoding conversion fails (Tom)
  This change extends fixes made in the last two minor releases for related failure scenarios. The previous fixes were narrowly tailored for the original problem reports, but we have now recognized that any error thrown by an encoding conversion function could potentially lead to infinite recursion while trying to report the error. The solution therefore is to disable translation and encoding conversion and report the plain-ASCII form of any error message, if we find we have gotten into a recursive error reporting situation. (CVE-2009-0922)
• Disallow CREATE CONVERSION with the wrong encodings for the specified conversion function (Heikki)
  This prevents one possible scenario for encoding conversion failure. The previous change is a backstop to guard against other kinds of failures in the same area.
• Fix xpath() to not modify the path expression unless necessary, and to make a saner attempt at it when necessary (Andrew)
The SQL standard suggests that xpath should work on data that is a document fragment, but libxml doesn’t support that, and indeed it’s not clear that this is sensible according to the XPath standard. xpath attempted to work around this mismatch by modifying both the data and the path expression, but the modification was buggy and could cause valid searches to fail. Now, xpath checks whether the data is in fact a well-formed document, and if so invokes libxml with no change to the data or path expression. Otherwise, a different modification method that is somewhat less likely to fail is used.

Note: The new modification method is still not 100% satisfactory, and it seems likely that no real solution is possible. This patch should therefore be viewed as a band-aid to keep from breaking existing applications unnecessarily. It is likely that PostgreSQL 8.4 will simply reject use of xpath on data that is not a well-formed document.

• Fix core dump when to_char() is given format codes that are inappropriate for the type of the data argument (Tom)

• Fix possible failure in text search when C locale is used with a multi-byte encoding (Teodor)
Crashes were possible on platforms where wchar_t is narrower than int; Windows in particular.

• Fix extreme inefficiency in text search parser’s handling of an email-like string containing multiple @ characters (Heikki)

• Fix planner problem with sub-SELECT in the output list of a larger subquery (Tom)
The known symptom of this bug is a “failed to locate grouping columns” error that is dependent on the datatype involved; but there could be other issues as well.

• Fix decompilation of CASE WHEN with an implicit coercion (Tom)
This mistake could lead to Assert failures in an Assert-enabled build, or an “unexpected CASE WHEN clause” error message in other cases, when trying to examine or dump a view.

• Fix possible misassignment of the owner of a TOAST table’s rowtype (Tom)
If CLUSTER or a rewriting variant of ALTER TABLE were executed by someone other than the table owner, the pg_type entry for the table’s TOAST table would end up marked as owned by that someone. This caused no immediate problems, since the permissions on the TOAST rowtype aren’t examined by any ordinary database operation. However, it could lead to unexpected failures if one later tried to drop the role that issued the command (in 8.1 or 8.2), or “owner of data type appears to be invalid” warnings from pg_dump after having done so (in 8.3).

• Change UNLISTEN to exit quickly if the current session has never executed any LISTEN command (Tom)
Most of the time this is not a particularly useful optimization, but since DISCARD ALL invokes UNLISTEN, the previous coding caused a substantial performance problem for applications that made heavy use of DISCARD ALL.

• Fix PL/pgSQL to not treat INTO after INSERT as an INTO-variables clause anywhere in the string, not only at the start; in particular, don’t fail for INSERT INTO within CREATE RULE (Tom)

• Clean up PL/pgSQL error status variables fully at block exit (Ashesh Vashi and Dave Page)
This is not a problem for PL/pgSQL itself, but the omission could cause the PL/pgSQL Debugger to crash while examining the state of a function.

- Retry failed calls to `CallNamedPipe()` on Windows (Steve Marshall, Magnus)
  
  It appears that this function can sometimes fail transiently; we previously treated any failure as a hard error, which could confuse `LISTEN/NOTIFY` as well as other operations.

- Add **MUST** (Mauritius Island Summer Time) to the default list of known timezone abbreviations (Xavier Bugaud)

### E.190. Release 8.3.6

**Release date:** 2009-02-02

This release contains a variety of fixes from 8.3.5. For information about new features in the 8.3 major release, see Section E.196.

#### E.190.1. Migration to Version 8.3.6

A dump/restore is not required for those running 8.3.X. However, if you are upgrading from a version earlier than 8.3.5, see Section E.191.

#### E.190.2. Changes

- Make `DISCARD ALL` release advisory locks, in addition to everything it already did (Tom)
  
  This was decided to be the most appropriate behavior. This could affect existing applications, however.

- Fix whole-index GiST scans to work correctly (Teodor)
  
  This error could cause rows to be lost if a table is clustered on a GiST index.

- Fix crash of `xmlconcat(NULL)` (Peter)

- Fix possible crash in `ispell` dictionary if high-bit-set characters are used as flags (Teodor)
  
  This is known to be done by one widely available Norwegian dictionary, and the same condition may exist in others.

- Fix misordering of `pg_dump` output for composite types (Tom)
  
  The most likely problem was for user-defined operator classes to be dumped after indexes or views that needed them.

- Improve handling of URLs in `headline()` function (Teodor)

- Improve handling of overlength headlines in `headline()` function (Teodor)

- Prevent possible Assert failure or misconversion if an encoding conversion is created with the wrong conversion function for the specified pair of encodings (Tom, Heikki)
Appendix E. Release Notes

- Fix possible Assert failure if a statement executed in PL/pgSQL is rewritten into another kind of statement, for example if an \texttt{INSERT} is rewritten into a \texttt{UPDATE} (Heikki)
- Ensure that a snapshot is available to datatype input functions (Tom)
  This primarily affects domains that are declared with \texttt{CHECK} constraints involving user-defined stable or immutable functions. Such functions typically fail if no snapshot has been set.
- Make it safer for SPI-using functions to be used within datatype I/O; in particular, to be used in domain check constraints (Tom)
- Avoid unnecessary locking of small tables in \texttt{VACUUM} (Heikki)
- Fix a problem that sometimes kept \texttt{ALTER TABLE ENABLE/DISABLE RULE} from being recognized by active sessions (Tom)
- Fix a problem that made \texttt{UPDATE RETURNING tableoid} return zero instead of the correct OID (Tom)
- Allow functions declared as taking \texttt{ANYARRAY} to work on the \texttt{pg_statistic} columns of that type (Tom)
  This used to work, but was unintentionally broken in 8.3.
- Fix planner misestimation of selectivity when transitive equality is applied to an outer-join clause (Tom)
  This could result in bad plans for queries like \ldots from a left join b on a.al = b.bl where a.al = 42 \ldots
- Improve optimizer’s handling of long \texttt{IN} lists (Tom)
  This change avoids wasting large amounts of time on such lists when constraint exclusion is enabled.
- Prevent synchronous scan during GIN index build (Tom)
  Because GIN is optimized for inserting tuples in increasing TID order, choosing to use a synchronous scan could slow the build by a factor of three or more.
- Ensure that the contents of a holdable cursor don’t depend on the contents of TOAST tables (Tom)
  Previously, large field values in a cursor result might be represented as TOAST pointers, which would fail if the referenced table got dropped before the cursor is read, or if the large value is deleted and then vacuumed away. This cannot happen with an ordinary cursor, but it could with a cursor that is held past its creating transaction.
- Fix memory leak when a set-returning function is terminated without reading its whole result (Tom)
- Fix encoding conversion problems in XML functions when the database encoding isn’t UTF-8 (Tom)
- Fix \texttt{contrib/dblink}'s \texttt{dblink_get_result(text,bool)} function (Joe)
- Fix possible garbage output from \texttt{contrib/sslinfo} functions (Tom)
- Fix incorrect behavior of \texttt{contrib/tsearch2} compatibility trigger when it’s fired more than once in a command (Teodor)
- Fix possible mis-signaling in autovacuum (Heikki)
- Support running as a service on Windows 7 beta (Dave and Magnus)
- Fix \texttt{ecpg}'s handling of varchar structs (Michael)
- Fix configure script to properly report failure when unable to obtain linkage information for PL/Perl (Andrew)
Appendix E. Release Notes

- Make all documentation reference **pgsql-bugs** and/or **pgsql-hackers** as appropriate, instead of the now-decommissioned **pgsql-ports** and **pgsql-patches** mailing lists (Tom)
- Update time zone data files to tzdata release 2009a (for Kathmandu and historical DST corrections in Switzerland, Cuba)

E.191. Release 8.3.5

**Release date:** 2008-11-03

This release contains a variety of fixes from 8.3.4. For information about new features in the 8.3 major release, see Section E.196.

E.191.1. Migration to Version 8.3.5

A dump/restore is not required for those running 8.3.X. However, if you are upgrading from a version earlier than 8.3.1, see Section E.195. Also, if you were running a previous 8.3.X release, it is recommended to **REINDEX** all GiST indexes after the upgrade.

E.191.2. Changes

- Fix GiST index corruption due to marking the wrong index entry “dead” after a deletion (Teodor)
  
  This would result in index searches failing to find rows they should have found. Corrupted indexes can be fixed with **REINDEX**.
- Fix backend crash when the client encoding cannot represent a localized error message (Tom)
  
  We have addressed similar issues before, but it would still fail if the “character has no equivalent” message itself couldn’t be converted. The fix is to disable localization and send the plain ASCII error message when we detect such a situation.
- Fix possible crash in bytea-to-XML mapping (Michael McMaster)
- Fix possible crash when deeply nested functions are invoked from a trigger (Tom)
- Improve optimization of **expression IN (expression-list)** queries (Tom, per an idea from Robert Haas)
  
  Cases in which there are query variables on the right-hand side had been handled less efficiently in 8.2.x and 8.3.x than in prior versions. The fix restores 8.1 behavior for such cases.
- Fix mis-expansion of rule queries when a sub-**SELECT** appears in a function call in **FROM**, a multi-row **VALUES** list, or a **RETURNING** list (Tom)
  
  The usual symptom of this problem is an “unrecognized node type” error.
- Fix Assert failure during rescan of an **IS NULL** search of a GiST index (Teodor)
- Fix memory leak during rescan of a hashed aggregation plan (Neil)
Appendix E. Release Notes

- Ensure an error is reported when a newly-defined PL/pgSQL trigger function is invoked as a normal function (Tom)
- Force a checkpoint before CREATE DATABASE starts to copy files (Heikki)
  This prevents a possible failure if files had recently been deleted in the source database.
- Prevent possible collision of relfilenode numbers when moving a table to another tablespace with ALTER SET TABLESPACE (Heikki)
  The command tried to re-use the existing filename, instead of picking one that is known unused in the destination directory.
- Fix incorrect text search headline generation when single query item matches first word of text (Sushant Sinha)
- Fix improper display of fractional seconds in interval values when using a non-ISO datestyle in an --enable-integer-datetimes build (Ron Mayer)
- Make ILIKE compare characters case-insensitively even when they're escaped (Andrew)
- Ensure DISCARD is handled properly by statement logging (Tom)
- Fix incorrect logging of last-completed-transaction time during PITR recovery (Tom)
- Ensure SPI_getvalue and SPI_getbinval behave correctly when the passed tuple and tuple descriptor have different numbers of columns (Tom)
  This situation is normal when a table has had columns added or removed, but these two functions didn’t handle it properly. The only likely consequence is an incorrect error indication.
- Mark SessionReplicationRole as PGDLLIMPORT so it can be used by Slony on Windows (Magnus)
- Fix small memory leak when using libpq’s gsslib parameter (Magnus)
  The space used by the parameter string was not freed at connection close.
- Ensure libgssapi is linked into libpq if needed (Markus Schaaf)
- Fix ecpg’s parsing of CREATE ROLE (Michael)
- Fix recent breakage of pg_ctl restart (Tom)
- Ensure pg_control is opened in binary mode (Itagaki Takahiro)
  pg_controldata and pg_resetxlog did this incorrectly, and so could fail on Windows.
- Update time zone data files to tzdata release 2008i (for DST law changes in Argentina, Brazil, Mauritius, Syria)

E.192. Release 8.3.4

Release date: 2008-09-22

This release contains a variety of fixes from 8.3.3. For information about new features in the 8.3 major release, see Section E.196.
E.192.1. Migration to Version 8.3.4

A dump/restore is not required for those running 8.3.X. However, if you are upgrading from a version earlier than 8.3.1, see Section E.195.

E.192.2. Changes

• Fix bug in btree WAL recovery code (Heikki)
  Recovery failed if the WAL ended partway through a page split operation.

• Fix potential use of wrong cutoff XID for HOT page pruning (Alvaro)
  This error created a risk of corruption in system catalogs that are consulted by VACUUM: dead tuple versions might be removed too soon. The impact of this on actual database operations would be minimal, since the system doesn’t follow MVCC rules while examining catalogs, but it might result in transiently wrong output from pg_dump or other client programs.

• Fix potential miscalculation of datfrozenxid (Alvaro)
  This error may explain some recent reports of failure to remove old pg_clog data.

• Fix incorrect HOT updates after pg_class is reindexed (Tom)
  Corruption of pg_class could occur if REINDEX TABLE pg_class was followed in the same session by an ALTER TABLE RENAME or ALTER TABLE SET SCHEMA command.

• Fix missed “combo cid” case (Karl Schnaitter)
  This error made rows incorrectly invisible to a transaction in which they had been deleted by multiple subtransactions that all aborted.

• Prevent autovacuum from crashing if the table it’s currently checking is deleted at just the wrong time (Alvaro)

• Widen local lock counters from 32 to 64 bits (Tom)
  This responds to reports that the counters could overflow in sufficiently long transactions, leading to unexpected “lock is already held” errors.

• Fix possible duplicate output of tuples during a GiST index scan (Teodor)

• Regenerate foreign key checking queries from scratch when either table is modified (Tom)
  Previously, 8.3 would attempt to replan the query, but would work from previously generated query text. This led to failures if a table or column was renamed.

• Fix missed permissions checks when a view contains a simple UNION ALL construct (Heikki)
  Permissions for the referenced tables were checked properly, but not permissions for the view itself.

• Add checks in executor startup to ensure that the tuples produced by an INSERT or UPDATE will match the target table’s current rowtype (Tom)
  This situation is believed to be impossible in 8.3, but it can happen in prior releases, so a check seems prudent.

• Fix possible repeated drops during DROP OWNED (Tom)
This would typically result in strange errors such as “cache lookup failed for relation NNN”.

- Fix several memory leaks in XML operations (Kris Jurka, Tom)
- Fix xmlserialize() to raise error properly for unacceptable target data type (Tom)
- Fix a couple of places that mis-handled multibyte characters in text search configuration file parsing (Tom)
  
  Certain characters occurring in configuration files would always cause “invalid byte sequence for encoding” failures.
- Provide file name and line number location for all errors reported in text search configuration files (Tom)
- Fix AT TIME ZONE to first try to interpret its timezone argument as a timezone abbreviation, and only try it as a full timezone name if that fails, rather than the other way around as formerly (Tom)
  
  The timestamp input functions have always resolved ambiguous zone names in this order. Making AT TIME ZONE do so as well improves consistency, and fixes a compatibility bug introduced in 8.1: in ambiguous cases we now behave the same as 8.0 and before did, since in the older versions AT TIME ZONE accepted only abbreviations.
- Fix datetime input functions to correctly detect integer overflow when running on a 64-bit platform (Tom)
- Prevent integer overflows during units conversion when displaying a configuration parameter that has units (Tom)
- Improve performance of writing very long log messages to syslog (Tom)
- Allow spaces in the suffix part of an LDAP URL in pg_hba.conf (Tom)
- Fix bug in backwards scanning of a cursor on a SELECT DISTINCT ON query (Tom)
- Fix planner bug that could improperly push down IS NULL tests below an outer join (Tom)
  
  This was triggered by occurrence of IS NULL tests for the same relation in all arms of an upper OR clause.
- Fix planner bug with nested sub-select expressions (Tom)
  
  If the outer sub-select has no direct dependency on the parent query, but the inner one does, the outer value might not get recalculated for new parent query rows.
- Fix planner to estimate that GROUP BY expressions yielding boolean results always result in two groups, regardless of the expressions’ contents (Tom)
  
  This is very substantially more accurate than the regular GROUP BY estimate for certain boolean tests like col IS NULL.
- Fix PL/pgSQL to not fail when a FOR loop’s target variable is a record containing composite-type fields (Tom)
- Fix PL/Tcl to behave correctly with Tcl 8.5, and to be more careful about the encoding of data sent to or from Tcl (Tom)
- Improve performance of PQescapeBytea() (Rudolf Leitgeb)
- On Windows, work around a Microsoft bug by preventing libpq from trying to send more than 64kB per system call (Magnus)
• Fix ecpg to handle variables properly in SET commands (Michael)
• Improve pg_dump and pg_restore’s error reporting after failure to send a SQL command (Tom)
• Fix pg_ctl to properly preserve postmaster command-line arguments across a restart (Bruce)
• Fix erroneous WAL file cutoff point calculation in pg_standby (Simon)
• Update time zone data files to tzdata release 2008f (for DST law changes in Argentina, Bahamas, Brazil, Mauritius, Morocco, Pakistan, Palestine, and Paraguay)

E.193. Release 8.3.3

Release date: 2008-06-12
This release contains one serious and one minor bug fix over 8.3.2. For information about new features in the 8.3 major release, see Section E.196.

E.193.1. Migration to Version 8.3.3
A dump/restore is not required for those running 8.3.X. However, if you are upgrading from a version earlier than 8.3.1, see Section E.195.

E.193.2. Changes

• Make pg_get_ruledef() parenthesize negative constants (Tom)
  Before this fix, a negative constant in a view or rule might be dumped as, say, -42::integer, which is subtly incorrect: it should be (-42)::integer due to operator precedence rules. Usually this would make little difference, but it could interact with another recent patch to cause PostgreSQL to reject what had been a valid SELECT DISTINCT view query. Since this could result in pg_dump output failing to reload, it is being treated as a high-priority fix. The only released versions in which dump output is actually incorrect are 8.3.1 and 8.2.7.

• Make ALTER AGGREGATE ... OWNER TO update pg_shdepend (Tom)
  This oversight could lead to problems if the aggregate was later involved in a DROP OWNED or REASSIGN OWNED operation.

E.194. Release 8.3.2

Release date: never released
This release contains a variety of fixes from 8.3.1. For information about new features in the 8.3 major release, see Section E.196.
E.194.1. Migration to Version 8.3.2

A dump/restore is not required for those running 8.3.X. However, if you are upgrading from a version earlier than 8.3.1, see Section E.195.

E.194.2. Changes

- Fix ERRORDATA_STACK_SIZE exceeded crash that occurred on Windows when using UTF-8 database encoding and a different client encoding (Tom)
- Fix incorrect archive truncation point calculation for the %r macro in restore_command parameters (Simon)
  This could lead to data loss if a warm-standby script relied on %r to decide when to throw away WAL segment files.
- Fix ALTER TABLE ADD COLUMN ... PRIMARY KEY so that the new column is correctly checked to see if it’s been initialized to all non-nulls (Brendan Jurd)
  Previous versions neglected to check this requirement at all.
- Fix REASSIGN OWNED so that it works on procedural languages too (Alvaro)
- Fix problems with SELECT FOR UPDATE/SHARE occurring as a subquery in a query with a non-SELECT top-level operation (Tom)
- Fix possible CREATE TABLE failure when inheriting the “same” constraint from multiple parent relations that inherited that constraint from a common ancestor (Tom)
- Fix pg_get_ruledef() to show the alias, if any, attached to the target table of an UPDATE or DELETE (Tom)
- Restore the pre-8.3 behavior that an out-of-range block number in a TID being used in a TidScan plan results in silently not matching any rows (Tom)
  8.3.0 and 8.3.1 threw an error instead.
- Fix GIN bug that could result in too many LWLocks taken failure (Teodor)
- Fix broken GiST comparison function for tsquery (Teodor)
- Fix tsvector_update_trigger() and ts_stat() to accept domains over the types they expect to work with (Tom)
- Fix failure to support enum data types as foreign keys (Tom)
- Avoid possible crash when decompressing corrupted data (Zdenek Kotala)
- Fix race conditions between delayed unlinks and DROP DATABASE (Heikki)
  In the worst case this could result in deleting a newly created table in a new database that happened to get the same OID as the recently-dropped one; but of course that is an extremely low-probability scenario.
- Repair two places where SIGTERM exit of a backend could leave corrupted state in shared memory (Tom)
Neither case is very important if SIGTERM is used to shut down the whole database cluster together, but there was a problem if someone tried to SIGTERM individual backends.

- Fix possible crash due to incorrect plan generated for an \texttt{x IN (SELECT \textit{y} FROM ...)} clause when \textit{x} and \textit{y} have different data types; and make sure the behavior is semantically correct when the conversion from \textit{y}'s type to \textit{x}'s type is lossy (Tom)

- Fix oversight that prevented the planner from substituting known Param values as if they were constants (Tom)

  This mistake partially disabled optimization of unnamed extended-Query statements in 8.3.0 and 8.3.1: in particular the LIKE-to-indexscan optimization would never be applied if the LIKE pattern was passed as a parameter, and constraint exclusion depending on a parameter value didn’t work either.

- Fix planner failure when an indexable \texttt{MIN} or \texttt{MAX} aggregate is used with \texttt{DISTINCT} or \texttt{ORDER BY} (Tom)

- Fix planner to ensure it never uses a “physical tlist” for a plan node that is feeding a Sort node (Tom)

  This led to the sort having to push around more data than it really needed to, since unused column values were included in the sorted data.

- Avoid unnecessary copying of query strings (Tom)

  This fixes a performance problem introduced in 8.3.0 when a very large number of commands are submitted as a single query string.

- Make \texttt{TransactionIdIsCurrentTransactionId()} use binary search instead of linear search when checking child-transaction XIDs (Heikki)

  This fixes some cases in which 8.3.0 was significantly slower than earlier releases.

- Fix conversions between ISO-8859-5 and other encodings to handle Cyrillic “Yo” characters (e and E with two dots) (Sergey Burladyan)

- Fix several datatype input functions, notably \texttt{array_in()}, that were allowing unused bytes in their results to contain uninitialized, unpredictable values (Tom)

  This could lead to failures in which two apparently identical literal values were not seen as equal, resulting in the parser complaining about unmatched \texttt{ORDER BY} and \texttt{DISTINCT} expressions.

- Fix a corner case in regular-expression substring matching (\texttt{substring(string from pattern)}) (Tom)

  The problem occurs when there is a match to the pattern overall but the user has specified a parenthesized subexpression and that subexpression hasn’t got a match. An example is \texttt{substring('foo' from 'foo(bar)?'). This should return NULL, since \texttt{(bar)} isn’t matched, but it was mistakenly returning the whole-pattern match instead (ie, $\texttt{foo}$).

- Prevent cancellation of an auto-vacuum that was launched to prevent XID wraparound (Alvaro)

- Improve \texttt{ANALYZE}'s handling of in-doubt tuples (those inserted or deleted by a not-yet-committed transaction) so that the counts it reports to the stats collector are more likely to be correct (Pavan Deolasee)

- Fix initdb to reject a relative path for its \texttt{--xlogdir (-X)} option (Tom)

- Make psql print tab characters as an appropriate number of spaces, rather than $\texttt{\backslash x09}$ as was done in 8.3.0 and 8.3.1 (Bruce)
Appendix E. Release Notes

- Update time zone data files to tzdata release 2008c (for DST law changes in Morocco, Iraq, Choibalsan, Pakistan, Syria, Cuba, and Argentina/San_Luis)
- Add ECPGget_PGconn() function to ecpglib (Michael)
- Fix incorrect result from ecpg’s PGTYPEStimestamp_sub() function (Michael)
- Fix handling of continuation line markers in ecpg (Michael)
- Fix possible crashes in contrib/cube functions (Tom)
- Fix core dump in contrib/xml2’s xpath_table() function when the input query returns a NULL value (Tom)
- Fix contrib/xml2’s makefile to not override CFLAGS, and make it auto-configure properly for libxslt present or not (Tom)

E.195. Release 8.3.1

Release date: 2008-03-17

This release contains a variety of fixes from 8.3.0. For information about new features in the 8.3 major release, see Section E.196.

E.195.1. Migration to Version 8.3.1

A dump/restore is not required for those running 8.3.X. However, you might need to REINDEX indexes on textual columns after updating, if you are affected by the Windows locale issue described below.

E.195.2. Changes

- Fix character string comparison for Windows locales that consider different character combinations as equal (Tom)
  This fix applies only on Windows and only when using UTF-8 database encoding. The same fix was made for all other cases over two years ago, but Windows with UTF-8 uses a separate code path that was not updated. If you are using a locale that considers some non-identical strings as equal, you may need to REINDEX to fix existing indexes on textual columns.
- Repair corner-case bugs in VACUUM FULL (Tom)
  A potential deadlock between concurrent VACUUM FULL operations on different system catalogs was introduced in 8.2. This has now been corrected. 8.3 made this worse because the deadlock could occur within a critical code section, making it a PANIC rather than just ERROR condition.
  Also, a VACUUM FULL that failed partway through vacuuming a system catalog could result in cache corruption in concurrent database sessions.
  Another VACUUM FULL bug introduced in 8.3 could result in a crash or out-of-memory report when dealing with pages containing no live tuples.
• Fix misbehavior of foreign key checks involving character or bit columns (Tom)
  If the referencing column were of a different but compatible type (for instance varchar), the constraint was enforced incorrectly.

• Avoid needless deadlock failures in no-op foreign-key checks (Stephan Szabo, Tom)

• Fix possible core dump when re-planning a prepared query (Tom)
  This bug affected only protocol-level prepare operations, not SQL PREPARE, and so tended to be seen only with JDBC, DBI, and other client-side drivers that use prepared statements heavily.

• Fix possible failure when re-planning a query that calls an SPI-using function (Tom)

• Fix failure in row-wise comparisons involving columns of different datatypes (Tom)

• Fix longstanding LISTEN/NOTIFY race condition (Tom)
  In rare cases a session that had just executed a LISTEN might not get a notification, even though one would be expected because the concurrent transaction executing NOTIFY was observed to commit later.

  A side effect of the fix is that a transaction that has executed a not-yet-committed LISTEN command will not see any row in pg_listener for the LISTEN, should it choose to look; formerly it would have.

  This behavior was never documented one way or the other, but it is possible that some applications depend on the old behavior.

• Disallow LISTEN and UNLISTEN within a prepared transaction (Tom)
  This was formerly allowed but trying to do it had various unpleasant consequences, notably that the originating backend could not exit as long as an UNLISTEN remained uncommitted.

• Disallow dropping a temporary table within a prepared transaction (Heikki)
  This was correctly disallowed by 8.1, but the check was inadvertently broken in 8.2 and 8.3.

• Fix rare crash when an error occurs during a query using a hash index (Heikki)

• Fix incorrect comparison of tsquery values (Teodor)

• Fix incorrect behavior of LIKE with non-ASCII characters in single-byte encodings (Rolf Jentsch)

• Disable xmlvalidate (Tom)
  This function should have been removed before 8.3 release, but was inadvertently left in the source code. It poses a small security risk since unprivileged users could use it to read the first few characters of any file accessible to the server.

• Fix memory leaks in certain usages of set-returning functions (Neil)

• Make encode(bytea, 'escape') convert all high-bit-set byte values into \nnn octal escape sequences (Tom)

  This is necessary to avoid encoding problems when the database encoding is multi-byte. This change could pose compatibility issues for applications that are expecting specific results from encode.

• Fix input of datetime values for February 29 in years BC (Tom)
  The former coding was mistaken about which years were leap years.

• Fix "unrecognized node type" error in some variants of ALTER OWNER (Tom)

• Avoid tablespace permissions errors in CREATE TABLE LIKE INCLUDING INDEXES (Tom)

• Ensure pg_stat_activity.waiting flag is cleared when a lock wait is aborted (Tom)
• Fix handling of process permissions on Windows Vista (Dave, Magnus)
  In particular, this fix allows starting the server as the Administrator user.
• Update time zone data files to tzdata release 2008a (in particular, recent Chile changes); adjust timezone abbreviation "VET" (Venezuela) to mean UTC-4:30, not UTC-4:00 (Tom)
• Fix ecpg problems with arrays (Michael)
• Fix pg_ctl to correctly extract the postmaster’s port number from command-line options (Itagaki Takahiro, Tom)
  Previously, `pg_ctl start -w` could try to contact the postmaster on the wrong port, leading to bogus reports of startup failure.
• Use `-fwrapv` to defend against possible misoptimization in recent gcc versions (Tom)
  This is known to be necessary when building PostgreSQL with gcc 4.3 or later.
• Enable building contrib/uuid-ossi with MSVC (Hiroshi Saito)

E.196. Release 8.3

Release date: 2008-02-04

E.196.1. Overview

With significant new functionality and performance enhancements, this release represents a major leap forward for PostgreSQL. This was made possible by a growing community that has dramatically accelerated the pace of development. This release adds the following major features:

• Full text search is integrated into the core database system
• Support for the SQL/XML standard, including new operators and an XML data type
• Enumerated data types (ENUM)
• Arrays of composite types
• Universally Unique Identifier (UUID) data type
• Add control over whether NULLs sort first or last
• Updatable cursors
• Server configuration parameters can now be set on a per-function basis
• User-defined types can now have type modifiers
• Automatically re-plan cached queries when table definitions change or statistics are updated
• Numerous improvements in logging and statistics collection
• Support Security Service Provider Interface (SSPI) for authentication on Windows
• Support multiple concurrent autovacuum processes, and other autovacuum improvements
• Allow the whole PostgreSQL distribution to be compiled with Microsoft Visual C++
Appendix E. Release Notes

Major performance improvements are listed below. Most of these enhancements are automatic and do not require user changes or tuning:

- Asynchronous commit delays writes to WAL during transaction commit
- Checkpoint writes can be spread over a longer time period to smooth the I/O spike during each checkpoint
- Heap-Only Tuples (HOT) accelerate space reuse for most updates and deletes
- Just-in-time background writer strategy improves disk write efficiency
- Using non-persistent transaction IDs for read-only transactions reduces overhead and vacuum requirements
- Per-field and per-row storage overhead has been reduced
- Large sequential scans no longer force out frequently used cached pages
- Concurrent large sequential scans can now share disk reads
- ORDER BY ... LIMIT can be done without sorting

The above items are explained in more detail in the sections below.

E.196.2. Migration to Version 8.3

A dump/restore using pg_dump is required for those wishing to migrate data from any previous release. Observe the following incompatibilities:

E.196.2.1. General

- Non-character data types are no longer automatically cast to TEXT (Peter, Tom)
  Previously, if a non-character value was supplied to an operator or function that requires text input, it was automatically cast to text, for most (though not all) built-in data types. This no longer happens: an explicit cast to text is now required for all non-character-string types. For example, these expressions formerly worked:

  substr(current_date, 1, 4)
  23 LIKE '2%'

  but will now draw “function does not exist” and “operator does not exist” errors respectively. Use an explicit cast instead:

  substr(current_date::text, 1, 4)
  23::text LIKE '2%'

  (Of course, you can use the more verbose CAST() syntax too.) The reason for the change is that these automatic casts too often caused surprising behavior. An example is that in previous releases, this expression was accepted but did not do what was expected:

  current_date < 2017-11-17

  This is actually comparing a date to an integer, which should be (and now is) rejected — but in the presence of automatic casts both sides were cast to text and a textual comparison was done, because the text < text operator was able to match the expression when no other < operator could.
Types \texttt{char(n)} and \texttt{varchar(n)} still cast to \texttt{text} automatically. Also, automatic casting to \texttt{text} still works for inputs to the concatenation (\texttt{||}) operator, so long as at least one input is a character-string type.

- Full text search features from \texttt{contrib/tsearch2} have been moved into the core server, with some minor syntax changes.

  \texttt{contrib/tsearch2} now contains a compatibility interface.

- \texttt{ARRAY(SELECT ...)}, where the \texttt{SELECT} returns no rows, now returns an empty array, rather than \texttt{NULL} (Tom)

- The array type name for a base data type is no longer always the base type’s name with an underscore prefix.

  The old naming convention is still honored when possible, but application code should no longer depend on it. Instead use the new \texttt{pg_type.typarray} column to identify the array data type associated with a given type.

- \texttt{ORDER BY ... USING operator} must now use a less-than or greater-than \texttt{operator} that is defined in a btree operator class.

  This restriction was added to prevent inconsistent results.

- \texttt{SET LOCAL} changes now persist until the end of the outermost transaction, unless rolled back (Tom)

  Previously \texttt{SET LOCAL}’s effects were lost after subtransaction commit (\texttt{RELEASE SAVEPOINT} or exit from a PL/pgSQL exception block).

- Commands rejected in transaction blocks are now also rejected in multiple-statement query strings (Tom)

  For example, \texttt{"BEGIN; DROP DATABASE; COMMIT"} will now be rejected even if submitted as a single query message.

- \texttt{ROLLBACK} outside a transaction block now issues \texttt{NOTICE} instead of \texttt{WARNING} (Bruce)

- Prevent \texttt{NOTIFY/\texttt{LISTEN}/\texttt{UNLISTEN}} from accepting schema-qualified names (Bruce)

  Formerly, these commands accepted \texttt{schema.relation} but ignored the schema part, which was confusing.

- \texttt{ALTER SEQUENCE} no longer affects the sequence’s \texttt{currval()} state (Tom)

  This improves semantic consistency and helps avoid performance problems.

- Restrict object size functions to users who have reasonable permissions to view such information (Tom)

  For example, \texttt{pg_database_size()} now requires \texttt{CONNECT} permission, which is granted to everyone by default. \texttt{pg_tablespace_size()} requires \texttt{CREATE} permission in the tablespace, or is allowed if the tablespace is the default tablespace for the database.

- Remove the undocumented \texttt{!!=} (not in) operator (Tom)

  \texttt{NOT IN (SELECT ...)} is the proper way to perform this operation.

- Internal hashing functions are now more uniformly-distributed (Tom)

  If application code was computing and storing hash values using internal PostgreSQL hashing functions, the hash values must be regenerated.

- C-code conventions for handling variable-length data values have changed (Greg Stark, Tom)
The new \texttt{SET_VARSIZE()} macro \textit{must} be used to set the length of generated \texttt{varlena} values. Also, it might be necessary to expand (“de-TOAST”) input values in more cases.

- Continuous archiving no longer reports each successful archive operation to the server logs unless \texttt{DEBUG} level is used (Simon)

\textbf{E.196.2.2. Configuration Parameters}

- Numerous changes in administrative server parameters
  \begin{verbatim}
  bgwriter_lru_percent,  bgwriter_all_percent,  bgwriter_all_maxpages,
  stats_start_collector,  and  stats_reset_on_server_start  are  removed.
  redirect_stderr  is renamed to logging_collector. stats_command_string  is renamed
  to  track_activities. stats_block_level  and  stats_row_level  are  merged  into
  track_counts. A new boolean configuration parameter,  archive_mode,  controls  archiving.
  Autovacuum’s  default  settings  have  changed.
  \end{verbatim}
  - Remove \texttt{stats_start_collector} parameter (Tom)
    We now always start the collector process, unless UDP socket creation fails.
  - Remove \texttt{stats_reset_on_server_start} parameter (Tom)
    This was removed because \texttt{pg_stat_reset()} can be used for this purpose.
  - Commenting out a parameter in \texttt{postgresql.conf} now causes it to revert to its default value (Joachim Wieland)
    Previously, commenting out an entry left the parameter’s value unchanged until the next server restart.

\textbf{E.196.2.3. Character Encodings}

- Add more checks for invalidly-encoded data (Andrew)
  This change plugs some holes that existed in literal backslash escape string processing and \texttt{COPY} escape processing. Now the de-escaped string is rechecked to see if the result created an invalid multi-byte character.
- Disallow database encodings that are inconsistent with the server’s locale setting (Tom)
  On most platforms, \texttt{C} locale is the only locale that will work with any database encoding. Other locale settings imply a specific encoding and will misbehave if the database encoding is something different. (Typical symptoms include bogus textual sort order and wrong results from \texttt{upper()} or \texttt{lower()}.)
  The server now rejects attempts to create databases that have an incompatible encoding.
- Ensure that \texttt{chr()} cannot create invalidly-encoded values (Andrew)
  In UTF8-encoded databases the argument of \texttt{chr()} is now treated as a Unicode code point. In other multi-byte encodings \texttt{chr()}’s argument must designate a 7-bit ASCII character. Zero is no longer accepted. \texttt{ascii()} has been adjusted to match.
- Adjust \texttt{convert()} behavior to ensure encoding validity (Andrew)
Appendix E. Release Notes

The two argument form of `convert()` has been removed. The three argument form now takes a `bytea` first argument and returns a `bytea`. To cover the loss of functionality, three new functions have been added:

- `convert_from(bytea, name)` returns `text` — converts the first argument from the named encoding to the database encoding
- `convert_to(text, name)` returns `bytea` — converts the first argument from the database encoding to the named encoding
- `length(bytea, name)` returns `integer` — gives the length of the first argument in characters in the named encoding

• Remove `convert(argument USING conversion_name)` (Andrew)
  Its behavior did not match the SQL standard.
• Make JOHAB encoding client-only (Tatsuo)
  JOHAB is not safe as a server-side encoding.

E.196.3. Changes

Below you will find a detailed account of the changes between PostgreSQL 8.3 and the previous major release.

E.196.3.1. Performance

• Asynchronous commit delays writes to WAL during transaction commit (Simon)
  This feature dramatically increases performance for short data-modifying transactions. The disadvantage is that because disk writes are delayed, if the database or operating system crashes before data is written to the disk, committed data will be lost. This feature is useful for applications that can accept some data loss. Unlike turning off `fsync`, using asynchronous commit does not put database consistency at risk; the worst case is that after a crash the last few reportedly-committed transactions might not be committed after all. This feature is enabled by turning off `synchronous_commit` (which can be done per-session or per-transaction, if some transactions are critical and others are not). `wal_writer_delay` can be adjusted to control the maximum delay before transactions actually reach disk.
• Checkpoint writes can be spread over a longer time period to smooth the I/O spike during each checkpoint (Itagaki Takahiro and Heikki Linnakangas)
  Previously all modified buffers were forced to disk as quickly as possible during a checkpoint, causing an I/O spike that decreased server performance. This new approach spreads out disk writes during checkpoints, reducing peak I/O usage. (User-requested and shutdown checkpoints are still written as quickly as possible.)
• Heap-Only Tuples (HOT) accelerate space reuse for most `UPDATE`s and `DELETE`s (Pavan Deolasee, with ideas from many others)
Appendix E. Release Notes

**UPDATE**s and **DELETE**s leave dead tuples behind, as do failed **INSERT**s. Previously only **VACUUM** could reclaim space taken by dead tuples. With HOT dead tuple space can be automatically reclaimed at the time of **INSERT** or **UPDATE** if no changes are made to indexed columns. This allows for more consistent performance. Also, HOT avoids adding duplicate index entries.

- Just-in-time background writer strategy improves disk write efficiency (Greg Smith, Itagaki Takahiro)
  This greatly reduces the need for manual tuning of the background writer.
- Per-field and per-row storage overhead have been reduced (Greg Stark, Heikki Linnakangas)
  Variable-length data types with data values less than 128 bytes long will see a storage decrease of 3 to 6 bytes. For example, two adjacent **char(1)** fields now use 4 bytes instead of 16. Row headers are also 4 bytes shorter than before.
- Using non-persistent transaction IDs for read-only transactions reduces overhead and **VACUUM** requirements (Florian Pflug)
  Non-persistent transaction IDs do not increment the global transaction counter. Therefore, they reduce the load on **pg_clog** and increase the time between forced vacuums to prevent transaction ID wraparound. Other performance improvements were also made that should improve concurrency.
- Avoid incrementing the command counter after a read-only command (Tom)
  There was formerly a hard limit of $2^{32}$ (4 billion) commands per transaction. Now only commands that actually changed the database count, so while this limit still exists, it should be significantly less annoying.
- Create a dedicated WAL writer process to off-load work from backends (Simon)
- Skip unnecessary WAL writes for **CLUSTER** and **COPY** (Simon)
  Unless WAL archiving is enabled, the system now avoids WAL writes for **CLUSTER** and just **fsync()**s the table at the end of the command. It also does the same for **COPY** if the table was created in the same transaction.
- Large sequential scans no longer force out frequently used cached pages (Simon, Heikki, Tom)
- Concurrent large sequential scans can now share disk reads (Jeff Davis)
  This is accomplished by starting the new sequential scan in the middle of the table (where another sequential scan is already in-progress) and wrapping around to the beginning to finish. This can affect the order of returned rows in a query that does not specify **ORDER BY**. The **synchronize_seqscans** configuration parameter can be used to disable this if necessary.
- **ORDER BY ... LIMIT** can be done without sorting (Greg Stark)
  This is done by sequentially scanning the table and tracking just the “top N” candidate rows, rather than performing a full sort of the entire table. This is useful when there is no matching index and the **LIMIT** is not large.
- Put a rate limit on messages sent to the statistics collector by backends (Tom)
  This reduces overhead for short transactions, but might sometimes increase the delay before statistics are tallied.
- Improve hash join performance for cases with many NULLs (Tom)
- Speed up operator lookup for cases with non-exact datatype matches (Tom)
E.196.3.2. Server

- Autovacuum is now enabled by default (Alvaro)
  Several changes were made to eliminate disadvantages of having autovacuum enabled, thereby justifying the change in default. Several other autovacuum parameter defaults were also modified.
- Support multiple concurrent autovacuum processes (Alvaro, Itagaki Takahiro)
  This allows multiple vacuums to run concurrently. This prevents vacuuming of a large table from delaying vacuuming of smaller tables.
- Automatically re-plan cached queries when table definitions change or statistics are updated (Tom)
  Previously PL/pgSQL functions that referenced temporary tables would fail if the temporary table was dropped and recreated between function invocations, unless `EXECUTE` was used. This improvement fixes that problem and many related issues.
- Add a `temp_tablespaces` parameter to control the tablespaces for temporary tables and files (Jaime Casanova, Albert Cervera, Bernd Helmle)
  This parameter defines a list of tablespaces to be used. This enables spreading the I/O load across multiple tablespaces. A random tablespace is chosen each time a temporary object is created. Temporary files are no longer stored in per-database `pgsql_tmp/` directories but in per-tablespace directories.
- Place temporary tables’ TOAST tables in special schemas named `pg_toast_temp_nnn` (Tom)
  This allows low-level code to recognize these tables as temporary, which enables various optimizations such as not WAL-logging changes and using local rather than shared buffers for access. This also fixes a bug wherein backends unexpectedly held open file references to temporary TOAST tables.
- Fix problem that a constant flow of new connection requests could indefinitely delay the postmaster from completing a shutdown or a crash restart (Tom)
- Guard against a very-low-probability data loss scenario by preventing re-use of a deleted table’s relfilenode until after the next checkpoint (Heikki)
- Fix `CREATE CONSTRAINT TRIGGER` to convert old-style foreign key trigger definitions into regular foreign key constraints (Tom)
  This will ease porting of foreign key constraints carried forward from pre-7.3 databases, if they were never converted using `contrib/adddepend`.
- Fix `DEFAULT NULL` to override inherited defaults (Tom)
  `DEFAULT NULL` was formerly considered a noise phrase, but it should (and now does) override non-null defaults that would otherwise be inherited from a parent table or domain.
- Add new encodings EUC_JIS_2004 and SHIFT_JIS_2004 (Tatsuo)
  These new encodings can be converted to and from UTF-8.
- Change server startup log message from “database system is ready” to “database system is ready to accept connections”, and adjust its timing
  The message now appears only when the postmaster is really ready to accept connections.
E.196.3.3. Monitoring

- Add `log_autovacuum_min_duration` parameter to support configurable logging of autovacuum activity (Simon, Alvaro)
- Add `log_lock_waits` parameter to log lock waiting (Simon)
- Add `log_temp_files` parameter to log temporary file usage (Bill Moran)
- Add `log_checkpoints` parameter to improve logging of checkpoints (Greg Smith, Heikki)
- `log_line_prefix` now supports `%s` and `%c` escapes in all processes (Andrew)
  
  Previously these escapes worked only for user sessions, not for background database processes.
- Add `log_restartpoints` to control logging of point-in-time recovery restart points (Simon)
- Last transaction end time is now logged at end of recovery and at each logged restart point (Simon)
- Autovacuum now reports its activity start time in `pg_stat_activity` (Tom)
- Allow server log output in comma-separated value (CSV) format (Arul Shaji, Greg Smith, Andrew Dunstan)
  
  CSV-format log files can easily be loaded into a database table for subsequent analysis.
- Use PostgreSQL-supplied timezone support for formatting timestamps displayed in the server log (Tom)
  
  This avoids Windows-specific problems with localized time zone names that are in the wrong encoding.
  
  There is a new `log_timezone` parameter that controls the timezone used in log messages, independently of the client-visible `timezone` parameter.
- New system view `pg_stat_bgwriter` displays statistics about background writer activity (Magnus)
- Add new columns for database-wide tuple statistics to `pg_stat_database` (Magnus)
- Add an `xact_start` (transaction start time) column to `pg_stat_activity` (Neil)
  
  This makes it easier to identify long-running transactions.
- Add `n_live_tuples` and `n_dead_tuples` columns to `pg_stat_all_tables` and related views (Glen Parker)
- Merge `stats_block_level` and `stats_row_level` parameters into a single parameter `track_counts`, which controls all messages sent to the statistics collector process (Tom)
- Rename `stats_command_string` parameter to `track_activities` (Tom)
- Fix statistical counting of live and dead tuples to recognize that committed and aborted transactions have different effects (Tom)

E.196.3.4. Authentication

- Support Security Service Provider Interface (SSPI) for authentication on Windows (Magnus)
- Support GSSAPI authentication (Henry Hotz, Magnus)
  
  This should be preferred to native Kerberos authentication because GSSAPI is an industry standard.
Appendix E. Release Notes

- Support a global SSL configuration file (Victor Wagner)
- Add `ssl_ciphers` parameter to control accepted SSL ciphers (Victor Wagner)
- Add a Kerberos realm parameter, `krb_realm` (Magnus)

E.196.3.5. Write-Ahead Log (WAL) and Continuous Archiving

- Change the timestamps recorded in transaction WAL records from `time_t` to `TimestampTz` representation (Tom)
  This provides sub-second resolution in WAL, which can be useful for point-in-time recovery.
- Reduce WAL disk space needed by warm standby servers (Simon)
  This change allows a warm standby server to pass the name of the earliest still-needed WAL file to the recovery script, allowing automatic removal of no-longer-needed WAL files. This is done using `%r` in the `restore_command` parameter of `recovery.conf`.
- New boolean configuration parameter, `archive_mode`, controls archiving (Simon)
  Previously setting `archive_command` to an empty string turned off archiving. Now `archive_mode` turns archiving on and off, independently of `archive_command`. This is useful for stopping archiving temporarily.

E.196.3.6. Queries

- Full text search is integrated into the core database system (Teodor, Oleg)
  Text search has been improved, moved into the core code, and is now installed by default. `contrib/tsearch2` now contains a compatibility interface.
- Add control over whether `NULLs` sort first or last (Teodor, Tom)
  The syntax is `ORDER BY ... NULLS FIRST/LAST`.
- Allow per-column ascending/descending (`ASC/DESC`) ordering options for indexes (Teodor, Tom)
  Previously a query using `ORDER BY` with mixed `ASC/DESC` specifiers could not fully use an index. Now an index can be fully used in such cases if the index was created with matching `ASC/DESC` specifications. `NULL` sort order within an index can be controlled, too.
- Allow `col IS NULL` to use an index (Teodor)
- Updatable cursors (Arul Shaji, Tom)
  This eliminates the need to reference a primary key to `UPDATE` or `DELETE` rows returned by a cursor. The syntax is `UPDATE/DELETE WHERE CURRENT OF`.
- Allow `FOR UPDATE` in cursors (Arul Shaji, Tom)
- Create a general mechanism that supports casts to and from the standard string types (`TEXT`, `VARCHAR`, `CHAR`) for every datatype, by invoking the datatype’s I/O functions (Tom)
Appendix E. Release Notes

Previously, such casts were available only for types that had specialized function(s) for the purpose. These new casts are assignment-only in the to-string direction, explicit-only in the other direction, and therefore should create no surprising behavior.

• Allow \texttt{UNION} and related constructs to return a domain type, when all inputs are of that domain type (Tom)
  Formerly, the output would be considered to be of the domain’s base type.

• Allow limited hashing when using two different data types (Tom)
  This allows hash joins, hash indexes, hashed subplans, and hash aggregation to be used in situations involving cross-data-type comparisons, if the data types have compatible hash functions. Currently, cross-data-type hashing support exists for \texttt{smallint/integer/bigint}, and for \texttt{float4/float8}.

• Improve optimizer logic for detecting when variables are equal in a \texttt{WHERE} clause (Tom)
  This allows mergejoins to work with descending sort orders, and improves recognition of redundant sort columns.

• Improve performance when planning large inheritance trees in cases where most tables are excluded by constraints (Tom)

E.196.3.7. Object Manipulation

• Arrays of composite types (David Fetter, Andrew, Tom)
  In addition to arrays of explicitly-declared composite types, arrays of the rowtypes of regular tables and views are now supported, except for rowtypes of system catalogs, sequences, and TOAST tables.

• Server configuration parameters can now be set on a per-function basis (Tom)
  For example, functions can now set their own \texttt{search\_path} to prevent unexpected behavior if a different \texttt{search\_path} exists at run-time. Security definer functions should set \texttt{search\_path} to avoid security loopholes.

• \texttt{CREATE/ALTER FUNCTION} now supports \texttt{COST} and \texttt{ROWS} options (Tom)
  \texttt{COST} allows specification of the cost of a function call. \texttt{ROWS} allows specification of the average number or rows returned by a set-returning function. These values are used by the optimizer in choosing the best plan.

• Implement \texttt{CREATE TABLE LIKE ... INCLUDING INDEXES} (Trevor Hardcastle, Nikhil Sontakke, Neil)

• Allow \texttt{CREATE INDEX CONCURRENTLY} to ignore transactions in other databases (Simon)

• Add \texttt{ALTER VIEW ... RENAME TO} and \texttt{ALTER SEQUENCE ... RENAME TO} (David Fetter, Neil)
  Previously this could only be done via \texttt{ALTER \textit{TABLE} ... RENAME TO}.

• Make \texttt{CREATE/DROP/RENAME DATABASE} wait briefly for conflicting backends to exit before failing (Tom)
  This increases the likelihood that these commands will succeed.

• Allow triggers and rules to be deactivated in groups using a configuration parameter, for replication purposes (Jan)
This allows replication systems to disable triggers and rewrite rules as a group without modifying the system catalogs directly. The behavior is controlled by ALTER TABLE and a new parameter session_replication_role.

- User-defined types can now have type modifiers (Teodor, Tom)
  This allows a user-defined type to take a modifier, like ssnum(7). Previously only built-in data types could have modifiers.

### E.196.3.8. Utility Commands

- Non-superuser database owners now are able to add trusted procedural languages to their databases by default (Jeremy Drake)
  While this is reasonably safe, some administrators might wish to revoke the privilege. It is controlled by pg_pltemplatetmpldbacreate.
- Allow a session’s current parameter setting to be used as the default for future sessions (Tom)
  This is done with SET ... FROM CURRENT in CREATE/ALTER FUNCTION, ALTER DATABASE, or ALTER ROLE.
- Implement new commands DISCARD ALL, DISCARD PLANS, DISCARD TEMPORARY, CLOSE ALL, and DEALLOCATE ALL (Marko Kreen, Neil)
  These commands simplify resetting a database session to its initial state, and are particularly useful for connection-pooling software.
- Make CLUSTER MVCC-safe (Heikki Linnakangas)
  Formerly, CLUSTER would discard all tuples that were committed dead, even if there were still transactions that should be able to see them under MVCC visibility rules.
- Add new CLUSTER syntax: CLUSTER table USING index (Holger Schurig)
  The old CLUSTER syntax is still supported, but the new form is considered more logical.
- Fix EXPLAIN so it can show complex plans more accurately (Tom)
  References to subplan outputs are now always shown correctly, instead of using ?columnN? for complicated cases.
- Limit the amount of information reported when a user is dropped (Alvaro)
  Previously, dropping (or attempting to drop) a user who owned many objects could result in large NOTICE or ERROR messages listing all these objects; this caused problems for some client applications. The length of the message is now limited, although a full list is still sent to the server log.

### E.196.3.9. Data Types

- Support for the SQL/XML standard, including new operators and an XML data type (Nikolay Samokhvalov, Pavel Stehule, Peter)
- Enumerated data types (ENUM) (Tom Dunstan)
Appendix E. Release Notes

This feature provides convenient support for fields that have a small, fixed set of allowed values. An example of creating an ENUM type is:

```
CREATE TYPE mood AS ENUM ('sad', 'ok', 'happy');
```

- Universally Unique Identifier (UUID) data type (Gevik Babakhani, Neil)
  
  This closely matches RFC 4122.
- Widen the MONEY data type to 64 bits (D’Arcy Cain)
  
  This greatly increases the range of supported MONEY values.
- Fix float4/float8 to handle Infinity and NAN (Not A Number) consistently (Bruce)
  
  The code formerly was not consistent about distinguishing Infinity from overflow conditions.
- Allow leading and trailing whitespace during input of boolean values (Neil)
- Prevent COPY from using digits and lowercase letters as delimiters (Tom)

E.196.3.10. Functions

- Add new regular expression functions `regexp_matches()`, `regexp_split_to_array()`, and `regexp_split_to_table()` (Jeremy Drake, Neil)
  
  These functions provide extraction of regular expression subexpressions and allow splitting a string using a POSIX regular expression.
- Add `lo_truncate()` for large object truncation (Kris Jurka)
- Implement `width_bucket()` for the `float8` data type (Neil)
- Add `pg_stat_clear_snapshot()` to discard statistics snapshots collected during the current transaction (Tom)
  
  The first request for statistics in a transaction takes a statistics snapshot that does not change during the transaction. This function allows the snapshot to be discarded and a new snapshot loaded during the next statistics query. This is particularly useful for PL/pgSQL functions, which are confined to a single transaction.
- Add `isodow` option to `EXTRACT()` and `date_part()` (Bruce)
  
  This returns the day of the week, with Sunday as seven. (dow returns Sunday as zero.)
- Add ID (ISO day of week) and IDDD (ISO day of year) format codes for `to_char()`, `to_date()`, and `to_timestamp()` (Brendan Jurd)
- Make `to_timestamp()` and `to_date()` assume `TM` (trim) option for potentially variable-width fields (Bruce)
  
  This matches Oracle’s behavior.
- Fix off-by-one conversion error in `to_date()`/`to_timestamp()` D (non-ISO day of week) fields (Bruce)
- Make `setseed()` return void, rather than a useless integer value (Neil)
- Add a hash function for NUMERIC (Neil)
  
  This allows hash indexes and hash-based plans to be used with NUMERIC columns.
Appendix E. Release Notes

• Improve efficiency of LIKE/ILIKE, especially for multi-byte character sets like UTF-8 (Andrew, Itagaki Takahiro)
• Make curtid() functions require SELECT privileges on the target table (Tom)
• Add several txid_*() functions to query active transaction IDs (Jan)
  This is useful for various replication solutions.

E.196.3.11. PL/pgSQL Server-Side Language

• Add scrollable cursor support, including directional control in FETCH (Pavel Stehule)
• Allow IN as an alternative to FROM in PL/pgSQL’s FETCH statement, for consistency with the backend’s FETCH command (Pavel Stehule)
• Add MOVE to PL/pgSQL (Magnus, Pavel Stehule, Neil)
• Implement RETURN QUERY (Pavel Stehule, Neil)
  This adds convenient syntax for PL/pgSQL set-returning functions that want to return the result of a query. RETURN QUERY is easier and more efficient than a loop around RETURN NEXT.
• Allow function parameter names to be qualified with the function’s name (Tom)
  For example, myfunc.myvar. This is particularly useful for specifying variables in a query where the variable name might match a column name.
• Make qualification of variables with block labels work properly (Tom)
  Formerly, outer-level block labels could unexpectedly interfere with recognition of inner-level record or row references.
• Tighten requirements for FOR loop STEP values (Tom)
  Prevent non-positive STEP values, and handle loop overflows.
• Improve accuracy when reporting syntax error locations (Tom)

E.196.3.12. Other Server-Side Languages

• Allow type-name arguments to PL/Perl spi_prepare() to be data type aliases in addition to names found in pg_type (Andrew)
• Allow type-name arguments to PL/Python plpy.prepare() to be data type aliases in addition to names found in pg_type (Andrew)
• Allow type-name arguments to PL/Tcl spi_prepare to be data type aliases in addition to names found in pg_type (Andrew)
• Enable PL/PythonU to compile on Python 2.5 (Marko Kreen)
• Support a true PL/Python boolean type in compatible Python versions (Python 2.3 and later) (Marko Kreen)
• Fix PL/Tcl problems with thread-enabled libtcl spawning multiple threads within the backend (Steve Marshall, Paul Bayer, Doug Knight)
  This caused all sorts of unpleasantness.

E.196.3.13. psql

• List disabled triggers separately in \d output (Brendan Jurd)
• In \d patterns, always match $ literally (Tom)
• Show aggregate return types in \da output (Greg Sabino Mullane)
• Add the function’s volatility status to the output of \df+ (Neil)
• Add \prompt capability (Chad Wagner)
• Allow \pset, \t, and \x to specify on or off, rather than just toggling (Chad Wagner)
• Add \sleep capability (Jan)
• Enable \timing output for \copy (Andrew)
• Improve \timing resolution on Windows (Itagaki Takahiro)
• Flush \o output after each backslash command (Tom)
• Correctly detect and report errors while reading a -f input file (Peter)
• Remove -u option (this option has long been deprecated) (Tom)

E.196.3.14. pg_dump

• Add --tablespaces-only and --roles-only options to pg_dumpall (Dave Page)
• Add an output file option to pg_dumpall (Dave Page)
  This is primarily useful on Windows, where output redirection of child pg_dump processes does not work.
• Allow pg_dumpall to accept an initial-connection database name rather than the default template1 (Dave Page)
• In -n and -t switches, always match $ literally (Tom)
• Improve performance when a database has thousands of objects (Tom)
• Remove -u option (this option has long been deprecated) (Tom)

E.196.3.15. Other Client Applications

• In initdb, allow the location of the pg_xlog directory to be specified (Euler Taveira de Oliveira)
• Enable server core dump generation in pg_regress on supported operating systems (Andrew)
• Add a -t (timeout) parameter to pg_ctl (Bruce)
This controls how long pg_ctl will wait when waiting for server startup or shutdown. Formerly the
timeout was hard-wired as 60 seconds.

- Add a pg_ctl option to control generation of server core dumps (Andrew)
- Allow Control-C to cancel clusterdb, reindexdb, and vacuumdb (Itagaki Takahiro, Magnus)
- Suppress command tag output for createdb, createuser, dropdb, and dropuser (Peter)

   The --quiet option is ignored and will be removed in 8.4. Progress messages when acting on all
databases now go to stdout instead of stderr because they are not actually errors.

### E.196.3.16. libpq

- Interpret the dbName parameter of PQsetdbLogin() as a conninfo string if it contains an equals
  sign (Andrew)

   This allows use of conninfo strings in client programs that still use PQsetdbLogin().

- Support a global SSL configuration file (Victor Wagner)
- Add environment variable PGSSLKEY to control SSL hardware keys (Victor Wagner)
- Add lo_truncate() for large object truncation (Kris Jurka)
- Add PQconnectionNeedsPassword() that returns true if the server required a password but none
  was supplied (Joe Conway, Tom)

   If this returns true after a failed connection attempt, a client application should prompt the user for
   a password. In the past applications have had to check for a specific error message string to decide
   whether a password is needed; that approach is now deprecated.

- Add PQconnectionUsedPassword() that returns true if the supplied password was actually used
  (Joe Conway, Tom)

   This is useful in some security contexts where it is important to know whether a user-supplied password
   is actually valid.

### E.196.3.17. ecpg

- Use V3 frontend/backend protocol (Michael)

   This adds support for server-side prepared statements.

- Use native threads, instead of pthreads, on Windows (Magnus)
- Improve thread-safety of ecpglib (Itagaki Takahiro)
- Make the ecpg libraries export only necessary API symbols (Michael)
Appendix E. Release Notes

E.196.3.18. Windows Port

- Allow the whole PostgreSQL distribution to be compiled with Microsoft Visual C++ (Magnus and others)

  This allows Windows-based developers to use familiar development and debugging tools. Windows executables made with Visual C++ might also have better stability and performance than those made with other tool sets. The client-only Visual C++ build scripts have been removed.

- Drastically reduce postmaster’s memory usage when it has many child processes (Magnus)

- Allow regression tests to be started by an administrative user (Magnus)

- Add native shared memory implementation (Magnus)

E.196.3.19. Server Programming Interface (SPI)

- Add cursor-related functionality in SPI (Pavel Stehule)

  Allow access to the cursor-related planning options, and add `FETCH`/`MOVE` routines.

- Allow execution of cursor commands through `SPI_execute` (Tom)

  The macro `SPI_ERROR_CURSOR` still exists but will never be returned.

- SPI plan pointers are now declared as `SPIPlanPtr` instead of `void *` (Tom)

  This does not break application code, but switching is recommended to help catch simple programming mistakes.

E.196.3.20. Build Options

- Add configure option `--enable-profiling` to enable code profiling (works only with gcc) (Korry Douglas and Nikhil Sontakke)

- Add configure option `--with-system-tzdata` to use the operating system’s time zone database (Peter)

- Fix PGXS so extensions can be built against PostgreSQL installations whose `pg_config` program does not appear first in the `PATH` (Tom)

- Support `gmake draft` when building the SGML documentation (Bruce)

  Unless `draft` is used, the documentation build will now be repeated if necessary to ensure the index is up-to-date.

E.196.3.21. Source Code

- Rename macro `DLLIMPORT` to `PGDLLIMPORT` to avoid conflicting with third party includes (like Tcl) that define `DLLIMPORT` (Magnus)
Appendix E. Release Notes

- Create “operator families” to improve planning of queries involving cross-data-type comparisons (Tom)
- Update GIN extractQuery() API to allow signalling that nothing can satisfy the query (Teodor)
- Move NAMEDATALEN definition from postgres_ext.h to pg_config_manual.h (Peter)
- Provide strlcpy() and strlcat() on all platforms, and replace error-prone uses of strncpy(), strncat(), etc (Peter)
- Create hooks to let an external plugin monitor (or even replace) the planner and create plans for hypothetical situations (Gurjeet Singh, Tom)
- Create a function variable join_search_hook to let plugins override the join search order portion of the planner (Julius Stroffek)
- Add tas() support for Renesas’ M32R processor (Kazuhiro Inaoka)
- quote_identifier() and pg_dump no longer quote keywords that are unreserved according to the grammar (Tom)
- Change the on-disk representation of the NUMERIC data type so that the sign_dscale word comes before the weight (Tom)
- Use SYSV semaphores rather than POSIX on Darwin >= 6.0, i.e., OS X 10.2 and up (Chris Marcellino)
- Add acronym and NFS documentation sections (Bruce)
- “Postgres” is now documented as an accepted alias for “PostgreSQL” (Peter)
- Add documentation about preventing database server spoofing when the server is down (Bruce)

E.196.3.22. Contrib

- Move contrib README content into the main PostgreSQL documentation (Albert Cervera i Areny)
- Add contrib/pageinspect module for low-level page inspection (Simon, Heikki)
- Add contrib/pg_standby module for controlling warm standby operation (Simon)
- Add contrib/uuid-ossp module for generating UUID values using the OSSP UUID library (Peter)
  Use configure --with-ossp-uuid to activate. This takes advantage of the new UUID builtin type.
- Add contrib/dict_int, contrib/dict_xsyn, and contrib/test_parser modules to provide sample add-on text search dictionary templates and parsers (Sergey Karpov)
- Allow contrib/pgbench to set the fillfactor (Pavan Deolasee)
- Add timestamps to contrib/pgbench -l (Greg Smith)
- Add usage count statistics to contrib/pgbuffercache (Greg Smith)
- Add GIN support for contrib/hstore (Teodor)
- Add GIN support for contrib/pg_trgm (Guillaume Smet, Teodor)
- Update OS/X startup scripts in contrib/start-scripts (Mark Cotner, David Fetter)
- Restrict pgrowlocks() and dblink_get_pkey() to users who have SELECT privilege on the target table (Tom)
- Restrict contrib/pgstatstuple functions to superusers (Tom)
Appendix E. Release Notes

- contrib/xml2 is deprecated and planned for removal in 8.4 (Peter)
  The new XML support in core PostgreSQL supersedes this module.

**E.197. Release 8.2.23**

**Release date:** 2011-12-05

This release contains a variety of fixes from 8.2.22. For information about new features in the 8.2 major release, see Section E.220.

This is expected to be the last PostgreSQL release in the 8.2.X series. Users are encouraged to update to a newer release branch soon.

**E.197.1. Migration to Version 8.2.23**

A dump/restore is not required for those running 8.2.X.

However, a longstanding error was discovered in the definition of the information_schema.referential_constraints view. If you rely on correct results from that view, you should replace its definition as explained in the first changelog item below.

Also, if you are upgrading from a version earlier than 8.2.14, see Section E.206.

**E.197.2. Changes**

- **Fix bugs in information_schema.referential_constraints view (Tom Lane)**
  This view was being insufficiently careful about matching the foreign-key constraint to the depended-on primary or unique key constraint. That could result in failure to show a foreign key constraint at all, or showing it multiple times, or claiming that it depends on a different constraint than the one it really does.
  Since the view definition is installed by initdb, merely upgrading will not fix the problem. If you need to fix this in an existing installation, you can (as a superuser) drop the information_schema schema then re-create it by sourcing $SHAREDIR/information_schema.sql. (Run `pg_config --sharedir` if you’re uncertain where $SHAREDIR is.) This must be repeated in each database to be fixed.

- **Fix TOAST-related data corruption during CREATE TABLE dest AS SELECT * FROM src or INSERT INTO dest SELECT * FROM src (Tom Lane)**
  If a table has been modified by ALTER TABLE ADD COLUMN, attempts to copy its data verbatim to another table could produce corrupt results in certain corner cases. The problem can only manifest in this precise form in 8.4 and later, but we patched earlier versions as well in case there are other code paths that could trigger the same bug.

- **Fix race condition during toast table access from stale syscache entries (Tom Lane)**
The typical symptom was transient errors like “missing chunk number 0 for toast value NNNNN in pg_toast_2619”, where the cited toast table would always belong to a system catalog.

- Improve locale support in money type’s input and output (Tom Lane)

Aside from not supporting all standard lc_monetary formatting options, the input and output functions were inconsistent, meaning there were locales in which dumped money values could not be re-read.

- Don’t let transform_null_equals affect CASE foo WHEN NULL ... constructs (Heikki Linnakangas)

    transform_null_equals is only supposed to affect foo = NULL expressions written directly by the user, not equality checks generated internally by this form of CASE.

- Change foreign-key trigger creation order to better support self-referential foreign keys (Tom Lane)

For a cascading foreign key that references its own table, a row update will fire both the ON UPDATE trigger and the CHECK trigger as one event. The ON UPDATE trigger must execute first, else the CHECK will check a non-final state of the row and possibly throw an inappropriate error. However, the firing order of these triggers is determined by their names, which generally sort in creation order since the triggers have auto-generated names following the convention “RI_ConstraintTrigger_NNNN”. A proper fix would require modifying that convention, which we will do in 9.2, but it seems risky to change it in existing releases. So this patch just changes the creation order of the triggers. Users encountering this type of error should drop and re-create the foreign key constraint to get its triggers into the right order.

- Preserve blank lines within commands in psql’s command history (Robert Haas)

The former behavior could cause problems if an empty line was removed from within a string literal, for example.

- Use the preferred version of xsubpp to build PL/Perl, not necessarily the operating system’s main copy (David Wheeler and Alex Hunsaker)

- Honor query cancel interrupts promptly in pgstatindex() (Robert Haas)

- Ensure VPATH builds properly install all server header files (Peter Eisentraut)

- Shorten file names reported in verbose error messages (Peter Eisentraut)

    Regular builds have always reported just the name of the C file containing the error message call, but VPATH builds formerly reported an absolute path name.

- Fix interpretation of Windows timezone names for Central America (Tom Lane)

    Map “Central America Standard Time” to CST6, not CST6CDT, because DST is generally not observed anywhere in Central America.

- Update time zone data files to tzdata release 2011n for DST law changes in Brazil, Cuba, Fiji, Palestine, Russia, and Samoa; also historical corrections for Alaska and British East Africa.

E.198. Release 8.2.22

Release date: 2011-09-26
Appendix E. Release Notes

This release contains a variety of fixes from 8.2.21. For information about new features in the 8.2 major release, see Section E.220.

The PostgreSQL community will stop releasing updates for the 8.2.X release series in December 2011. Users are encouraged to update to a newer release branch soon.

E.198.1. Migration to Version 8.2.22

A dump/restore is not required for those running 8.2.X. However, if you are upgrading from a version earlier than 8.2.14, see Section E.206.

E.198.2. Changes

• Fix multiple bugs in GiST index page split processing (Heikki Linnakangas)
  The probability of occurrence was low, but these could lead to index corruption.
• Avoid possibly accessing off the end of memory in `ANALYZE` (Noah Misch)
  This fixes a very-low-probability server crash scenario.
• Fix race condition in relcache init file invalidation (Tom Lane)
  There was a window wherein a new backend process could read a stale init file but miss the inval messages that would tell it the data is stale. The result would be bizarre failures in catalog accesses, typically “could not read block 0 in file ...” later during startup.
• Fix memory leak at end of a GiST index scan (Tom Lane)
  Commands that perform many separate GiST index scans, such as verification of a new GiST-based exclusion constraint on a table already containing many rows, could transiently require large amounts of memory due to this leak.
• Fix performance problem when constructing a large, lossy bitmap (Tom Lane)
• Fix array- and path-creating functions to ensure padding bytes are zeroes (Tom Lane)
  This avoids some situations where the planner will think that semantically-equal constants are not equal, resulting in poor optimization.
• Work around gcc 4.6.0 bug that breaks WAL replay (Tom Lane)
  This could lead to loss of committed transactions after a server crash.
• Fix dump bug for `VALUES` in a view (Tom Lane)
•Disallow `SELECT FOR UPDATE/SHARE` on sequences (Tom Lane)
  This operation doesn’t work as expected and can lead to failures.
• Defend against integer overflow when computing size of a hash table (Tom Lane)
• Fix portability bugs in use of credentials control messages for “peer” authentication (Tom Lane)
• Fix typo in `pg_srand48` seed initialization (Andres Freund)
This led to failure to use all bits of the provided seed. This function is not used on most platforms (only those without srand), and the potential security exposure from a less-random-than-expected seed seems minimal in any case.

- Avoid integer overflow when the sum of LIMIT and OFFSET values exceeds 2^63 (Heikki Linnakangas)
- Add overflow checks to int4 and int8 versions of generate_series() (Robert Haas)
- Fix trailing-zero removal in to_char() (Marti Raudsepp)
  In a format with FM and no digit positions after the decimal point, zeroes to the left of the decimal point could be removed incorrectly.
- Fix pg_size_pretty() to avoid overflow for inputs close to 2^63 (Tom Lane)
- Fix psql’s counting of script file line numbers during COPY from a different file (Tom Lane)
- Fix pg_restore’s direct-to-database mode for standard_conforming_strings (Tom Lane)
  pg_restore could emit incorrect commands when restoring directly to a database server from an archive file that had been made with standard_conforming_strings set to on.
- Fix write-past-buffer-end and memory leak in libpq’s LDAP service lookup code (Albe Laurenz)
- In libpq, avoid failures when using nonblocking I/O and an SSL connection (Martin Pihlak, Tom Lane)
- Improve libpq’s handling of failures during connection startup (Tom Lane)
  In particular, the response to a server report of fork() failure during SSL connection startup is now saner.
- Make ecpglib write double values with 15 digits precision (Akira Kurosawa)
- Apply upstream fix for blowfish signed-character bug (CVE-2011-2483) (Tom Lane)
  contrib/pg_crypto’s blowfish encryption code could give wrong results on platforms where char is signed (which is most), leading to encrypted passwords being weaker than they should be.
- Fix memory leak in contrib/seg (Heikki Linnakangas)
- Fix pgstatindex() to give consistent results for empty indexes (Tom Lane)
- Allow building with perl 5.14 (Alex Hunsaker)
- Update configure script’s method for probing existence of system functions (Tom Lane)
  The version of autoconf we used in 8.3 and 8.2 could be fooled by compilers that perform link-time optimization.
- Fix assorted issues with build and install file paths containing spaces (Tom Lane)
- Update time zone data files to tzdata release 2011i for DST law changes in Canada, Egypt, Russia, Samoa, and South Sudan.

E.199. Release 8.2.21

Release date: 2011-04-18

This release contains a variety of fixes from 8.2.20. For information about new features in the 8.2 major release, see Section E.220.
E.199.1. Migration to Version 8.2.21

A dump/restore is not required for those running 8.2.X. However, if you are upgrading from a version earlier than 8.2.14, see Section E.206.

E.199.2. Changes

- Avoid potential deadlock during catalog cache initialization (Nikhil Sontakke)
  In some cases the cache loading code would acquire share lock on a system index before locking the index’s catalog. This could deadlock against processes trying to acquire exclusive locks in the other, more standard order.
- Fix dangling-pointer problem in BEFORE ROW UPDATE trigger handling when there was a concurrent update to the target tuple (Tom Lane)
  This bug has been observed to result in intermittent “cannot extract system attribute from virtual tuple” failures while trying to do UPDATE RETURNING ctid. There is a very small probability of more serious errors, such as generating incorrect index entries for the updated tuple.
- Disallow DROP TABLE when there are pending deferred trigger events for the table (Tom Lane)
  Formerly the DROP would go through, leading to “could not open relation with OID nnn” errors when the triggers were eventually fired.
- Fix PL/Python memory leak involving array slices (Daniel Popowich)
- Fix pg_restore to cope with long lines (over 1KB) in TOC files (Tom Lane)
- Put in more safeguards against crashing due to division-by-zero with overly enthusiastic compiler optimization (Aurelien Jarno)
- Support use of dlopen() in FreeBSD and OpenBSD on MIPS (Tom Lane)
  There was a hard-wired assumption that this system function was not available on MIPS hardware on these systems. Use a compile-time test instead, since more recent versions have it.
- Fix compilation failures on HP-UX (Heikki Linnakangas)
- Fix path separator used by pg_regress on Cygwin (Andrew Dunstan)
- Update time zone data files to tzdata release 2011f for DST law changes in Chile, Cuba, Falkland Islands, Morocco, Samoa, and Turkey; also historical corrections for South Australia, Alaska, and Hawaii.

E.200. Release 8.2.20

Release date: 2011-01-31

This release contains a variety of fixes from 8.2.19. For information about new features in the 8.2 major release, see Section E.220.
E.200.1. Migration to Version 8.2.20

A dump/restore is not required for those running 8.2.X. However, if you are upgrading from a version earlier than 8.2.14, see Section E.206.

E.200.2. Changes

- Avoid failures when EXPLAIN tries to display a simple-form CASE expression (Tom Lane)
  
  If the CASE’s test expression was a constant, the planner could simplify the CASE into a form that confused the expression-display code, resulting in “unexpected CASE WHEN clause” errors.

- Fix assignment to an array slice that is before the existing range of subscripts (Tom Lane)
  
  If there was a gap between the newly added subscripts and the first pre-existing subscript, the code mis-calculated how many entries needed to be copied from the old array’s null bitmap, potentially leading to data corruption or crash.

- Avoid unexpected conversion overflow in planner for very distant date values (Tom Lane)
  
  The date type supports a wider range of dates than can be represented by the timestamp types, but the planner assumed it could always convert a date to timestamp with impunity.

- Fix pg_restore’s text output for large objects (BLOBs) when standard_conforming_strings is on (Tom Lane)
  
  Although restoring directly to a database worked correctly, string escaping was incorrect if pg_restore was asked for SQL text output and standard_conforming_strings had been enabled in the source database.

- Fix erroneous parsing of tsquery values containing ... & !(subexpression) | ... (Tom Lane)
  
  Queries containing this combination of operators were not executed correctly. The same error existed in contrib/intarray’s query_int type and contrib/ltree’s ltxtquery type.

- Fix buffer overrun in contrib/intarray’s input function for the query_int type (Apple)
  
  This bug is a security risk since the function’s return address could be overwritten. Thanks to Apple Inc’s security team for reporting this issue and supplying the fix. (CVE-2010-4015)

- Fix bug in contrib/seg’s GiST picksplit algorithm (Alexander Korotkov)
  
  This could result in considerable inefficiency, though not actually incorrect answers, in a GiST index on a seg column. If you have such an index, consider REINDEXing it after installing this update. (This is identical to the bug that was fixed in contrib/cube in the previous update.)

E.201. Release 8.2.19

Release date: 2010-12-16

This release contains a variety of fixes from 8.2.18. For information about new features in the 8.2 major release, see Section E.220.
E.201.1. Migration to Version 8.2.19

A dump/restore is not required for those running 8.2.X. However, if you are upgrading from a version earlier than 8.2.14, see Section E.206.

E.201.2. Changes

• Force the default `wal_sync_method` to be `fdatasync` on Linux (Tom Lane, Marti Raudsepp)
  The default on Linux has actually been `fdatasync` for many years, but recent kernel changes caused PostgreSQL to choose `open_datasync` instead. This choice did not result in any performance improvement, and caused outright failures on certain filesystems, notably `ext4` with the `data=journal` mount option.

• Fix assorted bugs in WAL replay logic for GIN indexes (Tom Lane)
  This could result in “bad buffer id: 0” failures or corruption of index contents during replication.

• Fix recovery from base backup when the starting checkpoint WAL record is not in the same WAL segment as its redo point (Jeff Davis)

• Add support for detecting register-stack overrun on IA64 (Tom Lane)
  The IA64 architecture has two hardware stacks. Full prevention of stack-overrun failures requires checking both.

• Add a check for stack overflow in `copyObject()` (Tom Lane)
  Certain code paths could crash due to stack overflow given a sufficiently complex query.

• Fix detection of page splits in temporary GiST indexes (Heikki Linnakangas)
  It is possible to have a “concurrent” page split in a temporary index, if for example there is an open cursor scanning the index when an insertion is done. GiST failed to detect this case and hence could deliver wrong results when execution of the cursor continued.

• Avoid memory leakage while `ANALYZE`'ing complex index expressions (Tom Lane)

• Ensure an index that uses a whole-row Var still depends on its table (Tom Lane)
  An index declared like `create index i on t (foo(t.*)` would not automatically get dropped when its table was dropped.

• Do not “inline” a SQL function with multiple `OUT` parameters (Tom Lane)
  This avoids a possible crash due to loss of information about the expected result rowtype.

• Behave correctly if `ORDER BY`, `LIMIT`, `FOR UPDATE`, or `WITH` is attached to the `VALUES` part of `INSERT ... VALUES` (Tom Lane)

• Fix constant-folding of `COALESCE()` expressions (Tom Lane)
  The planner would sometimes attempt to evaluate sub-expressions that in fact could never be reached, possibly leading to unexpected errors.

• Add print functionality for `InhRelation` nodes (Tom Lane)
  This avoids a failure when `debug_print_parse` is enabled and certain types of query are executed.
Appendix E. Release Notes

- Fix incorrect calculation of distance from a point to a horizontal line segment (Tom Lane)
  This bug affected several different geometric distance-measurement operators.
- Fix PL/pgSQL’s handling of “simple” expressions to not fail in recursion or error-recovery cases (Tom Lane)
- Fix PL/Python’s handling of set-returning functions (Jan Urbanski)
  Attempts to call SPI functions within the iterator generating a set result would fail.
- Fix bug in contrib/cube’s GiST picksplit algorithm (Alexander Korotkov)
  This could result in considerable inefficiency, though not actually incorrect answers, in a GiST index on a cube column. If you have such an index, consider REINDEXing it after installing this update.
- Don’t emit “identifier will be truncated” notices in contrib/dblink except when creating new connections (Itagaki Takahiro)
- Fix potential coredump on missing public key in contrib/pgcrypto (Marti Raudsepp)
- Fix memory leak in contrib/xml2’s XPath query functions (Tom Lane)
- Update time zone data files to tzdata release 2010o for DST law changes in Fiji and Samoa; also historical corrections for Hong Kong.

E.202. Release 8.2.18

Release date: 2010-10-04

This release contains a variety of fixes from 8.2.17. For information about new features in the 8.2 major release, see Section E.220.

E.202.1. Migration to Version 8.2.18

A dump/restore is not required for those running 8.2.X. However, if you are upgrading from a version earlier than 8.2.14, see Section E.206.

E.202.2. Changes

- Use a separate interpreter for each calling SQL userid in PL/Perl and PL/Tcl (Tom Lane)
  This change prevents security problems that can be caused by subverting Perl or Tcl code that will be executed later in the same session under another SQL user identity (for example, within a SECURITY DEFINER function). Most scripting languages offer numerous ways that that might be done, such as redefining standard functions or operators called by the target function. Without this change, any SQL user with Perl or Tcl language usage rights can do essentially anything with the SQL privileges of the target function’s owner.
  The cost of this change is that intentional communication among Perl and Tcl functions becomes more difficult. To provide an escape hatch, PL/PerlU and PL/TclU functions continue to use only one inter-
preter per session. This is not considered a security issue since all such functions execute at the trust
level of a database superuser already.
It is likely that third-party procedural languages that claim to offer trusted execution have similar se-
curity issues. We advise contacting the authors of any PL you are depending on for security-critical
purposes.
Our thanks to Tim Bunce for pointing out this issue (CVE-2010-3433).

• Prevent possible crashes in \texttt{pg\_get\_expr()} by disallowing it from being called with an argument that
is not one of the system catalog columns it’s intended to be used with (Heikki Linnakangas, Tom Lane)

• Fix Windows shared-memory allocation code (Tsutomu Yamada, Magnus Hagander)
This bug led to the often-reported “could not reattach to shared memory” error message. This is a
back-patch of a fix that was applied to newer branches some time ago.

• Treat exit code 128 (\texttt{ERROR\_WAIT\_NO\_CHILDREN}) as non-fatal on Windows (Magnus Hagander)
Under high load, Windows processes will sometimes fail at startup with this error code. Formerly the
postmaster treated this as a panic condition and restarted the whole database, but that seems to be an
overreaction.

• Fix possible duplicate scans of \texttt{UNION ALL} member relations (Tom Lane)
• Fix “cannot handle unplanned sub-select” error (Tom Lane)
This occurred when a sub-select contains a join alias reference that expands into an expression contain-
ing another sub-select.

• Reduce PANIC to ERROR in some occasionally-reported btree failure cases, and provide additional
detail in the resulting error messages (Tom Lane)
This should improve the system’s robustness with corrupted indexes.

• Prevent show\_session\_authorization() from crashing within autovacuum processes (Tom Lane)

• Defend against functions returning setof record where not all the returned rows are actually of the same
rowtype (Tom Lane)

• Fix possible failure when hashing a pass-by-reference function result (Tao Ma, Tom Lane)

• Take care to fsync the contents of lockfiles (both \texttt{postmaster.pid} and the socket lockfile) while
writing them (Tom Lane)
This omission could result in corrupted lockfile contents if the machine crashes shortly after postmaster
start. That could in turn prevent subsequent attempts to start the postmaster from succeeding, until the
lockfile is manually removed.

• Avoid recursion while assigning XIDs to heavily-nested subtransactions (Andres Freund, Robert Haas)
The original coding could result in a crash if there was limited stack space.

• Fix log\_line\_prefix’s %i escape, which could produce junk early in backend startup (Tom Lane)

• Fix possible data corruption in \texttt{ALTER TABLE ... SET TABLESPACE} when archiving is enabled (Jeff
Davis)

• Allow \texttt{CREATE DATABASE} and \texttt{ALTER DATABASE ... SET TABLESPACE} to be interrupted by
query-cancel (Guillaume Lelarge)
• In PL/Python, defend against null pointer results from PyCObject_AsVoidPtr and PyCObject_FromVoidPtr (Peter Eisentraut)
• Improve contrib/dblink’s handling of tables containing dropped columns (Tom Lane)
• Fix connection leak after “duplicate connection name” errors in contrib/dblink (Itagaki Takahiro)
• Fix contrib/dblink to handle connection names longer than 62 bytes correctly (Itagaki Takahiro)
• Add hstore(text, text) function to contrib/hstore (Robert Haas)
  This function is the recommended substitute for the now-deprecated => operator. It was back-patched so that future-proofed code can be used with older server versions. Note that the patch will be effective only after contrib/hstore is installed or reinstalled in a particular database. Users might prefer to execute the CREATE FUNCTION command by hand, instead.
• Update build infrastructure and documentation to reflect the source code repository’s move from CVS to Git (Magnus Hagander and others)
• Update time zone data files to tzdata release 2010l for DST law changes in Egypt and Palestine; also historical corrections for Finland.
  This change also adds new names for two Micronesian timezones: Pacific/Chuuk is now preferred over Pacific/Truk (and the preferred abbreviation is CHUT not TRUT) and Pacific/Pohnpei is preferred over Pacific/Ponape.
• Make Windows’ “N. Central Asia Standard Time” timezone map to Asia/Novosibirsk, not Asia/Almaty (Magnus Hagander)
  Microsoft changed the DST behavior of this zone in the timezone update from KB976098. Asia/Novosibirsk is a better match to its new behavior.

E.203. Release 8.2.17

Release date: 2010-05-17
This release contains a variety of fixes from 8.2.16. For information about new features in the 8.2 major release, see Section E.220.

E.203.1. Migration to Version 8.2.17
A dump/restore is not required for those running 8.2.X. However, if you are upgrading from a version earlier than 8.2.14, see Section E.206.

E.203.2. Changes

• Enforce restrictions in plperl using an opmask applied to the whole interpreter, instead of using Safe.pm (Tim Bunce, Andrew Dunstan)
Appendix E. Release Notes

Recent developments have convinced us that Safe.pm is too insecure to rely on for making plperl trustable. This change removes use of Safe.pm altogether, in favor of using a separate interpreter with an opcode mask that is always applied. Pleasant side effects of the change include that it is now possible to use Perl's strict pragma in a natural way in plperl, and that Perl's $a and $b variables work as expected in sort routines, and that function compilation is significantly faster. (CVE-2010-1169)

• Prevent PL/Tcl from executing untrustworthy code from pltcl_modules (Tom)

PL/Tcl’s feature for autoloading Tcl code from a database table could be exploited for trojan-horse attacks, because there was no restriction on who could create or insert into that table. This change disables the feature unless pltcl_modules is owned by a superuser. (However, the permissions on the table are not checked, so installations that really need a less-than-secure modules table can still grant suitable privileges to trusted non-superusers.) Also, prevent loading code into the unrestricted “normal” Tcl interpreter unless we are really going to execute a pltclu function. (CVE-2010-1170)

• Fix possible crash if a cache reset message is received during rebuild of a relcache entry (Heikki)

This error was introduced in 8.2.16 while fixing a related failure.

• Do not allow an unprivileged user to reset superuser-only parameter settings (Alvaro)

Previously, if an unprivileged user ran ALTER USER ... RESET ALL for himself, or ALTER DATABASE ... RESET ALL for a database he owns, this would remove all special parameter settings for the user or database, even ones that are only supposed to be changeable by a superuser. Now, the ALTER will only remove the parameters that the user has permission to change.

• Avoid possible crash during backend shutdown if shutdown occurs when a CONTEXT addition would be made to log entries (Tom)

In some cases the context-printing function would fail because the current transaction had already been rolled back when it came time to print a log message.

• Update pl/perl’s ppport.h for modern Perl versions (Andrew)

• Fix assorted memory leaks in pl/python (Andreas Freund, Tom)

• Prevent infinite recursion in psql when expanding a variable that refers to itself (Tom)

• Fix psql’s \copy to not add spaces around a dot within \copy (select ...) (Tom)

Addition of spaces around the decimal point in a numeric literal would result in a syntax error.

• Ensure that contrib/pgstattuple functions respond to cancel interrupts promptly (Tatsuhito Kasa-hara)

• Make server startup deal properly with the case that shmget() returns EINVAL for an existing shared memory segment (Tom)

This behavior has been observed on BSD-derived kernels including OS X. It resulted in an entirely-misleading startup failure complaining that the shared memory request size was too large.

• Avoid possible crashes in syslogger process on Windows (Heikki)

• Deal more robustly with incomplete time zone information in the Windows registry (Magnus)

• Update the set of known Windows time zone names (Magnus)

• Update time zone data files to tzdata release 2010j for DST law changes in Argentina, Australian Antarctic, Bangladesh, Mexico, Morocco, Pakistan, Palestine, Russia, Syria, Tunisia; also historical corrections for Taiwan.
Appendix E. Release Notes

Also, add **PKST** (Pakistan Summer Time) to the default set of timezone abbreviations.

E.204. Release 8.2.16

**Release date:** 2010-03-15

This release contains a variety of fixes from 8.2.15. For information about new features in the 8.2 major release, see Section E.220.

E.204.1. Migration to Version 8.2.16

A dump/restore is not required for those running 8.2.X. However, if you are upgrading from a version earlier than 8.2.14, see Section E.206.

E.204.2. Changes

- Add new configuration parameter `ssl_renegotiation_limit` to control how often we do session key renegotiation for an SSL connection (Magnus)
  
  This can be set to zero to disable renegotiation completely, which may be required if a broken SSL library is used. In particular, some vendors are shipping stopgap patches for CVE-2009-3555 that cause renegotiation attempts to fail.

- Fix possible deadlock during backend startup (Tom)

- Fix possible crashes due to not handling errors during relcache reload cleanly (Tom)

- Fix possible crashes when trying to recover from a failure in subtransaction start (Tom)

- Fix server memory leak associated with use of savepoints and a client encoding different from server’s encoding (Tom)

- Fix incorrect WAL data emitted during end-of-recovery cleanup of a GIST index page split (Yoichi Hirai)
  
  This would result in index corruption, or even more likely an error during WAL replay, if we were unlucky enough to crash during end-of-recovery cleanup after having completed an incomplete GIST insertion.

- Make `substring()` for bit types treat any negative length as meaning “all the rest of the string” (Tom)

  The previous coding treated only -1 that way, and would produce an invalid result value for other negative values, possibly leading to a crash (CVE-2010-0442).

- Fix integer-to-bit-string conversions to handle the first fractional byte correctly when the output bit width is wider than the given integer by something other than a multiple of 8 bits (Tom)

- Fix some cases of pathologically slow regular expression matching (Tom)
• Fix the STOP WAL LOCATION entry in backup history files to report the next WAL segment’s name when the end location is exactly at a segment boundary (Itagaki Takahiro)

• Fix some more cases of temporary-file leakage (Heikki)

  This corrects a problem introduced in the previous minor release. One case that failed is when a plpgsql function returning set is called within another function’s exception handler.

• Improve constraint exclusion processing of boolean-variable cases, in particular make it possible to exclude a partition that has a “bool_column = false” constraint (Tom)

• When reading pg_hba.conf and related files, do not treat @something as a file inclusion request if the @ appears inside quote marks; also, never treat @ by itself as a file inclusion request (Tom)

  This prevents erratic behavior if a role or database name starts with @. If you need to include a file whose path name contains spaces, you can still do so, but you must write @"/path to/file" rather than putting the quotes around the whole construct.

• Prevent infinite loop on some platforms if a directory is named as an inclusion target in pg_hba.conf and related files (Tom)

• Fix possible infinite loop if SSL_read or SSL_write fails without setting errno (Tom)

  This is reportedly possible with some Windows versions of openssl.

• Fix psql’s numericlocale option to not format strings it shouldn’t in latex and troff output formats (Heikki)

• Make psql return the correct exit status (3) when ON_ERROR_STOP and --single-transaction are both specified and an error occurs during the implied COMMIT (Bruce)

• Fix plpgsql failure in one case where a composite column is set to NULL (Tom)

• Fix possible failure when calling PL/Perl functions from PL/PerlU or vice versa (Tim Bunce)

• Add volatile markings in PL/Python to avoid possible compiler-specific misbehavior (Zdenek Kotala)

• Ensure PL/Tcl initializes the Tcl interpreter fully (Tom)

  The only known symptom of this oversight is that the Tcl clock command misbehaves if using Tcl 8.5 or later.

• Prevent crash in contrib/dblink when too many key columns are specified to a dblink_build_sql_* function (Rushabh Lathia, Joe Conway)

• Fix assorted crashes in contrib/xml2 caused by sloppy memory management (Tom)

• Make building of contrib/xml2 more robust on Windows (Andrew)

• Fix race condition in Windows signal handling (Radu Ilie)

  One known symptom of this bug is that rows in pg_listener could be dropped under heavy load.

• Update time zone data files to tzdata release 2010e for DST law changes in Bangladesh, Chile, Fiji, Mexico, Paraguay, Samoa.
Appendix E. Release Notes

E.205. Release 8.2.15

Release date: 2009-12-14

This release contains a variety of fixes from 8.2.14. For information about new features in the 8.2 major release, see Section E.220.

E.205.1. Migration to Version 8.2.15

A dump/restore is not required for those running 8.2.X. However, if you are upgrading from a version earlier than 8.2.14, see Section E.206.

E.205.2. Changes

- Protect against indirect security threats caused by index functions changing session-local state (Gurjeet Singh, Tom)
  This change prevents allegedly-immutable index functions from possibly subverting a superuser’s session (CVE-2009-4136).

- Reject SSL certificates containing an embedded null byte in the common name (CN) field (Magnus)
  This prevents unintended matching of a certificate to a server or client name during SSL validation (CVE-2009-4034).

- Fix possible crash during backend-startup-time cache initialization (Tom)

- Prevent signals from interrupting VACUUM at unsafe times (Alvaro)
  This fix prevents a PANIC if a VACUUM FULL is canceled after it’s already committed its tuple movements, as well as transient errors if a plain VACUUM is interrupted after having truncated the table.

- Fix possible crash due to integer overflow in hash table size calculation (Tom)
  This could occur with extremely large planner estimates for the size of a hashjoin’s result.

- Fix very rare crash in inet/cidr comparisons (Chris Mikkelson)

- Ensure that shared tuple-level locks held by prepared transactions are not ignored (Heikki)

- Fix premature drop of temporary files used for a cursor that is accessed within a subtransaction (Heikki)

- Fix incorrect logic for GiST index page splits, when the split depends on a non-first column of the index (Paul Ramsey)

- Don’t error out if recycling or removing an old WAL file fails at the end of checkpoint (Heikki)
  It’s better to treat the problem as non-fatal and allow the checkpoint to complete. Future checkpoints will retry the removal. Such problems are not expected in normal operation, but have been seen to be caused by misdesigned Windows anti-virus and backup software.

- Ensure WAL files aren’t repeatedly archived on Windows (Heikki)
  This is another symptom that could happen if some other process interfered with deletion of a no-longer-needed file.
Appendix E. Release Notes

• Fix PAM password processing to be more robust (Tom)
  The previous code is known to fail with the combination of the Linux pam_krb5 PAM module with Microsoft Active Directory as the domain controller. It might have problems elsewhere too, since it was making unjustified assumptions about what arguments the PAM stack would pass to it.

• Fix processing of ownership dependencies during CREATE OR REPLACE FUNCTION (Tom)

• Fix bug with calling plperl from plperlu or vice versa (Tom)
  An error exit from the inner function could result in crashes due to failure to re-select the correct Perl interpreter for the outer function.

• Fix session-lifespan memory leak when a PL/Perl function is redefined (Tom)

• Ensure that Perl arrays are properly converted to PostgreSQL arrays when returned by a set-returning PL/Perl function (Andrew Dunstan, Abhijit Menon-Sen)
  This worked correctly already for non-set-returning functions.

• Fix rare crash in exception processing in PL/Python (Peter)

• Ensure psql’s flex module is compiled with the correct system header definitions (Tom)
  This fixes build failures on platforms where --enable-largefile causes incompatible changes in the generated code.

• Make the postmaster ignore any application_name parameter in connection request packets, to improve compatibility with future libpq versions (Tom)

• Update the timezone abbreviation files to match current reality (Joachim Wieland)
  This includes adding IDT and SGT to the default timezone abbreviation set.

• Update time zone data files to tzdata release 2009s for DST law changes in Antarctica, Argentina, Bangladesh, Fiji, Novokuznetsk, Pakistan, Palestine, Samoa, Syria; also historical corrections for Hong Kong.

E.206. Release 8.2.14

Release date: 2009-09-09
This release contains a variety of fixes from 8.2.13. For information about new features in the 8.2 major release, see Section E.220.

E.206.1. Migration to Version 8.2.14
A dump/restore is not required for those running 8.2.X. However, if you have any hash indexes on interval columns, you must REINDEX them after updating to 8.2.14. Also, if you are upgrading from a version earlier than 8.2.11, see Section E.209.
E.206.2. Changes

- Force WAL segment switch during `pg_start_backup()` (Heikki)
  This avoids corner cases that could render a base backup unusable.
- Disallow `RESET ROLE` and `RESET SESSION AUTHORIZATION` inside security-definer functions (Tom, Heikki)
  This covers a case that was missed in the previous patch that disallowed `SET ROLE` and `SET SESSION AUTHORIZATION` inside security-definer functions. (See CVE-2007-6600)
- Make `LOAD` of an already-loaded loadable module into a no-op (Tom)
  Formerly, `LOAD` would attempt to unload and re-load the module, but this is unsafe and not all that useful.
- Disallow empty passwords during LDAP authentication (Magnus)
- Fix handling of sub-SELECTs appearing in the arguments of an outer-level aggregate function (Tom)
- Fix bugs associated with fetching a whole-row value from the output of a Sort or Materialize plan node (Tom)
- Revert planner change that disabled partial-index and constraint exclusion optimizations when there were more than 100 clauses in an AND or OR list (Tom)
- Fix hash calculation for data type `interval` (Tom)
  This corrects wrong results for hash joins on interval values. It also changes the contents of hash indexes on interval columns. If you have any such indexes, you must `REINDEX` them after updating.
- Treat `to_char(..., 'TH')` as an uppercase ordinal suffix with `HH'/HH12'` (Heikki)
  It was previously handled as `th'` (lowercase).
- Fix overflow for `INTERVAL 'x ms'` when `x` is more than 2 million and integer datetimes are in use (Alex Hunsaker)
- Fix calculation of distance between a point and a line segment (Tom)
  This led to incorrect results from a number of geometric operators.
- Fix `money` data type to work in locales where currency amounts have no fractional digits, e.g. Japan (Itagaki Takahiro)
- Properly round datetime input like `00:12:57.9999999999999999999999999999` (Tom)
- Fix poor choice of page split point in GiST R-tree operator classes (Teodor)
- Avoid performance degradation in bulk inserts into GIN indexes when the input values are (nearly) in sorted order (Tom)
- Correctly enforce NOT NULL domain constraints in some contexts in PL/pgSQL (Tom)
- Fix portability issues in `plperl` initialization (Andrew Dunstan)
- Fix `pg_ctl` to not go into an infinite loop if `postgresql.conf` is empty (Jeff Davis)
- Make `contrib/hstore` throw an error when a key or value is too long to fit in its data structure, rather than silently truncating it (Andrew Gierth)
• Fix contrib/xml2’s xslt_process() to properly handle the maximum number of parameters (twenty) (Tom)
• Improve robustness of libpq’s code to recover from errors during COPY FROM STDIN (Tom)
• Avoid including conflicting readline and editline header files when both libraries are installed (Zdenek Kotala)
• Update time zone data files to tzdata release 2009l for DST law changes in Bangladesh, Egypt, Jordan, Pakistan, Argentina/San_Luis, Cuba, Jordan (historical correction only), Mauritius, Morocco, Palestine, Syria, Tunisia.

E.207. Release 8.2.13

Release date: 2009-03-16

This release contains a variety of fixes from 8.2.12. For information about new features in the 8.2 major release, see Section E.220.

E.207.1. Migration to Version 8.2.13

A dump/restore is not required for those running 8.2.X. However, if you are upgrading from a version earlier than 8.2.11, see Section E.209.

E.207.2. Changes

• Prevent error recursion crashes when encoding conversion fails (Tom)
  This change extends fixes made in the last two minor releases for related failure scenarios. The previous fixes were narrowly tailored for the original problem reports, but we have now recognized that any error thrown by an encoding conversion function could potentially lead to infinite recursion while trying to report the error. The solution therefore is to disable translation and encoding conversion and report the plain-ASCII form of any error message, if we find we have gotten into a recursive error reporting situation. (CVE-2009-0922)
• Disallow CREATE CONVERSION with the wrong encodings for the specified conversion function (Heikki)
  This prevents one possible scenario for encoding conversion failure. The previous change is a backstop to guard against other kinds of failures in the same area.
• Fix core dump when to_char() is given format codes that are inappropriate for the type of the data argument (Tom)
• Fix possible failure in contrib/tsearch2 when C locale is used with a multi-byte encoding (Teodor)
  Crashes were possible on platforms where wchar_t is narrower than int; Windows in particular.
• Fix extreme inefficiency in contrib/tsearch2 parser’s handling of an email-like string containing multiple @ characters (Heikki)
• Fix decompilation of \texttt{CASE WHEN} with an implicit coercion (Tom)
  
  This mistake could lead to Assert failures in an Assert-enabled build, or an “unexpected CASE WHEN clause” error message in other cases, when trying to examine or dump a view.

• Fix possible misassignment of the owner of a TOAST table’s rowtype (Tom)
  
  If \texttt{CLUSTER} or a rewriting variant of \texttt{ALTER TABLE} were executed by someone other than the table owner, the \texttt{pg_type} entry for the table’s TOAST table would end up marked as owned by that someone. This caused no immediate problems, since the permissions on the TOAST rowtype aren’t examined by any ordinary database operation. However, it could lead to unexpected failures if one later tried to drop the role that issued the command (in 8.1 or 8.2), or “owner of data type appears to be invalid” warnings from \texttt{pg_dump} after having done so (in 8.3).

• Fix PL/pgSQL to not treat \texttt{INTO} after \texttt{INSERT} as an INTO-variables clause anywhere in the string, not only at the start; in particular, don’t fail for \texttt{INSERT INTO} within \texttt{CREATE RULE} (Tom)

• Clean up PL/pgSQL error status variables fully at block exit (Ashesh Vashi and Dave Page)

  This is not a problem for PL/pgSQL itself, but the omission could cause the PL/pgSQL Debugger to crash while examining the state of a function.

• Retry failed calls to \texttt{CallNamedPipe()} on Windows (Steve Marshall, Magnus)

  It appears that this function can sometimes fail transiently; we previously treated any failure as a hard error, which could confuse \texttt{LISTEN} / \texttt{NOTIFY} as well as other operations.

• Add \texttt{MUST} (Mauritius Island Summer Time) to the default list of known timezone abbreviations (Xavier Bugaud)

\section*{E.208. Release 8.2.12}

\textbf{Release date:} 2009-02-02

This release contains a variety of fixes from 8.2.11. For information about new features in the 8.2 major release, see Section E.220.

\section*{E.208.1. Migration to Version 8.2.12}

A dump/restore is not required for those running 8.2.X. However, if you are upgrading from a version earlier than 8.2.11, see Section E.209.

\section*{E.208.2. Changes}

• Improve handling of URLs in \texttt{headline()} function (Teodor)

• Improve handling of overlength headlines in \texttt{headline()} function (Teodor)

• Prevent possible Assert failure or misconversion if an encoding conversion is created with the wrong conversion function for the specified pair of encodings (Tom, Heikki)
• Fix possible Assert failure if a statement executed in PL/pgSQL is rewritten into another kind of statement, for example if an INSERT is rewritten into an UPDATE (Heikki)

• Ensure that a snapshot is available to datatype input functions (Tom)

  This primarily affects domains that are declared with CHECK constraints involving user-defined stable or immutable functions. Such functions typically fail if no snapshot has been set.

• Make it safer for SPI-using functions to be used within datatype I/O; in particular, to be used in domain check constraints (Tom)

• Avoid unnecessary locking of small tables in VACUUM (Heikki)

• Fix a problem that made UPDATE RETURNING tableoid return zero instead of the correct OID (Tom)

• Fix planner misestimation of selectivity when transitive equality is applied to an outer-join clause (Tom)

  This could result in bad plans for queries like ...

  from a left join b on a.a1 = b.b1

  where a.a1 = 42 ...

• Improve optimizer’s handling of long IN lists (Tom)

  This change avoids wasting large amounts of time on such lists when constraint exclusion is enabled.

• Ensure that the contents of a holdable cursor don’t depend on the contents of TOAST tables (Tom)

  Previously, large field values in a cursor result might be represented as TOAST pointers, which would fail if the referenced table got dropped before the cursor is read, or if the large value is deleted and then vacuumed away. This cannot happen with an ordinary cursor, but it could with a cursor that is held past its creating transaction.

• Fix memory leak when a set-returning function is terminated without reading its whole result (Tom)

• Fix contrib/dblink’s dblink_get_result(text, bool) function (Joe)

• Fix possible garbage output from contrib/sslinfo functions (Tom)

• Fix configure script to properly report failure when unable to obtain linkage information for PL/Perl (Andrew)

• Make all documentation reference pgsql-bugs and/or pgsql-hackers as appropriate, instead of the now-decommissioned pgsql-ports and pgsql-patches mailing lists (Tom)

• Update time zone data files to tzdata release 2009a (for Kathmandu and historical DST corrections in Switzerland, Cuba)

E.209. Release 8.2.11

Release date: 2008-11-03

This release contains a variety of fixes from 8.2.10. For information about new features in the 8.2 major release, see Section E.220.
E.209.1. Migration to Version 8.2.11

A dump/restore is not required for those running 8.2.X. However, if you are upgrading from a version earlier than 8.2.7, see Section E.213. Also, if you were running a previous 8.2.X release, it is recommended to \texttt{REINDEX} all GiST indexes after the upgrade.

E.209.2. Changes

- Fix GiST index corruption due to marking the wrong index entry “dead” after a deletion (Teodor)
  
  This would result in index searches failing to find rows they should have found. Corrupted indexes can be fixed with \texttt{REINDEX}.

- Fix backend crash when the client encoding cannot represent a localized error message (Tom)
  
  We have addressed similar issues before, but it would still fail if the “character has no equivalent” message itself couldn’t be converted. The fix is to disable localization and send the plain ASCII error message when we detect such a situation.

- Fix possible crash when deeply nested functions are invoked from a trigger (Tom)

- Improve optimization of \texttt{expression\:IN\(\)\(expression\-list\)} queries (Tom, per an idea from Robert Haas)
  
  Cases in which there are query variables on the right-hand side had been handled less efficiently in 8.2.x and 8.3.x than in prior versions. The fix restores 8.1 behavior for such cases.

- Fix mis-expansion of rule queries when a sub-\texttt{SELECT} appears in a function call in \texttt{FROM}, a multi-row \texttt{VALUES} list, or a \texttt{RETURNING} list (Tom)
  
  The usual symptom of this problem is an “unrecognized node type” error.

- Fix memory leak during rescan of a hashed aggregation plan (Neil)

- Ensure an error is reported when a newly-defined PL/pgSQL trigger function is invoked as a normal function (Tom)

- Prevent possible collision of \texttt{relfilenode} numbers when moving a table to another tablespace with \texttt{ALTER\:SET\:TABLESPACE} (Heikki)
  
  The command tried to re-use the existing filename, instead of picking one that is known unused in the destination directory.

- Fix incorrect \texttt{tsearch2} headline generation when single query item matches first word of text (Sushant Sinha)

- Fix improper display of fractional seconds in interval values when using a non-ISO datestyle in an \texttt{--enable-integer-datetimes} build (Ron Mayer)

- Ensure \texttt{SPI\_getvalue} and \texttt{SPI\_getbinval} behave correctly when the passed tuple and tuple descriptor have different numbers of columns (Tom)
  
  This situation is normal when a table has had columns added or removed, but these two functions didn’t handle it properly. The only likely consequence is an incorrect error indication.

- Fix \texttt{ecpg}’s parsing of \texttt{CREATE\:ROLE} (Michael)
• Fix recent breakage of `pg_ctl restart` (Tom)

• Ensure `pg_control` is opened in binary mode (Itagaki Takahiro)
  
  `pg_controldata` and `pg_resetxlog` did this incorrectly, and so could fail on Windows.

• Update time zone data files to `tzdata` release 2008i (for DST law changes in Argentina, Brazil, Mauritius, Syria)

#### E.210. Release 8.2.10

**Release date:** 2008-09-22

This release contains a variety of fixes from 8.2.9. For information about new features in the 8.2 major release, see Section E.220.

#### E.210.1. Migration to Version 8.2.10

A dump/restore is not required for those running 8.2.X. However, if you are upgrading from a version earlier than 8.2.7, see Section E.213.

#### E.210.2. Changes

• Fix bug in btree WAL recovery code (Heikki)
  Recovery failed if the WAL ended partway through a page split operation.

• Fix potential miscalculation of `datfrozenxid` (Alvaro)
  This error may explain some recent reports of failure to remove old `pg_clog` data.

• Widen local lock counters from 32 to 64 bits (Tom)
  This responds to reports that the counters could overflow in sufficiently long transactions, leading to unexpected “lock is already held” errors.

• Fix possible duplicate output of tuples during a GiST index scan (Teodor)

• Fix missed permissions checks when a view contains a simple `UNION ALL` construct (Heikki)
  Permissions for the referenced tables were checked properly, but not permissions for the view itself.

• Add checks in executor startup to ensure that the tuples produced by an `INSERT` or `UPDATE` will match the target table’s current rowtype (Tom)
  `ALTER COLUMN TYPE`, followed by re-use of a previously cached plan, could produce this type of situation. The check protects against data corruption and/or crashes that could ensue.

• Fix possible repeated drops during `DROP OWNED` (Tom)
  This would typically result in strange errors such as “cache lookup failed for relation NNN”. 
Appendix E. Release Notes

- Fix \texttt{AT TIME ZONE} to first try to interpret its timezone argument as a timezone abbreviation, and only try it as a full timezone name if that fails, rather than the other way around as formerly (Tom)

The timestamp input functions have always resolved ambiguous zone names in this order. Making \texttt{AT TIME ZONE} do so as well improves consistency, and fixes a compatibility bug introduced in 8.1: in ambiguous cases we now behave the same as 8.0 and before did, since in the older versions \texttt{AT TIME ZONE} accepted only abbreviations.

- Fix datetime input functions to correctly detect integer overflow when running on a 64-bit platform (Tom)

- Prevent integer overflows during units conversion when displaying a configuration parameter that has units (Tom)

- Improve performance of writing very long log messages to syslog (Tom)

- Allow spaces in the suffix part of an LDAP URL in \texttt{pg_hba.conf} (Tom)

- Fix bug in backwards scanning of a cursor on a \texttt{SELECT DISTINCT ON} query (Tom)

- Fix planner bug with nested sub-select expressions (Tom)

  If the outer sub-select has no direct dependency on the parent query, but the inner one does, the outer value might not get recalculated for new parent query rows.

- Fix planner to estimate that \texttt{GROUP BY} expressions yielding boolean results always result in two groups, regardless of the expressions' contents (Tom)

  This is very substantially more accurate than the regular \texttt{GROUP BY} estimate for certain boolean tests like \texttt{col IS NULL}.

- Fix PL/pgSQL to not fail when a \texttt{FOR} loop's target variable is a record containing composite-type fields (Tom)

- Fix PL/Tcl to behave correctly with Tcl 8.5, and to be more careful about the encoding of data sent to or from Tcl (Tom)

- On Windows, work around a Microsoft bug by preventing libpq from trying to send more than 64kB per system call (Magnus)

- Improve pg\_dump and pg\_restore’s error reporting after failure to send a SQL command (Tom)

- Fix pg\_ctl to properly preserve postmaster command-line arguments across a \texttt{restart} (Bruce)

- Update time zone data files to tzdata release 2008f (for DST law changes in Argentina, Bahamas, Brazil, Mauritius, Morocco, Pakistan, Palestine, and Paraguay)

\textbf{E.211. Release 8.2.9}

\textbf{Release date}: 2008-06-12

This release contains one serious and one minor bug fix over 8.2.8. For information about new features in the 8.2 major release, see Section E.220.
E.211.1. Migration to Version 8.2.9

A dump/restore is not required for those running 8.2.X. However, if you are upgrading from a version earlier than 8.2.7, see Section E.213.

E.211.2. Changes

- Make \texttt{pg\_get\_ruledef()} parenthesize negative constants (Tom)
  
  Before this fix, a negative constant in a view or rule might be dumped as, say, \texttt{-42::integer}, which is subtly incorrect: it should be \texttt{(-42)::integer} due to operator precedence rules. Usually this would make little difference, but it could interact with another recent patch to cause PostgreSQL to reject what had been a valid \texttt{SELECT DISTINCT} view query. Since this could result in \texttt{pg\_dump} output failing to reload, it is being treated as a high-priority fix. The only released versions in which dump output is actually incorrect are 8.3.1 and 8.2.7.

- Make \texttt{ALTER AGGREGATE ... OWNER TO} update \texttt{pg\_shdepend} (Tom)

  This oversight could lead to problems if the aggregate was later involved in a \texttt{DROP OWNED} or \texttt{REASSIGN OWNED} operation.

E.212. Release 8.2.8

Release date: never released

This release contains a variety of fixes from 8.2.7. For information about new features in the 8.2 major release, see Section E.220.

E.212.1. Migration to Version 8.2.8

A dump/restore is not required for those running 8.2.X. However, if you are upgrading from a version earlier than 8.2.7, see Section E.213.

E.212.2. Changes

- Fix \texttt{ERRORDATA\_STACK\_SIZE exceeded} crash that occurred on Windows when using UTF-8 database encoding and a different client encoding (Tom)

- Fix \texttt{ALTER TABLE ADD COLUMN ... PRIMARY KEY} so that the new column is correctly checked to see if it’s been initialized to all non-nulls (Brendan Jurd)

  Previous versions neglected to check this requirement at all.

- Fix possible \texttt{CREATE TABLE} failure when inheriting the “same” constraint from multiple parent relations that inherited that constraint from a common ancestor (Tom)
• Fix `pg_get_ruledef()` to show the alias, if any, attached to the target table of an UPDATE or DELETE (Tom)

• Fix GIN bug that could result in a too many LWLocks taken failure (Teodor)

• Avoid possible crash when decompressing corrupted data (Zdenek Kotala)

• Repair two places where SIGTERM exit of a backend could leave corrupted state in shared memory (Tom)

  Neither case is very important if SIGTERM is used to shut down the whole database cluster together, but there was a problem if someone tried to SIGTERM individual backends.

• Fix conversions between ISO-8859-5 and other encodings to handle Cyrillic “Yo” characters (e and E with two dots) (Sergey Burladyan)

• Fix several datatype input functions, notably `array_in()`, that were allowing unused bytes in their results to contain uninitialized, unpredictable values (Tom)

  This could lead to failures in which two apparently identical literal values were not seen as equal, resulting in the parser complaining about unmatched ORDER BY and DISTINCT expressions.

• Fix a corner case in regular-expression substring matching (`substring(string from pattern)`) (Tom)

  The problem occurs when there is a match to the pattern overall but the user has specified a parenthesized subexpression and that subexpression hasn’t got a match. An example is `substring(’foo’ from ’foo(bar)?’). This should return NULL, since (bar) isn’t matched, but it was mistakenly returning the whole-pattern match instead (ie, foo).

• Update time zone data files to tzdata release 2008c (for DST law changes in Morocco, Iraq, Choibalsan, Pakistan, Syria, Cuba, and Argentina/San_Luis)

• Fix incorrect result from ecpg’s `PGTYPEStimestamp_sub()` function (Michael)

• Fix broken GiST comparison function for contrib/tsearch2’s tsquery type (Teodor)

• Fix possible crashes in contrib/cube functions (Tom)

• Fix core dump in contrib/xml2’s xpath_table() function when the input query returns a NULL value (Tom)

• Fix contrib/xml2’s makefile to not override CFLAGS (Tom)

  This problem affects “old style” (V0) C functions that return boolean. The fix is already in 8.3, but the need to back-patch it was not realized at the time.

### E.213. Release 8.2.7

**Release date:** 2008-03-17

This release contains a variety of fixes from 8.2.6. For information about new features in the 8.2 major release, see Section E.220.
E.213.1. Migration to Version 8.2.7

A dump/restore is not required for those running 8.2.X. However, you might need to `REINDEX` indexes on textual columns after updating, if you are affected by the Windows locale issue described below.

E.213.2. Changes

- Fix character string comparison for Windows locales that consider different character combinations as equal (Tom)
  This fix applies only on Windows and only when using UTF-8 database encoding. The same fix was made for all other cases over two years ago, but Windows with UTF-8 uses a separate code path that was not updated. If you are using a locale that considers some non-identical strings as equal, you may need to `REINDEX` to fix existing indexes on textual columns.
- Repair potential deadlock between concurrent `VACUUM FULL` operations on different system catalogs (Tom)
- Fix longstanding `LISTEN`/`NOTIFY` race condition (Tom)
  In rare cases a session that had just executed a `LISTEN` might not get a notification, even though one would be expected because the concurrent transaction executing `NOTIFY` was observed to commit later.
  A side effect of the fix is that a transaction that has executed a not-yet-committed `LISTEN` command will not see any row in `pg_listener` for the `LISTEN`, should it choose to look; formerly it would have.
  This behavior was never documented one way or the other, but it is possible that some applications depend on the old behavior.
- Disallow `LISTEN` and `UNLISTEN` within a prepared transaction (Tom)
  This was formerly allowed but trying to do it had various unpleasant consequences, notably that the originating backend could not exit as long as an `UNLISTEN` remained uncommitted.
- Disallow dropping a temporary table within a prepared transaction (Heikki)
  This was correctly disallowed by 8.1, but the check was inadvertently broken in 8.2.
- Fix rare crash when an error occurs during a query using a hash index (Heikki)
- Fix memory leaks in certain usages of set-returning functions (Neil)
- Fix input of datetime values for February 29 in years BC (Tom)
  The former coding was mistaken about which years were leap years.
- Fix “unrecognized node type” error in some variants of `ALTER OWNER` (Tom)
- Ensure `pg_stat_activity.waiting` flag is cleared when a lock wait is aborted (Tom)
- Fix handling of process permissions on Windows Vista (Dave, Magnus)
  In particular, this fix allows starting the server as the Administrator user.
- Update time zone data files to tzdata release 2008a (in particular, recent Chile changes); adjust timezone abbreviation `VET` (Venezuela) to mean UTC-4:30, not UTC-4:00 (Tom)
- Fix `pg_ctl` to correctly extract the postmaster’s port number from command-line options (Itagaki Takahiro, Tom)
Previously, `pg_ctl start -w` could try to contact the postmaster on the wrong port, leading to bogus reports of startup failure.

- Use `-fwrapv` to defend against possible misoptimization in recent gcc versions (Tom)
  
  This is known to be necessary when building PostgreSQL with gcc 4.3 or later.

- Correctly enforce `statement_timeout` values longer than `INT_MAX` microseconds (about 35 minutes) (Tom)
  
  This bug affects only builds with `--enable-integer-datetimes`.

- Fix “unexpected PARAM_SUBLINK ID” planner error when constant-folding simplifies a sub-select (Tom)

- Fix logical errors in constraint-exclusion handling of `IS NULL` and `NOT` expressions (Tom)
  
  The planner would sometimes exclude partitions that should not have been excluded because of the possibility of NULL results.

- Fix another cause of “failed to build any N-way joins” planner errors (Tom)
  
  This could happen in cases where a clauseless join needed to be forced before a join clause could be exploited.

- Fix incorrect constant propagation in outer-join planning (Tom)
  
  The planner could sometimes incorrectly conclude that a variable could be constrained to be equal to a constant, leading to wrong query results.

- Fix display of constant expressions in `ORDER BY` and `GROUP BY` (Tom)
  
  An explicitly casted constant would be shown incorrectly. This could for example lead to corruption of a view definition during dump and reload.

- Fix `libpq` to handle `NOTICE` messages correctly during `COPY OUT` (Tom)
  
  This failure has only been observed to occur when a user-defined datatype’s output routine issues a `NOTICE`, but there is no guarantee it couldn’t happen due to other causes.

---

**E.214. Release 8.2.6**

**Release date:** 2008-01-07

This release contains a variety of fixes from 8.2.5, including fixes for significant security issues. For information about new features in the 8.2 major release, see Section E.220.

**E.214.1. Migration to Version 8.2.6**

A dump/restore is not required for those running 8.2.X.
Appendix E. Release Notes

E.214.2. Changes

• Prevent functions in indexes from executing with the privileges of the user running VACUUM, ANALYZE, etc (Tom)

Functions used in index expressions and partial-index predicates are evaluated whenever a new table entry is made. It has long been understood that this poses a risk of trojan-horse code execution if one modifies a table owned by an untrustworthy user. (Note that triggers, defaults, check constraints, etc. pose the same type of risk.) But functions in indexes pose extra danger because they will be executed by routine maintenance operations such as VACUUM FULL, which are commonly performed automatically under a superuser account. For example, a nefarious user can execute code with superuser privileges by setting up a trojan-horse index definition and waiting for the next routine vacuum. The fix arranges for standard maintenance operations (including VACUUM, ANALYZE, REINDEX, and CLUSTER) to execute as the table owner rather than the calling user, using the same privilege-switching mechanism already used for SECURITY DEFINER functions. To prevent bypassing this security measure, execution of SET SESSION AUTHORIZATION and SET ROLE is now forbidden within a SECURITY DEFINER context. (CVE-2007-6600)

• Repair assorted bugs in the regular-expression package (Tom, Will Drewry)

Suitably crafted regular-expression patterns could cause crashes, infinite or near-infinite looping, and/or massive memory consumption, all of which pose denial-of-service hazards for applications that accept regex search patterns from untrustworthy sources. (CVE-2007-4769, CVE-2007-4772, CVE-2007-6067)

• Require non-superusers who use /contrib/dblink to use only password authentication, as a security measure (Joe)

The fix that appeared for this in 8.2.5 was incomplete, as it plugged the hole for only some dblink functions. (CVE-2007-6601, CVE-2007-3278)

• Fix bugs in WAL replay for GIN indexes (Teodor)

• Fix GIN index build to work properly when maintenance_work_mem is 4GB or more (Tom)

• Update time zone data files to tzdata release 2007k (in particular, recent Argentina changes) (Tom)

• Improve planner’s handling of LIKE/regex estimation in non-C locales (Tom)

• Fix planning-speed problem for deep outer-join nests, as well as possible poor choice of join order (Tom)

• Fix planner failure in some cases of WHERE false AND var IN (SELECT ...) (Tom)

• Make CREATE TABLE ... SERIAL and ALTER SEQUENCE ... OWNED BY not change the currval() state of the sequence (Tom)

• Preserve the tablespace and storage parameters of indexes that are rebuilt by ALTER TABLE ... ALTER COLUMN TYPE (Tom)

• Make archive recovery always start a new WAL timeline, rather than only when a recovery stop time was used (Simon)

This avoids a corner-case risk of trying to overwrite an existing archived copy of the last WAL segment, and seems simpler and cleaner than the original definition.
• Make VACUUM not use all of maintenance_work_mem when the table is too small for it to be useful (Alvaro)
• Fix potential crash in translate() when using a multibyte database encoding (Tom)
• Make corr() return the correct result for negative correlation values (Neil)
• Fix overflow in extract(epoch from interval) for intervals exceeding 68 years (Tom)
• Fix PL/Perl to not fail when a UTF-8 regular expression is used in a trusted function (Andrew)
• Fix PL/Perl to cope when platform’s Perl defines type bool as int rather than char (Tom)
  While this could theoretically happen anywhere, no standard build of Perl did things this way ... until
  Mac OS X 10.5.
• Fix PL/Python to work correctly with Python 2.5 on 64-bit machines (Marko Kreen)
• Fix PL/Python to not crash on long exception messages (Alvaro)
• Fix pg_dump to correctly handle inheritance child tables that have default expressions different from
  their parent’s (Tom)
• Fix libpq crash when PGPASSFILE refers to a file that is not a plain file (Martin Pitt)
• ecpg parser fixes (Michael)
• Make contrib/pgcrypto defend against OpenSSL libraries that fail on keys longer than 128 bits;
  which is the case at least on some Solaris versions (Marko Kreen)
• Make contrib/tablefunc’s crosstab() handle NULL rowid as a category in its own right, rather
  than crashing (Joe)
• Fix tsvector and tsquery output routines to escape backslashes correctly (Teodor, Bruce)
• Fix crash of to_tsvector() on huge input strings (Teodor)
• Require a specific version of Autoconf to be used when re-generating the configure script (Peter)
  This affects developers and packagers only. The change was made to prevent accidental use of untested
  combinations of Autoconf and PostgreSQL versions. You can remove the version check if you really
  want to use a different Autoconf version, but it’s your responsibility whether the result works or not.
• Update gettimeofday configuration check so that PostgreSQL can be built on newer versions of
  MinGW (Magnus)

E.215. Release 8.2.5

Release date: 2007-09-17
This release contains a variety of fixes from 8.2.4. For information about new features in the 8.2 major
release, see Section E.220.

E.215.1. Migration to Version 8.2.5
A dump/restore is not required for those running 8.2.X.

3071
E.215.2. Changes

- Prevent index corruption when a transaction inserts rows and then aborts close to the end of a concurrent VACUUM on the same table (Tom)
- Fix ALTER DOMAIN ADD CONSTRAINT for cases involving domains over domains (Tom)
- Make CREATE DOMAIN ... DEFAULT NULL work properly (Tom)
- Fix some planner problems with outer joins, notably poor size estimation for t1 LEFT JOIN t2 WHERE t2.col IS NULL (Tom)
- Allow the interval data type to accept input consisting only of milliseconds or microseconds (Neil)
- Allow timezone name to appear before the year in timestamp input (Tom)
- Fixes for GIN indexes used by /contrib/tsearch2 (Teodor)
- Speed up rtree index insertion (Teodor)
- Fix excessive logging of SSL error messages (Tom)
- Fix logging so that log messages are never interleaved when using the syslogger process (Andrew)
- Fix crash when log_min_error_statement logging runs out of memory (Tom)
- Fix incorrect handling of some foreign-key corner cases (Tom)
- Fix stddev_pop(numeric) and var_pop(numeric) (Tom)
- Prevent REINDEX and CLUSTER from failing due to attempting to process temporary tables of other sessions (Alvaro)
- Update the time zone database rules, particularly New Zealand’s upcoming changes (Tom)
- Windows socket and semaphore improvements (Magnus)
- Make pg_ctl -w work properly in Windows service mode (Dave Page)
- Fix memory allocation bug when using MIT Kerberos on Windows (Magnus)
- Suppress timezone name (%Z) in log timestamps on Windows because of possible encoding mismatches (Tom)
- Require non-superusers who use /contrib/dblink to use only password authentication, as a security measure (Joe)
- Restrict /contrib/pgstattuple functions to superusers, for security reasons (Tom)
- Do not let /contrib/intarray try to make its GIN opclass the default (this caused problems at dump/restore) (Tom)

E.216. Release 8.2.4

Release date: 2007-04-23

This release contains a variety of fixes from 8.2.3, including a security fix. For information about new features in the 8.2 major release, see Section E.220.
Appendix E. Release Notes

E.216.1. Migration to Version 8.2.4

A dump/restore is not required for those running 8.2.X.

E.216.2. Changes

- Support explicit placement of the temporary-table schema within `search_path`, and disable searching it for functions and operators (Tom)
  
  This is needed to allow a security-definer function to set a truly secure value of `search_path`. Without it, an unprivileged SQL user can use temporary objects to execute code with the privileges of the security-definer function (CVE-2007-2138). See `CREATE FUNCTION` for more information.

- Fix `shared_preload_libraries` for Windows by forcing reload in each backend (Korry Douglas)

- Fix `to_char()` so it properly upper/lower cases localized day or month names (Pavel Stehule)

- `/contrib/tsearch2` crash fixes (Teodor)

- Require `COMMIT PREPARED` to be executed in the same database as the transaction was prepared in (Heikki)

- Allow `pg_dump` to do binary backups larger than two gigabytes on Windows (Magnus)

- New traditional (Taiwan) Chinese FAQ (Zhou Daojing)

- Prevent the statistics collector from writing to disk too frequently (Tom)

- Fix potential-data-corruption bug in how `VACUUM FULL` handles `UPDATE` chains (Tom, Pavan Deolasee)

- Fix bug in domains that use array types (Tom)

- Fix `pg_dump` so it can dump a serial column’s sequence using `-t` when not also dumping the owning table (Tom)

- Planner fixes, including improving outer join and bitmap scan selection logic (Tom)

- Fix possible wrong answers or crash when a PL/pgSQL function tries to `RETURN` from within an `EXCEPTION` block (Tom)

- Fix `PANIC` during enlargement of a hash index (Tom)

- Fix POSIX-style timezone specs to follow new USA DST rules (Tom)

E.217. Release 8.2.3

Release date: 2007-02-07

This release contains two fixes from 8.2.2. For information about new features in the 8.2 major release, see Section E.220.
Appendix E. Release Notes

E.217.1. Migration to Version 8.2.3
A dump/restore is not required for those running 8.2.X.

E.217.2. Changes

- Remove overly-restrictive check for type length in constraints and functional indexes (Tom)
- Fix optimization so MIN/MAX in subqueries can again use indexes (Tom)

E.218. Release 8.2.2

Release date: 2007-02-05
This release contains a variety of fixes from 8.2.1, including a security fix. For information about new features in the 8.2 major release, see Section E.220.

E.218.1. Migration to Version 8.2.2
A dump/restore is not required for those running 8.2.X.

E.218.2. Changes

- Remove security vulnerabilities that allowed connected users to read backend memory (Tom)
  The vulnerabilities involve suppressing the normal check that a SQL function returns the data type it's declared to, and changing the data type of a table column (CVE-2007-0555, CVE-2007-0556). These errors can easily be exploited to cause a backend crash, and in principle might be used to read database content that the user should not be able to access.
- Fix not-so-rare-anymore bug wherein btree index page splits could fail due to choosing an infeasible split point (Heikki Linnakangas)
- Fix Borland C compile scripts (L Bayuk)
- Properly handle `to_char('C')` for years ending in 00 (Tom)
  Year 2000 is in the twentieth century, not the twenty-first.
- `/contrib/tsearch2` localization improvements (Tatsuo, Teodor)
- Fix incorrect permission check in `information_schema.key_column_usage` view (Tom)
  The symptom is “relation with OID mmmn does not exist” errors. To get this fix without using `initdb`, use `CREATE OR REPLACE VIEW` to install the corrected definition found in `share/information_schema.sql`. Note you will need to do this in each database.
- Improve `VACUUM` performance for databases with many tables (Tom)
Appendix E. Release Notes

- Fix for rare Assert() crash triggered by \texttt{UNION} (Tom)
- Fix potentially incorrect results from index searches using \texttt{ROW} inequality conditions (Tom)
- Tighten security of multi-byte character processing for UTF8 sequences over three bytes long (Tom)
- Fix bogus “permission denied” failures occurring on Windows due to attempts to fsync already-deleted files (Magnus, Tom)
- Fix bug that could cause the statistics collector to hang on Windows (Magnus)
  This would in turn lead to autovacuum not working.
- Fix possible crashes when an already-in-use PL/pgSQL function is updated (Tom)
- Improve PL/pgSQL handling of domain types (Sergiy Vyshnevetskiy, Tom)
- Fix possible errors in processing PL/pgSQL exception blocks (Tom)

E.219. Release 8.2.1

Release date: 2007-01-08

This release contains a variety of fixes from 8.2. For information about new features in the 8.2 major release, see Section E.220.

E.219.1. Migration to Version 8.2.1

A dump/restore is not required for those running 8.2.

E.219.2. Changes

- Fix crash with \texttt{SELECT ... LIMIT ALL} (also \texttt{LIMIT NULL}) (Tom)
- Several /contrib/tsearch2 fixes (Teodor)
- On Windows, make log messages coming from the operating system use ASCII encoding (Hiroshi Saito)
  This fixes a conversion problem when there is a mismatch between the encoding of the operating system and database server.
- Fix Windows linking of \texttt{pg_dump} using \texttt{win32.mak} (Hiroshi Saito)
- Fix planner mistakes for outer join queries (Tom)
- Fix several problems in queries involving sub-SELECTs (Tom)
- Fix potential crash in SPI during subtransaction abort (Tom)
  This affects all PL functions since they all use SPI.
- Improve build speed of PDF documentation (Peter)
• Re-add JST (Japan) timezone abbreviation (Tom)
• Improve optimization decisions related to index scans (Tom)
• Have psql print multi-byte combining characters as before, rather than output as \u (Tom)
• Improve index usage of regular expressions that use parentheses (Tom)
  This improves psql \d performance also.
• Make pg_dumpall assume that databases have public CONNECT privilege, when dumping from a pre-8.2 server (Tom)
  This preserves the previous behavior that anyone can connect to a database if allowed by pg_hba.conf.

E.220. Release 8.2

Release date: 2006-12-05

E.220.1. Overview

This release adds many functionality and performance improvements that were requested by users, including:

• Query language enhancements including INSERT/UPDATE/DELETE RETURNING, multirow VALUES lists, and optional target-table alias in UPDATE/DELETE
• Index creation without blocking concurrent INSERT/UPDATE/DELETE operations
• Many query optimization improvements, including support for reordering outer joins
• Improved sorting performance with lower memory usage
• More efficient locking with better concurrency
• More efficient vacuuming
• Easier administration of warm standby servers
• New FILLFACTOR support for tables and indexes
• Monitoring, logging, and performance tuning additions
• More control over creating and dropping objects
• Table inheritance relationships can be defined for and removed from pre-existing tables
• COPY TO can copy the output of an arbitrary SELECT statement
• Array improvements, including nulls in arrays
• Aggregate-function improvements, including multiple-input aggregates and SQL:2003 statistical functions
• Many contrib/ improvements
E.220.2. Migration to Version 8.2

A dump/restore using pg_dump is required for those wishing to migrate data from any previous release.

Observe the following incompatibilities:

- **Set escape_string_warning to on by default (Bruce)**
  This issues a warning if backslash escapes are used in non-escape (non-E") strings.

- **Change the row constructor syntax (ROW(. . .)) so that list elements foo.* will be expanded to a list of their member fields, rather than creating a nested row type field as formerly (Tom)**
  The new behavior is substantially more useful since it allows, for example, triggers to check for data changes with IF row(new.*) IS DISTINCT FROM row(old.*). The old behavior is still available by omitting .*.

- **Make row comparisons follow SQL standard semantics and allow them to be used in index scans (Tom)**
  Previously, row = and <> comparisons followed the standard but <= >= did not. A row comparison can now be used as an index constraint for a multicolumn index matching the row value.

- **Make row IS [NOT] NULL tests follow SQL standard semantics (Tom)**
  The former behavior conformed to the standard for simple cases with IS NULL, but IS NOT NULL would return true if any row field was non-null, whereas the standard says it should return true only when all fields are non-null.

- **Make SET CONSTRAINT affect only one constraint (Kris Jurka)**
  In previous releases, SET CONSTRAINT modified all constraints with a matching name. In this release, the schema search path is used to modify only the first matching constraint. A schema specification is also supported. This more nearly conforms to the SQL standard.

- **Remove RULE permission for tables, for security reasons (Tom)**
  As of this release, only a table’s owner can create or modify rules for the table. For backwards compatibility, GRANT/REVOKE RULE is still accepted, but it does nothing.

- **Array comparison improvements (Tom)**
  Now array dimensions are also compared.

- **Change array concatenation to match documented behavior (Tom)**
  This changes the previous behavior where concatenation would modify the array lower bound.

- **Make command-line options of postmaster and postgres identical (Peter)**
  This allows the postmaster to pass arguments to each backend without using -o. Note that some options are now only available as long-form options, because there were conflicting single-letter options.

- **Deprecate use of postmaster symbolic link (Peter)**
  postmaster and postgres commands now act identically, with the behavior determined by command-line options. The postmaster symbolic link is kept for compatibility, but is not really needed.

- **Change log_duration to output even if the query is not output (Tom)**
  In prior releases, log_duration only printed if the query appeared earlier in the log.

- **Make to_char(time) and to_char(interval) treat HH and HH12 as 12-hour intervals**
Most applications should use HH24 unless they want a 12-hour display.

- Zero unmasked bits in conversion from INET to CIDR (Tom)

  This ensures that the converted value is actually valid for CIDR.

- Remove australian_timezones configuration variable (Joachim Wieland)

  This variable has been superseded by a more general facility for configuring timezone abbreviations.

- Improve cost estimation for nested-loop index scans (Tom)

  This might eliminate the need to set unrealistically small values of random_page_cost. If you have been using a very small random_page_cost, please recheck your test cases.

- Change behavior of pg_dump -n and -t options. (Greg Sabino Mullane)

  See the pg_dump manual page for details.

- Change libpq PQdsplen() to return a useful value (Martijn van Oosterhout)

- Declare libpq PQgetssl() as returning void *, rather than SSL * (Martijn van Oosterhout)

  This allows applications to use the function without including the OpenSSL headers.

- C-language loadable modules must now include a PG_MODULE_MAGIC macro call for version compatibility checking (Martijn van Oosterhout)

- For security’s sake, modules used by a PL/PerlU function are no longer available to PL/Perl functions (Andrew)

  Note: This also implies that data can no longer be shared between a PL/Perl function and a PL/PerlU function. Some Perl installations have not been compiled with the correct flags to allow multiple interpreters to exist within a single process. In this situation PL/Perl and PL/PerlU cannot both be used in a single backend. The solution is to get a Perl installation which supports multiple interpreters.

- In contrib/xml2/, rename xml_valid() to xml_is_well_formed() (Tom)

  xml_valid() will remain for backward compatibility, but its behavior will change to do schema checking in a future release.

- Remove contrib/ora2pg/, now at http://www.samse.fr/GPL/ora2pg

- Remove contrib modules that have been migrated to PgFoundry: adddepend, dbase, dbmirror, fulltextindex, mac, userlock

- Remove abandoned contrib modules: mSQL-interface, tips

- Remove QNX and BEOS ports (Bruce)

  These ports no longer had active maintainers.
E.220.3. Changes

Below you will find a detailed account of the changes between PostgreSQL 8.2 and the previous major release.

E.220.3.1. Performance Improvements

- Allow the planner to reorder outer joins in some circumstances (Tom)
  In previous releases, outer joins would always be evaluated in the order written in the query. This change allows the query optimizer to consider reordering outer joins, in cases where it can determine that the join order can be changed without altering the meaning of the query. This can make a considerable performance difference for queries involving multiple outer joins or mixed inner and outer joins.

- Improve efficiency of IN (list-of-expressions) clauses (Tom)

- Improve sorting speed and reduce memory usage (Simon, Tom)

- Improve subtransaction performance (Alvaro, Itagaki Takahiro, Tom)

- Add FILLFACTOR to table and index creation (ITAGAKI Takahiro)
  This leaves extra free space in each table or index page, allowing improved performance as the database grows. This is particularly valuable to maintain clustering.

- Increase default values for shared_buffers and max_fsm_pages (Andrew)

- Improve locking performance by breaking the lock manager tables into sections (Tom)
  This allows locking to be more fine-grained, reducing contention.

- Reduce locking requirements of sequential scans (Qingqing Zhou)

- Reduce locking required for database creation and destruction (Tom)

- Improve the optimizer’s selectivity estimates for LIKE, ILIKE, and regular expression operations (Tom)

- Improve planning of joins to inherited tables and UNION ALL views (Tom)

- Allow constraint exclusion to be applied to inherited UPDATE and DELETE queries (Tom)
  SELECT already honored constraint exclusion.

- Improve planning of constant WHERE clauses, such as a condition that depends only on variables inherited from an outer query level (Tom)

- Protocol-level unnamed prepared statements are re-planned for each set of BIND values (Tom)
  This improves performance because the exact parameter values can be used in the plan.

- Speed up vacuuming of B-Tree indexes (Heikki Linnakangas, Tom)

- Avoid extra scan of tables without indexes during VACUUM (Greg Stark)

- Improve multicolumn GiST indexing (Oleg, Teodor)

- Remove dead index entries before B-Tree page split (Junji Teramoto)
E.220.3.2. Server Changes

- Allow a forced switch to a new transaction log file (Simon, Tom)
  This is valuable for keeping warm standby slave servers in sync with the master. Transaction log file switching now also happens automatically during `pg_stop_backup()`. This ensures that all transaction log files needed for recovery can be archived immediately.

- Add WAL informational functions (Simon)
  Add functions for interrogating the current transaction log insertion point and determining WAL file-names from the hex WAL locations displayed by `pg_stop_backup()` and related functions.

- Improve recovery from a crash during WAL replay (Simon)
  The server now does periodic checkpoints during WAL recovery, so if there is a crash, future WAL recovery is shortened. This also eliminates the need for warm standby servers to replay the entire log since the base backup if they crash.

- Improve reliability of long-term WAL replay (Heikki, Simon, Tom)
  Formerly, trying to roll forward through more than 2 billion transactions would not work due to XID wraparound. This meant warm standby servers had to be reloaded from fresh base backups periodically.

- Add `archive_timeout` to force transaction log file switches at a given interval (Simon)
  This enforces a maximum replication delay for warm standby servers.

- Add native LDAP authentication (Magnus Hagander)
  This is particularly useful for platforms that do not support PAM, such as Windows.

- Add `GRANT CONNECT ON DATABASE` (Gevik Babakhani)
  This gives SQL-level control over database access. It works as an additional filter on top of the existing `pg_hba.conf` controls.

- Add support for SSL Certificate Revocation List (CRL) files (Libor Hohoš)
  The server and libpq both recognize CRL files now.

- GiST indexes are now clusterable (Teodor)

- Remove routine autovacuum server log entries (Bruce)
  `pg_stat_activity` now shows autovacuum activity.

- Track maximum XID age within individual tables, instead of whole databases (Alvaro)
  This reduces the overhead involved in preventing transaction ID wraparound, by avoiding unnecessary VACUUMs.

- Add last vacuum and analyze timestamp columns to the stats collector (Larry Rosenman)
  These values now appear in the `pg_stat_*_tables` system views.

- Improve performance of statistics monitoring, especially `stats_command_string` (Tom, Bruce)
  This release enables `stats_command_string` by default, now that its overhead is minimal. This means `pg_stat_activity` will now show all active queries by default.

- Add a `waiting` column to `pg_stat_activity` (Tom)
This allows `pg_stat_activity` to show all the information included in the ps display.

- **Add configuration parameter** `update_process_title` **to control whether the ps display is updated for every command** (Bruce)
  
  On platforms where it is expensive to update the ps display, it might be worthwhile to turn this off and rely solely on `pg_stat_activity` for status information.

- **Allow units to be specified in configuration settings** (Peter)
  
  For example, you can now set `shared_buffers` to 32MB rather than mentally converting sizes.

- **Add support for include directives in `postgresql.conf`** (Joachim Wieland)

- **Improve logging of protocol-level prepare/bind/execute messages** (Bruce, Tom)
  
  Such logging now shows statement names, bind parameter values, and the text of the query being executed. Also, the query text is properly included in logged error messages when enabled by `log_min_error_statement`.

- **Prevent `max_stack_depth` from being set to unsafe values**
  
  On platforms where we can determine the actual kernel stack depth limit (which is most), make sure that the initial default value of `max_stack_depth` is safe, and reject attempts to set it to unsafely large values.

- **Enable highlighting of error location in query in more cases** (Tom)
  
  The server is now able to report a specific error location for some semantic errors (such as unrecognized column name), rather than just for basic syntax errors as before.

- **Fix “failed to re-find parent key” errors in VACUUM** (Tom)

- **Clean out `pg_internal.init` cache files during server restart** (Simon)
  
  This avoids a hazard that the cache files might contain stale data after PITR recovery.

- **Fix race condition for truncation of a large relation across a gigabyte boundary by VACUUM** (Tom)

- **Fix bug causing needless deadlock errors on row-level locks** (Tom)

- **Fix bugs affecting multi-gigabyte hash indexes** (Tom)

- **Each backend process is now its own process group leader** (Tom)
  
  This allows query cancel to abort subprocesses invoked from a backend or archive/recovery process.

### E.220.3.3. Query Changes

- **Add** `INSERT/UPDATE/DELETE RETURNING` **(Jonah Harris, Tom)**
  
  This allows these commands to return values, such as the computed serial key for a new row. In the `UPDATE` case, values from the updated version of the row are returned.

- **Add support for multiple-row VALUES clauses, per SQL standard** (Joe, Tom)
  
  This allows `INSERT` to insert multiple rows of constants, or queries to generate result sets using constants. For example, `INSERT ... VALUES (...), (....), ......, and SELECT * FROM (VALUES (...), (....), ....) AS alias(f1, ...)`. 

---

3081
Appendix E. Release Notes

- Allow `UPDATE` and `DELETE` to use an alias for the target table (Atsushi Ogawa)
  
The SQL standard does not permit an alias in these commands, but many database systems allow one anyway for notational convenience.

- Allow `UPDATE` to set multiple columns with a list of values (Susanne Ebrecht)
  
  This is basically a short-hand for assigning the columns and values in pairs. The syntax is `UPDATE tab SET (column, ...) = (val, ...)`. 

- Make row comparisons work per standard (Tom)
  
  The forms `<, <=, >, >=` now compare rows lexicographically, that is, compare the first elements, if equal compare the second elements, and so on. Formerly they expanded to an AND condition across all the elements, which was neither standard nor very useful.

- Add `CASCADE` option to `TRUNCATE` (Joachim Wieland)
  
  This causes `TRUNCATE` to automatically include all tables that reference the specified table(s) via foreign keys. While convenient, this is a dangerous tool — use with caution!

- Support `FOR UPDATE` and `FOR SHARE` in the same `SELECT` command (Tom)

- Add `IS NOT DISTINCT FROM` (Pavel Stehule)
  
  This operator is similar to equality (`=`, but evaluates to true when both left and right operands are `NULL`, and to false when just one is, rather than yielding `NULL` in these cases.

- Improve the length output used by `UNION/INTERSECT/EXCEPT` (Tom)
  
  When all corresponding columns are of the same defined length, that length is used for the result, rather than a generic length.

- Allow `ILIKE` to work for multi-byte encodings (Tom)
  
  Internally, `ILIKE` now calls `lower()` and then uses `LIKE`. Locale-specific regular expression patterns still do not work in these encodings.

- Enable `standard_conforming_strings` to be turned on (Kevin Grittner)
  
  This allows backslash escaping in strings to be disabled, making PostgreSQL more standards-compliant. The default is off for backwards compatibility, but future releases will default this to on.

- Do not flatten subqueries that contain `volatile` functions in their target lists (Jaime Casanova)

  This prevents surprising behavior due to multiple evaluation of a `volatile` function (such as `random()` or `nextval()`). It might cause performance degradation in the presence of functions that are unnecessarily marked as `volatile`.

- Add system views `pg_prepared_statements` and `pg_cursors` to show prepared statements and open cursors (Joachim Wieland, Neil)

  These are very useful in pooled connection setups.

- Support portal parameters in `EXPLAIN` and `EXECUTE` (Tom)

  This allows, for example, JDBC `?` parameters to work in these commands.

- If SQL-level `PREPARE` parameters are unspecified, infer their types from the content of the query (Neil)

  Protocol-level `PREPARE` already did this.
Appendix E. Release Notes

• Allow LIMIT and OFFSET to exceed two billion (Dhanaraj M)

E.220.3.4. Object Manipulation Changes

• Add TABLESPACE clause to CREATE TABLE AS (Neil)
  This allows a tablespace to be specified for the new table.
• Add ON COMMIT clause to CREATE TABLE AS (Neil)
  This allows temporary tables to be truncated or dropped on transaction commit. The default behavior is for the table to remain until the session ends.
• Add INCLUDING CONSTRAINTS to CREATE TABLE LIKE (Greg Stark)
  This allows easy copying of CHECK constraints to a new table.
• Allow the creation of placeholder (shell) types (Martijn van Oosterhout)
  A shell type declaration creates a type name, without specifying any of the details of the type. Making a shell type is useful because it allows cleaner declaration of the type’s input/output functions, which must exist before the type can be defined “for real”. The syntax is CREATE TYPE typename.
• Aggregate functions now support multiple input parameters (Sergey Koposov, Tom)
• Add new aggregate creation syntax (Tom)
  The new syntax is CREATE AGGREGATE agname (input_type) (parameter_list). This more naturally supports the new multi-parameter aggregate functionality. The previous syntax is still supported.
• Add ALTER ROLE PASSWORD NULL to remove a previously set role password (Peter)
• Add DROP object IF EXISTS for many object types (Andrew)
  This allows DROP operations on non-existent objects without generating an error.
• Add DROP OWNED to drop all objects owned by a role (Alvaro)
• Add REASSIGN OWNED to reassign ownership of all objects owned by a role (Alvaro)
  This, and DROP OWNED above, facilitate dropping roles.
• Add GRANT ON SEQUENCE syntax (Bruce)
  This was added for setting sequence-specific permissions. GRANT ON TABLE for sequences is still supported for backward compatibility.
• Add USAGE permission for sequences that allows only currval() and nextval(), not setval() (Bruce)
  USAGE permission allows more fine-grained control over sequence access. Granting USAGE allows users to increment a sequence, but prevents them from setting the sequence to an arbitrary value using setval().
• Add ALTER TABLE [ NO ] INHERIT (Greg Stark)
  This allows inheritance to be adjusted dynamically, rather than just at table creation and destruction. This is very valuable when using inheritance to implement table partitioning.
• Allow comments on global objects to be stored globally (Kris Jurka)
Previously, comments attached to databases were stored in individual databases, making them ineffective, and there was no provision at all for comments on roles or tablespaces. This change adds a new shared catalog `pg_shdescription` and stores comments on databases, roles, and tablespaces therein.

### E.220.3.5. Utility Command Changes

- **Add option to allow indexes to be created without blocking concurrent writes to the table** (Greg Stark, Tom)
  
  The new syntax is `CREATE INDEX CONCURRENTLY`. The default behavior is still to block table modification while an index is being created.

- **Provide advisory locking functionality** (Abhijit Menon-Sen, Tom)
  
  This is a new locking API designed to replace what used to be in `/contrib/userlock`. The userlock code is now on pgfoundry.

- **Allow `COPY` to dump a `SELECT` query** (Zoltan Boszormenyi, Karel Zak)
  
  This allows `COPY` to dump arbitrary SQL queries. The syntax is `COPY (SELECT ...) TO`.

- **Make the `COPY` command return a command tag that includes the number of rows copied** (Volkan YAZICI)

- **Allow `VACUUM` to expire rows without being affected by other concurrent `VACUUM` operations** (Hannu Krossing, Alvaro, Tom)

- **Make initdb detect the operating system locale and set the default `DateStyle` accordingly** (Peter)
  
  This makes it more likely that the installed `postgresql.conf DateStyle` value will be as desired.

- **Reduce number of progress messages displayed by initdb** (Tom)

### E.220.3.6. Date/Time Changes

- **Allow full timezone names in `timestamp` input values** (Joachim Wieland)
  
  For example, `'2006-05-24 21:11 America/New_York'::timestamptz`.

- **Support configurable timezone abbreviations** (Joachim Wieland)
  
  A desired set of timezone abbreviations can be chosen via the configuration parameter `timezone_abbreviations`.

- **Add `pg_timezone_abbrevs` and `pg_timezone_names` views to show supported timezones** (Magnus Hagander)

- **Add `clock_timestamp()`, `statement_timestamp()`, and `transaction_timestamp()`** (Bruce)
  
  `clock_timestamp()` is the current wall-clock time, `statement_timestamp()` is the time the current statement arrived at the server, and `transaction_timestamp()` is an alias for `now()`.

- **Allow `to_char()` to print localized month and day names** (Euler Taveira de Oliveira)

- **Allow `to_char(time)` and `to_char(interval)` to output AM/PM specifications** (Bruce)
Appendix E. Release Notes

Intervals and times are treated as 24-hour periods, e.g. 25 hours is considered AM.

- Add new function `justify_interval()` to adjust interval units (Mark Dilger)
- Allow timezone offsets up to 14:59 away from GMT
  Kiribati uses GMT+14, so we’d better accept that.
- Interval computation improvements (Michael Gläsemann, Bruce)

E.220.3.7. Other Data Type and Function Changes

- Allow arrays to contain `NULL` elements (Tom)
- Allow assignment to array elements not contiguous with the existing entries (Tom)
  The intervening array positions will be filled with nulls. This is per SQL standard.
- New built-in operators for array-subset comparisons (@>, <@, &@) (Teodor, Tom)
  These operators can be indexed for many data types using GiST or GIN indexes.
- Add convenient arithmetic operations on `INET/CIDR` values (Stephen R. van den Berg)
  The new operators are & (and), | (or), ~ (not), inet + int8, inet - int8, and inet - inet.
- Add new aggregate functions from SQL:2003 (Neil)
  The new functions are `var_pop()`, `var_samp()`, `stddev_pop()`, and `stddev_samp()`.
  `var_samp()` and `stddev_samp()` are merely renamings of the existing aggregates `variance()` and `stddev()`.
  The latter names remain available for backward compatibility.
- Add SQL:2003 statistical aggregates (Sergey Koposov)
  New functions: `regr_intercept()`, `regr_slope()`, `regr_r2()`, `corr()`, `covar_samp()`,
  `covar_pop()`, `regr_avgx()`, `regr_avgy()`, `regr_sxy()`, `regr_sxx()`, `regr_syy()`,
  `regr_count()`.
- Allow domains to be based on other domains (Tom)
- Properly enforce domain CHECK constraints everywhere (Neil, Tom)
  For example, the result of a user-defined function that is declared to return a domain type is now checked against the domain’s constraints. This closes a significant hole in the domain implementation.
- Fix problems with dumping renamed SERIAL columns (Tom)
  The fix is to dump a SERIAL column by explicitly specifying its DEFAULT and sequence elements, and
  reconstructing the SERIAL column on reload using a new ALTER SEQUENCE OWNED BY command.
  This also allows dropping a SERIAL column specification.
- Add a server-side sleep function `pg_sleep()` (Joachim Wieland)
- Add all comparison operators for the `tid` (tuple id) data type (Mark Kirkwood, Greg Stark, Tom)

E.220.3.8. PL/pgSQL Server-Side Language Changes

- Add `TG_table_name` and `TG_table_schema` to trigger parameters (Andrew)
Appendix E. Release Notes

TG Relname is now deprecated. Comparable changes have been made in the trigger parameters for the other PLs as well.

- Allow FOR statements to return values to scalars as well as records and row types (Pavel Stehule)
- Add a BY clause to the FOR loop, to control the iteration increment (Jaime Casanova)
- Add STRICT to SELECT INTO (Matt Miller)

STRICT mode throws an exception if more or less than one row is returned by the SELECT, for Oracle PL/SQL compatibility.

E.220.3.9. PL/Perl Server-Side Language Changes

- Add table_name and table_schema to trigger parameters (Adam Sjøgren)
- Add prepared queries (Dmitry Karasik)
- Make $_TD trigger data a global variable (Andrew)
  Previously, it was lexical, which caused unexpected sharing violations.
- Run PL/Perl and PL/PerlU in separate interpreters, for security reasons (Andrew)
  In consequence, they can no longer share data nor loaded modules. Also, if Perl has not been compiled
  with the requisite flags to allow multiple interpreters, only one of these languages can be used in any
  given backend process.

E.220.3.10. PL/Python Server-Side Language Changes

- Named parameters are passed as ordinary variables, as well as in the args[] array (Sven Suursoho)
- Add table_name and table_schema to trigger parameters (Andrew)
- Allow returning of composite types and result sets (Sven Suursoho)
- Return result-set as list, iterator, or generator (Sven Suursoho)
- Allow functions to return void (Neil)
- Python 2.5 is now supported (Tom)

E.220.3.11. psql Changes

- Add new command \password for changing role password with client-side password encryption (Peter)
- Allow \c to connect to a new host and port number (David, Volkan YAZICI)
- Add tablespace display to \l+ (Philip Yarra)
- Improve \df slash command to include the argument names and modes (OUT or INOUT) of the function
  (David Fetter)
Appendix E. Release Notes

• Support binary COPY (Andreas Pflug)

• Add option to run the entire session in a single transaction (Simon)
  Use option -1 or --single-transaction.

• Support for automatically retrieving SELECT results in batches using a cursor (Chris Mair)
  This is enabled using \set FETCH_COUNT n. This feature allows large result sets to be retrieved in psql without attempting to buffer the entire result set in memory.

• Make multi-line values align in the proper column (Martijn van Oosterhout)
  Field values containing newlines are now displayed in a more readable fashion.

• Save multi-line statements as a single entry, rather than one line at a time (Sergey E. Koposov)
  This makes up-arrow recall of queries easier. (This is not available on Windows, because that platform uses the native command-line editing present in the operating system.)

• Make the line counter 64-bit so it can handle files with more than two billion lines (David Fetter)

• Report both the returned data and the command status tag for INSERT/UPDATE/DELETE RETURNING (Tom)

E.220.3.12. pg_dump Changes

• Allow complex selection of objects to be included or excluded by pg_dump (Greg Sabino Mullane)
  pg_dump now supports multiple -n (schema) and -t (table) options, and adds -N and -T options to exclude objects. Also, the arguments of these switches can now be wild-card expressions rather than single object names, for example -t ‘foo*’, and a schema can be part of a -t or -T switch, for example -t schema1.table1.

• Add pg_restore --no-data-for-failed-tables option to suppress loading data if table creation failed (i.e., the table already exists) (Martin Pitt)

• Add pg_restore option to run the entire session in a single transaction (Simon)
  Use option -1 or --single-transaction.

E.220.3.13. libpq Changes

• Add PQencryptPassword() to encrypt passwords (Tom)
  This allows passwords to be sent pre-encrypted for commands like ALTER ROLE ... PASSWORD.

• Add function PQisthreadsafe() (Bruce)
  This allows applications to query the thread-safety status of the library.

• Add PQdescribePrepared(), PQdescribePortal(), and related functions to return information about previously prepared statements and open cursors (Volkan YAZICI)

• Allow LDAP lookups from pg_service.conf (Laurenz Albe)

• Allow a hostname in ~/.pgpass to match the default socket directory (Bruce)
A blank hostname continues to match any Unix-socket connection, but this addition allows entries that are specific to one of several postmasters on the machine.

**E.220.3.14. ecpg Changes**

- Allow `SHOW` to put its result into a variable (Joachim Wieland)
- Add `COPY TO STDOUT` (Joachim Wieland)
- Add regression tests (Joachim Wieland, Michael)
- Major source code cleanups (Joachim Wieland, Michael)

**E.220.3.15. Windows Port**

- Allow MSVC to compile the PostgreSQL server (Magnus, Hiroshi Saito)
- Add MSVC support for utility commands and pg_dump (Hiroshi Saito)
- Add support for Windows code pages 1253, 1254, 1255, and 1257 (Kris Jurka)
- Drop privileges on startup, so that the server can be started from an administrative account (Magnus)
- Stability fixes (Qingqing Zhou, Magnus)
- Add native semaphore implementation (Qingqing Zhou)
  
  The previous code mimicked SysV semaphores.

**E.220.3.16. Source Code Changes**

- Add GIN (Generalized Inverted iNdex) index access method (Teodor, Oleg)
- Remove R-tree indexing (Tom)
  
  Rtree has been re-implemented using GiST. Among other differences, this means that rtree indexes now have support for crash recovery via write-ahead logging (WAL).

- Reduce libraries needlessly linked into the backend (Martijn van Oosterhout, Tom)
- Add a configure flag to allow libedit to be preferred over GNU readline (Bruce)
  
  Use `configure --with-libedit-preferred`.

- Allow installation into directories containing spaces (Peter)
- Improve ability to relocate installation directories (Tom)
- Add support for Solaris x86_64 using the Solaris compiler (Pierre Girard, Theo Schlossnagle, Bruce)
- Add DTrace support (Robert Lor)
- Add `PG_VERSION_NUM` for use by third-party applications wanting to test the backend version in C using `>` and `<` comparisons (Bruce)
- Add `XLOG_BLCKSZ` as independent from `BLCKSZ` (Mark Wong)
• Add LWLOCK_STATS define to report locking activity (Tom)

• Emit warnings for unknown configure options (Martijn van Oosterhout)

• Add server support for “plugin” libraries that can be used for add-on tasks such as debugging and performance measurement (Korry Douglas)

  This consists of two features: a table of “rendezvous variables” that allows separately-loaded shared libraries to communicate, and a new configuration parameter local_preload_libraries that allows libraries to be loaded into specific sessions without explicit cooperation from the client application. This allows external add-ons to implement features such as a PL/pgSQL debugger.

• Rename existing configuration parameter preload_libraries to shared_preload_libraries (Tom)

  This was done for clarity in comparison to local_preload_libraries.

• Add new configuration parameter server_version_num (Greg Sabino Mullane)

  This is like server_version, but is an integer, e.g. 80200. This allows applications to make version checks more easily.

• Add a configuration parameter seq_page_cost (Tom)

• Re-implement the regression test script as a C program (Magnus, Tom)

• Allow loadable modules to allocate shared memory and lightweight locks (Marc Munro)

• Add automatic initialization and finalization of dynamically loaded libraries (Ralf Engelschall, Tom)

  New functions _PG_init() and _PG_fini() are called if the library defines such symbols. Hence we no longer need to specify an initialization function in shared_preload_libraries; we can assume that the library used the _PG_init() convention instead.

• Add PG_MODULE_MAGIC header block to all shared object files (Martijn van Oosterhout)

  The magic block prevents version mismatches between loadable object files and servers.

• Add shared library support for AIX (Laurenz Albe)

• New XML documentation section (Bruce)

### E.220.3.17. Contrib Changes

• Major tsearch2 improvements (Oleg, Teodor)
  * multibyte encoding support, including UTF8
  * query rewriting support
  * improved ranking functions
  * thesaurus dictionary support
  * Ispell dictionaries now recognize MySpell format, used by OpenOffice
  * GIN support

• Add adminpack module containing Pgadmin administration functions (Dave)
These functions provide additional file system access routines not present in the default PostgreSQL server.

- Add sslinfo module (Victor Wagner)
  Reports information about the current connection’s SSL certificate.
- Add pgrowlocks module (Tatsuo)
  This shows row locking information for a specified table.
- Add hstore module (Oleg, Teodor)
- Add isn module, replacing isbn_isn (Jeremy Kronuz)
  This new implementation supports EAN13, UPC, ISBN (books), ISMN (music), and ISSN (serials).
- Add index information functions to pgstattuple (ITAGAKI Takahiro, Satoshi Nagayasu)
- Add pg_freespacemap module to display free space map information (Mark Kirkwood)
- pgcrypto now has all planned functionality (Marko Kreen)
  - Include iMath library in pgcrypto to have the public-key encryption functions always available.
  - Add SHA224 algorithm that was missing in OpenBSD code.
  - Activate builtin code for SHA224/256/384/512 hashes on older OpenSSL to have those algorithms always available.
  - New function gen_random_bytes() that returns cryptographically strong randomness. Useful for generating encryption keys.
  - Remove digest_exists(), hmac_exists() and cipher_exists() functions.

- Improvements to cube module (Joshua Reich)
  New functions are cube(float[]), cube(float[], float[]), and cube_subset(cube, int4[]).
- Add async query capability to dblink (Kai Londenberg, Joe Conway)
- New operators for array-subset comparisons (≥, ≤, ⊃, ⊂) (Tom)
  Various contrib packages already had these operators for their datatypes, but the naming wasn’t consistent. We have now added consistently named array-subset comparison operators to the core code and all the contrib packages that have such functionality. (The old names remain available, but are deprecated.)
- Add uninstall scripts for all contrib packages that have install scripts (David, Josh Drake)

**E.221. Release 8.1.23**

**Release date:** 2010-12-16

This release contains a variety of fixes from 8.1.22. For information about new features in the 8.1 major release, see Section E.244.
This is expected to be the last PostgreSQL release in the 8.1.X series. Users are encouraged to update to a newer release branch soon.

E.221.1. Migration to Version 8.1.23

A dump/restore is not required for those running 8.1.X. However, if you are upgrading from a version earlier than 8.1.18, see Section E.226.

E.221.2. Changes

- Force the default \texttt{wal\_sync\_method} to be \texttt{fdatasync} on Linux (Tom Lane, Marti Raudsepp)
  
  The default on Linux has actually been \texttt{fdatasync} for many years, but recent kernel changes caused PostgreSQL to choose \texttt{open\_datasync} instead. This choice did not result in any performance improvement, and caused outright failures on certain filesystems, notably \texttt{ext4} with the \texttt{data=journal} mount option.
- Fix recovery from base backup when the starting checkpoint WAL record is not in the same WAL segment as its redo point (Jeff Davis)
- Add support for detecting register-stack overrun on IA64 (Tom Lane)
  
  The IA64 architecture has two hardware stacks. Full prevention of stack-overrun failures requires checking both.
- Add a check for stack overflow in \texttt{copyObject()} (Tom Lane)
  
  Certain code paths could crash due to stack overflow given a sufficiently complex query.
- Fix detection of page splits in temporary GiST indexes (Heikki Linnakangas)
  
  It is possible to have a “concurrent” page split in a temporary index, if for example there is an open cursor scanning the index when an insertion is done. GiST failed to detect this case and hence could deliver wrong results when execution of the cursor continued.
- Avoid memory leakage while \texttt{ANALYZE}ing complex index expressions (Tom Lane)
- Ensure an index that uses a whole-row Var still depends on its table (Tom Lane)
  
  An index declared like \texttt{create index i on t (foo(t.*)}) would not automatically get dropped when its table was dropped.
- Do not “inline” a SQL function with multiple \texttt{OUT} parameters (Tom Lane)
  
  This avoids a possible crash due to loss of information about the expected result rowtype.
- Fix constant-folding of \texttt{COALESCE()} expressions (Tom Lane)
  
  The planner would sometimes attempt to evaluate sub-expressions that in fact could never be reached, possibly leading to unexpected errors.
- Add print functionality for \texttt{InhRelation} nodes (Tom Lane)
  
  This avoids a failure when \texttt{debug\_print\_parse} is enabled and certain types of query are executed.
- Fix incorrect calculation of distance from a point to a horizontal line segment (Tom Lane)
Appendix E. Release Notes

This bug affected several different geometric distance-measurement operators.

- Fix PL/pgSQL’s handling of “simple” expressions to not fail in recursion or error-recovery cases (Tom Lane)
- Fix bug in contrib/cube’s GiST picksplit algorithm (Alexander Korotkov)
  This could result in considerable inefficiency, though not actually incorrect answers, in a GiST index on a cube column. If you have such an index, consider REINDEXing it after installing this update.
- Don’t emit “identifier will be truncated” notices in contrib/dblink except when creating new connections (Itagaki Takahiro)
- Fix potential coredump on missing public key in contrib/pgcrypto (Marti Raudsepp)
- Fix memory leak in contrib/xml2’s XPath query functions (Tom Lane)
- Update time zone data files to tzdata release 2010o for DST law changes in Fiji and Samoa; also historical corrections for Hong Kong.

E.222. Release 8.1.22

Release date: 2010-10-04

This release contains a variety of fixes from 8.1.21. For information about new features in the 8.1 major release, see Section E.244.

The PostgreSQL community will stop releasing updates for the 8.1.X release series in November 2010. Users are encouraged to update to a newer release branch soon.

E.222.1. Migration to Version 8.1.22

A dump/restore is not required for those running 8.1.X. However, if you are upgrading from a version earlier than 8.1.18, see Section E.226.

E.222.2. Changes

- Use a separate interpreter for each calling SQL userid in PL/Perl and PL/Tcl (Tom Lane)

  This change prevents security problems that can be caused by subverting Perl or Tcl code that will be executed later in the same session under another SQL user identity (for example, within a SECURITY DEFINER function). Most scripting languages offer numerous ways that that might be done, such as redefining standard functions or operators called by the target function. Without this change, any SQL user with Perl or Tcl language usage rights can do essentially anything with the SQL privileges of the target function’s owner.

  The cost of this change is that intentional communication among Perl and Tcl functions becomes more difficult. To provide an escape hatch, PL/PerlU and PL/TclU functions continue to use only one interpreter per session. This is not considered a security issue since all such functions execute at the trust level of a database superuser already.
Appendix E. Release Notes

It is likely that third-party procedural languages that claim to offer trusted execution have similar security issues. We advise contacting the authors of any PL you are depending on for security-critical purposes.

Our thanks to Tim Bunce for pointing out this issue (CVE-2010-3433).

• Prevent possible crashes in \texttt{pg\_get\_expr()} by disallowing it from being called with an argument that is not one of the system catalog columns it’s intended to be used with (Heikki Linnakangas, Tom Lane)

• Fix “cannot handle unplanned sub-select” error (Tom Lane)

  This occurred when a sub-select contains a join alias reference that expands into an expression containing another sub-select.

• Prevent show\_session\_authorization() from crashing within autovacuum processes (Tom Lane)

• Defend against functions returning setof record where not all the returned rows are actually of the same rowtype (Tom Lane)

• Fix possible failure when hashing a pass-by-reference function result (Tao Ma, Tom Lane)

• Take care to fsync the contents of lockfiles (both postmaster.pid and the socket lockfile) while writing them (Tom Lane)

  This omission could result in corrupted lockfile contents if the machine crashes shortly after postmaster start. That could in turn prevent subsequent attempts to start the postmaster from succeeding, until the lockfile is manually removed.

• Avoid recursion while assigning XIDs to heavily-nested subtransactions (Andres Freund, Robert Haas)

  The original coding could result in a crash if there was limited stack space.

• Fix log\_line\_prefix’s \%i escape, which could produce junk early in backend startup (Tom Lane)

• Fix possible data corruption in \texttt{ALTER TABLE \ldots SET TABLESPACE} when archiving is enabled (Jeff Davis)

• Allow \texttt{CREATE DATABASE} and \texttt{ALTER DATABASE \ldots SET TABLESPACE} to be interrupted by query-cancel (Guillaume Lelarge)

• In PL/Python, defend against null pointer results from PyCObject\_AsVoidPtr and PyCObject\_FromVoidPtr (Peter Eisentraut)

• Improve contrib/dblink’s handling of tables containing dropped columns (Tom Lane)

• Fix connection leak after “duplicate connection name” errors in contrib/dblink (Itagaki Takahiro)

• Fix contrib/dblink to handle connection names longer than 62 bytes correctly (Itagaki Takahiro)

• Update build infrastructure and documentation to reflect the source code repository’s move from CVS to Git (Magnus Hagander and others)

• Update time zone data files to tzdata release 2010l for DST law changes in Egypt and Palestine; also historical corrections for Finland.

  This change also adds new names for two Micronesian timezones: Pacific/Chuuk is now preferred over Pacific/Truk (and the preferred abbreviation is CHUT not TRUT) and Pacific/Pohnpei is preferred over Pacific/Ponape.
E.223. Release 8.1.21

Release date: 2010-05-17

This release contains a variety of fixes from 8.1.20. For information about new features in the 8.1 major release, see Section E.244.

E.223.1. Migration to Version 8.1.21

A dump/restore is not required for those running 8.1.X. However, if you are upgrading from a version earlier than 8.1.18, see Section E.226.

E.223.2. Changes

- Enforce restrictions in plperl using an opmask applied to the whole interpreter, instead of using Safe.pm (Tim Bunce, Andrew Dunstan)

  Recent developments have convinced us that Safe.pm is too insecure to rely on for making plperl trustable. This change removes use of Safe.pm altogether, in favor of using a separate interpreter with an opcode mask that is always applied. Pleasant side effects of the change include that it is now possible to use Perl’s strict pragma in a natural way in plperl, and that Perl’s $a and $b variables work as expected in sort routines, and that function compilation is significantly faster. (CVE-2010-1169)

- Prevent PL/Tcl from executing untrustworthy code from pltcl_modules (Tom)

  PL/Tcl’s feature for autoloading Tcl code from a database table could be exploited for trojan-horse attacks, because there was no restriction on who could create or insert into that table. This change disables the feature unless pltcl_modules is owned by a superuser. (However, the permissions on the table are not checked, so installations that really need a less-than-secure modules table can still grant suitable privileges to trusted non-superusers.) Also, prevent loading code into the unrestricted “normal” Tcl interpreter unless we are really going to execute a pltclu function. (CVE-2010-1170)

- Do not allow an unprivileged user to reset superuser-only parameter settings (Alvaro)

  Previously, if an unprivileged user ran ALTER USER ... RESET ALL for himself, or ALTER DATABASE ... RESET ALL for a database he owns, this would remove all special parameter settings for the user or database, even ones that are only supposed to be changeable by a superuser. Now, the ALTER will only remove the parameters that the user has permission to change.

- Avoid possible crash during backend shutdown if shutdown occurs when a CONTEXT addition would be made to log entries (Tom)

  In some cases the context-printing function would fail because the current transaction had already been rolled back when it came time to print a log message.

- Update pl/perl’s ppport.h for modern Perl versions (Andrew)

- Fix assorted memory leaks in pl/python (Andreas Freund, Tom)

- Prevent infinite recursion in psql when expanding a variable that refers to itself (Tom)

- Ensure that contrib/pgstattuple functions respond to cancel interrupts promptly (Tatsuhito Kasa-hara)
• Make server startup deal properly with the case that `shmget()` returns `EINVAL` for an existing shared memory segment (Tom)

  This behavior has been observed on BSD-derived kernels including OS X. It resulted in an entirely misleading startup failure complaining that the shared memory request size was too large.

• Update time zone data files to tzdata release 2010j for DST law changes in Argentina, Australian Antarctic, Bangladesh, Mexico, Morocco, Pakistan, Palestine, Russia, Syria, Tunisia; also historical corrections for Taiwan.

E.224. Release 8.1.20

Release date: 2010-03-15

This release contains a variety of fixes from 8.1.19. For information about new features in the 8.1 major release, see Section E.244.

E.224.1. Migration to Version 8.1.20

A dump/restore is not required for those running 8.1.X. However, if you are upgrading from a version earlier than 8.1.18, see Section E.226.

E.224.2. Changes

• Add new configuration parameter `ssl_renegotiation_limit` to control how often we do session key renegotiation for an SSL connection (Magnus)

  This can be set to zero to disable renegotiation completely, which may be required if a broken SSL library is used. In particular, some vendors are shipping stopgap patches for CVE-2009-3555 that cause renegotiation attempts to fail.

• Fix possible crashes when trying to recover from a failure in subtransaction start (Tom)

• Fix server memory leak associated with use of savepoints and a client encoding different from server’s encoding (Tom)

• Make `substring()` for bit types treat any negative length as meaning “all the rest of the string” (Tom)

  The previous coding treated only -1 that way, and would produce an invalid result value for other negative values, possibly leading to a crash (CVE-2010-0442).

• Fix integer-to-bit-string conversions to handle the first fractional byte correctly when the output bit width is wider than the given integer by something other than a multiple of 8 bits (Tom)

• Fix some cases of pathologically slow regular expression matching (Tom)

• Fix the `STOP WAL LOCATION` entry in backup history files to report the next WAL segment’s name when the end location is exactly at a segment boundary (Itagaki Takahiro)
Appendix E. Release Notes

- Fix some more cases of temporary-file leakage (Heikki)
  This corrects a problem introduced in the previous minor release. One case that failed is when a plpgsql function returning set is called within another function’s exception handler.

- When reading pg_hba.conf and related files, do not treat @something as a file inclusion request if the @ appears inside quote marks; also, never treat @ by itself as a file inclusion request (Tom)
  This prevents erratic behavior if a role or database name starts with @. If you need to include a file whose path name contains spaces, you can still do so, but you must write @"/path to/file" rather than putting the quotes around the whole construct.

- Prevent infinite loop on some platforms if a directory is named as an inclusion target in pg_hba.conf and related files (Tom)

- Fix psql's numericlocale option to not format strings it shouldn't in latex and troff output formats (Heikki)

- Fix plpgsql failure in one case where a composite column is set to NULL (Tom)

- Add volatile markings in PL/Python to avoid possible compiler-specific misbehavior (Zdenek Kotala)

- Ensure PL/Tcl initializes the Tcl interpreter fully (Tom)
  The only known symptom of this oversight is that the Tcl clock command misbehaves if using Tcl 8.5 or later.

- Prevent crash in contrib/dblink when too many key columns are specified to a dblink_build_sql_* function (Rushabh Lathia, Joe Conway)

- Fix assorted crashes in contrib/xml2 caused by sloppy memory management (Tom)

- Update time zone data files to tzdata release 2010e for DST law changes in Bangladesh, Chile, Fiji, Mexico, Paraguay, Samoa.

E.225. Release 8.1.19

Release date: 2009-12-14
This release contains a variety of fixes from 8.1.18. For information about new features in the 8.1 major release, see Section E.244.

E.225.1. Migration to Version 8.1.19
A dump/restore is not required for those running 8.1.X. However, if you are upgrading from a version earlier than 8.1.18, see Section E.226.
E.225.2. Changes

- Protect against indirect security threats caused by index functions changing session-local state (Gurjeet Singh, Tom)
  
  This change prevents allegedly-immutable index functions from possibly subverting a superuser’s session (CVE-2009-4136).

- Reject SSL certificates containing an embedded null byte in the common name (CN) field (Magnus)
  
  This prevents unintended matching of a certificate to a server or client name during SSL validation (CVE-2009-4034).

- Fix possible crash during backend-startup-time cache initialization (Tom)

- Prevent signals from interrupting VACUUM at unsafe times (Alvaro)
  
  This fix prevents a PANIC if a VACUUM FULL is canceled after it’s already committed its tuple movements, as well as transient errors if a plain VACUUM is interrupted after having truncated the table.

- Fix possible crash due to integer overflow in hash table size calculation (Tom)
  
  This could occur with extremely large planner estimates for the size of a hashjoin’s result.

- Fix very rare crash in inet/cidr comparisons (Chris Mikkelson)

- Ensure that shared tuple-level locks held by prepared transactions are not ignored (Heikki)

- Fix premature drop of temporary files used for a cursor that is accessed within a subtransaction (Heikki)

- Fix PAM password processing to be more robust (Tom)
  
  The previous code is known to fail with the combination of the Linux pam_krb5 PAM module with Microsoft Active Directory as the domain controller. It might have problems elsewhere too, since it was making unjustified assumptions about what arguments the PAM stack would pass to it.

- Fix processing of ownership dependencies during CREATE OR REPLACE FUNCTION (Tom)

- Ensure that Perl arrays are properly converted to PostgreSQL arrays when returned by a set-returning PL/Perl function (Andrew Dunstan, Abhijit Menon-Sen)
  
  This worked correctly already for non-set-returning functions.

- Fix rare crash in exception processing in PL/Python (Peter)

- Ensure psql’s flex module is compiled with the correct system header definitions (Tom)
  
  This fixes build failures on platforms where --enable-largefile causes incompatible changes in the generated code.

- Make the postmaster ignore any application_name parameter in connection request packets, to improve compatibility with future libpq versions (Tom)

- Update time zone data files to tzdata release 2009s for DST law changes in Antarctica, Argentina, Bangladesh, Fiji, Novokuznetsk, Pakistan, Palestine, Samoa, Syria; also historical corrections for Hong Kong.
E.226. Release 8.1.18

Release date: 2009-09-09

This release contains a variety of fixes from 8.1.17. For information about new features in the 8.1 major release, see Section E.244.

E.226.1. Migration to Version 8.1.18

A dump/restore is not required for those running 8.1.X. However, if you have any hash indexes on interval columns, you must REINDEX them after updating to 8.1.18. Also, if you are upgrading from a version earlier than 8.1.15, see Section E.229.

E.226.2. Changes

- Disallow RESET ROLE and RESET SESSION AUTHORIZATION inside security-definer functions (Tom, Heikki)
  This covers a case that was missed in the previous patch that disallowed SET ROLE and SET SESSION AUTHORIZATION inside security-definer functions. (See CVE-2007-6600)
- Fix handling of sub-SELECTs appearing in the arguments of an outer-level aggregate function (Tom)
- Fix hash calculation for data type interval (Tom)
  This corrects wrong results for hash joins on interval values. It also changes the contents of hash indexes on interval columns. If you have any such indexes, you must REINDEX them after updating.
- Treat to_char(..., 'TH') as an uppercase ordinal suffix with 'HH'/'HH12' (Heikki)
  It was previously handled as 'th' (lowercase).
- Fix overflow for INTERVAL 'x ms' when x is more than 2 million and integer datetimes are in use (Alex Hunsaker)
- Fix calculation of distance between a point and a line segment (Tom)
  This led to incorrect results from a number of geometric operators.
- Fix money data type to work in locales where currency amounts have no fractional digits, e.g. Japan (Itagaki Takahiro)
- Properly round datetime input like 00:12:57.9999999999999999999999999999 (Tom)
- Fix poor choice of page split point in GiST R-tree operator classes (Teodor)
- Fix portability issues in plperl initialization (Andrew Dunstan)
- Fix pg_ctl to not go into an infinite loop if postgresql.conf is empty (Jeff Davis)
- Fix contrib/xml2's xslt_process() to properly handle the maximum number of parameters (twenty) (Tom)
- Improve robustness of libpq’s code to recover from errors during COPY FROM STDIN (Tom)
Appendix E. Release Notes

- Avoid including conflicting readline and editline header files when both libraries are installed (Zdenek Kotala)
- Update time zone data files to tzdata release 2009l for DST law changes in Bangladesh, Egypt, Jordan, Pakistan, Argentina/San_Luis, Cuba, Jordan (historical correction only), Mauritius, Morocco, Palestine, Syria, Tunisia.

E.227. Release 8.1.17

Release date: 2009-03-16

This release contains a variety of fixes from 8.1.16. For information about new features in the 8.1 major release, see Section E.244.

E.227.1. Migration to Version 8.1.17

A dump/restore is not required for those running 8.1.X. However, if you are upgrading from a version earlier than 8.1.15, see Section E.229.

E.227.2. Changes

- Prevent error recursion crashes when encoding conversion fails (Tom)
  This change extends fixes made in the last two minor releases for related failure scenarios. The previous fixes were narrowly tailored for the original problem reports, but we have now recognized that any error thrown by an encoding conversion function could potentially lead to infinite recursion while trying to report the error. The solution therefore is to disable translation and encoding conversion and report the plain-ASCII form of any error message, if we find we have gotten into a recursive error reporting situation. (CVE-2009-0922)
-Disallow CREATE CONVERSION with the wrong encodings for the specified conversion function (Heikki)
  This prevents one possible scenario for encoding conversion failure. The previous change is a backstop to guard against other kinds of failures in the same area.
- Fix core dump when to_char() is given format codes that are inappropriate for the type of the data argument (Tom)
- Fix decompilation of CASE WHEN with an implicit coercion (Tom)
  This mistake could lead to Assert failures in an Assert-enabled build, or an “unexpected CASE WHEN clause” error message in other cases, when trying to examine or dump a view.
- Fix possible misassignment of the owner of a TOAST table’s rowtype (Tom)
  If CLUSTER or a rewriting variant of ALTER TABLE were executed by someone other than the table owner, the pg_type entry for the table’s TOAST table would end up marked as owned by that someone. This caused no immediate problems, since the permissions on the TOAST rowtype aren’t examined by
any ordinary database operation. However, it could lead to unexpected failures if one later tried to drop the role that issued the command (in 8.1 or 8.2), or “owner of data type appears to be invalid” warnings from pg_dump after having done so (in 8.3).

- Clean up PL/pgSQL error status variables fully at block exit (Ashesh Vashi and Dave Page)
  This is not a problem for PL/pgSQL itself, but the omission could cause the PL/pgSQL Debugger to crash while examining the state of a function.

- Add MUST (Mauritius Island Summer Time) to the default list of known timezone abbreviations (Xavier Bugaud)

E.228. Release 8.1.16

Release date: 2009-02-02

This release contains a variety of fixes from 8.1.15. For information about new features in the 8.1 major release, see Section E.244.

E.228.1. Migration to Version 8.1.16

A dump/restore is not required for those running 8.1.X. However, if you are upgrading from a version earlier than 8.1.15, see Section E.229.

E.228.2. Changes

- Fix crash in autovacuum (Alvaro)
  The crash occurs only after vacuuming a whole database for anti-transaction-wraparound purposes, which means that it occurs infrequently and is hard to track down.

- Improve handling of URLs in headline() function (Teodor)

- Improve handling of overlength headlines in headline() function (Teodor)

- Prevent possible Assert failure or misconversion if an encoding conversion is created with the wrong conversion function for the specified pair of encodings (Tom, Heikki)

- Avoid unnecessary locking of small tables in VACUUM (Heikki)

- Ensure that the contents of a holdable cursor don’t depend on the contents of TOAST tables (Tom)
  Previously, large field values in a cursor result might be represented as TOAST pointers, which would fail if the referenced table got dropped before the cursor is read, or if the large value is deleted and then vacuumed away. This cannot happen with an ordinary cursor, but it could with a cursor that is held past its creating transaction.

- Fix uninitialized variables in contrib/tsearch2’s get_covers() function (Teodor)

- Fix configure script to properly report failure when unable to obtain linkage information for PL/Perl (Andrew)
• Make all documentation reference `pgsql-bugs` and/or `pgsql-hackers` as appropriate, instead of the now-decommissioned `pgsql-ports` and `pgsql-patches` mailing lists (Tom)
• Update time zone data files to `tzdata` release 2009a (for Kathmandu and historical DST corrections in Switzerland, Cuba)

E.229. Release 8.1.15

Release date: 2008-11-03

This release contains a variety of fixes from 8.1.14. For information about new features in the 8.1 major release, see Section E.244.

E.229.1. Migration to Version 8.1.15

A dump/restore is not required for those running 8.1.X. However, if you are upgrading from a version earlier than 8.1.2, see Section E.242. Also, if you were running a previous 8.1.X release, it is recommended to `REINDEX` all GiST indexes after the upgrade.

E.229.2. Changes

• Fix GiST index corruption due to marking the wrong index entry “dead” after a deletion (Teodor)
  This would result in index searches failing to find rows they should have found. Corrupted indexes can be fixed with `REINDEX`.
• Fix backend crash when the client encoding cannot represent a localized error message (Tom)
  We have addressed similar issues before, but it would still fail if the “character has no equivalent” message itself couldn’t be converted. The fix is to disable localization and send the plain ASCII error message when we detect such a situation.
• Fix possible crash when deeply nested functions are invoked from a trigger (Tom)
• Fix mis-expansion of rule queries when a sub-`SELECT` appears in a function call in `FROM`, a multi-row `VALUES` list, or a `RETURNING` list (Tom)
  The usual symptom of this problem is an “unrecognized node type” error.
• Ensure an error is reported when a newly-defined PL/pgSQL trigger function is invoked as a normal function (Tom)
• Prevent possible collision of `relnode` numbers when moving a table to another tablespace with `ALTER TABLESPACE` (Heikki)
  The command tried to re-use the existing filename, instead of picking one that is known unused in the destination directory.
• Fix incorrect `tsearch2` headline generation when single query item matches first word of text (Sushant Sinha)
• Fix improper display of fractional seconds in interval values when using a non-ISO datestyle in an
```
--enable-integer-datetimes
```
bui (Ron Mayer)

• Ensure SPI_getvalue and SPI_getbinval behave correctly when the passed tuple and tuple de-
scriptor have different numbers of columns (Tom)

  This situation is normal when a table has had columns added or removed, but these two functions didn’t
  handle it properly. The only likely consequence is an incorrect error indication.

• Fix ecpg’s parsing of CREATE ROLE (Michael)

• Fix recent breakage of pg_ctl restart (Tom)

• Update time zone data files to tzdata release 2008i (for DST law changes in Argentina, Brazil, Mauri-
tius, Syria)

### E.230. Release 8.1.14

**Release date:** 2008-09-22

This release contains a variety of fixes from 8.1.13. For information about new features in the 8.1 major
release, see Section E.244.

### E.230.1. Migration to Version 8.1.14

A dump/restore is not required for those running 8.1.X. However, if you are upgrading from a version
earlier than 8.1.2, see Section E.242.

### E.230.2. Changes

• Widen local lock counters from 32 to 64 bits (Tom)

  This responds to reports that the counters could overflow in sufficiently long transactions, leading to
unexpected “lock is already held” errors.

• Fix possible duplicate output of tuples during a GiST index scan (Teodor)

• Add checks in executor startup to ensure that the tuples produced by an INSERT or UPDATE will match
the target table’s current rowtype (Tom)

  ALTER COLUMN TYPE, followed by re-use of a previously cached plan, could produce this type of
situation. The check protects against data corruption and/or crashes that could ensue.

• Fix AT TIME ZONE to first try to interpret its timezone argument as a timezone abbreviation, and only
try it as a full timezone name if that fails, rather than the other way around as formerly (Tom)

  The timestamp input functions have always resolved ambiguous zone names in this order. Making AT
TIME ZONE do so as well improves consistency, and fixes a compatibility bug introduced in 8.1: in
ambiguous cases we now behave the same as 8.0 and before did, since in the older versions AT TIME
ZONE accepted only abbreviations.
• Fix datetime input functions to correctly detect integer overflow when running on a 64-bit platform (Tom)
• Improve performance of writing very long log messages to syslog (Tom)
• Fix bug in backwards scanning of a cursor on a `SELECT DISTINCT ON` query (Tom)
• Fix planner bug with nested sub-select expressions (Tom)
  If the outer sub-select has no direct dependency on the parent query, but the inner one does, the outer value might not get recalculated for new parent query rows.
• Fix planner to estimate that `GROUP BY` expressions yielding boolean results always result in two groups, regardless of the expressions’ contents (Tom)
  This is very substantially more accurate than the regular `GROUP BY` estimate for certain boolean tests like `col IS NULL`.
• Fix PL/pgSQL to not fail when a `FOR` loop’s target variable is a record containing composite-type fields (Tom)
• Fix PL/Tcl to behave correctly with Tcl 8.5, and to be more careful about the encoding of data sent to or from Tcl (Tom)
• Fix PL/Python to work with Python 2.5
  This is a back-port of fixes made during the 8.2 development cycle.
• Improve `pg_dump` and `pg_restore`’s error reporting after failure to send a SQL command (Tom)
• Fix `pg_ctl` to properly preserve postmaster command-line arguments across a restart (Bruce)
• Update time zone data files to tzdata release 2008f (for DST law changes in Argentina, Bahamas, Brazil, Mauritius, Morocco, Pakistan, Palestine, and Paraguay)

E.231. Release 8.1.13

Release date: 2008-06-12

This release contains one serious and one minor bug fix over 8.1.12. For information about new features in the 8.1 major release, see Section E.244.

E.231.1. Migration to Version 8.1.13

A dump/restore is not required for those running 8.1.X. However, if you are upgrading from a version earlier than 8.1.2, see Section E.242.

E.231.2. Changes

• Make `pg_get_ruledef()` parenthesize negative constants (Tom)
Before this fix, a negative constant in a view or rule might be dumped as, say, \(-42:\text{integer}\), which is subtly incorrect: it should be \((-42)\text{:integer}\) due to operator precedence rules. Usually this would make little difference, but it could interact with another recent patch to cause PostgreSQL to reject what had been a valid \textit{SELECT DISTINCT} view query. Since this could result in \texttt{pg_dump} output failing to reload, it is being treated as a high-priority fix. The only released versions in which dump output is actually incorrect are 8.3.1 and 8.2.7.

- Make \texttt{ALTER AGGREGATE ... OWNER TO} update \texttt{pg_shdepend} (Tom)

  This oversight could lead to problems if the aggregate was later involved in a \texttt{DROP OWNED} or \texttt{REASSIGN OWNED} operation.

### E.232. Release 8.1.12

\textbf{Release date:} never released

This release contains a variety of fixes from 8.1.11. For information about new features in the 8.1 major release, see Section E.244.

### E.232.1. Migration to Version 8.1.12

A dump/restore is not required for those running 8.1.X. However, if you are upgrading from a version earlier than 8.1.2, see Section E.242.

### E.232.2. Changes

- Fix \texttt{ALTER TABLE ADD COLUMN ... PRIMARY KEY} so that the new column is correctly checked to see if it’s been initialized to all non-nulls (Brendan Jurd)

  Previous versions neglected to check this requirement at all.

- Fix possible \texttt{CREATE TABLE} failure when inheriting the “same” constraint from multiple parent relations that inherited that constraint from a common ancestor (Tom)

- Fix conversions between ISO-8859-5 and other encodings to handle Cyrillic “Yo” characters (ё and Е with two dots) (Sergey Burladyan)

- Fix a few datatype input functions that were allowing unused bytes in their results to contain uninitialized, unpredictable values (Tom)

  This could lead to failures in which two apparently identical literal values were not seen as equal, resulting in the parser complaining about unmatched \texttt{ORDER BY} and \texttt{DISTINCT} expressions.

- Fix a corner case in regular-expression substring matching (\texttt{substring(string from pattern)}) (Tom)

  The problem occurs when there is a match to the pattern overall but the user has specified a parenthesized subexpression and that subexpression hasn’t got a match. An example is \texttt{substring(‘foo’}}
Appendix E. Release Notes

from ‘foo(bar)?’). This should return NULL, since (bar) isn’t matched, but it was mistakenly returning the whole-pattern match instead (ie, foo).

- Update time zone data files to tzdata release 2008c (for DST law changes in Morocco, Iraq, Choibalsan, Pakistan, Syria, Cuba, Argentina/San_Luis, and Chile)
- Fix incorrect result from ecpg’s PGTYPEStimestamp_sub() function (Michael)
- Fix core dump in contrib/xml2’s xpath_table() function when the input query returns a NULL value (Tom)
- Fix contrib/xml2’s makefile to not override CFLAGS (Tom)
- Fix DatumGetBool macro to not fail with gcc 4.3 (Tom)
  This problem affects “old style” (V0) C functions that return boolean. The fix is already in 8.3, but the need to back-patch it was not realized at the time.
- Fix longstanding LISTEN/NOTIFY race condition (Tom)
  In rare cases a session that had just executed a LISTEN might not get a notification, even though one would be expected because the concurrent transaction executing NOTIFY was observed to commit later.
  A side effect of the fix is that a transaction that has executed a not-yet-committed LISTEN command will not see any row in pg_listener for the LISTEN, should it choose to look; formerly it would have. This behavior was never documented one way or the other, but it is possible that some applications depend on the old behavior.
- Disallow LISTEN and UNLISTEN within a prepared transaction (Tom)
  This was formerly allowed but trying to do it had various unpleasant consequences, notably that the originating backend could not exit as long as an UNLISTEN remained uncommitted.
- Fix rare crash when an error occurs during a query using a hash index (Heikki)
- Fix input of datetime values for February 29 in years BC (Tom)
  The former coding was mistaken about which years were leap years.
- Fix “unrecognized node type” error in some variants of ALTER OWNER (Tom)
- Fix pg_ctl to correctly extract the postmaster’s port number from command-line options (Itagaki Takahiro, Tom)
  Previously, pg_ctl start -w could try to contact the postmaster on the wrong port, leading to bogus reports of startup failure.
- Use -fwrapv to defend against possible misoptimization in recent gcc versions (Tom)
  This is known to be necessary when building PostgreSQL with gcc 4.3 or later.
- Fix display of constant expressions in ORDER BY and GROUP BY (Tom)
  An explicitly casted constant would be shown incorrectly. This could for example lead to corruption of a view definition during dump and reload.
- Fix libpq to handle NOTICE messages correctly during COPY OUT (Tom)
  This failure has only been observed to occur when a user-defined datatype’s output routine issues a NOTICE, but there is no guarantee it couldn’t happen due to other causes.
E.233. Release 8.1.11

Release date: 2008-01-07

This release contains a variety of fixes from 8.1.10, including fixes for significant security issues. For information about new features in the 8.1 major release, see Section E.244.

This is the last 8.1.X release for which the PostgreSQL community will produce binary packages for Windows. Windows users are encouraged to move to 8.2.X or later, since there are Windows-specific fixes in 8.2.X that are impractical to back-port. 8.1.X will continue to be supported on other platforms.

E.233.1. Migration to Version 8.1.11

A dump/restore is not required for those running 8.1.X. However, if you are upgrading from a version earlier than 8.1.2, see Section E.242.

E.233.2. Changes

- Prevent functions in indexes from executing with the privileges of the user running VACUUM, ANALYZE, etc (Tom)
  
  Functions used in index expressions and partial-index predicates are evaluated whenever a new table entry is made. It has long been understood that this poses a risk of trojan-horse code execution if one modifies a table owned by an untrustworthy user. (Note that triggers, defaults, check constraints, etc. pose the same type of risk.) But functions in indexes pose extra danger because they will be executed by routine maintenance operations such as VACUUM FULL, which are commonly performed automatically under a superuser account. For example, a nefarious user can execute code with superuser privileges by setting up a trojan-horse index definition and waiting for the next routine vacuum. The fix arranges for standard maintenance operations (including VACUUM, ANALYZE, REINDEX, and CLUSTER) to execute as the table owner rather than the calling user, using the same privilege-switching mechanism already used for SECURITY DEFINER functions. To prevent bypassing this security measure, execution of SET SESSION AUTHORIZATION and SET ROLE is now forbidden within a SECURITY DEFINER context. (CVE-2007-6600)

- Repair assorted bugs in the regular-expression package (Tom, Will Drewry)
  
  Suitably crafted regular-expression patterns could cause crashes, infinite or near-infinite looping, and/or massive memory consumption, all of which pose denial-of-service hazards for applications that accept regex search patterns from untrustworthy sources. (CVE-2007-4769, CVE-2007-4772, CVE-2007-6067)

- Require non-superusers who use /contrib/dblink to use only password authentication, as a security measure (Joe)
  
  The fix that appeared for this in 8.1.10 was incomplete, as it plugged the hole for only some dblink functions. (CVE-2007-6601, CVE-2007-3278)

- Update time zone data files to tzdata release 2007k (in particular, recent Argentina changes) (Tom)

- Improve planner’s handling of LIKE/regex estimation in non-C locales (Tom)
Appendix E. Release Notes

- Fix planner failure in some cases of `WHERE false AND var IN (SELECT ...)` (Tom)
- Preserve the tablespace of indexes that are rebuilt by `ALTER TABLE ... ALTER COLUMN TYPE` (Tom)
- Make archive recovery always start a new WAL timeline, rather than only when a recovery stop time was used (Simon)
  This avoids a corner-case risk of trying to overwrite an existing archived copy of the last WAL segment, and seems simpler and cleaner than the original definition.
- Make `VACUUM` not use all of `maintenance_work_mem` when the table is too small for it to be useful (Alvaro)
- Fix potential crash in `translate()` when using a multibyte database encoding (Tom)
- Fix overflow in `extract(epoch from interval)` for intervals exceeding 68 years (Tom)
- Fix PL/Perl to not fail when a UTF-8 regular expression is used in a trusted function (Andrew)
- Fix PL/Perl to cope when platform’s Perl defines type `bool` as `int` rather than `char` (Tom)
  While this could theoretically happen anywhere, no standard build of Perl did things this way ... until Mac OS X 10.5.
- Fix PL/Python to not crash on long exception messages (Alvaro)
- Fix `pg_dump` to correctly handle inheritance child tables that have default expressions different from their parent’s (Tom)
- Fix libpq crash when `PGPASSFILE` refers to a file that is not a plain file (Martin Pitt)
- `ecpg` parser fixes (Michael)
- Make `contrib/pgcrypto` defend against OpenSSL libraries that fail on keys longer than 128 bits; which is the case at least on some Solaris versions (Marko Kreen)
- Make `contrib/tablefunc`'s `crosstab()` handle NULL rowid as a category in its own right, rather than crashing (Joe)
- Fix `tsvector` and `tsquery` output routines to escape backslashes correctly (Teodor, Bruce)
- Fix crash of `to_tsvector()` on huge input strings (Teodor)
- Require a specific version of Autoconf to be used when re-generating the `configure` script (Peter)
  This affects developers and packagers only. The change was made to prevent accidental use of untested combinations of Autoconf and PostgreSQL versions. You can remove the version check if you really want to use a different Autoconf version, but it’s your responsibility whether the result works or not.

E.234. Release 8.1.10

Release date: 2007-09-17

This release contains a variety of fixes from 8.1.9. For information about new features in the 8.1 major release, see Section E.244.
Appendix E. Release Notes

E.234.1. Migration to Version 8.1.10

A dump/restore is not required for those running 8.1.X. However, if you are upgrading from a version earlier than 8.1.2, see Section E.242.

E.234.2. Changes

- Prevent index corruption when a transaction inserts rows and then aborts close to the end of a concurrent VACUUM on the same table (Tom)
- Make CREATE DOMAIN ... DEFAULT NULL work properly (Tom)
- Allow the interval data type to accept input consisting only of milliseconds or microseconds (Neil)
- Speed up rtree index insertion (Teodor)
- Fix excessive logging of SSL error messages (Tom)
- Fix logging so that log messages are never interleaved when using the syslogger process (Andrew)
- Fix crash when log_min_error_statement logging runs out of memory (Tom)
- Fix incorrect handling of some foreign-key corner cases (Tom)
- Prevent REINDEX and CLUSTER from failing due to attempting to process temporary tables of other sessions (Alvaro)
- Update the time zone database rules, particularly New Zealand’s upcoming changes (Tom)
- Windows socket improvements (Magnus)
- Suppress timezone name (%%) in log timestamps on Windows because of possible encoding mismatches (Tom)
- Require non-superusers who use /contrib/dblink to use only password authentication, as a security measure (Joe)

E.235. Release 8.1.9

Release date: 2007-04-23

This release contains a variety of fixes from 8.1.8, including a security fix. For information about new features in the 8.1 major release, see Section E.244.

E.235.1. Migration to Version 8.1.9

A dump/restore is not required for those running 8.1.X. However, if you are upgrading from a version earlier than 8.1.2, see Section E.242.
**E.235.2. Changes**

- Support explicit placement of the temporary-table schema within `search_path`, and disable searching it for functions and operators (Tom)
  
  This is needed to allow a security-definer function to set a truly secure value of `search_path`. Without it, an unprivileged SQL user can use temporary objects to execute code with the privileges of the security-definer function (CVE-2007-2138). See `CREATE FUNCTION` for more information.

- `/contrib/tsearch2` crash fixes (Teodor)

- Require `COMMIT PREPARED` to be executed in the same database as the transaction was prepared in (Heikki)

- Fix potential-data-corruption bug in how `VACUUM FULL` handles `UPDATE` chains (Tom, Pavan Deolasee)

- Planner fixes, including improving outer join and bitmap scan selection logic (Tom)

- Fix `PANIC` during enlargement of a hash index (bug introduced in 8.1.6) (Tom)

- Fix POSIX-style timezone specs to follow new USA DST rules (Tom)

**E.236. Release 8.1.8**

**Release date:** 2007-02-07

This release contains one fix from 8.1.7. For information about new features in the 8.1 major release, see Section E.244.

**E.236.1. Migration to Version 8.1.8**

A dump/restore is not required for those running 8.1.X. However, if you are upgrading from a version earlier than 8.1.2, see Section E.242.

**E.236.2. Changes**

- Remove overly-restrictive check for type length in constraints and functional indexes (Tom)

**E.237. Release 8.1.7**

**Release date:** 2007-02-05

This release contains a variety of fixes from 8.1.6, including a security fix. For information about new features in the 8.1 major release, see Section E.244.
Appendix E. Release Notes

E.237.1. Migration to Version 8.1.7
A dump/restore is not required for those running 8.1.X. However, if you are upgrading from a version earlier than 8.1.2, see Section E.242.

E.237.2. Changes

• Remove security vulnerabilities that allowed connected users to read backend memory (Tom)
  The vulnerabilities involve suppressing the normal check that a SQL function returns the data type it's declared to, and changing the data type of a table column (CVE-2007-0555, CVE-2007-0556). These errors can easily be exploited to cause a backend crash, and in principle might be used to read database content that the user should not be able to access.
• Fix rare bug wherein btree index page splits could fail due to choosing an infeasible split point (Heikki Linnakangas)
• Improve VACUUM performance for databases with many tables (Tom)
• Fix autovacuum to avoid leaving non-permanent transaction IDs in non-connectable databases (Alvaro)
  This bug affects the 8.1 branch only.
• Fix for rare Assert() crash triggered by UNION (Tom)
• Tighten security of multi-byte character processing for UTF8 sequences over three bytes long (Tom)
• Fix bogus “permission denied” failures occurring on Windows due to attempts to fsync already-deleted files (Magnus, Tom)
• Fix possible crashes when an already-in-use PL/pgSQL function is updated (Tom)

E.238. Release 8.1.6
Release date: 2007-01-08
This release contains a variety of fixes from 8.1.5. For information about new features in the 8.1 major release, see Section E.244.

E.238.1. Migration to Version 8.1.6
A dump/restore is not required for those running 8.1.X. However, if you are upgrading from a version earlier than 8.1.2, see Section E.242.

E.238.2. Changes

• Improve handling of getaddrinfo() on AIX (Tom)
This fixes a problem with starting the statistics collector, among other things.

- Fix pg_restore to handle a tar-format backup that contains large objects (blobs) with comments (Tom)
- Fix “failed to re-find parent key” errors in VACUUM (Tom)
- Clean out pg_internal.init cache files during server restart (Simon)
  This avoids a hazard that the cache files might contain stale data after PITR recovery.
- Fix race condition for truncation of a large relation across a gigabyte boundary by VACUUM (Tom)
- Fix bug causing needless deadlock errors on row-level locks (Tom)
- Fix bugs affecting multi-gigabyte hash indexes (Tom)
- Fix possible deadlock in Windows signal handling (Teodor)
- Fix error when constructing an ARRAY[] made up of multiple empty elements (Tom)
- Fix ecpg memory leak during connection (Michael)
- Fix for Darwin (OS X) compilation (Tom)
- to_number() and to_char(numeric) are now STABLE, not IMMUTABLE, for new initdb installs (Tom)
  This is because lc_numeric can potentially change the output of these functions.
- Improve index usage of regular expressions that use parentheses (Tom)
  This improves psql \d performance also.
- Update timezone database
  This affects Australian and Canadian daylight-savings rules in particular.

E.239. Release 8.1.5

Release date: 2006-10-16
This release contains a variety of fixes from 8.1.4. For information about new features in the 8.1 major release, see Section E.244.

E.239.1. Migration to Version 8.1.5

A dump/restore is not required for those running 8.1.X. However, if you are upgrading from a version earlier than 8.1.2, see Section E.242.

E.239.2. Changes

- Disallow aggregate functions in UPDATE commands, except within sub-SELECTs (Tom)
The behavior of such an aggregate was unpredictable, and in 8.1.X could cause a crash, so it has been disabled. The SQL standard does not allow this either.

- Fix core dump when an untyped literal is taken as ANYARRAY
- Fix core dump in duration logging for extended query protocol when a COMMIT or ROLLBACK is executed
- Fix mishandling of AFTER triggers when query contains a SQL function returning multiple rows (Tom)
- Fix ALTER TABLE ... TYPE to recheck NOT NULL for USING clause (Tom)
- Fix string_to_array() to handle overlapping matches for the separator string
  For example, string_to_array('123xx456xxx789', 'xx').
- Fix to_timestamp() for AM/PM formats (Bruce)
- Fix autovacuum's calculation that decides whether ANALYZE is needed (Alvaro)
- Fix corner cases in pattern matching for psql’s \\d commands
- Fix index-corrupting bugs in /contrib/ltree (Teodor)
- Numerous robustness fixes in ecpg (Joachim Wieland)
- Fix backslash escaping in /contrib/dbmirror
- Minor fixes in /contrib/dblink and /contrib/tsearch2
- Efficiency improvements in hash tables and bitmap index scans (Tom)
- Fix instability of statistics collection on Windows (Tom, Andrew)
- Fix statement_timeout to use the proper units on Win32 (Bruce)
  In previous Win32 8.1.X versions, the delay was off by a factor of 100.
- Fixes for MSVC and Borland C++ compilers (Hiroshi Saito)
- Fixes for AIX and Intel compilers (Tom)
- Fix rare bug in continuous archiving (Tom)

E.240. Release 8.1.4

Release date: 2006-05-23

This release contains a variety of fixes from 8.1.3, including patches for extremely serious security issues. For information about new features in the 8.1 major release, see Section E.244.

E.240.1. Migration to Version 8.1.4

A dump/restore is not required for those running 8.1.X. However, if you are upgrading from a version earlier than 8.1.2, see Section E.242.

Full security against the SQL-injection attacks described in CVE-2006-2313 and CVE-2006-2314 might require changes in application code. If you have applications that embed untrustworthy strings into SQL
Appendix E. Release Notes

For commands, you should examine them as soon as possible to ensure that they are using recommended escaping techniques. In most cases, applications should be using subroutines provided by libraries or drivers (such as libpq's `PQescapeStringConn()`) to perform string escaping, rather than relying on ad hoc code to do it.

E.240.2. Changes

- **Change the server to reject invalidly-encoded multibyte characters in all cases (Tatsuo, Tom)**
  
  While PostgreSQL has been moving in this direction for some time, the checks are now applied uniformly to all encodings and all textual input, and are now always errors not merely warnings. This change defends against SQL-injection attacks of the type described in CVE-2006-2313.

- **Reject unsafe uses of `\'` in string literals**
  
  As a server-side defense against SQL-injection attacks of the type described in CVE-2006-2314, the server now only accepts `"` and not `\'` as a representation of ASCII single quote in SQL string literals. By default, `\'` is rejected only when `client_encoding` is set to a client-only encoding (SJIS, BIG5, GBK, GB18030, or UHC), which is the scenario in which SQL injection is possible. A new configuration parameter `backslash_quote` is available to adjust this behavior when needed. Note that full security against CVE-2006-2314 might require client-side changes; the purpose of `backslash_quote` is in part to make it obvious that insecure clients are insecure.

- **Modify libpq's string-escaping routines to be aware of encoding considerations and `standard_conforming_strings`**
  
  This fixes libpq-using applications for the security issues described in CVE-2006-2313 and CVE-2006-2314, and also future-proofs them against the planned changeover to SQL-standard string literal syntax. Applications that use multiple PostgreSQL connections concurrently should migrate to `PQescapeStringConn()` and `PQescapeByteaConn()` to ensure that escaping is done correctly for the settings in use in each database connection. Applications that do string escaping “by hand” should be modified to rely on library routines instead.

- **Fix weak key selection in pgcrypto (Marko Kreen)**
  
  Errors in fortuna PRNG reseeding logic could cause a predictable session key to be selected by `pgp_sym_encrypt()` in some cases. This only affects non-OpenSSL-using builds.

- **Fix some incorrect encoding conversion functions**
  
  `win1251_to_iso`, `win866_to_iso`, `euc_tw_to_big5`, `euc_tw_to_mic`, `mic_to_euc_tw` were all broken to varying extents.

- **Clean up stray remaining uses of `\'` in strings (Bruce, Jan)**

- **Make autovacuum visible in `pg_stat_activity` (Alvaro)**

- **Disable `full_page_writes` (Tom)**
  
  In certain cases, having `full_page_writes` off would cause crash recovery to fail. A proper fix will appear in 8.2; for now it’s just disabled.

- **Various planner fixes, particularly for bitmap index scans and MIN/MAX optimization (Tom)**

- **Fix incorrect optimization in merge join (Tom)**
Appendix E. Release Notes

Outer joins could sometimes emit multiple copies of unmatched rows.

- Fix crash from using and modifying a plpgsql function in the same transaction
- Fix WAL replay for case where a B-Tree index has been truncated
- Fix \texttt{SIMILAR TO} for patterns involving | (Tom)
- Fix \texttt{SELECT INTO} and \texttt{CREATE TABLE AS} to create tables in the default tablespace, not the base directory (Kris Jurka)
- Fix server to use custom DH SSL parameters correctly (Michael Fuhr)
- Improve qsort performance (Dann Corbit)
  
  Currently this code is only used on Solaris.
- Fix for OS/X Bonjour on x86 systems (Ashley Clark)
- Fix various minor memory leaks
- Fix problem with password prompting on some Win32 systems (Robert Kinberg)
- Improve \texttt{pg\_dump}'s handling of default values for domains
- Fix \texttt{pg\_dumpall} to handle identically-named users and groups reasonably (only possible when dumping from a pre-8.1 server) (Tom)
  
  The user and group will be merged into a single role with \texttt{LOGIN} permission. Formerly the merged role wouldn't have \texttt{LOGIN} permission, making it unusable as a user.
- Fix \texttt{pg\_restore\ -n} to work as documented (Tom)

\section*{E.241. Release 8.1.3}

\textbf{Release date:} 2006-02-14

This release contains a variety of fixes from 8.1.2, including one very serious security issue. For information about new features in the 8.1 major release, see Section E.244.

\section*{E.241.1. Migration to Version 8.1.3}

A dump/restore is not required for those running 8.1.X. However, if you are upgrading from a version earlier than 8.1.2, see Section E.242.

\section*{E.241.2. Changes}

- Fix bug that allowed any logged-in user to \texttt{SET ROLE} to any other database user id (CVE-2006-0553)
  
  Due to inadequate validity checking, a user could exploit the special case that \texttt{SET ROLE} normally uses to restore the previous role setting after an error. This allowed ordinary users to acquire superuser status, for example. The escalation-of-privilege risk exists only in 8.1.0-8.1.2. However, in all releases back to 7.3 there is a related bug in \texttt{SET SESSION AUTHORIZATION} that allows unprivileged users to
crash the server, if it has been compiled with Asserts enabled (which is not the default). Thanks to Akio Ishida for reporting this problem.

- Fix bug with row visibility logic in self-inserted rows (Tom)
  Under rare circumstances a row inserted by the current command could be seen as already valid, when it should not be. Repairs bug created in 8.0.4, 7.4.9, and 7.3.11 releases.

- Fix race condition that could lead to “file already exists” errors during pg_clog and pg_subtrans file creation (Tom)

- Fix cases that could lead to crashes if a cache-invalidation message arrives at just the wrong time (Tom)

- Properly check `DOMAIN` constraints for `UNKNOWN` parameters in prepared statements (Neil)

- Ensure `ALTER COLUMN TYPE` will process `FOREIGN KEY`, `UNIQUE`, and `PRIMARY KEY` constraints in the proper order (Nakano Yoshihisa)

- Fix cases that could lead to crashes if a cache-invalidation message arrives at just the wrong time (Tom)

- Allow `pg_restore` to continue properly after a `COPY` failure; formerly it tried to treat the remaining `COPY` data as SQL commands (Stephen Frost)

- Fix `pg_ctl unregister` crash when the data directory is not specified (Magnus)

- Fix libpq`PQprint` HTML tags (Christoph Zwerschke)

- Fix ecpg crash on AMD64 and PPC (Neil)

- Allow `SETOF` and `%TYPE` to be used together in function result type declarations

- Recover properly if error occurs during argument passing in PL/python (Neil)

- Fix memory leak in `plperl_return_next` (Neil)

- Fix PL/perl’s handling of locales on Win32 to match the backend (Andrew)

- Various optimizer fixes (Tom)

- Fix crash when `log_min_messages` is set to `DEBUG3` or above in `postgresql.conf` on Win32 (Bruce)

- Fix pgxs `-L` library path specification for Win32, Cygwin, OS X, AIX (Bruce)

- Check that SID is enabled while checking for Win32 admin privileges (Magnus)

- Properly reject out-of-range date inputs (Kris Jurka)

- Portability fix for testing presence of `finite` and `isinf` during configure (Tom)

- Improve speed of `COPY IN` via libpq, by avoiding a kernel call per data line (Alon Goldshuv)

- Improve speed of `/contrib/tsearch2` index creation (Tom)

---

**E.242. Release 8.1.2**

*Release date: 2006-01-09*
This release contains a variety of fixes from 8.1.1. For information about new features in the 8.1 major release, see Section E.244.

E.242.1. Migration to Version 8.1.2

A dump/restore is not required for those running 8.1.X. However, you might need to \texttt{REINDEX} indexes on textual columns after updating, if you are affected by the locale or plperl issues described below.

E.242.2. Changes

- Fix Windows code so that postmaster will continue rather than exit if there is no more room in Shmem-BackendArray (Magnus)

  The previous behavior could lead to a denial-of-service situation if too many connection requests arrive close together. This applies \textit{only} to the Windows port.

- Fix bug introduced in 8.0 that could allow ReadBuffer to return an already-used page as new, potentially causing loss of recently-committed data (Tom)

- Fix for protocol-level Describe messages issued outside a transaction or in a failed transaction (Tom)

- Fix character string comparison for locales that consider different character combinations as equal, such as Hungarian (Tom)

  This might require \texttt{REINDEX} to fix existing indexes on textual columns.

- Set locale environment variables during postmaster startup to ensure that plperl won’t change the locale later

  This fixes a problem that occurred if the postmaster was started with environment variables specifying a different locale than what initdb had been told. Under these conditions, any use of plperl was likely to lead to corrupt indexes. You might need \texttt{REINDEX} to fix existing indexes on textual columns if this has happened to you.

- Allow more flexible relocation of installation directories (Tom)

  Previous releases supported relocation only if all installation directory paths were the same except for the last component.

- Prevent crashes caused by the use of \texttt{ISO-8859-5} and \texttt{ISO-8859-9} encodings (Tatsuo)

- Fix longstanding bug in \texttt{strpos()} and regular expression handling in certain rarely used Asian multi-byte character sets (Tatsuo)

- Fix bug where \texttt{COPY CSV} mode considered any \\
  to terminate the copy data

  The new code requires \\
  to appear alone on a line, as per documentation.

- Make \texttt{COPY CSV} mode quote a literal data value of \\
  to ensure it cannot be interpreted as the end-of-data marker (Bruce)

- Various fixes for functions returning \texttt{RECORDs} (Tom)

- Fix processing of \texttt{postgresql.conf} so a final line with no newline is processed properly (Tom)
• Fix bug in /contrib/pgcrypto gen_salt, which caused it not to use all available salt space for MD5 and XDES algorithms (Marko Kreen, Solar Designer)
  Salts for Blowfish and standard DES are unaffected.
• Fix autovacuum crash when processing expression indexes
• Fix /contrib/dblink to throw an error, rather than crashing, when the number of columns specified is different from what’s actually returned by the query (Joe)

### E.243. Release 8.1.1

**Release date:** 2005-12-12

This release contains a variety of fixes from 8.1.0. For information about new features in the 8.1 major release, see Section E.244.

### E.243.1. Migration to Version 8.1.1

A dump/restore is not required for those running 8.1.X.

### E.243.2. Changes

• Fix incorrect optimizations of outer-join conditions (Tom)
• Fix problems with wrong reported column names in cases involving sub-selects flattened by the optimizer (Tom)
• Fix update failures in scenarios involving CHECK constraints, toasted columns, and indexes (Tom)
• Fix bgwriter problems after recovering from errors (Tom)
  The background writer was found to leak buffer pins after write errors. While not fatal in itself, this might lead to mysterious blockages of later VACUUM commands.
• Prevent failure if client sends Bind protocol message when current transaction is already aborted
• /contrib/tsearch2 and /contrib/ltree fixes (Teodor)
• Fix problems with translated error messages in languages that require word reordering, such as Turkish; also problems with unexpected truncation of output strings and wrong display of the smallest possible bigint value (Andrew, Tom)
  These problems only appeared on platforms that were using our port/snprintf.c code, which includes BSD variants if --enable-nls was given, and perhaps others. In addition, a different form of the translated-error-message problem could appear on Windows depending on which version of libintl was used.
• Re-allow AM/PM, HH, HH12, and D format specifiers for to_char(time) and to_char(interval). (to_char(interval) should probably use HH24.) (Bruce)
Appendix E. Release Notes

- AIX, HPUX, and MSVC compile fixes (Tom, Hiroshi Saito)
- Optimizer improvements (Tom)
- Retry file reads and writes after Windows NO_SYSTEM_RESOURCES error (Qingqing Zhou)
- Prevent autovacuum from crashing during ANALYZE of expression index (Alvaro)
- Fix problems with ON COMMIT DELETE ROWS temp tables
- Fix problems when a trigger alters the output of a SELECT DISTINCT query
- Add 8.1.0 release note item on how to migrate invalid UTF-8 byte sequences (Paul Lindner)

E.244. Release 8.1

Release date: 2005-11-08

E.244.1. Overview

Major changes in this release:

Improve concurrent access to the shared buffer cache (Tom)

Access to the shared buffer cache was identified as a significant scalability problem, particularly on multi-CPU systems. In this release, the way that locking is done in the buffer manager has been overhauled to reduce lock contention and improve scalability. The buffer manager has also been changed to use a “clock sweep” replacement policy.

Allow index scans to use an intermediate in-memory bitmap (Tom)

In previous releases, only a single index could be used to do lookups on a table. With this feature, if a query has WHERE tab.col1 = 4 and tab.col2 = 9, and there is no multicolindex on col1 and col2, but there is an index on col1 and another on col2, it is possible to search both indexes and combine the results in memory, then do heap fetches for only the rows matching both the col1 and col2 restrictions. This is very useful in environments that have a lot of unstructured queries where it is impossible to create indexes that match all possible access conditions. Bitmap scans are useful even with a single index, as they reduce the amount of random access needed; a bitmap index scan is efficient for retrieving fairly large fractions of the complete table, whereas plain index scans are not.

Add two-phase commit (Heikki Linnakangas, Alvaro, Tom)

Two-phase commit allows transactions to be "prepared" on several computers, and once all computers have successfully prepared their transactions (none failed), all transactions can be committed. Even if a machine crashes after a prepare, the prepared transaction can be committed after the machine is restarted. New syntax includes PREPARE TRANSACTION and COMMIT/ROLLBACK PREPARED. A new system view pg_prepared_xacts has also been added.
Appendix E. Release Notes

Create a new role system that replaces users and groups (Stephen Frost)

Roles are a combination of users and groups. Like users, they can have login capability, and like groups, a role can have other roles as members. Roles basically remove the distinction between users and groups. For example, a role can:

• Have login capability (optionally)
• Own objects
• Hold access permissions for database objects
• Inherit permissions from other roles it is a member of

Once a user logs into a role, she obtains capabilities of the login role plus any inherited roles, and can use SET ROLE to switch to other roles she is a member of. This feature is a generalization of the SQL standard’s concept of roles. This change also replaces pg_shadow and pg_group by new role-capable catalogs pg_authid and pg_auth_members. The old tables are redefined as read-only views on the new role tables.

Automatically use indexes for MIN() and MAX() (Tom)

In previous releases, the only way to use an index for MIN() or MAX() was to rewrite the query as SELECT col FROM tab ORDER BY col LIMIT 1. Index usage now happens automatically.

Move /contrib/pg_autovacuum into the main server (Alvaro)

Integrating autovacuum into the server allows it to be automatically started and stopped in sync with the database server, and allows autovacuum to be configured from postgresql.conf.

Add shared row level locks using SELECT ... FOR SHARE (Alvaro)

While PostgreSQL’s MVCC locking allows SELECT to never be blocked by writers and therefore does not need shared row locks for typical operations, shared locks are useful for applications that require shared row locking. In particular this reduces the locking requirements imposed by referential integrity checks.

Add dependencies on shared objects, specifically roles (Alvaro)

This extension of the dependency mechanism prevents roles from being dropped while there are still database objects they own. Formerly it was possible to accidentally “orphan” objects by deleting their owner. While this could be recovered from, it was messy and unpleasant.

Improve performance for partitioned tables (Simon)

The new constraint_exclusion configuration parameter avoids lookups on child tables where constraints indicate that no matching rows exist in the child table.

This allows for a basic type of table partitioning. If child tables store separate key ranges and this is enforced using appropriate CHECK constraints, the optimizer will skip child table accesses when the constraint guarantees no matching rows exist in the child table.

E.244.2. Migration to Version 8.1

A dump/restore using pg_dump is required for those wishing to migrate data from any previous release.
The 8.0 release announced that the `to_char()` function for intervals would be removed in 8.1. However, since no better API has been suggested, `to_char(interval)` has been enhanced in 8.1 and will remain in the server.

Observe the following incompatibilities:

- **add_missing_from** is now false by default (Neil)
  
  By default, we now generate an error if a table is used in a query without a `FROM` reference. The old behavior is still available, but the parameter must be set to 'true' to obtain it.

  It might be necessary to set `add_missing_from` to true in order to load an existing dump file, if the dump contains any views or rules created using the implicit-`FROM` syntax. This should be a one-time annoyance, because PostgreSQL 8.1 will convert such views and rules to standard explicit-`FROM` syntax. Subsequent dumps will therefore not have the problem.

- **Cause input of a zero-length string ("") for float4/float8/oid to throw an error, rather than treating it as a zero (Neil)**
  
  This change is consistent with the current handling of zero-length strings for integers. The schedule for this change was announced in 8.0.

- **default_with_oids** is now false by default (Neil)
  
  With this option set to false, user-created tables no longer have an OID column unless `WITH OIDS` is specified in `CREATE TABLE`. Though OIDs have existed in all releases of PostgreSQL, their use is limited because they are only four bytes long and the counter is shared across all installed databases. The preferred way of uniquely identifying rows is via sequences and the `SERIAL` type, which have been supported since PostgreSQL 6.4.

- **Add E” syntax so eventually ordinary strings can treat backslashes literally (Bruce)**
  
  Currently PostgreSQL processes a backslash in a string literal as introducing a special escape sequence, e.g. \n or \010. While this allows easy entry of special values, it is nonstandard and makes porting of applications from other databases more difficult. For this reason, the PostgreSQL project is planning to remove the special meaning of backslashes in strings. For backward compatibility and for users who want special backslash processing, a new string syntax has been created. This new string syntax is formed by writing an `E` immediately preceding the single quote that starts the string, e.g. `E’hi
’`. While this release does not change the handling of backslashes in strings, it does add new configuration parameters to help users migrate applications for future releases:

  - `standard_conforming_strings` — does this release treat backslashes literally in ordinary strings?
  - `escape_string_warning` — warn about backslashes in ordinary (non-E) strings

  The `standard_conforming_strings` value is read-only. Applications can retrieve the value to know how backslashes are processed. (Presence of the parameter can also be taken as an indication that E” string syntax is supported.) In a future release, `standard_conforming_strings` will be true, meaning backslashes will be treated literally in non-E strings. To prepare for this change, use E” strings in places that need special backslash processing, and turn on `escape_string_warning` to find additional strings that need to be converted to use E”. Also, use two single-quotes (”) to embed a literal single-quote in a string, rather than the PostgreSQL-supported syntax of backslash single-quote (\’). The former is standards-conforming and does not require the use of the E” string syntax. You can also use the $$ string syntax, which does not treat backslashes specially.
• Make REINDEX DATABASE reindex all indexes in the database (Tom)

Formerly, REINDEX DATABASE reindexed only system tables. This new behavior seems more intuitive. A new command REINDEX SYSTEM provides the old functionality of reindexing just the system tables.

• Read-only large object descriptors now obey MVCC snapshot semantics

When a large object is opened with INV_READ (and not INV_WRITE), the data read from the descriptor will now reflect a “snapshot” of the large object’s state at the time of the transaction snapshot in use by the query that called lo_open(). To obtain the old behavior of always returning the latest committed data, include INV_WRITE in the mode flags for lo_open().

• Add proper dependencies for arguments of sequence functions (Tom)

In previous releases, sequence names passed to nextval(), currval(), and setval() were stored as simple text strings, meaning that renaming or dropping a sequence used in a DEFAULT clause made the clause invalid. This release stores all newly-created sequence function arguments as internal OIDs, allowing them to track sequence renaming, and adding dependency information that prevents improper sequence removal. It also makes such DEFAULT clauses immune to schema renaming and search path changes.

Some applications might rely on the old behavior of run-time lookup for sequence names. This can still be done by explicitly casting the argument to text, for example nextval(‘myseq’::text).

Pre-8.1 database dumps loaded into 8.1 will use the old text-based representation and therefore will not have the features of OID-stored arguments. However, it is possible to update a database containing text-based DEFAULT clauses. First, save this query into a file, such as fixseq.sql:

```sql
SELECT ‘ALTER TABLE ’ ||
    pg_catalog.quote_ident(n.nspname) || ‘.’ ||
    pg_catalog.quote_ident(c.relname) ||
    ‘ALTER COLUMN ‘ || pg_catalog.quote_ident(a.attname) ||
    ‘SET DEFAULT ‘ ||
    regexp_replace(d.adsrc,
        $$val\(\([^‘]*’::text\):regclass$$,
        $$val\(\1$$,
        ‘g’) ||
    ‘’
FROM pg_namespace n, pg_class c, pg_attribute a, pg_attrdef d
WHERE n.oid = c.relnamespace AND
    c.oid = a.attrelid AND
    a.attnum = d.adnum AND
    d.adsrc ~ $$val\(\([^‘]*’::text\):regclass$$;
```

Next, run the query against a database to find what adjustments are required, like this for database db1:

```bash
psql -t -f fixseq.sql db1
```

This will show the ALTER TABLE commands needed to convert the database to the newer OID-based representation. If the commands look reasonable, run this to update the database:

```bash
psql -t -f fixseq.sql db1 | psql -e db1
```

This process must be repeated in each database to be updated.

• In psql, treat unquoted \{digit\}+ sequences as octal (Bruce)

In previous releases, \{digit\}+ sequences were treated as decimal, and only \0{digit}+ were treated as octal. This change was made for consistency.
• Remove grammar productions for prefix and postfix % and ^ operators (Tom)

These have never been documented and complicated the use of the modulus operator (%) with negative numbers.

• Make \&< and \&> for polygons consistent with the box "over" operators (Tom)

• CREATE LANGUAGE can ignore the provided arguments in favor of information from pg_pltemplate (Tom)

A new system catalog `pg_pltemplate` has been defined to carry information about the preferred definitions of procedural languages (such as whether they have validator functions). When an entry exists in this catalog for the language being created, CREATE LANGUAGE will ignore all its parameters except the language name and instead use the catalog information. This measure was taken because of increasing problems with obsolete language definitions being loaded by old dump files. As of 8.1, `pg_dump` will dump procedural language definitions as just CREATE LANGUAGE `name`, relying on a template entry to exist at load time. We expect this will be a more future-proof representation.

• Make `pg_cancel_backend(int)` return a boolean rather than an integer (Neil)

• Some users are having problems loading UTF-8 data into 8.1.X. This is because previous versions allowed invalid UTF-8 byte sequences to be entered into the database, and this release properly accepts only valid UTF-8 sequences. One way to correct a dumpfile is to run the command `iconv -c -f UTF-8 -t UTF-8 -o cleanfile.sql dumpfile.sql`. The `-c` option removes invalid character sequences. A diff of the two files will show the sequences that are invalid. `iconv` reads the entire input file into memory so it might be necessary to use `split` to break up the dump into multiple smaller files for processing.

### E.244.3. Additional Changes

Below you will find a detailed account of the additional changes between PostgreSQL 8.1 and the previous major release.

#### E.244.3.1. Performance Improvements

• Improve GiST and R-tree index performance (Neil)

• Improve the optimizer, including auto-resizing of hash joins (Tom)

• Overhaul internal API in several areas

• Change WAL record CRCs from 64-bit to 32-bit (Tom)

  We determined that the extra cost of computing 64-bit CRCs was significant, and the gain in reliability too marginal to justify it.

• Prevent writing large empty gaps in WAL pages (Tom)

• Improve spinlock behavior on SMP machines, particularly Opterons (Tom)

• Allow nonconsecutive index columns to be used in a multicolindex (Tom)

  For example, this allows an index on columns a,b,c to be used in a query with `WHERE a = 4 and c = 10`.  

Appendix E. Release Notes

• Skip WAL logging for `CREATE TABLE AS SELECT INTO` (Simon)
  
  Since a crash during `CREATE TABLE AS` would cause the table to be dropped during recovery, there is no reason to WAL log as the table is loaded. (Logging still happens if WAL archiving is enabled, however.)

• Allow concurrent GiST index access (Teodor, Oleg)

• Add configuration parameter `full_page_writes` to control writing full pages to WAL (Bruce)
  
  To prevent partial disk writes from corrupting the database, PostgreSQL writes a complete copy of each database disk page to WAL the first time it is modified after a checkpoint. This option turns off that functionality for more speed. This is safe to use with battery-backed disk caches where partial page writes cannot happen.

• Use `O_DIRECT` if available when using `O_SYNC` for `wal_sync_method` (Itagaki Takahiro)
  
  `O_DIRECT` causes disk writes to bypass the kernel cache, and for WAL writes, this improves performance.

• Improve `COPY FROM` performance (Alon Goldshuv)
  
  This was accomplished by reading `COPY` input in larger chunks, rather than character by character.

• Improve the performance of `COUNT()`, `SUM`, `AVG()`, `STDDEV()`, and `VARIANCE()` (Neil, Tom)

E.244.3.2. Server Changes

• Prevent problems due to transaction ID (XID) wraparound (Tom)
  
  The server will now warn when the transaction counter approaches the wraparound point. If the counter becomes too close to wraparound, the server will stop accepting queries. This ensures that data is not lost before needed vacuuming is performed.

• Fix problems with object IDs (OIDs) conflicting with existing system objects after the OID counter has wrapped around (Tom)

• Add warning about the need to increase `max_fsm_relations` and `max_fsm_pages` during `VACUUM` (Ron Mayer)

• Add `temp_buffers` configuration parameter to allow users to determine the size of the local buffer area for temporary table access (Tom)

• Add session start time and client IP address to `pg_stat_activity` (Magnus)

• Adjust `pg_stat` views for bitmap scans (Tom)
  
  The meanings of some of the fields have changed slightly.

• Enhance `pg_locks` view (Tom)

• Log queries for client-side `PREPARE` and `EXECUTE` (Simon)

• Allow Kerberos name and user name case sensitivity to be specified in `postgresql.conf` (Magnus)

• Add configuration parameter `krb_server_hostname` so that the server host name can be specified as part of service principal (Todd Kover)
If not set, any service principal matching an entry in the keytab can be used. This is new Kerberos matching behavior in this release.

- Add `log_line_prefix` options for millisecond timestamps (`%m`) and remote host (`%h`) (Ed L.)
- Add WAL logging for GiST indexes (Teodor, Oleg)
  GiST indexes are now safe for crash and point-in-time recovery.
- Remove old `*.backup` files when we do `pg_stop_backup()` (Bruce)
  This prevents a large number of `*.backup` files from existing in `pg_xlog/`.
- Add configuration parameters to control TCP/IP keep-alive times for idle, interval, and count (Oliver Jowett)
  These values can be changed to allow more rapid detection of lost client connections.
- Add per-user and per-database connection limits (Petr Jelinek)
  Using `ALTER USER` and `ALTER DATABASE`, limits can now be enforced on the maximum number of sessions that can concurrently connect as a specific user or to a specific database. Setting the limit to zero disables user or database connections.
- Allow more than two gigabytes of shared memory and per-backend work memory on 64-bit machines (Koichi Suzuki)
- New system catalog `pg_pltemplate` allows overriding obsolete procedural-language definitions in dump files (Tom)

### E.244.3.3. Query Changes

- Add temporary views (Koju Iijima, Neil)
- Fix `HAVING` without any aggregate functions or `GROUP BY` so that the query returns a single group (Tom)
  Previously, such a case would treat the `HAVING` clause the same as a `WHERE` clause. This was not per spec.
- Add `USING` clause to allow additional tables to be specified to `DELETE` (Euler Taveira de Oliveira, Neil)
  In prior releases, there was no clear method for specifying additional tables to be used for joins in a `DELETE` statement. `UPDATE` already has a `FROM` clause for this purpose.
- Add support for `\x` hex escapes in backend and ecpg strings (Bruce)
  This is just like the standard C `\x` escape syntax. Octal escapes were already supported.
- Add `BETWEEN SYMMETRIC` query syntax (Pavel Stehule)
  This feature allows `BETWEEN` comparisons without requiring the first value to be less than the second.
  For example, `2 BETWEEN [ASYMMETRIC] 3 AND 1` returns false, while `2 BETWEEN SYMMETRIC 3 AND 1` returns true. `BETWEEN ASYMMETRIC` was already supported.
- Add `NOWAIT` option to `SELECT ... FOR UPDATE/SHARE` (Hans-Juergen Schoenig)
While the `statement_timeout` configuration parameter allows a query taking more than a certain amount of time to be canceled, the `NOWAIT` option allows a query to be canceled as soon as a `SELECT ... FOR UPDATE/SHARE` command cannot immediately acquire a row lock.

### E.244.3.4. Object Manipulation Changes

- Track dependencies of shared objects (Alvaro)
  PostgreSQL allows global tables (users, databases, tablespaces) to reference information in multiple databases. This addition adds dependency information for global tables, so, for example, user ownership can be tracked across databases, so a user who owns something in any database can no longer be removed. Dependency tracking already existed for database-local objects.

- Allow limited `ALTER OWNER` commands to be performed by the object owner (Stephen Frost)
  Prior releases allowed only superusers to change object owners. Now, ownership can be transferred if the user executing the command owns the object and would be able to create it as the new owner (that is, the user is a member of the new owning role and that role has the `CREATE` permission that would be needed to create the object afresh).

- Add `ALTER object SET SCHEMA` capability for some object types (tables, functions, types) (Bernd Helmle)
  This allows objects to be moved to different schemas.

- Add `ALTER TABLE ENABLE/DISABLE TRIGGER` to disable triggers (Satoshi Nagayasu)

### E.244.3.5. Utility Command Changes

- Allow `TRUNCATE` to truncate multiple tables in a single command (Alvaro)
  Because of referential integrity checks, it is not allowed to truncate a table that is part of a referential integrity constraint. Using this new functionality, `TRUNCATE` can be used to truncate such tables, if both tables involved in a referential integrity constraint are truncated in a single `TRUNCATE` command.

- Properly process carriage returns and line feeds in `COPY CSV` mode (Andrew)
  In release 8.0, carriage returns and line feeds in `COPY TO` were processed in an inconsistent manner. (This was documented on the TODO list.)

- Add `COPY WITH CSV HEADER` to allow a header line as the first line in `COPY` (Andrew)
  This allows handling of the common CSV usage of placing the column names on the first line of the data file. For `COPY TO`, the first line contains the column names, and for `COPY FROM`, the first line is ignored.

- On Windows, display better sub-second precision in `EXPLAIN ANALYZE` (Magnus)

- Add trigger duration display to `EXPLAIN ANALYZE` (Tom)
  Prior releases included trigger execution time as part of the total execution time, but did not show it separately. It is now possible to see how much time is spent in each trigger.

- Add support for `\x` hex escapes in `COPY` (Sergey Ten)
Appendix E. Release Notes

Previous releases only supported octal escapes.

- **Make SHOW ALL** include variable descriptions (Matthias Schmidt)
  
  `SHOW varname` still only displays the variable’s value and does not include the description.

- **Make initdb** create a new standard database called `postgres`, and convert utilities to use `postgres` rather than `template1` for standard lookups (Dave)

  In prior releases, `template1` was used both as a default connection for utilities like `createuser`, and as a template for new databases. This caused `CREATE DATABASE` to sometimes fail, because a new database cannot be created if anyone else is in the template database. With this change, the default connection database is now `postgres`, meaning it is much less likely someone will be using `template1` during `CREATE DATABASE`.

- Create new `reindexdb` command-line utility by moving `/contrib/reindexdb` into the server (Euler Taveira de Oliveira)

### E.244.3.6. Data Type and Function Changes

- **Add** `MAX()` and `MIN()` aggregates for array types (Koju Iijima)

- **Fix** `to_date()` and `to_timestamp()` to behave reasonably when `CC` and `YY` fields are both used (Karel Zak)

  If the format specification contains `CC` and a year specification is `YYY` or longer, ignore the `CC`. If the year specification is `YY` or shorter, interpret `CC` as the previous century.

- **Add** `md5(bytea)` (Abhijit Menon-Sen)

  `md5(text)` already existed.

- **Add support for** `numeric ^ numeric` based on `power(numeric, numeric)`

  The function already existed, but there was no operator assigned to it.

- **Fix** `NUMERIC` modulus by properly truncating the quotient during computation (Bruce)

  In previous releases, modulus for large values sometimes returned negative results due to rounding of the quotient.

- **Add a function** `lastval()` (Dennis Björklund)

  `lastval()` is a simplified version of `currval()`. It automatically determines the proper sequence name based on the most recent `nextval()` or `setval()` call performed by the current session.

- **Add** `to_timestamp(DOUBLE PRECISION)` (Michael Glaesemann)

  Converts Unix seconds since 1970 to a `TIMESTAMP WITH TIMEZONE`.

- **Add** `pg_postmaster_start_time()` function (Euler Taveira de Oliveira, Matthias Schmidt)

- **Allow the full use of** `time zone` names in `AT TIME ZONE`, not just the short list previously available (Magnus)

  Previously, only a predefined list of time zone names were supported by `AT TIME ZONE`. Now any supported time zone name can be used, e.g.:

  ```
  SELECT CURRENT_TIMESTAMP AT TIME ZONE 'Europe/London';
  ```
In the above query, the time zone used is adjusted based on the daylight saving time rules that were in effect on the supplied date.

- Add GREATEST() and LEAST() variadic functions (Pavel Stehule)
  These functions take a variable number of arguments and return the greatest or least value among the arguments.
- Add pg_column_size() (Mark Kirkwood)
  This returns storage size of a column, which might be compressed.
- Add regexp_replace() (Atsushi Ogawa)
  This allows regular expression replacement, like sed. An optional flag argument allows selection of global (replace all) and case-insensitive modes.
- Fix interval division and multiplication (Bruce)
  Previous versions sometimes returned unjustified results, like ‘4 months’::interval / 5 returning ‘1 mon -6 days’.
- Fix roundoff behavior in timestamp, time, and interval output (Tom)
  This fixes some cases in which the seconds field would be shown as 60 instead of incrementing the higher-order fields.
- Add a separate day field to type interval so a one day interval can be distinguished from a 24 hour interval (Michael Glaesemann)
  Days that contain a daylight saving time adjustment are not 24 hours long, but typically 23 or 25 hours. This change creates a conceptual distinction between intervals of “so many days” and intervals of “so many hours”. Adding 1 day to a timestamp now gives the same local time on the next day even if a daylight saving time adjustment occurs between, whereas adding 24 hours will give a different local time when this happens. For example, under US DST rules:

  '2005-04-03 00:00:00-05' + '1 day' = '2005-04-04 00:00:00-04'
  '2005-04-03 00:00:00-05' + '24 hours' = '2005-04-04 01:00:00-04'

- Add justify_days() and justify_hours() (Michael Glaesemann)
  These functions, respectively, adjust days to an appropriate number of full months and days, and adjust hours to an appropriate number of full days and hours.
- Move /contrib/dbsize into the backend, and rename some of the functions (Dave Page, Andreas Pflug)
  - pg_tablespace_size()
  - pg_database_size()
  - pg_relation_size()
  - pg_total_relation_size()
  - pg_size_pretty()

  pg_total_relation_size() includes indexes and TOAST tables.
- Add functions for read-only file access to the cluster directory (Dave Page, Andreas Pflug)
Appendix E. Release Notes

- pg_stat_file()
- pg_read_file()
- pg_ls_dir()

- Add pg_reload_conf() to force reloading of the configuration files (Dave Page, Andreas Pflug)
- Add pg_rotate_logfile() to force rotation of the server log file (Dave Page, Andreas Pflug)
- Change pg_stat_* views to include TOAST tables (Tom)

E.244.3.7. Encoding and Locale Changes

- Rename some encodings to be more consistent and to follow international standards (Bruce)
  - UNICODE is now UTF8
  - ALT is now WIN866
  - WIN is now WIN1251
  - TCVN is now WIN1258

  The original names still work.
- Add support for WIN1252 encoding (Roland Volkmann)
- Add support for four-byte UTF8 characters (John Hansen)
  Previously only one, two, and three-byte UTF8 characters were supported. This is particularly important for support for some Chinese character sets.
- Allow direct conversion between EUC_JP and SJIS to improve performance (Atsushi Ogawa)
- Allow the UTF8 encoding to work on Windows (Magnus)
  This is done by mapping UTF8 to the Windows-native UTF16 implementation.

E.244.3.8. General Server-Side Language Changes

- Fix ALTER LANGUAGE RENAME (Sergey Yatskevich)
- Allow function characteristics, like strictness and volatility, to be modified via ALTER FUNCTION (Neil)
- Increase the maximum number of function arguments to 100 (Tom)
- Allow SQL and PL/pgSQL functions to use OUT and INOUT parameters (Tom)

OUT is an alternate way for a function to return values. Instead of using RETURN, values can be returned by assigning to parameters declared as OUT or INOUT. This is notionally simpler in some cases, particularly so when multiple values need to be returned. While returning multiple values from a function was possible in previous releases, this greatly simplifies the process. (The feature will be extended to other server-side languages in future releases.)
• Move language handler functions into the `pg_catalog` schema
  
  This makes it easier to drop the public schema if desired.
• Add `SPI_getnspname()` to SPI (Neil)

**E.244.3.9. PL/pgSQL Server-Side Language Changes**

• Overhaul the memory management of PL/pgSQL functions (Neil)
  
  The parsetree of each function is now stored in a separate memory context. This allows this memory to be easily reclaimed when it is no longer needed.
• Check function syntax at `CREATE FUNCTION` time, rather than at runtime (Neil)
  
  Previously, most syntax errors were reported only when the function was executed.
• Allow `OPEN` to open non-`SELECT` queries like `EXPLAIN` and `SHOW` (Tom)
• No longer require functions to issue a `RETURN` statement (Tom)
  
  This is a byproduct of the newly added `OUT` and `INOUT` functionality. `RETURN` can be omitted when it is not needed to provide the function’s return value.
• Add support for an optional `INTO` clause to PL/pgSQL’s `EXECUTE` statement (Pavel Stehule, Neil)
• Make `CREATE TABLE AS` set `ROW_COUNT` (Tom)
• Define `SQLSTATE` and `SQLERRM` to return the `SQLSTATE` and error message of the current exception (Pavel Stehule, Neil)
  
  These variables are only defined inside exception blocks.
• Allow the parameters to the `RAISE` statement to be expressions (Pavel Stehule, Neil)
• Add a loop `CONTINUE` statement (Pavel Stehule, Neil)
• Allow block and loop labels (Pavel Stehule)

**E.244.3.10. PL/Perl Server-Side Language Changes**

• Allow large result sets to be returned efficiently (Abhijit Menon-Sen)
  
  This allows functions to use `return_next()` to avoid building the entire result set in memory.
• Allow one-row-at-a-time retrieval of query results (Abhijit Menon-Sen)
  
  This allows functions to use `spi_query()` and `spi_fetchrow()` to avoid accumulating the entire result set in memory.
• Force PL/Perl to handle strings as `UTF8` if the server encoding is `UTF8` (David Kamholz)
• Add a validator function for PL/Perl (Andrew)
  
  This allows syntax errors to be reported at definition time, rather than execution time.
• Allow PL/Perl to return a Perl array when the function returns an array type (Andrew)
  
  This basically maps PostgreSQL arrays to Perl arrays.
Appendix E. Release Notes

- Allow Perl nonfatal warnings to generate NOTICE messages (Andrew)
- Allow Perl's strict mode to be enabled (Andrew)

E.244.3.11. psql Changes

- Add \set ON_ERROR_ROLLBACK to allow statements in a transaction to error without affecting the rest of the transaction (Greg Sabino Mullane)
  This is basically implemented by wrapping every statement in a sub-transaction.
- Add support for \x hex strings in psql variables (Bruce)
  Octal escapes were already supported.
- Add support for troff -ms output format (Roger Leigh)
- Allow the history file location to be controlled by HISTFILE (Andreas Seltenreich)
  This allows configuration of per-database history storage.
- Prevent \x (expanded mode) from affecting the output of \d tablename (Neil)
- Add -L option to psql to log sessions (Lorne Sunley)
  This option was added because some operating systems do not have simple command-line activity logging functionality.
- Make \d show the tablespaces of indexes (Qingqing Zhou)
- Allow psql help (\h) to make a best guess on the proper help information (Greg Sabino Mullane)
  This allows the user to just add \h to the front of the syntax error query and get help on the supported syntax. Previously any additional query text beyond the command name had to be removed to use \h.
- Add \pset numericlocale to allow numbers to be output in a locale-aware format (Eugen Nedelcu)
  For example, using C locale 100000 would be output as 100,000.0 while a European locale might output this value as 100.000,0.
- Make startup banner show both server version number and psql's version number, when they are different (Bruce)
  Also, a warning will be shown if the server and psql are from different major releases.

E.244.3.12. pg_dump Changes

- Add -n / --schema switch to pg_restore (Richard van den Berg)
  This allows just the objects in a specified schema to be restored.
- Allow pg_dump to dump large objects even in text mode (Tom)
  With this change, large objects are now always dumped; the former -b switch is a no-op.
- Allow pg_dump to dump a consistent snapshot of large objects (Tom)
- Dump comments for large objects (Tom)
• Add \textit{--encoding} to \texttt{pg\_dump} (Magnus Hagander)

This allows a database to be dumped in an encoding that is different from the server’s encoding. This is valuable when transferring the dump to a machine with a different encoding.

• Rely on \texttt{pg\_pltemplate} for procedural languages (Tom)

If the call handler for a procedural language is in the \texttt{pg\_catalog} schema, \texttt{pg\_dump} does not dump the handler. Instead, it dumps the language using just \texttt{CREATE LANGUAGE \textit{name}}, relying on the \texttt{pg\_pltemplate} catalog to provide the language’s creation parameters at load time.

\textbf{E.244.3.13. libpq Changes}

• Add a \texttt{PGPASSFILE} environment variable to specify the password file’s filename (Andrew)

• Add \texttt{lo\_create()}, that is similar to \texttt{lo\_creat()} but allows the OID of the large object to be specified (Tom)

• Make \texttt{libpq} consistently return an error to the client application on \texttt{malloc()} failure (Neil)

\textbf{E.244.3.14. Source Code Changes}

• Fix \texttt{pgxs} to support building against a relocated installation

• Add spinlock support for the Itanium processor using Intel compiler (Vikram Kalsi)

• Add Kerberos 5 support for Windows (Magnus)

• Add Chinese FAQ (laser@pgsqldb.com)

• Rename Rendezvous to Bonjour to match OS/X feature renaming (Bruce)

• Add support for \texttt{fsync\_writethrough} on Darwin (Chris Campbell)

• Streamline the passing of information within the server, the optimizer, and the lock system (Tom)

• Allow \texttt{pg\_config} to be compiled using MSVC (Andrew)

  This is required to build DBD::Pg using MSVC.

• Remove support for Kerberos V4 (Magnus)

  Kerberos 4 had security vulnerabilities and is no longer maintained.

• Code cleanups (Coverity static analysis performed by EnterpriseDB)

• Modify \texttt{postgresql.conf} to use documentation defaults \texttt{on/off} rather than \texttt{true/false} (Bruce)

• Enhance \texttt{pg\_config} to be able to report more build-time values (Tom)

• Allow \texttt{libpq} to be built thread-safe on Windows (Dave Page)

• Allow IPv6 connections to be used on Windows (Andrew)

• Add Server Administration documentation about I/O subsystem reliability (Bruce)

• Move private declarations from \texttt{gist\_h} to \texttt{gist\_private\_h} (Neil)
In previous releases, `gist.h` contained both the public GiST API (intended for use by authors of GiST index implementations) as well as some private declarations used by the implementation of GiST itself. The latter have been moved to a separate file, `gist_private.h`. Most GiST index implementations should be unaffected.

- **Overhaul GiST memory management (Neil)**
  GiST methods are now always invoked in a short-lived memory context. Therefore, memory allocated via `palloc()` will be reclaimed automatically, so GiST index implementations do not need to manually release allocated memory via `pfree()`.

**E.244.3.15. Contrib Changes**

- **Add /contrib/pg_buffercache contrib module (Mark Kirkwood)**
  This displays the contents of the buffer cache, for debugging and performance tuning purposes.
- **Remove /contrib/array because it is obsolete (Tom)**
- **Clean up the /contrib/lo module (Tom)**
- **Move /contrib/findoidjoins to /src/tools (Tom)**
- **Remove the <<,>>, &<, and >& operators from /contrib/cube**
  These operators were not useful.
- **Improve /contrib/btree_gist (Janko Richter)**
- **Improve /contrib/pgbench (Tomoaki Sato, Tatsuo)**
  There is now a facility for testing with SQL command scripts given by the user, instead of only a hard-wired command sequence.
- **Improve /contrib/pgcrypto (Marko Kreen)**
  - Implementation of OpenPGP symmetric-key and public-key encryption
    Both RSA and Elgamal public-key algorithms are supported.
  - Stand alone build: include SHA256/384/512 hashes, Fortuna PRNG
  - OpenSSL build: support 3DES, use internal AES with OpenSSL < 0.9.7
  - Take build parameters (OpenSSL, zlib) from `configure` result
    There is no need to edit the `Makefile` anymore.
- **Remove support for libmhash and libmcrypt**

**E.245. Release 8.0.26**

Release date: 2010-10-04
Appendix E. Release Notes

This release contains a variety of fixes from 8.0.25. For information about new features in the 8.0 major release, see Section E.271.

This is expected to be the last PostgreSQL release in the 8.0.X series. Users are encouraged to update to a newer release branch soon.

E.245.1. Migration to Version 8.0.26

A dump/restore is not required for those running 8.0.X. However, if you are upgrading from a version earlier than 8.0.22, see Section E.249.

E.245.2. Changes

• Use a separate interpreter for each calling SQL userid in PL/Perl and PL/Tcl (Tom Lane)

This change prevents security problems that can be caused by subverting Perl or Tcl code that will be executed later in the same session under another SQL user identity (for example, within a SECURITY DEFINER function). Most scripting languages offer numerous ways that that might be done, such as redefining standard functions or operators called by the target function. Without this change, any SQL user with Perl or Tcl language usage rights can do essentially anything with the SQL privileges of the target function’s owner.

The cost of this change is that intentional communication among Perl and Tcl functions becomes more difficult. To provide an escape hatch, PL/PerlU and PL/TclU functions continue to use only one interpreter per session. This is not considered a security issue since all such functions execute at the trust level of a database superuser already.

It is likely that third-party procedural languages that claim to offer trusted execution have similar security issues. We advise contacting the authors of any PL you are depending on for security-critical purposes.

Our thanks to Tim Bunce for pointing out this issue (CVE-2010-3433).

• Prevent possible crashes in pg_get_expr() by disallowing it from being called with an argument that is not one of the system catalog columns it’s intended to be used with (Heikki Linnakangas, Tom Lane)

• Fix “cannot handle unplanned sub-select” error (Tom Lane)

This occurred when a sub-select contains a join alias reference that expands into an expression containing another sub-select.

• Defend against functions returning setof record where not all the returned rows are actually of the same rowtype (Tom Lane)

• Take care to fsync the contents of lockfiles (both postmaster.pid and the socket lockfile) while writing them (Tom Lane)

This omission could result in corrupted lockfile contents if the machine crashes shortly after postmaster start. That could in turn prevent subsequent attempts to start the postmaster from succeeding, until the lockfile is manually removed.

• Avoid recursion while assigning XIDs to heavily-nested subtransactions (Andres Freund, Robert Haas)
Appendix E. Release Notes

The original coding could result in a crash if there was limited stack space.

- Fix log_line_prefix's %i escape, which could produce junk early in backend startup (Tom Lane)
- Fix possible data corruption in ALTER TABLE ... SET TABLESPACE when archiving is enabled (Jeff Davis)
- Allow CREATE DATABASE and ALTER DATABASE ... SET TABLESPACE to be interrupted by query-cancel (Guillaume Lelarge)
- In PL/Python, defend against null pointer results from PyCObject_AsVoidPtr and PyCObject_FromVoidPtr (Peter Eisentraut)
- Improve contrib/dblink's handling of tables containing dropped columns (Tom Lane)
- Fix connection leak after “duplicate connection name” errors in contrib/dblink (Itagaki Takahiro)
- Fix contrib/dblink to handle connection names longer than 62 bytes correctly (Itagaki Takahiro)
- Update build infrastructure and documentation to reflect the source code repository's move from CVS to Git (Magnus Hagander and others)
- Update time zone data files to tzdata release 2010l for DST law changes in Egypt and Palestine; also historical corrections for Finland.

This change also adds new names for two Micronesian timezones: Pacific/Chuuk is now preferred over Pacific/Truk (and the preferred abbreviation is CHUT not TRUT) and Pacific/Pohnpei is preferred over Pacific/Ponape.

E.246. Release 8.0.25

Release date: 2010-05-17

This release contains a variety of fixes from 8.0.24. For information about new features in the 8.0 major release, see Section E.271.

The PostgreSQL community will stop releasing updates for the 8.0.X release series in July 2010. Users are encouraged to update to a newer release branch soon.

E.246.1. Migration to Version 8.0.25

A dump/restore is not required for those running 8.0.X. However, if you are upgrading from a version earlier than 8.0.22, see Section E.249.

E.246.2. Changes

- Enforce restrictions in plperl using an opmask applied to the whole interpreter, instead of using Safe.pm (Tim Bunce, Andrew Dunstan)

Recent developments have convinced us that Safe.pm is too insecure to rely on for making plperl trustable. This change removes use of Safe.pm altogether, in favor of using a separate interpreter with
an opcode mask that is always applied. Pleasant side effects of the change include that it is now possible to use Perl’s `strict` pragma in a natural way in `plperl`, and that Perl’s `$a` and `$b` variables work as expected in sort routines, and that function compilation is significantly faster. (CVE-2010-1169)

- Prevent PL/Tcl from executing untrustworthy code from `pltcl_modules` (Tom)
  PL/Tcl’s feature for autoloading Tcl code from a database table could be exploited for trojan-horse attacks, because there was no restriction on who could create or insert into that table. This change disables the feature unless `pltcl_modules` is owned by a superuser. (However, the permissions on the table are not checked, so installations that really need a less-than-secure modules table can still grant suitable privileges to trusted non-superusers.) Also, prevent loading code into the unrestricted “normal” Tcl interpreter unless we are really going to execute a `pltclu` function. (CVE-2010-1170)

- Do not allow an unprivileged user to reset superuser-only parameter settings (Alvaro)
  Previously, if an unprivileged user ran `ALTER USER ... RESET ALL` for himself, or `ALTER DATABASE ... RESET ALL` for a database he owns, this would remove all special parameter settings for the user or database, even ones that are only supposed to be changeable by a superuser. Now, the `ALTER` will only remove the parameters that the user has permission to change.

- Avoid possible crash during backend shutdown if shutdown occurs when a `CONTEXT` addition would be made to log entries (Tom)
  In some cases the context-printing function would fail because the current transaction had already been rolled back when it came time to print a log message.

- Update `pl/perl`’s `ppport.h` for modern Perl versions (Andrew)

- Fix assorted memory leaks in `pl/python` (Andreas Freund, Tom)

- Prevent infinite recursion in `psql` when expanding a variable that refers to itself (Tom)

- Ensure that `contrib/pgstattuple` functions respond to cancel interrupts promptly (Tatsuhito Kasa-hara)

- Make server startup deal properly with the case that `shmget()` returns `EINVAL` for an existing shared memory segment (Tom)
  This behavior has been observed on BSD-derived kernels including OS X. It resulted in an entirely-misleading startup failure complaining that the shared memory request size was too large.

- Update time zone data files to `tzdata` release 2010j for DST law changes in Argentina, Australian Antarctic, Bangladesh, Mexico, Morocco, Pakistan, Palestine, Russia, Syria, Tunisia; also historical corrections for Taiwan.

### E.247. Release 8.0.24

**Release date:** 2010-03-15

This release contains a variety of fixes from 8.0.23. For information about new features in the 8.0 major release, see Section E.271.

The PostgreSQL community will stop releasing updates for the 8.0.X release series in July 2010. Users are encouraged to update to a newer release branch soon.
Appendix E. Release Notes

E.247.1. Migration to Version 8.0.24

A dump/restore is not required for those running 8.0.X. However, if you are upgrading from a version earlier than 8.0.22, see Section E.249.

E.247.2. Changes

- Add new configuration parameter `ssl_renegotiation_limit` to control how often we do session key renegotiation for an SSL connection (Magnus)
  
  This can be set to zero to disable renegotiation completely, which may be required if a broken SSL library is used. In particular, some vendors are shipping stopgap patches for CVE-2009-3555 that cause renegotiation attempts to fail.

- Fix possible crashes when trying to recover from a failure in subtransaction start (Tom)

- Fix server memory leak associated with use of savepoints and a client encoding different from server’s encoding (Tom)

- Make `substring()` for bit types treat any negative length as meaning “all the rest of the string” (Tom)
  
  The previous coding treated only -1 that way, and would produce an invalid result value for other negative values, possibly leading to a crash (CVE-2010-0442).

- Fix integer-to-bit-string conversions to handle the first fractional byte correctly when the output bit width is wider than the given integer by something other than a multiple of 8 bits (Tom)

- Fix some cases of pathologically slow regular expression matching (Tom)

- Fix the `STOP WAL LOCATION` entry in backup history files to report the next WAL segment’s name when the end location is exactly at a segment boundary (Itagaki Takahiro)

- When reading `pg_hba.conf` and related files, do not treat `@something` as a file inclusion request if the `@` appears inside quote marks; also, never treat `@` by itself as a file inclusion request (Tom)
  
  This prevents erratic behavior if a role or database name starts with `@`. If you need to include a file whose path name contains spaces, you can still do so, but you must write `"/path to/file"` rather than putting the quotes around the whole construct.

- Prevent infinite loop on some platforms if a directory is named as an inclusion target in `pg_hba.conf` and related files (Tom)

- Fix plpgsql failure in one case where a composite column is set to NULL (Tom)

- Add `volatile` markings in PL/Python to avoid possible compiler-specific misbehavior (Zdenek Kotala)

- Ensure PL/Tcl initializes the Tcl interpreter fully (Tom)
  
  The only known symptom of this oversight is that the Tcl `clock` command misbehaves if using Tcl 8.5 or later.

- Prevent crash in `contrib/dblink` when too many key columns are specified to a `dblink_build_sql_` function (Rushabh Lathia, Joe Conway)

- Fix assorted crashes in `contrib/xml2` caused by sloppy memory management (Tom)
Appendix E. Release Notes

- Update time zone data files to tzdata release 2010e for DST law changes in Bangladesh, Chile, Fiji, Mexico, Paraguay, Samoa.

E.248. Release 8.0.23

Release date: 2009-12-14

This release contains a variety of fixes from 8.0.22. For information about new features in the 8.0 major release, see Section E.271.

E.248.1. Migration to Version 8.0.23

A dump/restore is not required for those running 8.0.X. However, if you are upgrading from a version earlier than 8.0.22, see Section E.249.

E.248.2. Changes

- Protect against indirect security threats caused by index functions changing session-local state (Gurjeet Singh, Tom)
  This change prevents allegedly-immutable index functions from possibly subverting a superuser’s session (CVE-2009-4136).

- Reject SSL certificates containing an embedded null byte in the common name (CN) field (Magnus)
  This prevents unintended matching of a certificate to a server or client name during SSL validation (CVE-2009-4034).

- Fix possible crash during backend-startup-time cache initialization (Tom)

- Prevent signals from interrupting VACUUM at unsafe times (Alvaro)
  This fix prevents a PANIC if a VACUUM FULL is canceled after it’s already committed its tuple movements, as well as transient errors if a plain VACUUM is interrupted after having truncated the table.

- Fix possible crash due to integer overflow in hash table size calculation (Tom)
  This could occur with extremely large planner estimates for the size of a hashjoin’s result.

- Fix very rare crash in inet/cidr comparisons (Chris Mikkelson)

- Fix premature drop of temporary files used for a cursor that is accessed within a subtransaction (Heikki)

- Fix PAM password processing to be more robust (Tom)
  The previous code is known to fail with the combination of the Linux pam_krb5 PAM module with Microsoft Active Directory as the domain controller. It might have problems elsewhere too, since it was making unjustified assumptions about what arguments the PAM stack would pass to it.

- Fix rare crash in exception processing in PL/Python (Peter)

- Ensure psql’s flex module is compiled with the correct system header definitions (Tom)
This fixes build failures on platforms where --enable-largefile causes incompatible changes in the generated code.

- Make the postmaster ignore any application_name parameter in connection request packets, to improve compatibility with future libpq versions (Tom)
- Update time zone data files to tzdata release 2009s for DST law changes in Antarctica, Argentina, Bangladesh, Fiji, Novokuznetsk, Pakistan, Palestine, Samoa, Syria; also historical corrections for Hong Kong.

E.249. Release 8.0.22

Release date: 2009-09-09

This release contains a variety of fixes from 8.0.21. For information about new features in the 8.0 major release, see Section E.271.

E.249.1. Migration to Version 8.0.22

A dump/restore is not required for those running 8.0.X. However, if you have any hash indexes on interval columns, you must REINDEX them after updating to 8.0.22. Also, if you are upgrading from a version earlier than 8.0.6, see Section E.265.

E.249.2. Changes

- Disallow RESET ROLE and RESET SESSION AUTHORIZATION inside security-definer functions (Tom, Heikki)
  This covers a case that was missed in the previous patch that disallowed SET ROLE and SET SESSION AUTHORIZATION inside security-definer functions. (See CVE-2007-6600)
- Fix handling of sub-SELECTs appearing in the arguments of an outer-level aggregate function (Tom)
- Fix hash calculation for data type interval (Tom)
  This corrects wrong results for hash joins on interval values. It also changes the contents of hash indexes on interval columns. If you have any such indexes, you must REINDEX them after updating.
- Treat to_char(..., 'TH') as an uppercase ordinal suffix with 'HH'/ HH12' (Heikki)
  It was previously handled as 'th' (lowercase).
- Fix overflow for INTERVAL 'x ms' when x is more than 2 million and integer datetimes are in use (Alex Hunsaker)
- Fix calculation of distance between a point and a line segment (Tom)
  This led to incorrect results from a number of geometric operators.
- Fix money data type to work in locales where currency amounts have no fractional digits, e.g. Japan (Itagaki Takahiro)
• Properly round datetime input like 00:12:57.9999999999999999999999999999 (Tom)
• Fix poor choice of page split point in GiST R-tree operator classes (Teodor)
• Fix portability issues in plperl initialization (Andrew Dunstan)
• Fix pg_ctl to not go into an infinite loop if postgresql.conf is empty (Jeff Davis)
• Fix contrib/xml2’s xslt_process() to properly handle the maximum number of parameters (twenty) (Tom)
• Improve robustness of libpq’s code to recover from errors during COPY FROM STDIN (Tom)
• Avoid including conflicting readline and editline header files when both libraries are installed (Zdenek Kotala)
• Update time zone data files to tzdata release 2009l for DST law changes in Bangladesh, Egypt, Jordan, Pakistan, Argentina/San_Luis, Cuba, Jordan (historical correction only), Mauritius, Morocco, Palestine, Syria, Tunisia.

E.250. Release 8.0.21

Release date: 2009-03-16
This release contains a variety of fixes from 8.0.20. For information about new features in the 8.0 major release, see Section E.271.

E.250.1. Migration to Version 8.0.21
A dump/restore is not required for those running 8.0.X. However, if you are upgrading from a version earlier than 8.0.6, see Section E.265.

E.250.2. Changes

• Prevent error recursion crashes when encoding conversion fails (Tom)
  This change extends fixes made in the last two minor releases for related failure scenarios. The previous fixes were narrowly tailored for the original problem reports, but we have now recognized that any error thrown by an encoding conversion function could potentially lead to infinite recursion while trying to report the error. The solution therefore is to disable translation and encoding conversion and report the plain-ASCII form of any error message, if we find we have gotten into a recursive error reporting situation. (CVE-2009-0922)
•Disallow CREATE CONVERSION with the wrong encodings for the specified conversion function (Heikki)
  This prevents one possible scenario for encoding conversion failure. The previous change is a backstop to guard against other kinds of failures in the same area.
• Fix core dump when `to_char()` is given format codes that are inappropriate for the type of the data argument (Tom)
• Add MUST (Mauritius Island Summer Time) to the default list of known timezone abbreviations (Xavier Bugaud)

E.251. Release 8.0.20

**Release date:** 2009-02-02

This release contains a variety of fixes from 8.0.19. For information about new features in the 8.0 major release, see Section E.271.

E.251.1. Migration to Version 8.0.20

A dump/restore is not required for those running 8.0.X. However, if you are upgrading from a version earlier than 8.0.6, see Section E.265.

E.251.2. Changes

• Improve handling of URLs in `headline()` function (Teodor)
• Improve handling of overlength headlines in `headline()` function (Teodor)
• Prevent possible Assert failure or misconversion if an encoding conversion is created with the wrong conversion function for the specified pair of encodings (Tom, Heikki)
• Avoid unnecessary locking of small tables in `VACUUM` (Heikki)
• Fix uninitialized variables in `contrib/tsearch2`'s `get_covers()` function (Teodor)
• Make all documentation reference `pgsql-bugs` and/or `pgsql-hackers` as appropriate, instead of the now-decommissioned `pgsql-ports` and `pgsql-patches` mailing lists (Tom)
• Update time zone data files to tzdata release 2009a (for Kathmandu and historical DST corrections in Switzerland, Cuba)

E.252. Release 8.0.19

**Release date:** 2008-11-03

This release contains a variety of fixes from 8.0.18. For information about new features in the 8.0 major release, see Section E.271.
E.252.1. Migration to Version 8.0.19

A dump/restore is not required for those running 8.0.X. However, if you are upgrading from a version earlier than 8.0.6, see Section E.265.

E.252.2. Changes

- Fix backend crash when the client encoding cannot represent a localized error message (Tom)
  We have addressed similar issues before, but it would still fail if the “character has no equivalent” message itself couldn’t be converted. The fix is to disable localization and send the plain ASCII error message when we detect such a situation.
- Fix possible crash when deeply nested functions are invoked from a trigger (Tom)
- Ensure an error is reported when a newly-defined PL/pgSQL trigger function is invoked as a normal function (Tom)
- Fix incorrect tsearch2 headline generation when single query item matches first word of text (Sushant Sinha)
- Fix improper display of fractional seconds in interval values when using a non-ISO datestyle in an --enable-integer-datetimes build (Ron Mayer)
- Ensure SPI_getvalue and SPI_getbinval behave correctly when the passed tuple and tuple descriptor have different numbers of columns (Tom)
  This situation is normal when a table has had columns added or removed, but these two functions didn’t handle it properly. The only likely consequence is an incorrect error indication.
- Fix ecpg’s parsing of CREATE USER (Michael)
- Fix recent breakage of pg_ctl restart (Tom)
- Update time zone data files to tzdata release 2008i (for DST law changes in Argentina, Brazil, Mauritius, Syria)

E.253. Release 8.0.18

Release date: 2008-09-22

This release contains a variety of fixes from 8.0.17. For information about new features in the 8.0 major release, see Section E.271.

E.253.1. Migration to Version 8.0.18

A dump/restore is not required for those running 8.0.X. However, if you are upgrading from a version earlier than 8.0.6, see Section E.265.
E.253.2. Changes

- Widen local lock counters from 32 to 64 bits (Tom)
  
  This responds to reports that the counters could overflow in sufficiently long transactions, leading to unexpected “lock is already held” errors.

- Add checks in executor startup to ensure that the tuples produced by an \texttt{INSERT} or \texttt{UPDATE} will match the target table’s current rowtype (Tom)
  
  \texttt{ALTER COLUMN TYPE}, followed by re-use of a previously cached plan, could produce this type of situation. The check protects against data corruption and/or crashes that could ensue.

- Fix datetime input functions to correctly detect integer overflow when running on a 64-bit platform (Tom)

- Improve performance of writing very long log messages to syslog (Tom)

- Fix bug in backwards scanning of a cursor on a \texttt{SELECT DISTINCT ON} query (Tom)

- Fix planner to estimate that \texttt{GROUP BY} expressions yielding boolean results always result in two groups, regardless of the expressions’ contents (Tom)
  
  This is very substantially more accurate than the regular \texttt{GROUP BY} estimate for certain boolean tests like \texttt{col IS NULL}.

- Fix PL/Tcl to behave correctly with Tcl 8.5, and to be more careful about the encoding of data sent to or from Tcl (Tom)

- Fix PL/Python to work with Python 2.5
  
  This is a back-port of fixes made during the 8.2 development cycle.

- Improve \texttt{pg_dump} and \texttt{pg_restore}’s error reporting after failure to send a SQL command (Tom)

- Fix \texttt{pg_ctl} to properly preserve postmaster command-line arguments across a restart (Bruce)

- Update time zone data files to \texttt{tzdata} release 2008f (for DST law changes in Argentina, Bahamas, Brazil, Mauritius, Morocco, Pakistan, Palestine, and Paraguay)

E.254. Release 8.0.17

Release date: 2008-06-12

This release contains one serious bug fix over 8.0.16. For information about new features in the 8.0 major release, see Section E.271.

E.254.1. Migration to Version 8.0.17

A dump/restore is not required for those running 8.0.X. However, if you are upgrading from a version earlier than 8.0.6, see Section E.265.
E.254.2. Changes

- Make `pg_get_ruledef()` parenthesize negative constants (Tom)

Before this fix, a negative constant in a view or rule might be dumped as, say, `-42::integer`, which is subtly incorrect: it should be `(-42)::integer` due to operator precedence rules. Usually this would make little difference, but it could interact with another recent patch to cause PostgreSQL to reject what had been a valid `SELECT DISTINCT` view query. Since this could result in `pg_dump` output failing to reload, it is being treated as a high-priority fix. The only released versions in which dump output is actually incorrect are 8.3.1 and 8.2.7.

E.255. Release 8.0.16

**Release date:** never released

This release contains a variety of fixes from 8.0.15. For information about new features in the 8.0 major release, see Section E.271.

E.255.1. Migration to Version 8.0.16

A dump/restore is not required for those running 8.0.X. However, if you are upgrading from a version earlier than 8.0.6, see Section E.265.

E.255.2. Changes

- **Fix** `ALTER TABLE ADD COLUMN ... PRIMARY KEY` so that the new column is correctly checked to see if it’s been initialized to all non-nulls (Brendan Jurd)

  Previous versions neglected to check this requirement at all.

- **Fix** possible `CREATE TABLE` failure when inheriting the “same” constraint from multiple parent relations that inherited that constraint from a common ancestor (Tom)

- **Fix** conversions between ISO-8859-5 and other encodings to handle Cyrillic “Yo” characters (є and Е with two dots) (Sergey Burladyan)

- **Fix** a few datatype input functions that were allowing unused bytes in their results to contain uninitialized, unpredictable values (Tom)

  This could lead to failures in which two apparently identical literal values were not seen as equal, resulting in the parser complaining about unmatched `ORDER BY` and `DISTINCT` expressions.

- **Fix** a corner case in regular-expression substring matching (`substring(string from pattern)`) (Tom)

  The problem occurs when there is a match to the pattern overall but the user has specified a parenthesized subexpression and that subexpression hasn’t got a match. An example is `substring('foo'
from 'foo(bar)?'). This should return NULL, since \( (\text{bar}) \) isn’t matched, but it was mistakenly returning the whole-pattern match instead (ie, \( \text{foo} \)).

- Update time zone data files to tzdata release 2008c (for DST law changes in Morocco, Iraq, Choibalsan, Pakistan, Syria, Cuba, Argentina/San_Luis, and Chile)

- Fix incorrect result from ecpg’s \text{PGTYPEStimestamp\_sub()} \text{function} (Michael)

- Fix core dump in contrib/xml2’s \text{xpath\_table()} \text{function} when the input query returns a NULL value (Tom)

- Fix contrib/xml2’s \text{makefile} to not override \text{CFLAGS} (Tom)

- Fix \text{DatumGetBool} \text{macro} to not fail with gcc 4.3 (Tom)

  This problem affects “old style” (V0) C functions that return boolean. The fix is already in 8.3, but the need to back-patch it was not realized at the time.

- Fix longstanding \text{LISTEN/NOTIFY} \text{race condition} (Tom)

  In rare cases a session that had just executed a \text{LISTEN} might not get a notification, even though one would be expected because the concurrent transaction executing \text{NOTIFY} was observed to commit later.

  A side effect of the fix is that a transaction that has executed a not-yet-committed \text{LISTEN} \text{command} will not see any row in \text{pg\_listener} for the \text{LISTEN}, should it choose to look; formerly it would have.

  This behavior was never documented one way or the other, but it is possible that some applications depend on the old behavior.

- Fix rare crash when an error occurs during a query using a hash index (Heikki)

- Fix input of datetime values for February 29 in years BC (Tom)

  The former coding was mistaken about which years were leap years.

- Fix “unrecognized node type” error in some variants of \text{ALTER OWNER} (Tom)

- Fix \text{pg\_ctl} to correctly extract the postmaster’s port number from command-line options (Itagaki Takahiro, Tom)

  Previously, \text{pg\_ctl start -w} could try to contact the postmaster on the wrong port, leading to bogus reports of startup failure.

- Use \text{--fwrapv} to defend against possible misoptimization in recent gcc versions (Tom)

  This is known to be necessary when building PostgreSQL with gcc 4.3 or later.

- Fix display of constant expressions in \text{ORDER BY} and \text{GROUP BY} (Tom)

  An explicitly casted constant would be shown incorrectly. This could for example lead to corruption of a view definition during dump and reload.

- Fix \text{libpq} to handle \text{NOTICE} messages correctly during \text{COPY OUT} (Tom)

  This failure has only been observed to occur when a user-defined datatype’s output routine issues a \text{NOTICE}, but there is no guarantee it couldn’t happen due to other causes.
E.256. Release 8.0.15

Release date: 2008-01-07

This release contains a variety of fixes from 8.0.14, including fixes for significant security issues. For information about new features in the 8.0 major release, see Section E.271.

This is the last 8.0.X release for which the PostgreSQL community will produce binary packages for Windows. Windows users are encouraged to move to 8.2.X or later, since there are Windows-specific fixes in 8.2.X that are impractical to back-port. 8.0.X will continue to be supported on other platforms.

E.256.1. Migration to Version 8.0.15

A dump/restore is not required for those running 8.0.X. However, if you are upgrading from a version earlier than 8.0.6, see Section E.265.

E.256.2. Changes

- Prevent functions in indexes from executing with the privileges of the user running VACUUM, ANALYZE, etc (Tom)

  Functions used in index expressions and partial-index predicates are evaluated whenever a new table entry is made. It has long been understood that this poses a risk of trojan-horse code execution if one modifies a table owned by an untrustworthy user. (Note that triggers, defaults, check constraints, etc. pose the same type of risk.) But functions in indexes pose extra danger because they will be executed by routine maintenance operations such as VACUUM FULL, which are commonly performed automatically under a superuser account. For example, a nefarious user can execute code with superuser privileges by setting up a trojan-horse index definition and waiting for the next routine vacuum. The fix arranges for standard maintenance operations (including VACUUM, ANALYZE, REINDEX, and CLUSTER) to execute as the table owner rather than the calling user, using the same privilege-switching mechanism already used for SECURITY DEFINER functions. To prevent bypassing this security measure, execution of SET SESSION AUTHORIZATION and SET ROLE is now forbidden within a SECURITY DEFINER context. (CVE-2007-6600)

- Repair assorted bugs in the regular-expression package (Tom, Will Drewry)

  Suitably crafted regular-expression patterns could cause crashes, infinite or near-infinite looping, and/or massive memory consumption, all of which pose denial-of-service hazards for applications that accept regex search patterns from untrustworthy sources. (CVE-2007-4769, CVE-2007-4772, CVE-2007-6067)

- Require non-superusers who use /contrib/dblink to use only password authentication, as a security measure (Joe)

  The fix that appeared for this in 8.0.14 was incomplete, as it plugged the hole for only some dblink functions. (CVE-2007-6601, CVE-2007-3278)

- Update time zone data files to tzdata release 2007k (in particular, recent Argentina changes) (Tom)

- Fix planner failure in some cases of WHERE false AND var IN (SELECT ...) (Tom)
Appendix E. Release Notes

• Preserve the tablespace of indexes that are rebuilt by ALTER TABLE ... ALTER COLUMN TYPE (Tom)

• Make archive recovery always start a new WAL timeline, rather than only when a recovery stop time was used (Simon)

  This avoids a corner-case risk of trying to overwrite an existing archived copy of the last WAL segment, and seems simpler and cleaner than the original definition.

• Make VACUUM not use all of maintenance_work_mem when the table is too small for it to be useful (Alvaro)

• Fix potential crash in translate() when using a multibyte database encoding (Tom)

• Fix PL/Perl to cope when platform’s Perl defines type bool as int rather than char (Tom)

  While this could theoretically happen anywhere, no standard build of Perl did things this way ... until Mac OS X 10.5.

• Fix PL/Python to not crash on long exception messages (Alvaro)

• Fix pg_dump to correctly handle inheritance child tables that have default expressions different from their parent’s (Tom)

• ecpg parser fixes (Michael)

• Make contrib/tablefunc’s crosstab() handle NULL rowid as a category in its own right, rather than crashing (Joe)

• Fix tsvector and tsquery output routines to escape backslashes correctly (Teodor, Bruce)

• Fix crash of to_tsvector() on huge input strings (Teodor)

• Require a specific version of Autoconf to be used when re-generating the configure script (Peter)

  This affects developers and packagers only. The change was made to prevent accidental use of untested combinations of Autoconf and PostgreSQL versions. You can remove the version check if you really want to use a different Autoconf version, but it’s your responsibility whether the result works or not.

E.257. Release 8.0.14

Release date: 2007-09-17

This release contains a variety of fixes from 8.0.13. For information about new features in the 8.0 major release, see Section E.271.

E.257.1. Migration to Version 8.0.14

A dump/restore is not required for those running 8.0.X. However, if you are upgrading from a version earlier than 8.0.6, see Section E.265.
E.257.2. Changes

- Prevent index corruption when a transaction inserts rows and then aborts close to the end of a concurrent VACUUM on the same table (Tom)
- Make CREATE DOMAIN ... DEFAULT NULL work properly (Tom)
- Fix excessive logging of SSL error messages (Tom)
- Fix logging so that log messages are never interleaved when using the syslogger process (Andrew)
- Fix crash when log_min_error_statement logging runs out of memory (Tom)
- Fix incorrect handling of some foreign-key corner cases (Tom)
- Prevent CLUSTER from failing due to attempting to process temporary tables of other sessions (Alvaro)
- Update the time zone database rules, particularly New Zealand’s upcoming changes (Tom)
- Windows socket improvements (Magnus)
- Suppress timezone name (%Z) in log timestamps on Windows because of possible encoding mismatches (Tom)
- Require non-superusers who use /contrib/dblink to use only password authentication, as a security measure (Joe)

E.258. Release 8.0.13

Release date: 2007-04-23

This release contains a variety of fixes from 8.0.12, including a security fix. For information about new features in the 8.0 major release, see Section E.271.

E.258.1. Migration to Version 8.0.13

A dump/restore is not required for those running 8.0.X. However, if you are upgrading from a version earlier than 8.0.6, see Section E.265.

E.258.2. Changes

- Support explicit placement of the temporary-table schema within search_path, and disable searching it for functions and operators (Tom)
  This is needed to allow a security-definer function to set a truly secure value of search_path. Without it, an unprivileged SQL user can use temporary objects to execute code with the privileges of the security-definer function (CVE-2007-2138). See CREATE FUNCTION for more information.
- /contrib/tsearch2 crash fixes (Teodor)
- Fix potential-data-corruption bug in how VACUUM FULL handles UPDATE chains (Tom, Pavan Deolasee)
• Fix PANIC during enlargement of a hash index (bug introduced in 8.0.10) (Tom)
• Fix POSIX-style timezone specs to follow new USA DST rules (Tom)

E.259. Release 8.0.12

Release date: 2007-02-07

This release contains one fix from 8.0.11. For information about new features in the 8.0 major release, see Section E.271.

E.259.1. Migration to Version 8.0.12

A dump/restore is not required for those running 8.0.X. However, if you are upgrading from a version earlier than 8.0.6, see Section E.265.

E.259.2. Changes

• Remove overly-restrictive check for type length in constraints and functional indexes (Tom)

E.260. Release 8.0.11

Release date: 2007-02-05

This release contains a variety of fixes from 8.0.10, including a security fix. For information about new features in the 8.0 major release, see Section E.271.

E.260.1. Migration to Version 8.0.11

A dump/restore is not required for those running 8.0.X. However, if you are upgrading from a version earlier than 8.0.6, see Section E.265.

E.260.2. Changes

• Remove security vulnerabilities that allowed connected users to read backend memory (Tom)

  The vulnerabilities involve suppressing the normal check that a SQL function returns the data type it's declared to, and changing the data type of a table column (CVE-2007-0555, CVE-2007-0556). These errors can easily be exploited to cause a backend crash, and in principle might be used to read database content that the user should not be able to access.
• Fix rare bug wherein btree index page splits could fail due to choosing an infeasible split point (Heikki Linnakangas)
• Fix for rare Assert() crash triggered by \texttt{UNION} (Tom)
• Tighten security of multi-byte character processing for UTF8 sequences over three bytes long (Tom)

\section*{E.261. Release 8.0.10}

\textbf{Release date:} 2007-01-08

This release contains a variety of fixes from 8.0.9. For information about new features in the 8.0 major release, see Section E.271.

\subsection*{E.261.1. Migration to Version 8.0.10}

A dump/restore is not required for those running 8.0.X. However, if you are upgrading from a version earlier than 8.0.6, see Section E.265.

\subsection*{E.261.2. Changes}

• Improve handling of \texttt{getaddrinfo()} on AIX (Tom)
  This fixes a problem with starting the statistics collector, among other things.
• Fix “failed to re-find parent key” errors in \texttt{VACUUM} (Tom)
• Fix race condition for truncation of a large relation across a gigabyte boundary by \texttt{VACUUM} (Tom)
• Fix bugs affecting multi-gigabyte hash indexes (Tom)
• Fix possible deadlock in Windows signal handling (Teodor)
• Fix error when constructing an \texttt{ARRAY[]} made up of multiple empty elements (Tom)
• Fix ecpg memory leak during connection (Michael)
• \texttt{to_number()} and \texttt{to_char(numeric)} are now \texttt{STABLE}, not \texttt{IMMUTABLE}, for new \texttt{initdb} installs (Tom)
  This is because \texttt{lc_numeric} can potentially change the output of these functions.
• Improve index usage of regular expressions that use parentheses (Tom)
  This improves \texttt{psql -d} performance also.
• Update timezone database
  This affects Australian and Canadian daylight-savings rules in particular.
E.262. Release 8.0.9

Release date: 2006-10-16
This release contains a variety of fixes from 8.0.8. For information about new features in the 8.0 major release, see Section E.271.

E.262.1. Migration to Version 8.0.9
A dump/restore is not required for those running 8.0.X. However, if you are upgrading from a version earlier than 8.0.6, see Section E.265.

E.262.2. Changes

- Fix crash when referencing NEW row values in rule WHERE expressions (Tom)
- Fix core dump when an untyped literal is taken as ANYARRAY
- Fix mishandling of AFTER triggers when query contains a SQL function returning multiple rows (Tom)
- Fix ALTER TABLE ... TYPE to recheck NOT NULL for USING clause (Tom)
- Fix string_to_array() to handle overlapping matches for the separator string
  For example, string_to_array('123xx456xxx789', 'xx').
- Fix corner cases in pattern matching for psql’s \d commands
- Fix index-corrupting bugs in /contrib/ltrie (Teodor)
- Numerous robustness fixes in ecpg (Joachim Wieland)
- Fix backslash escaping in /contrib/dbmirror
- Fix instability of statistics collection on Win32 (Tom, Andrew)
- Fixes for AIX and Intel compilers (Tom)

E.263. Release 8.0.8

Release date: 2006-05-23
This release contains a variety of fixes from 8.0.7, including patches for extremely serious security issues. For information about new features in the 8.0 major release, see Section E.271.

E.263.1. Migration to Version 8.0.8
A dump/restore is not required for those running 8.0.X. However, if you are upgrading from a version earlier than 8.0.6, see Section E.265.
Full security against the SQL-injection attacks described in CVE-2006-2313 and CVE-2006-2314 might require changes in application code. If you have applications that embed untrustworthy strings into SQL commands, you should examine them as soon as possible to ensure that they are using recommended escaping techniques. In most cases, applications should be using subroutines provided by libraries or drivers (such as libpq's `PQescapeStringConn()`) to perform string escaping, rather than relying on *ad hoc* code to do it.

### E.263.2. Changes

- **Change the server to reject invalidly-encoded multibyte characters in all cases** (Tatsuo, Tom)
  
  While PostgreSQL has been moving in this direction for some time, the checks are now applied uniformly to all encodings and all textual input, and are now always errors not merely warnings. This change defends against SQL-injection attacks of the type described in CVE-2006-2313.

- **Reject unsafe uses of ‘\’ in string literals**
  
  As a server-side defense against SQL-injection attacks of the type described in CVE-2006-2314, the server now only accepts ‘” and not ‘\’ as a representation of ASCII single quote in SQL string literals. By default, ‘\’ is rejected only when `client_encoding` is set to a client-only encoding (SJIS, BIG5, GBK, GB18030, or UHC), which is the scenario in which SQL injection is possible. A new configuration parameter `backslash_quote` is available to adjust this behavior when needed. Note that full security against CVE-2006-2314 might require client-side changes; the purpose of `backslash_quote` is in part to make it obvious that insecure clients are insecure.

- **Modify libpq’s string-escaping routines to be aware of encoding considerations and `standard_conforming_strings`**
  
  This fixes libpq-using applications for the security issues described in CVE-2006-2313 and CVE-2006-2314, and also future-proofs them against the planned changeover to SQL-standard string literal syntax. Applications that use multiple PostgreSQL connections concurrently should migrate to `PQescapeStringConn()` and `PQescapeByteaConn()` to ensure that escaping is done correctly for the settings in use in each database connection. Applications that do string escaping “by hand” should be modified to rely on library routines instead.

- **Fix some incorrect encoding conversion functions**
  
  `win1251_to_iso`, `alt_to_iso`, `euc_tw_to_big5`, `euc_tw_to_mic`, `mic_to_euc_tw` were all broken to varying extents.

- **Clean up stray remaining uses of \’ in strings** (Bruce, Jan)

- **Fix bug that sometimes caused OR’d index scans to miss rows they should have returned**

- **Fix WAL replay for case where a btree index has been truncated**

- **Fix `SIMILAR TO` for patterns involving |** (Tom)

- **Fix `SELECT INTO` and `CREATE TABLE AS` to create tables in the default tablespace, not the base directory** (Kris Jurka)

- **Fix server to use custom DH SSL parameters correctly** (Michael Fuhr)

- **Fix for Bonjour on Intel Macs** (Ashley Clark)
• Fix various minor memory leaks
• Fix problem with password prompting on some Win32 systems (Robert Kinberg)

E.264. Release 8.0.7

Release date: 2006-02-14

This release contains a variety of fixes from 8.0.6. For information about new features in the 8.0 major release, see Section E.271.

E.264.1. Migration to Version 8.0.7

A dump/restore is not required for those running 8.0.X. However, if you are upgrading from a version earlier than 8.0.6, see Section E.265.

E.264.2. Changes

• Fix potential crash in SET SESSION AUTHORIZATION (CVE-2006-0553)
  An unprivileged user could crash the server process, resulting in momentary denial of service to other users, if the server has been compiled with Asserts enabled (which is not the default). Thanks to Akio Ishida for reporting this problem.
• Fix bug with row visibility logic in self-inserted rows (Tom)
  Under rare circumstances a row inserted by the current command could be seen as already valid, when it should not be. Repairs bug created in 8.0.4, 7.4.9, and 7.3.11 releases.
• Fix race condition that could lead to “file already exists” errors during pg_clog and pg_subtrans file creation (Tom)
• Fix cases that could lead to crashes if a cache-invalidation message arrives at just the wrong time (Tom)
• Properly check DOMAIN constraints for UNKNOWN parameters in prepared statements (Neil)
• Ensure ALTER COLUMN TYPE will process FOREIGN KEY, UNIQUE, and PRIMARY KEY constraints in the proper order (Nakano Yoshihisa)
• Fixes to allow restoring dumps that have cross-schema references to custom operators or operator classes (Tom)
• Allow pg_restore to continue properly after a COPY failure; formerly it tried to treat the remaining COPY data as SQL commands (Stephen Frost)
• Fix pg_ctl unregister crash when the data directory is not specified (Magnus)
• Fix ecpg crash on AMD64 and PPC (Neil)
• Recover properly if error occurs during argument passing in PL/python (Neil)
• Fix PL/perl’s handling of locales on Win32 to match the backend (Andrew)
• Fix crash when `log_min_messages` is set to `DEBUG3` or above in `postgresql.conf` on Win32 (Bruce)
• Fix `pgxs -L` library path specification for Win32, Cygwin, OS X, AIX (Bruce)
• Check that SID is enabled while checking for Win32 admin privileges (Magnus)
• Properly reject out-of-range date inputs (Kris Jurka)
• Portability fix for testing presence of `finite` and `isinf` during configure (Tom)

E.265. Release 8.0.6

Release date: 2006-01-09

This release contains a variety of fixes from 8.0.5. For information about new features in the 8.0 major release, see Section E.271.

E.265.1. Migration to Version 8.0.6

A dump/restore is not required for those running 8.0.X. However, if you are upgrading from a version earlier than 8.0.3, see Section E.268. Also, you might need to `REINDEX` indexes on textual columns after updating, if you are affected by the locale or plperl issues described below.

E.265.2. Changes

• Fix Windows code so that postmaster will continue rather than exit if there is no more room in Shmem-BackendArray (Magnus)

  The previous behavior could lead to a denial-of-service situation if too many connection requests arrive close together. This applies only to the Windows port.

• Fix bug introduced in 8.0 that could allow ReadBuffer to return an already-used page as new, potentially causing loss of recently-committed data (Tom)

• Fix for protocol-level Describe messages issued outside a transaction or in a failed transaction (Tom)

• Fix character string comparison for locales that consider different character combinations as equal, such as Hungarian (Tom)

  This might require `REINDEX` to fix existing indexes on textual columns.

• Set locale environment variables during postmaster startup to ensure that plperl won’t change the locale later

  This fixes a problem that occurred if the postmaster was started with environment variables specifying a different locale than what initdb had been told. Under these conditions, any use of plperl was likely to lead to corrupt indexes. You might need `REINDEX` to fix existing indexes on textual columns if this has happened to you.

• Allow more flexible relocation of installation directories (Tom)
Previous releases supported relocation only if all installation directory paths were the same except for the last component.

• Fix longstanding bug in strpos() and regular expression handling in certain rarely used Asian multi-byte character sets (Tatsuo)
• Various fixes for functions returning RECORDs (Tom)
• Fix bug in /contrib/pgcrypto gen_salt, which caused it not to use all available salt space for MD5 and XDES algorithms (Marko Kreen, Solar Designer)
  Salts for Blowfish and standard DES are unaffected.
• Fix /contrib/dblink to throw an error, rather than crashing, when the number of columns specified is different from what’s actually returned by the query (Joe)

E.266. Release 8.0.5

Release date: 2005-12-12

This release contains a variety of fixes from 8.0.4. For information about new features in the 8.0 major release, see Section E.271.

E.266.1. Migration to Version 8.0.5

A dump/restore is not required for those running 8.0.X. However, if you are upgrading from a version earlier than 8.0.3, see Section E.268.

E.266.2. Changes

• Fix race condition in transaction log management
  There was a narrow window in which an I/O operation could be initiated for the wrong page, leading to an Assert failure or data corruption.
• Fix bgwriter problems after recovering from errors (Tom)
  The background writer was found to leak buffer pins after write errors. While not fatal in itself, this might lead to mysterious blockages of later VACUUM commands.
• Prevent failure if client sends Bind protocol message when current transaction is already aborted
• /contrib/ltree fixes (Teodor)
• AIX and HPUX compile fixes (Tom)
• Retry file reads and writes after Windows NO_SYSTEM_RESOURCES error (Qingqing Zhou)
• Fix intermittent failure when log_line_prefix includes %i
• Fix psql performance issue with long scripts on Windows (Merlin Moncure)
• Fix missing updates of pg_group flat file
• Fix longstanding planning error for outer joins
  This bug sometimes caused a bogus error “RIGHT JOIN is only supported with merge-joinable join conditions”.
• Postpone timezone initialization until after postmaster.pid is created
  This avoids confusing startup scripts that expect the pid file to appear quickly.
• Prevent core dump in pg_autovacuum when a table has been dropped
• Fix problems with whole-row references (foo.*) to subquery results

---

E.267. Release 8.0.4

**Release date:** 2005-10-04

This release contains a variety of fixes from 8.0.3. For information about new features in the 8.0 major release, see Section E.271.

E.267.1. Migration to Version 8.0.4

A dump/restore is not required for those running 8.0.X. However, if you are upgrading from a version earlier than 8.0.3, see Section E.268.

E.267.2. Changes

• Fix error that allowed VACUUM to remove ctid chains too soon, and add more checking in code that follows ctid links
  This fixes a long-standing problem that could cause crashes in very rare circumstances.
• Fix CHAR() to properly pad spaces to the specified length when using a multiple-byte character set
  (Yoshiyuki Asaba)
  In prior releases, the padding of CHAR() was incorrect because it only padded to the specified number of bytes without considering how many characters were stored.
• Force a checkpoint before committing CREATE DATABASE
  This should fix recent reports of “index is not a btree” failures when a crash occurs shortly after CREATE DATABASE.
• Fix the sense of the test for read-only transaction in COPY
  The code formerly prohibited COPY TO, where it should prohibit COPY FROM.
• Handle consecutive embedded newlines in COPY CSV-mode input
• Fix date_trunc(week) for dates near year end
• Fix planning problem with outer-join ON clauses that reference only the inner-side relation
Appendix E. Release Notes

- Further fixes for `x FULL JOIN y ON true` corner cases
- Fix overenthusiastic optimization of `x IN (SELECT DISTINCT ...)` and related cases
- Fix mis-planning of queries with small `LIMIT` values due to poorly thought out “fuzzy” cost comparison
- Make `array_in` and `array_recv` more paranoid about validating their OID parameter
- Fix missing rows in queries like `UPDATE a=... WHERE a...` with GiST index on column `a`
- Improve robustness of datetime parsing
- Improve checking for partially-written WAL pages
- Improve robustness of signal handling when SSL is enabled
- Improve MIPS and M68K spinlock code
- Don’t try to open more than `max_files_per_process` files during postmaster startup
- Various memory leakage fixes
- Various portability improvements
- Update timezone data files
- Improve handling of DLL load failures on Windows
- Improve random-number generation on Windows
- Make `psql -f filename` return a nonzero exit code when opening the file fails
- Change `pg_dump` to handle inherited check constraints more reliably
- Fix password prompting in `pg_restore` on Windows
- Fix PL/pgSQL to handle `var := var` correctly when the variable is of pass-by-reference type
- Fix PL/Perl `%_SHARED` so it’s actually shared
- Fix `contrib/pg_autovacuum` to allow sleep intervals over 2000 sec
- Update `contrib/tsearch2` to use current Snowball code

E.268. Release 8.0.3

Release date: 2005-05-09

This release contains a variety of fixes from 8.0.2, including several security-related issues. For information about new features in the 8.0 major release, see Section E.271.

E.268.1. Migration to Version 8.0.3

A dump/restore is not required for those running 8.0.X. However, it is one possible way of handling two significant security problems that have been found in the initial contents of 8.0.X system catalogs. A dump/initdb/reload sequence using 8.0.3’s initdb will automatically correct these problems.

The larger security problem is that the built-in character set encoding conversion functions can be invoked from SQL commands by unprivileged users, but the functions were not designed for such use and are not
secure against malicious choices of arguments. The fix involves changing the declared parameter list of these functions so that they can no longer be invoked from SQL commands. (This does not affect their normal use by the encoding conversion machinery.)

The lesser problem is that the contrib/tsearch2 module creates several functions that are improperly declared to return internal when they do not accept internal arguments. This breaks type safety for all functions using internal arguments.

It is strongly recommended that all installations repair these errors, either by initdb or by following the manual repair procedure given below. The errors at least allow unprivileged database users to crash their server process, and might allow unprivileged users to gain the privileges of a database superuser.

If you wish not to do an initdb, perform the same manual repair procedures shown in the 7.4.8 release notes.

E.268.2. Changes

- Change encoding function signature to prevent misuse
- Change contrib/tsearch2 to avoid unsafe use of INTERNAL function results
- Guard against incorrect second parameter to record_out
- Repair ancient race condition that allowed a transaction to be seen as committed for some purposes (eg SELECT FOR UPDATE) slightly sooner than for other purposes
  This is an extremely serious bug since it could lead to apparent data inconsistencies being briefly visible to applications.
- Repair race condition between relation extension and VACUUM
  This could theoretically have caused loss of a page’s worth of freshly-inserted data, although the scenario seems of very low probability. There are no known cases of it having caused more than an Assert failure.
- Fix comparisons of TIME WITH TIME ZONE values
  The comparison code was wrong in the case where the --enable-integer-datetimes configuration switch had been used. NOTE: if you have an index on a TIME WITH TIME ZONE column, it will need to be REINDEXed after installing this update, because the fix corrects the sort order of column values.
- Fix EXTRACT(EPOCH) for TIME WITH TIME ZONE values
- Fix mis-display of negative fractional seconds in INTERVAL values
  This error only occurred when the --enable-integer-datetimes configuration switch had been used.
- Fix pg_dump to dump trigger names containing % correctly (Neil)
- Still more 64-bit fixes for contrib/intagg
- Prevent incorrect optimization of functions returning RECORD
- Prevent crash on COALESCE (NULL,NULL)
• Fix Borland makefile for libpq
• Fix contrib/btree_gist for timetz type (Teodor)
• Make pg_ctl check the PID found in postmaster.pid to see if it is still a live process
• Fix pg_dump/pg_restore problems caused by addition of dump timestamps
• Fix interaction between materializing holdable cursors and firing deferred triggers during transaction commit
• Fix memory leak in SQL functions returning pass-by-reference data types

E.269. Release 8.0.2

Release date: 2005-04-07

This release contains a variety of fixes from 8.0.1. For information about new features in the 8.0 major release, see Section E.271.

E.269.1. Migration to Version 8.0.2

A dump/restore is not required for those running 8.0.*. This release updates the major version number of the PostgreSQL libraries, so it might be necessary to re-link some user applications if they cannot find the properly-numbered shared library.

E.269.2. Changes

• Increment the major version number of all interface libraries (Bruce)
  This should have been done in 8.0.0. It is required so 7.4.X versions of PostgreSQL client applications, like psql, can be used on the same machine as 8.0.X applications. This might require re-linking user applications that use these libraries.
• Add Windows-only wal_sync_method setting of fsync_writethrough (Magnus, Bruce)
  This setting causes PostgreSQL to write through any disk-drive write cache when writing to WAL. This behavior was formerly called fsync, but was renamed because it acts quite differently from fsync on other platforms.
• Enable the wal_sync_method setting of open Datosync on Windows, and make it the default for that platform (Magnus, Bruce)
  Because the default is no longer fsync_writethrough, data loss is possible during a power failure if the disk drive has write caching enabled. To turn off the write cache on Windows, from the Device Manager, choose the drive properties, then Policies.
• New cache management algorithm 2Q replaces ARC (Tom)
  This was done to avoid a pending US patent on ARC. The 2Q code might be a few percentage points slower than ARC for some work loads. A better cache management algorithm will appear in 8.1.
Appendix E. Release Notes

- Planner adjustments to improve behavior on freshly-created tables (Tom)
- Allow plpgsql to assign to an element of an array that is initially NULL (Tom)
  Formerly the array would remain NULL, but now it becomes a single-element array. The main SQL engine was changed to handle UPDATE of a null array value this way in 8.0, but the similar case in plpgsql was overlooked.
- Convert \r\n and \r to \n in ppython function bodies (Michael Fuhr)
  This prevents syntax errors when ppython code is written on a Windows or Mac client.
- Allow SPI cursors to handle utility commands that return rows, such as EXPLAIN (Tom)
- Fix CLUSTER failure after ALTER TABLE SET WITHOUT OIDS (Tom)
- Reduce memory usage of ALTER TABLE ADD COLUMN (Neil)
- Fix ALTER LANGUAGE RENAME (Tom)
- Document the Windows-only register and unregister options of pg_ctl (Magnus)
- Ensure operations done during backend shutdown are counted by statistics collector
  This is expected to resolve reports of pg_autovacuum not vacuuming the system catalogs often enough — it was not being told about catalog deletions caused by temporary table removal during backend exit.
- Change the Windows default for configuration parameter log_destination to eventlog (Magnus)
  By default, a server running on Windows will now send log output to the Windows event logger rather than standard error.
- Make Kerberos authentication work on Windows (Magnus)
- Allow ALTER DATABASE RENAME by superusers who aren’t flagged as having CREATEDB privilege (Tom)
- Modify WAL log entries for CREATE and DROP DATABASE to not specify absolute paths (Tom)
  This allows point-in-time recovery on a different machine with possibly different database location. Note that CREATE TABLESPACE still poses a hazard in such situations.
- Fix crash from a backend exiting with an open transaction that created a table and opened a cursor on it (Tom)
- Fix array_map() so it can call PL functions (Tom)
- Several contrib/tsearch2 and contrib/btree_gist fixes (Teodor)
- Fix crash of some contrib/pgcrypto functions on some platforms (Marko Kreen)
- Fix contrib/intagg for 64-bit platforms (Tom)
- Fix ecpg bugs in parsing of CREATE statement (Michael)
- Work around gcc bug on powerpc and amd64 causing problems in ecpg (Christof Petig)
- Do not use locale-aware versions of upper(), lower(), and initcap() when the locale is C (Bruce)
  This allows these functions to work on platforms that generate errors for non-7-bit data when the locale is C.
- Fix quote_ident() to quote names that match keywords (Tom)
- Fix to_date() to behave reasonably when CC and YY fields are both used (Karel)
Appendix E. Release Notes

- Prevent `to_char(interval)` from failing when given a zero-month interval (Tom)
- Fix wrong week returned by `date_trunc('week')` (Bruce)
  `date_trunc('week')` returned the wrong year for the first few days of January in some years.
- Use the correct default mask length for class D addresses in INET data types (Tom)

E.270. Release 8.0.1

Release date: 2005-01-31

This release contains a variety of fixes from 8.0.0, including several security-related issues. For information about new features in the 8.0 major release, see Section E.271.

E.270.1. Migration to Version 8.0.1

A dump/restore is not required for those running 8.0.0.

E.270.2. Changes

- Disallow LOAD to non-superusers
  On platforms that will automatically execute initialization functions of a shared library (this includes at least Windows and ELF-based Unixen), LOAD can be used to make the server execute arbitrary code. Thanks to NGS Software for reporting this.
- Check that creator of an aggregate function has the right to execute the specified transition functions
  This oversight made it possible to bypass denial of EXECUTE permission on a function.
- Fix security and 64-bit issues in contrib/intagg
- Add needed STRICT marking to some contrib functions (Kris Jurka)
- Avoid buffer overrun when plpgsql cursor declaration has too many parameters (Neil)
- Make `ALTER TABLE ADD COLUMN` enforce domain constraints in all cases
- Fix planning error for FULL and RIGHT outer joins
  The result of the join was mistakenly supposed to be sorted the same as the left input. This could not only deliver mis-sorted output to the user, but in case of nested merge joins could give outright wrong answers.
- Improve planning of grouped aggregate queries
- ROLLBACK TO `savpoint` closes cursors created since the savpoint
- Fix inadequate backend stack size on Windows
- Avoid SHGetSpecialFolderPath() on Windows (Magnus)
- Fix some problems in running `pg_autovacuum` as a Windows service (Dave Page)
Appendix E. Release Notes

- Multiple minor bug fixes in pg_dump/pg_restore
- Fix ecpg segfault with named structs used in typedefs (Michael)

E.271. Release 8.0

Release date: 2005-01-19

E.271.1. Overview

Major changes in this release:

Microsoft Windows Native Server

This is the first PostgreSQL release to run natively on Microsoft Windows® as a server. It can run as a Windows service. This release supports NT-based Windows releases like Windows 2000 SP4, Windows XP, and Windows 2003. Older releases like Windows 95, Windows 98, and Windows ME are not supported because these operating systems do not have the infrastructure to support PostgreSQL. A separate installer project has been created to ease installation on Windows — see http://www.postgresql.org/ftp/win32/.

Although tested throughout our release cycle, the Windows port does not have the benefit of years of use in production environments that PostgreSQL has on Unix platforms. Therefore it should be treated with the same level of caution as you would a new product.

Previous releases required the Unix emulation toolkit Cygwin in order to run the server on Windows operating systems. PostgreSQL has supported native clients on Windows for many years.

Savepoints

Savepoints allow specific parts of a transaction to be aborted without affecting the remainder of the transaction. Prior releases had no such capability; there was no way to recover from a statement failure within a transaction except by aborting the whole transaction. This feature is valuable for application writers who require error recovery within a complex transaction.

Point-In-Time Recovery

In previous releases there was no way to recover from disk drive failure except to restore from a previous backup or use a standby replication server. Point-in-time recovery allows continuous backup of the server. You can recover either to the point of failure or to some transaction in the past.

Tablespaces

Tablespaces allow administrators to select different file systems for storage of individual tables, indexes, and databases. This improves performance and control over disk space usage. Prior releases used initlocation and manual symlink management for such tasks.

Improved Buffer Management, CHECKPOINT, VACUUM

This release has a more intelligent buffer replacement strategy, which will make better use of available shared buffers and improve performance. The performance impact of vacuum and checkpoints is also lessened.
Appendix E. Release Notes

Change Column Types

A column’s data type can now be changed with ALTER TABLE.

New Perl Server-Side Language

A new version of the plperl server-side language now supports a persistent shared storage area, triggers, returning records and arrays of records, and SPI calls to access the database.

Comma-separated-value (CSV) support in COPY

COPY can now read and write comma-separated-value files. It has the flexibility to interpret nonstandard quoting and separation characters too.

E.271.2. Migration to Version 8.0

A dump/restore using pg_dump is required for those wishing to migrate data from any previous release.

Observe the following incompatibilities:

• In READ COMMITTED serialization mode, volatile functions now see the results of concurrent transactions committed up to the beginning of each statement within the function, rather than up to the beginning of the interactive command that called the function.

• Functions declared STABLE or IMMUTABLE always use the snapshot of the calling query, and therefore do not see the effects of actions taken after the calling query starts, whether in their own transaction or other transactions. Such a function must be read-only, too, meaning that it cannot use any SQL commands other than SELECT.

• Nondeferred AFTER triggers are now fired immediately after completion of the triggering query, rather than upon finishing the current interactive command. This makes a difference when the triggering query occurred within a function: the trigger is invoked before the function proceeds to its next operation.

• Server configuration parameters virtual_host and tcpip_socket have been replaced with a more general parameter listen_addresses. Also, the server now listens on localhost by default, which eliminates the need for the -i postmaster switch in many scenarios.

• Server configuration parameters SortMem and VacuumMem have been renamed to work_mem and maintenance_work_mem to better reflect their use. The original names are still supported in SET and SHOW.

• Server configuration parameters log_pid, log_timestamp, and log_source_port have been replaced with a more general parameter log_line_prefix.

• Server configuration parameter syslog has been replaced with a more logical log_destination variable to control the log output destination.

• Server configuration parameter log_statement has been changed so it can selectively log just database modification or data definition statements. Server configuration parameter log_duration now prints only when log_statement prints the query.

• Server configuration parameter max_expr_depth parameter has been replaced with max_stack_depth which measures the physical stack size rather than the expression nesting depth. This helps prevent session termination due to stack overflow caused by recursive functions.

• The length() function no longer counts trailing spaces in CHAR(n) values.
• Casting an integer to $\text{BIT}(N)$ selects the rightmost $N$ bits of the integer, not the leftmost $N$ bits as before.

• Updating an element or slice of a NULL array value now produces a nonnull array result, namely an array containing just the assigned-to positions.

• Syntax checking of array input values has been tightened up considerably. Junk that was previously allowed in odd places with odd results now causes an error. Empty-string element values must now be written as "", rather than writing nothing. Also changed behavior with respect to whitespace surrounding array elements: trailing whitespace is now ignored, for symmetry with leading whitespace (which has always been ignored).

• Overflow in integer arithmetic operations is now detected and reported as an error.

• The arithmetic operators associated with the single-byte "char" data type have been removed.

• The `extract()` function (also called `date_part`) now returns the proper year for BC dates. It previously returned one less than the correct year. The function now also returns the proper values for millennium and century.

• CIDR values now must have their nonmasked bits be zero. For example, we no longer allow 204.248.199.1/31 as a CIDR value. Such values should never have been accepted by PostgreSQL and will now be rejected.

• `EXECUTE` now returns a completion tag that matches the executed statement.

• `psql`'s `\copy` command now reads or writes to the query's stdin/stdout, rather than `psql`'s stdin/stdout. The previous behavior can be accessed via new `pstdin/pstdout` parameters.

• The JDBC client interface has been removed from the core distribution, and is now hosted at http://jdbc.postgresql.org.

• The Tcl client interface has also been removed. There are several Tcl interfaces now hosted at http://gborg.postgresql.org.

• The server now uses its own time zone database, rather than the one supplied by the operating system. This will provide consistent behavior across all platforms. In most cases, there should be little noticeable difference in time zone behavior, except that the time zone names used by `SET/SHOW Time Zone` might be different from what your platform provides.

• Configure’s threading option no longer requires users to run tests or edit configuration files; threading options are now detected automatically.

• Now that tablespaces have been implemented, initlocation has been removed.

• The API for user-defined GiST indexes has been changed. The `Union` and `PickSplit` methods are now passed a pointer to a special `GistEntryVector` structure, rather than a `bytea`.

**E.271.3. Deprecated Features**

Some aspects of PostgreSQL’s behavior have been determined to be suboptimal. For the sake of backward compatibility these have not been removed in 8.0, but they are considered deprecated and will be removed in the next major release.

• The 8.1 release will remove the `to_char()` function for intervals.
• The server now warns of empty strings passed to oid/float4/float8 data types, but continues to interpret them as zeroes as before. In the next major release, empty strings will be considered invalid input for these data types.

• By default, tables in PostgreSQL 8.0 and earlier are created with OIDs. In the next release, this will not be the case: to create a table that contains OIDs, the WITH OIDS clause must be specified or the default_with_oids configuration parameter must be set. Users are encouraged to explicitly specify WITH OIDS if their tables require OIDs for compatibility with future releases of PostgreSQL.

**E.271.4. Changes**

Below you will find a detailed account of the changes between release 8.0 and the previous major release.

**E.271.4.1. Performance Improvements**

• Support cross-data-type index usage (Tom)

  Before this change, many queries would not use an index if the data types did not match exactly. This improvement makes index usage more intuitive and consistent.

• New buffer replacement strategy that improves caching (Jan)

  Prior releases used a least-recently-used (LRU) cache to keep recently referenced pages in memory. The LRU algorithm did not consider the number of times a specific cache entry was accessed, so large table scans could force out useful cache pages. The new cache algorithm uses four separate lists to track most recently used and most frequently used cache pages and dynamically optimize their replacement based on the work load. This should lead to much more efficient use of the shared buffer cache. Administrators who have tested shared buffer sizes in the past should retest with this new cache replacement policy.

• Add subprocess to write dirty buffers periodically to reduce checkpoint writes (Jan)

  In previous releases, the checkpoint process, which runs every few minutes, would write all dirty buffers to the operating system’s buffer cache then flush all dirty operating system buffers to disk. This resulted in a periodic spike in disk usage that often hurt performance. The new code uses a background writer to trickle disk writes at a steady pace so checkpoints have far fewer dirty pages to write to disk. Also, the new code does not issue a global sync() call, but instead fsync()s just the files written since the last checkpoint. This should improve performance and minimize degradation during checkpoints.

• Add ability to prolong vacuum to reduce performance impact (Jan)

  On busy systems, VACUUM performs many I/O requests which can hurt performance for other users. This release allows you to slow down VACUUM to reduce its impact on other users, though this increases the total duration of VACUUM.

• Improve B-tree index performance for duplicate keys (Dmitry Tkach, Tom)

  This improves the way indexes are scanned when many duplicate values exist in the index.

• Use dynamically-generated table size estimates while planning (Tom)

  Formerly the planner estimated table sizes using the values seen by the last VACUUM or ANALYZE, both as to physical table size (number of pages) and number of rows. Now, the current physical table size is obtained from the kernel, and the number of rows is estimated by multiplying the table size by the
row density (rows per page) seen by the last VACUUM or ANALYZE. This should produce more reliable estimates in cases where the table size has changed significantly since the last housekeeping command.

- Improved index usage with OR clauses (Tom)
  This allows the optimizer to use indexes in statements with many OR clauses that would not have been indexed in the past. It can also use multi-column indexes where the first column is specified and the second column is part of an OR clause.

- Improve matching of partial index clauses (Tom)
  The server is now smarter about using partial indexes in queries involving complex WHERE clauses.

- Improve performance of the GEQO optimizer (Tom)
  The GEQO optimizer is used to plan queries involving many tables (by default, twelve or more). This release speeds up the way queries are analyzed to decrease time spent in optimization.

- Miscellaneous optimizer improvements
  There is not room here to list all the minor improvements made, but numerous special cases work better than in prior releases.

- Improve lookup speed for C functions (Tom)
  This release uses a hash table to lookup information for dynamically loaded C functions. This improves their speed so they perform nearly as quickly as functions that are built into the server executable.

- Add type-specific ANALYZE statistics capability (Mark Cave-Ayland)
  This feature allows more flexibility in generating statistics for nonstandard data types.

- ANALYZE now collects statistics for expression indexes (Tom)
  Expression indexes (also called functional indexes) allow users to index not just columns but the results of expressions and function calls. With this release, the optimizer can gather and use statistics about the contents of expression indexes. This will greatly improve the quality of planning for queries in which an expression index is relevant.

- New two-stage sampling method for ANALYZE (Manfred Koizar)
  This gives better statistics when the density of valid rows is very different in different regions of a table.

- Speed up TRUNCATE (Tom)
  This buys back some of the performance loss observed in 7.4, while still keeping TRUNCATE transaction-safe.

### E.271.4.2. Server Changes

- Add WAL file archiving and point-in-time recovery (Simon Riggs)
- Add tablespaces so admins can control disk layout (Gavin)
- Add a built-in log rotation program (Andreas Pflug)
  It is now possible to log server messages conveniently without relying on either syslog or an external log rotation program.
Appendix E. Release Notes

- Add new read-only server configuration parameters to show server compile-time settings:
  block_size, integer_datetimes, max_function_args, max_identifier_length, max_index_keys (Joe)
- Make quoting of sameuser, samegroup, and all remove special meaning of these terms in pg_hba.conf (Andrew)
- Use clearer IPv6 name ::1/128 for localhost in default pg_hba.conf (Andrew)
- Use CIDR format in pg_hba.conf examples (Andrew)
- Rename server configuration parameters SortMem and VacuumMem to work_mem and maintenance_work_mem (Old names still supported) (Tom)
  This change was made to clarify that bulk operations such as index and foreign key creation use maintenance_work_mem, while work_mem is for workspaces used during query execution.
- Allow logging of session disconnections using server configuration log_disconnections (Andrew)
- Add new server configuration parameter log_line_prefix to allow control of information emitted in each log line (Andrew)
  Available information includes user name, database name, remote IP address, and session start time.
- Remove server configuration parameters log_pid, log_timestamp, log_source_port; functionality superseded by log_line_prefix (Andrew)
- Replace the virtual_host and tcpip_socket parameters with a unified listen_addresses parameter (Andrew, Tom)
  virtual_host could only specify a single IP address to listen on. listen_addresses allows multiple addresses to be specified.
- Listen on localhost by default, which eliminates the need for the –i postmaster switch in many scenarios (Andrew)
  Listening on localhost (127.0.0.1) opens no new security holes but allows configurations like Windows and JDBC, which do not support local sockets, to work without special adjustments.
- Remove syslog server configuration parameter, and add more logical log_destination variable to control log output location (Magnus)
- Change server configuration parameter log_statement to take values all, mod, ddl, or none to select which queries are logged (Bruce)
  This allows administrators to log only data definition changes or only data modification statements.
- Some logging-related configuration parameters could formerly be adjusted by ordinary users, but only in the “more verbose” direction. They are now treated more strictly: only superusers can set them. However, a superuser can use ALTER USER to provide per-user settings of these values for non-superusers. Also, it is now possible for superusers to set values of superuser-only configuration parameters via PGOPTIONS.
- Allow configuration files to be placed outside the data directory (mlw)
  By default, configuration files are kept in the cluster’s top directory. With this addition, configuration files can be placed outside the data directory, easing administration.
- Plan prepared queries only when first executed so constants can be used for statistics (Oliver Jowett)
Appendix E. Release Notes

Prepared statements plan queries once and execute them many times. While prepared queries avoid the overhead of re-planning on each use, the quality of the plan suffers from not knowing the exact parameters to be used in the query. In this release, planning of unnamed prepared statements is delayed until the first execution, and the actual parameter values of that execution are used as optimization hints. This allows use of out-of-line parameter passing without incurring a performance penalty.

- **Allow DECLARE CURSOR to take parameters** (Oliver Jowett)
  
  It is now useful to issue DECLARE CURSOR in a Parse message with parameters. The parameter values sent at Bind time will be substituted into the execution of the cursor’s query.

- **Fix hash joins and aggregates of inet and cidr data types** (Tom)
  
  Release 7.4 handled hashing of mixed inet and cidr values incorrectly. (This bug did not exist in prior releases because they wouldn’t try to hash either data type.)

- **Make log_duration print only when log_statement prints the query** (Ed L.)

E.271.4.3. Query Changes

- **Add savepoints (nested transactions)** (Alvaro)

- **Unsupported isolation levels are now accepted and promoted to the nearest supported level** (Peter)
  
  The SQL specification states that if a database doesn’t support a specific isolation level, it should use the next more restrictive level. This change complies with that recommendation.

- **Allow BEGIN WORK to specify transaction isolation levels like START TRANSACTION does** (Bruce)

- **Fix table permission checking for cases in which rules generate a query type different from the originally submitted query** (Tom)

- **Implement dollar quoting to simplify single-quote usage** (Andrew, Tom, David Fetter)
  
  In previous releases, because single quotes had to be used to quote a function’s body, the use of single quotes inside the function text required use of two single quotes or other error-prone notations. With this release we add the ability to use “dollar quoting” to quote a block of text. The ability to use different quoting delimiters at different nesting levels greatly simplifies the task of quoting correctly, especially in complex functions. Dollar quoting can be used anywhere quoted text is needed.

- **Make CASE val WHEN compval THEN ... evaluate val only once** (Tom)
  
  CASE no longer evaluates the tested expression multiple times. This has benefits when the expression is complex or is volatile.

- **Test HAVING before computing target list of an aggregate query** (Tom)
  
  Fixes improper failure of cases such as SELECT SUM(win)/SUM(lose) ... GROUP BY ... HAVING SUM(lose) > 0. This should work but formerly could fail with divide-by-zero.

- **Replace max_expr_depth parameter with max_stack_depth parameter, measured in kilobytes of stack size** (Tom)
  
  This gives us a fairly bulletproof defense against crashing due to runaway recursive functions. Instead of measuring the depth of expression nesting, we now directly measure the size of the execution stack.

- **Allow arbitrary row expressions** (Tom)
This release allows SQL expressions to contain arbitrary composite types, that is, row values. It also allows functions to more easily take rows as arguments and return row values.

- Allow `LIKE`/`ILIKE` to be used as the operator in row and subselect comparisons (Fabien Coelho)
- Avoid locale-specific case conversion of basic ASCII letters in identifiers and keywords (Tom)
  This solves the “Turkish problem” with mangling of words containing İ and i. Folding of characters outside the 7-bit-ASCII set is still locale-aware.
- Improve syntax error reporting (Fabien, Tom)
  Syntax error reports are more useful than before.
- Change `EXECUTE` to return a completion tag matching the executed statement (Kris Jurka)
  Previous releases return an `EXECUTE` tag for any `EXECUTE` call. In this release, the tag returned will reflect the command executed.
- Avoid emitting `NATURAL CROSS JOIN` in rule listings (Tom)
  Such a clause makes no logical sense, but in some cases the rule decompiler formerly produced this syntax.

**E.271.4.4. Object Manipulation Changes**

- Add `COMMENT ON` for casts, conversions, languages, operator classes, and large objects (Christopher)
- Add new server configuration parameter `default_with_oids` to control whether tables are created with OIDs by default (Neil)
  This allows administrators to control whether `CREATE TABLE` commands create tables with or without OID columns by default. (Note: the current factory default setting for `default_with_oids` is `TRUE`, but the default will become `FALSE` in future releases.)
- Add `WITH / WITHOUT OIDS` clause to `CREATE TABLE AS` (Neil)
- Allow `ALTER TABLE DROP COLUMN` to drop an OID column (`ALTER TABLE SET WITHOUT OIDS` still works) (Tom)
- Allow composite types as table columns (Tom)
- Allow `ALTER ... ADD COLUMN` with defaults and `NOT NULL` constraints; works per SQL spec (Rod)
  It is now possible for `ADD COLUMN` to create a column that is not initially filled with NULLs, but with a specified default value.
- Add `ALTER COLUMN TYPE` to change column’s type (Rod)
  It is now possible to alter a column’s data type without dropping and re-adding the column.
- Allow multiple `ALTER` actions in a single `ALTER TABLE` command (Rod)
  This is particularly useful for `ALTER` commands that rewrite the table (which include `ALTER COLUMN TYPE` and `ADD COLUMN` with a default). By grouping `ALTER` commands together, the table need be rewritten only once.
- Allow `ALTER TABLE` to add `SERIAL` columns (Tom)
  This falls out from the new capability of specifying defaults for new columns.
Appendix E. Release Notes

- Allow changing the owners of aggregates, conversions, databases, functions, operators, operator classes, schemas, types, and tablespaces (Christopher, Euler Taveira de Oliveira)
  
  Previously this required modifying the system tables directly.

- Allow temporary object creation to be limited to \texttt{SECURITY DEFINER} functions (Sean Chittenden)

- Add \texttt{ALTER TABLE \ldots SET WITHOUT CLUSTER} (Christopher)
  
  Prior to this release, there was no way to clear an auto-cluster specification except to modify the system tables.

- Constraint/Index/SERIAL names are now \texttt{table_column_type} with numbers appended to guarantee uniqueness within the schema (Tom)
  
  The SQL specification states that such names should be unique within a schema.

- Add \texttt{pg_get_serial_sequence()} to return a SERIAL column’s sequence name (Christopher)
  
  This allows automated scripts to reliably find the SERIAL sequence name.

- Warn when primary/foreign key data type mismatch requires costly lookup

- New \texttt{ALTER INDEX} command to allow moving of indexes between tablespaces (Gavin)

- Make \texttt{ALTER TABLE OWNER} change dependent sequence ownership too (Alvaro)

E.271.4.5. Utility Command Changes

- Allow \texttt{CREATE SCHEMA} to create triggers, indexes, and sequences (Neil)

- Add \texttt{ALSO} keyword to \texttt{CREATE RULE} (Fabien Coelho)
  
  This allows \texttt{ALSO} to be added to rule creation to contrast it with \texttt{INSTEAD} rules.

- Add \texttt{NOWAIT} option to \texttt{LOCK} (Tatsuo)
  
  This allows the \texttt{LOCK} command to fail if it would have to wait for the requested lock.

- Allow \texttt{COPY} to read and write comma-separated-value (CSV) files (Andrew, Bruce)

- Generate error if the \texttt{COPY} delimiter and NULL string conflict (Bruce)

- \texttt{GRANT/REVOKE} behavior follows the SQL spec more closely

- Avoid locking conflict between \texttt{CREATE INDEX} and \texttt{CHECKPOINT} (Tom)
  
  In 7.3 and 7.4, a long-running B-tree index build could block concurrent \texttt{CHECKPOINT}s from completing, thereby causing WAL bloat because the WAL log could not be recycled.

- Database-wide \texttt{ANALYZE} does not hold locks across tables (Tom)
  
  This reduces the potential for deadlocks against other backends that want exclusive locks on tables. To get the benefit of this change, do not execute database-wide \texttt{ANALYZE} inside a transaction block (\texttt{BEGIN} block); it must be able to commit and start a new transaction for each table.

- \texttt{REINDEX} does not exclusively lock the index’s parent table anymore
  
  The index itself is still exclusively locked, but readers of the table can continue if they are not using the particular index being rebuilt.

- Erase MD5 user passwords when a user is renamed (Bruce)
Appendix E. Release Notes

PostgreSQL uses the user name as salt when encrypting passwords via MD5. When a user’s name is changed, the salt will no longer match the stored MD5 password, so the stored password becomes useless. In this release a notice is generated and the password is cleared. A new password must then be assigned if the user is to be able to log in with a password.

- New `pg_ctl kill` option for Windows (Andrew)
  Windows does not have a `kill` command to send signals to backends so this capability was added to `pg_ctl`.
- Information schema improvements
- Add `--pwfile` option to `initdb` so the initial password can be set by GUI tools (Magnus)
- Detect locale/encoding mismatch in `initdb` (Peter)
- Add `register` command to `pg_ctl` to register Windows operating system service (Dave Page)

### E.271.4.6. Data Type and Function Changes

- More complete support for composite types (row types) (Tom)
  Composite values can be used in many places where only scalar values worked before.
- Reject nonrectangular array values as erroneous (Joe)
  Formerly, `array_in` would silently build a surprising result.
- Overflow in integer arithmetic operations is now detected (Tom)
- The arithmetic operators associated with the single-byte "char" data type have been removed.
  Formerly, the parser would select these operators in many situations where an “unable to select an operator” error would be more appropriate, such as `null * null`. If you actually want to do arithmetic on a "char" column, you can cast it to integer explicitly.
- Syntax checking of array input values considerably tightened up (Joe)
  Junk that was previously allowed in odd places with odd results now causes an `ERROR`, for example, non-whitespace after the closing right brace.
- Empty-string array element values must now be written as "", rather than writing nothing (Joe)
  Formerly, both ways of writing an empty-string element value were allowed, but now a quoted empty string is required. The case where nothing at all appears will probably be considered to be a NULL element value in some future release.
- Array element trailing whitespace is now ignored (Joe)
  Formerly leading whitespace was ignored, but trailing whitespace between an element value and the delimiter or right brace was significant. Now trailing whitespace is also ignored.
- Emit array values with explicit array bounds when lower bound is not one (Joe)
- Accept `YYYY-monthname-DD` as a date string (Tom)
- Make `netmask` and `hostmask` functions return maximum-length mask length (Tom)
- Change factorial function to return `numeric` (Gavin)
Returning numeric allows the factorial function to work for a wider range of input values.

- **to_char/to_date()** date conversion improvements (Kurt Roeckx, Fabien Coelho)
- **Make length()** disregard trailing spaces in CHAR(n) (Gavin)
  
  This change was made to improve consistency: trailing spaces are semantically insignificant in CHAR(n) data, so they should not be counted by length().

- **Warn about empty string being passed to OID/float4/float8 data types** (Neil)
  
  8.1 will throw an error instead.

- **Allow leading or trailing whitespace in int2/int4/int8/float4/float8 input routines** (Neil)

- **Better support for IEEE Infinity and NaN values in float4/float8** (Neil)
  
  These should now work on all platforms that support IEEE-compliant floating point arithmetic.

- **Add week option to date_trunc()** (Robert Creager)

- **Fix to_char for 1 BC** (previously it returned 1 AD) (Bruce)

- **Fix date_part(year) for BC dates** (previously it returned one less than the correct year) (Bruce)

  In previous versions, the century and millennium results had a wrong number and started in the wrong year, as compared to standard reckoning of such things.

- **Add ceiling() as an alias for ceil(), and power() as an alias for pow() for standards compliance** (Neil)

- **Change ln(), log(), power(), and sqrt() to emit the correct SQLSTATE error codes for certain error conditions, as specified by SQL:2003** (Neil)

- **Add width_bucket() function as defined by SQL:2003** (Neil)

- **Add generate_series() functions to simplify working with numeric sets** (Joe)

- **Fix upper/lower/initcap() functions to work with multibyte encodings** (Tom)

- **Add boolean and bitwise integer AND/OR aggregates** (Fabien Coelho)

- **New session information functions to return network addresses for client and server** (Sean Chittenden)

- **Add function to determine the area of a closed path** (Sean Chittenden)

- **Add function to send cancel request to other backends** (Magnus)

- **Add interval plus datetime operators** (Tom)
  
  The reverse ordering, datetime plus interval, was already supported, but both are required by the SQL standard.

- **Casting an integer to BIT(N) selects the rightmost N bits of the integer** (Tom)
  
  In prior releases, the leftmost N bits were selected, but this was deemed unhelpful, not to mention inconsistent with casting from bit to int.

- **Require CIDR values to have all nonmasked bits be zero** (Kevin Brintnall)
E.271.4.7. Server-Side Language Changes

- In **READ COMMITTED** serialization mode, volatile functions now see the results of concurrent transactions committed up to the beginning of each statement within the function, rather than up to the beginning of the interactive command that called the function.

- Functions declared **STABLE** or **IMMUTABLE** always use the snapshot of the calling query, and therefore do not see the effects of actions taken after the calling query starts, whether in their own transaction or other transactions. Such a function must be read-only, too, meaning that it cannot use any SQL commands other than **SELECT**. There is a considerable performance gain from declaring a function **STABLE** or **IMMUTABLE** rather than **VOLATILE**.

- Nondeferred **AFTER** triggers are now fired immediately after completion of the triggering query, rather than upon finishing the current interactive command. This makes a difference when the triggering query occurred within a function: the trigger is invoked before the function proceeds to its next operation. For example, if a function inserts a new row into a table, any nondeferred foreign key checks occur before proceeding with the function.

- Allow function parameters to be declared with names (Dennis Björklund)
  This allows better documentation of functions. Whether the names actually do anything depends on the specific function language being used.

- Allow PL/pgSQL parameter names to be referenced in the function (Dennis Björklund)
  This basically creates an automatic alias for each named parameter.

- Do minimal syntax checking of PL/pgSQL functions at creation time (Tom)
  This allows us to catch simple syntax errors sooner.

- More support for composite types (row and record variables) in PL/pgSQL
  For example, it now works to pass a rowtype variable to another function as a single variable.

- Default values for PL/pgSQL variables can now reference previously declared variables

- Improve parsing of PL/pgSQL FOR loops (Tom)
  Parsing is now driven by presence of ".." rather than data type of **FOR** variable. This makes no difference for correct functions, but should result in more understandable error messages when a mistake is made.

- Major overhaul of PL/Perl server-side language (Command Prompt, Andrew Dunstan)

- In PL/Tcl, SPI commands are now run in subtransactions. If an error occurs, the subtransaction is cleaned up and the error is reported as an ordinary Tcl error, which can be trapped with **catch**. Formerly, it was not possible to catch such errors.

- Accept **ELSEIF** in PL/pgSQL (Neil)
  Previously PL/pgSQL only allowed **ELSIF**, but many people are accustomed to spelling this keyword **ELSEIF**.
E.271.4.8. psql Changes

- Improve psql information display about database objects (Christopher)
- Allow psql to display group membership in `\du` and `\dg` (Markus Bertheau)
- Prevent psql `\dn` from showing temporary schemas (Bruce)
- Allow psql to handle tilde user expansion for file names (Zach Irmen)
- Allow psql to display fancy prompts, including color, via readline (Reece Hart, Chet Ramey)
- Make psql `\copy` match `COPY` command syntax fully (Tom)
- Show the location of syntax errors (Fabien Coelho, Tom)
- Add `CLUSTER` information to psql `\d` display (Bruce)
- Change psql `\copy stdin/stdout` to read from command input/output (Bruce)
- Add `pstdin/pstdout` to read from psql’s stdin/stdout (Mark Feit)
- Add global psql configuration file, `psqlrc.sample` (Bruce)
  This allows a central file where global psql startup commands can be stored.
- Have psql `\d+` indicate if the table has an OID column (Neil)
- On Windows, use binary mode in psql when reading files so control-Z is not seen as end-of-file
- Have `\dn+` show permissions and description for schemas (Dennis Björklund)
- Improve tab completion support (Stefan Kaltenbrunn, Greg Sabino Mullane)
- Allow boolean settings to be set using upper or lower case (Michael Paesold)

E.271.4.9. pg_dump Changes

- Use dependency information to improve the reliability of pg_dump (Tom)
  This should solve the longstanding problems with related objects sometimes being dumped in the wrong order.
- Have pg_dump output objects in alphabetical order if possible (Tom)
  This should make it easier to identify changes between dump files.
- Allow pg_restore to ignore some SQL errors (Fabien Coelho)
  This makes pg_restore’s behavior similar to the results of feeding a pg_dump output script to psql. In most cases, ignoring errors and plowing ahead is the most useful thing to do. Also added was a pg_restore option to give the old behavior of exiting on an error.
- pg_restore -l display now includes objects’ schema names
- New begin/end markers in pg_dump text output (Bruce)
- Add start/stop times for pg_dump/pg_dumpall in verbose mode (Bruce)
- Allow most pg_dump options in pg_dumpall (Christopher)
• Have pg_dump use `ALTER OWNER` rather than `SET SESSION AUTHORIZATION` by default (Christopher)

**E.271.4.10. libpq Changes**

• Make libpq's `SIGPIPE` handling thread-safe (Bruce)
• Add `PQmbdsplen()` which returns the display length of a character (Tatsuo)
• Add thread locking to SSL and Kerberos connections (Manfred Spraul)
• Allow `PQoidValue()`, `PQcmdTuples()`, and `PQoidStatus()` to work on `EXECUTE` commands (Neil)
• Add `PQserverVersion()` to provide more convenient access to the server version number (Greg Sabino Mullane)
• Add `PQprepare/PQsendPrepared()` functions to support preparing statements without necessarily specifying the data types of their parameters (Abhijit Menon-Sen)
• Many ECPG improvements, including `SET DESCRIPTOR` (Michael)

**E.271.4.11. Source Code Changes**

• Allow the database server to run natively on Windows (Claudio, Magnus, Andrew)
• Shell script commands converted to C versions for Windows support (Andrew)
• Create an extension makefile framework (Fabien Coelho, Peter)
  This simplifies the task of building extensions outside the original source tree.
• Support relocatable installations (Bruce)
  Directory paths for installed files (such as the `/share` directory) are now computed relative to the actual location of the executables, so that an installation tree can be moved to another place without reconfiguring and rebuilding.
• Use `--with-docdir` to choose installation location of documentation; also allow `--infodir` (Peter)
• Add `--without-docdir` to prevent installation of documentation (Peter)
• Upgrade to DocBook V4.2 SGML (Peter)
• New PostgreSQL CVS tag (Marc)
  This was done to make it easier for organizations to manage their own copies of the PostgreSQL CVS repository. File version stamps from the master repository will not get munged by checking into or out of a copied repository.
• Clarify locking code (Manfred Koizar)
• Buffer manager cleanup (Neil)
• Decouple platform tests from CPU spinlock code (Bruce, Tom)
• Add inlined test-and-set code on PA-RISC for gcc (ViSolve, Tom)
• Improve i386 spinlock code (Manfred Spraul)
• Clean up spinlock assembly code to avoid warnings from newer gcc releases (Tom)
• Remove JDBC from source tree; now a separate project
• Remove the libpgtcl client interface; now a separate project
• More accurately estimate memory and file descriptor usage (Tom)
• Improvements to the Mac OS X startup scripts (Ray A.)
• New `fsync()` test program (Bruce)
• Major documentation improvements (Neil, Peter)
• Remove pg_encoding; not needed anymore
• Remove pg_id; not needed anymore
• Remove initlocation; not needed anymore
• Auto-detect thread flags (no more manual testing) (Bruce)
• Use Olson’s public domain timezone library (Magnus)
• With threading enabled, use thread flags on Unixware for backend executables too (Bruce)
  Unixware cannot mix threaded and nonthreaded object files in the same executable, so everything must
  be compiled as threaded.
• psql now uses a flex-generated lexical analyzer to process command strings
• Reimplement the linked list data structure used throughout the backend (Neil)
  This improves performance by allowing list append and length operations to be more efficient.
• Allow dynamically loaded modules to create their own server configuration parameters (Thomas Hall-
  gren)
• New Brazilian version of FAQ (Euler Taveira de Oliveira)
• Add French FAQ (Guillaume Lelarge)
• New pgevent for Windows logging
• Make libpq and ECPG build as proper shared libraries on OS X (Tom)

E.271.4.12. Contrib Changes

• Overhaul of contrib/dblink (Joe)
• contrib/dbmirror improvements (Steven Singer)
• New contrib/xml2 (John Gray, Torchbox)
• Updated contrib/mysql
• New version of contrib/btree_gist (Teodor)
• New contrib/trgm, trigram matching for PostgreSQL (Teodor)
• Many contrib/tsearch2 improvements (Teodor)
Appendix E. Release Notes

• Add double metaphone to `contrib/fuzzystromatch` (Andrew)
• Allow `contrib/pg_autovacuum` to run as a Windows service (Dave Page)
• Add functions to `contrib/dbsize` (Andreas Pflug)
• Removed `contrib/pg_logger`: obsoleted by integrated logging subprocess
• Removed `contrib/rserv`: obsoleted by various separate projects

E.272. Release 7.4.30

Release date: 2010-10-04

This release contains a variety of fixes from 7.4.29. For information about new features in the 7.4 major release, see Section E.302.

This is expected to be the last PostgreSQL release in the 7.4.X series. Users are encouraged to update to a newer release branch soon.

E.272.1. Migration to Version 7.4.30

A dump/restore is not required for those running 7.4.X. However, if you are upgrading from a version earlier than 7.4.26, see Section E.276.

E.272.2. Changes

• Use a separate interpreter for each calling SQL userid in PL/Perl and PL/Tcl (Tom Lane)

  This change prevents security problems that can be caused by subverting Perl or Tcl code that will be executed later in the same session under another SQL user identity (for example, within a `SECURITY DEFINER` function). Most scripting languages offer numerous ways that might be done, such as redefining standard functions or operators called by the target function. Without this change, any SQL user with Perl or Tcl language usage rights can do essentially anything with the SQL privileges of the target function’s owner.

  The cost of this change is that intentional communication among Perl and Tcl functions becomes more difficult. To provide an escape hatch, PL/PerlU and PL/TclU functions continue to use only one interpreter per session. This is not considered a security issue since all such functions execute at the trust level of a database superuser already.

  It is likely that third-party procedural languages that claim to offer trusted execution have similar security issues. We advise contacting the authors of any PL you are depending on for security-critical purposes.

  Our thanks to Tim Bunce for pointing out this issue (CVE-2010-3433).

• Prevent possible crashes in `pg_get_expr()` by disallowing it from being called with an argument that is not one of the system catalog columns it’s intended to be used with (Heikki Linnakangas, Tom Lane)
• Fix “cannot handle unplanned sub-select” error (Tom Lane)
  This occurred when a sub-select contains a join alias reference that expands into an expression containing another sub-select.
• Take care to fsync the contents of lockfiles (both postmaster.pid and the socket lockfile) while writing them (Tom Lane)
  This omission could result in corrupted lockfile contents if the machine crashes shortly after postmaster start. That could in turn prevent subsequent attempts to start the postmaster from succeeding, until the lockfile is manually removed.
• Improve contrib/dblink’s handling of tables containing dropped columns (Tom Lane)
• Fix connection leak after “duplicate connection name” errors in contrib/dblink (Itagaki Takahiro)
• Update build infrastructure and documentation to reflect the source code repository’s move from CVS to Git (Magnus Hagander and others)

E.273. Release 7.4.29

Release date: 2010-05-17

This release contains a variety of fixes from 7.4.28. For information about new features in the 7.4 major release, see Section E.302.

The PostgreSQL community will stop releasing updates for the 7.4.X release series in July 2010. Users are encouraged to update to a newer release branch soon.

E.273.1. Migration to Version 7.4.29

A dump/restore is not required for those running 7.4.X. However, if you are upgrading from a version earlier than 7.4.26, see Section E.276.

E.273.2. Changes

• Enforce restrictions in plperl using an opmask applied to the whole interpreter, instead of using Safe.pm (Tim Bunce, Andrew Dunstan)
  Recent developments have convinced us that Safe.pm is too insecure to rely on for making plperl trustable. This change removes use of Safe.pm altogether, in favor of using a separate interpreter with an opcode mask that is always applied. Pleasant side effects of the change include that it is now possible to use Perl’s strict pragma in a natural way in plperl, and that Perl’s $a and $b variables work as expected in sort routines, and that function compilation is significantly faster. (CVE-2010-1169)
• Prevent PL/Tcl from executing untrustworthy code from pltcl_modules (Tom)
  PL/Tcl’s feature for autoloading Tcl code from a database table could be exploited for trojan-horse attacks, because there was no restriction on who could create or insert into that table. This change disables the feature unless pltcl_modules is owned by a superuser. (However, the permissions on the
Add new configuration parameter ssl_renegotiation_limit to control how often we do session key renegotiation for an SSL connection (Magnus)
This can be set to zero to disable renegotiation completely, which may be required if a broken SSL library is used. In particular, some vendors are shipping stopgap patches for CVE-2009-3555 that cause renegotiation attempts to fail.

- Make substring() for bit types treat any negative length as meaning “all the rest of the string” (Tom)
  The previous coding treated only -1 that way, and would produce an invalid result value for other negative values, possibly leading to a crash (CVE-2010-0442).
- Fix some cases of pathologically slow regular expression matching (Tom)
- When reading pg_hba.conf and related files, do not treat @something as a file inclusion request if the @ appears inside quote marks; also, never treat @ by itself as a file inclusion request (Tom)
  This prevents erratic behavior if a role or database name starts with @. If you need to include a file whose path name contains spaces, you can still do so, but you must write @"/path to/file" rather than putting the quotes around the whole construct.
- Prevent infinite loop on some platforms if a directory is named as an inclusion target in pg_hba.conf and related files (Tom)
- Ensure PL/Tcl initializes the Tcl interpreter fully (Tom)
  The only known symptom of this oversight is that the Tcl clock command misbehaves if using Tcl 8.5 or later.
- Prevent crash in contrib/dblink when too many key columns are specified to a dblink_build_sql_* function (Rushabh Lathia, Joe Conway)

E.275. Release 7.4.27

Release date: 2009-12-14

This release contains a variety of fixes from 7.4.26. For information about new features in the 7.4 major release, see Section E.302.

E.275.1. Migration to Version 7.4.27

A dump/restore is not required for those running 7.4.X. However, if you are upgrading from a version earlier than 7.4.26, see Section E.276.

E.275.2. Changes

- Protect against indirect security threats caused by index functions changing session-local state (Gurjeet Singh, Tom)
  This change prevents allegedly-immutable index functions from possibly subverting a superuser’s session (CVE-2009-4136).
Appendix E. Release Notes

- Reject SSL certificates containing an embedded null byte in the common name (CN) field (Magnus)
  
  This prevents unintended matching of a certificate to a server or client name during SSL validation (CVE-2009-4034).

- Fix possible crash during backend-startup-time cache initialization (Tom)

- Prevent signals from interrupting VACUUM at unsafe times (Alvaro)
  
  This fix prevents a PANIC if a VACUUM FULL is canceled after it’s already committed its tuple movements, as well as transient errors if a plain VACUUM is interrupted after having truncated the table.

- Fix possible crash due to integer overflow in hash table size calculation (Tom)
  
  This could occur with extremely large planner estimates for the size of a hashjoin’s result.

- Fix very rare crash in inet/cidr comparisons (Chris Mikkelson)

- Fix PAM password processing to be more robust (Tom)
  
  The previous code is known to fail with the combination of the Linux pam_krb5 PAM module with Microsoft Active Directory as the domain controller. It might have problems elsewhere too, since it was making unjustified assumptions about what arguments the PAM stack would pass to it.

- Make the postmaster ignore any application_name parameter in connection request packets, to improve compatibility with future libpq versions (Tom)

E.276. Release 7.4.26

Release date: 2009-09-09

This release contains a variety of fixes from 7.4.25. For information about new features in the 7.4 major release, see Section E.302.

E.276.1. Migration to Version 7.4.26

A dump/restore is not required for those running 7.4.X. However, if you have any hash indexes on interval columns, you must REINDEX them after updating to 7.4.26. Also, if you are upgrading from a version earlier than 7.4.11, see Section E.291.

E.276.2. Changes

- Disallow RESET ROLE and RESET SESSION AUTHORIZATION inside security-definer functions (Tom, Heikki)
  
  This covers a case that was missed in the previous patch that disallowed SET ROLE and SET SESSION AUTHORIZATION inside security-definer functions. (See CVE-2007-6600)

- Fix handling of sub-SELECTs appearing in the arguments of an outer-level aggregate function (Tom)

- Fix hash calculation for data type interval (Tom)
This corrects wrong results for hash joins on interval values. It also changes the contents of hash indexes on interval columns. If you have any such indexes, you must `REINDEX` them after updating.

- Fix overflow for `INTERVAL 'x ms'` when `x` is more than 2 million and integer datetimes are in use (Alex Hunsaker)
- Fix calculation of distance between a point and a line segment (Tom)
  This led to incorrect results from a number of geometric operators.
- Fix `money` data type to work in locales where currency amounts have no fractional digits, e.g. Japan (Itagaki Takahiro)
- Properly round datetime input like 00:12:57.99999999999999999999999999999999 (Tom)
- Fix poor choice of page split point in GiST R-tree operator classes (Teodor)
- Fix portability issues in plperl initialization (Andrew Dunstan)
- Improve robustness of libpq’s code to recover from errors during `COPY FROM STDIN` (Tom)
- Avoid including conflicting readline and editline header files when both libraries are installed (Zdenek Kotala)

### E.277. Release 7.4.25

**Release date:** 2009-03-16

This release contains a variety of fixes from 7.4.24. For information about new features in the 7.4 major release, see Section E.302.

#### E.277.1. Migration to Version 7.4.25

A dump/restore is not required for those running 7.4.X. However, if you are upgrading from a version earlier than 7.4.11, see Section E.291.

#### E.277.2. Changes

- Prevent error recursion crashes when encoding conversion fails (Tom)
  This change extends fixes made in the last two minor releases for related failure scenarios. The previous fixes were narrowly tailored for the original problem reports, but we have now recognized that *any* error thrown by an encoding conversion function could potentially lead to infinite recursion while trying to report the error. The solution therefore is to disable translation and encoding conversion and report the plain-ASCII form of any error message, if we find we have gotten into a recursive error reporting situation. (CVE-2009-0922)
- Disallow `CREATE CONVERSION` with the wrong encodings for the specified conversion function (Heikki)
This prevents one possible scenario for encoding conversion failure. The previous change is a backstop to guard against other kinds of failures in the same area.

- Fix core dump when `to_char()` is given format codes that are inappropriate for the type of the data argument (Tom)
- Add **MUST** (Mauritius Island Summer Time) to the default list of known timezone abbreviations (Xavier Bugaud)

**E.278. Release 7.4.24**

**Release date:** 2009-02-02

This release contains a variety of fixes from 7.4.23. For information about new features in the 7.4 major release, see Section E.302.

**E.278.1. Migration to Version 7.4.24**

A dump/restore is not required for those running 7.4.X. However, if you are upgrading from a version earlier than 7.4.11, see Section E.291.

**E.278.2. Changes**

- Improve handling of URLs in `headline()` function (Teodor)
- Improve handling of overlength headlines in `headline()` function (Teodor)
- Prevent possible Assert failure or misconversion if an encoding conversion is created with the wrong conversion function for the specified pair of encodings (Tom, Heikki)
- Avoid unnecessary locking of small tables in `VACUUM` (Heikki)
- Fix uninitialized variables in `contrib/tsearch2`'s `get_covers()` function (Teodor)
- Fix bug in `to_char()`'s handling of TH format codes (Andreas Scherbaum)
- Make all documentation reference `pgsql-bugs` and/or `pgsql-hackers` as appropriate, instead of the now-decommissioned `pgsql-ports` and `pgsql-patches` mailing lists (Tom)

**E.279. Release 7.4.23**

**Release date:** 2008-11-03

This release contains a variety of fixes from 7.4.22. For information about new features in the 7.4 major release, see Section E.302.
E.279.1. Migration to Version 7.4.23

A dump/restore is not required for those running 7.4.X. However, if you are upgrading from a version earlier than 7.4.11, see Section E.291.

E.279.2. Changes

- Fix backend crash when the client encoding cannot represent a localized error message (Tom)
  
  We have addressed similar issues before, but it would still fail if the “character has no equivalent” message itself couldn’t be converted. The fix is to disable localization and send the plain ASCII error message when we detect such a situation.

- Fix incorrect tsearch2 headline generation when single query item matches first word of text (Sushant Sinha)

- Fix improper display of fractional seconds in interval values when using a non-ISO datestyle in an --enable-integer-datetimes build (Ron Mayer)

- Ensure SPI_getvalue and SPI_getberval behave correctly when the passed tuple and tuple descriptor have different numbers of columns (Tom)
  
  This situation is normal when a table has had columns added or removed, but these two functions didn’t handle it properly. The only likely consequence is an incorrect error indication.

- Fix ecpg’s parsing of CREATE USER (Michael)

E.280. Release 7.4.22

Release date: 2008-09-22

This release contains a variety of fixes from 7.4.21. For information about new features in the 7.4 major release, see Section E.302.

E.280.1. Migration to Version 7.4.22

A dump/restore is not required for those running 7.4.X. However, if you are upgrading from a version earlier than 7.4.11, see Section E.291.

E.280.2. Changes

- Fix datetime input functions to correctly detect integer overflow when running on a 64-bit platform (Tom)

- Improve performance of writing very long log messages to syslog (Tom)

- Fix bug in backwards scanning of a cursor on a SELECT DISTINCT ON query (Tom)
• Fix planner to estimate that `GROUP BY` expressions yielding boolean results always result in two groups, regardless of the expressions’ contents (Tom)
  This is very substantially more accurate than the regular `GROUP BY` estimate for certain boolean tests like `col IS NULL`.
• Improve `pg_dump` and `pg_restore`’s error reporting after failure to send a SQL command (Tom)

**E.281. Release 7.4.21**

*Release date:* 2008-06-12

This release contains one serious bug fix over 7.4.20. For information about new features in the 7.4 major release, see Section E.302.

**E.281.1. Migration to Version 7.4.21**

A dump/restore is not required for those running 7.4.X. However, if you are upgrading from a version earlier than 7.4.11, see Section E.291.

**E.281.2. Changes**

• Make `pg_get_ruledef()` parenthesize negative constants (Tom)
  Before this fix, a negative constant in a view or rule might be dumped as, say, `-42::integer`, which is subtly incorrect: it should be `(-42)::integer` due to operator precedence rules. Usually this would make little difference, but it could interact with another recent patch to cause PostgreSQL to reject what had been a valid `SELECT DISTINCT` view query. Since this could result in `pg_dump` output failing to reload, it is being treated as a high-priority fix. The only released versions in which dump output is actually incorrect are 8.3.1 and 8.2.7.

**E.282. Release 7.4.20**

*Release date:* never released

This release contains a variety of fixes from 7.4.19. For information about new features in the 7.4 major release, see Section E.302.

**E.282.1. Migration to Version 7.4.20**

A dump/restore is not required for those running 7.4.X. However, if you are upgrading from a version earlier than 7.4.11, see Section E.291.
E.282.2. Changes

- Fix conversions between ISO-8859-5 and other encodings to handle Cyrillic “Yo” characters (ё and Е with two dots) (Sergey Burladyan)
- Fix a few datatype input functions that were allowing unused bytes in their results to contain uninitialized, unpredictable values (Tom)
  This could lead to failures in which two apparently identical literal values were not seen as equal, resulting in the parser complaining about unmatched ORDER BY and DISTINCT expressions.
- Fix a corner case in regular-expression substring matching \( \text{substring}(\text{string from pattern}) \) (Tom)
  The problem occurs when there is a match to the pattern overall but the user has specified a parenthesized subexpression and that subexpression hasn’t got a match. An example is \( \text{substring}('foo from 'foo(bar)?') \). This should return NULL, since (bar) isn’t matched, but it was mistakenly returning the whole-pattern match instead (ie, foo).
- Fix incorrect result from ecpg’s `PGTYPEStimestamp_sub()` function (Michael)
- Fix `DatumGetBool` macro to not fail with gcc 4.3 (Tom)
  This problem affects “old style” (V0) C functions that return boolean. The fix is already in 8.3, but the need to back-patch it was not realized at the time.
- Fix longstanding `LISTEN/NOTIFY` race condition (Tom)
  In rare cases a session that had just executed a `LISTEN` might not get a notification, even though one would be expected because the concurrent transaction executing `NOTIFY` was observed to commit later.
  A side effect of the fix is that a transaction that has executed a not-yet-committed `LISTEN` command will not see any row in `pg_listener` for the `LISTEN`, should it choose to look; formerly it would have. This behavior was never documented one way or the other, but it is possible that some applications depend on the old behavior.
- Fix display of constant expressions in ORDER BY and GROUP BY (Tom)
  An explicitly casted constant would be shown incorrectly. This could for example lead to corruption of a view definition during dump and reload.
- Fix libpq to handle NOTICE messages correctly during COPY OUT (Tom)
  This failure has only been observed to occur when a user-defined datatype’s output routine issues a NOTICE, but there is no guarantee it couldn’t happen due to other causes.

E.283. Release 7.4.19

Release date: 2008-01-07

This release contains a variety of fixes from 7.4.18, including fixes for significant security issues. For information about new features in the 7.4 major release, see Section E.302.
E.283.1. Migration to Version 7.4.19

A dump/restore is not required for those running 7.4.X. However, if you are upgrading from a version earlier than 7.4.11, see Section E.291.

E.283.2. Changes

- Prevent functions in indexes from executing with the privileges of the user running `VACUUM`, `ANALYZE`, etc (Tom)

  Functions used in index expressions and partial-index predicates are evaluated whenever a new table entry is made. It has long been understood that this poses a risk of trojan-horse code execution if one modifies a table owned by an untrustworthy user. (Note that triggers, defaults, check constraints, etc. pose the same type of risk.) But functions in indexes pose extra danger because they will be executed by routine maintenance operations such as `VACUUM FULL`, which are commonly performed automatically under a superuser account. For example, a nefarious user can execute code with superuser privileges by setting up a trojan-horse index definition and waiting for the next routine vacuum. The fix arranges for standard maintenance operations (including `VACUUM`, `ANALYZE`, `REINDEX`, and `CLUSTER`) to execute as the table owner rather than the calling user, using the same privilege-switching mechanism already used for `SECURITY DEFINER` functions. To prevent bypassing this security measure, execution of `SET SESSION AUTHORIZATION` and `SET ROLE` is now forbidden within a `SECURITY DEFINER` context. (CVE-2007-6600)

- Repair assorted bugs in the regular-expression package (Tom, Will Drewry)

  Suitably crafted regular-expression patterns could cause crashes, infinite or near-infinite looping, and/or massive memory consumption, all of which pose denial-of-service hazards for applications that accept regex search patterns from untrustworthy sources. (CVE-2007-4769, CVE-2007-4772, CVE-2007-6067)

- Require non-superusers who use `/contrib/dblink` to use only password authentication, as a security measure (Joe)

  The fix that appeared for this in 7.4.18 was incomplete, as it plugged the hole for only some `dblink` functions. (CVE-2007-6601, CVE-2007-3278)

- Fix planner failure in some cases of `WHERE false AND var IN (SELECT ...) (Tom)

- Fix potential crash in `translate()` when using a multibyte database encoding (Tom)

- Fix PL/Python to not crash on long exception messages (Alvaro)

- ecpg parser fixes (Michael)

- Make `contrib/tablefunc`'s `crosstab()` handle NULL rowid as a category in its own right, rather than crashing (Joe)

- Fix `tsvector` and `tsquery` output routines to escape backslashes correctly (Teodor, Bruce)

- Fix crash of `to_tsvector()` on huge input strings (Teodor)

- Require a specific version of Autoconf to be used when re-generating the `configure` script (Peter)
This affects developers and packagers only. The change was made to prevent accidental use of untested combinations of Autoconf and PostgreSQL versions. You can remove the version check if you really want to use a different Autoconf version, but it’s your responsibility whether the result works or not.

E.284. Release 7.4.18

Release date: 2007-09-17

This release contains fixes from 7.4.17. For information about new features in the 7.4 major release, see Section E.302.

E.284.1. Migration to Version 7.4.18

A dump/restore is not required for those running 7.4.X. However, if you are upgrading from a version earlier than 7.4.11, see Section E.291.

E.284.2. Changes

- Prevent index corruption when a transaction inserts rows and then aborts close to the end of a concurrent VACUUM on the same table (Tom)
- Make CREATE DOMAIN ... DEFAULT NULL work properly (Tom)
- Fix excessive logging of SSL error messages (Tom)
- Fix crash when log_min_error_statement logging runs out of memory (Tom)
- Prevent CLUSTER from failing due to attempting to process temporary tables of other sessions (Alvaro)
- Require non-superusers who use /contrib/dblink to use only password authentication, as a security measure (Joe)

E.285. Release 7.4.17

Release date: 2007-04-23

This release contains fixes from 7.4.16, including a security fix. For information about new features in the 7.4 major release, see Section E.302.

E.285.1. Migration to Version 7.4.17

A dump/restore is not required for those running 7.4.X. However, if you are upgrading from a version earlier than 7.4.11, see Section E.291.
E.285.2. Changes

- Support explicit placement of the temporary-table schema within `search_path`, and disable searching it for functions and operators (Tom)

  This is needed to allow a security-definer function to set a truly secure value of `search_path`. Without it, an unprivileged SQL user can use temporary objects to execute code with the privileges of the security-definer function (CVE-2007-2138). See CREATE FUNCTION for more information.

- `/contrib/tsearch2` crash fixes (Teodor)

- Fix potential-data-corruption bug in how VACUUM FULL handles UPDATE chains (Tom, Pavan Deolasee)

- Fix PANIC during enlargement of a hash index (bug introduced in 7.4.15) (Tom)

E.286. Release 7.4.16

Release date: 2007-02-05

This release contains a variety of fixes from 7.4.15, including a security fix. For information about new features in the 7.4 major release, see Section E.302.

E.286.1. Migration to Version 7.4.16

A dump/restore is not required for those running 7.4.X. However, if you are upgrading from a version earlier than 7.4.11, see Section E.291.

E.286.2. Changes

- Remove security vulnerability that allowed connected users to read backend memory (Tom)

  The vulnerability involves suppressing the normal check that a SQL function returns the data type it’s declared to, or changing the data type of a table column used in a SQL function (CVE-2007-0555). This error can easily be exploited to cause a backend crash, and in principle might be used to read database content that the user should not be able to access.

- Fix rare bug wherein btree index page splits could fail due to choosing an infeasible split point (Heikki Linnakangas)

- Fix for rare Assert() crash triggered by UNION (Tom)

- Tighten security of multi-byte character processing for UTF8 sequences over three bytes long (Tom)
E.287. Release 7.4.15

Release date: 2007-01-08

This release contains a variety of fixes from 7.4.14. For information about new features in the 7.4 major release, see Section E.302.

E.287.1. Migration to Version 7.4.15

A dump/restore is not required for those running 7.4.X. However, if you are upgrading from a version earlier than 7.4.11, see Section E.291.

E.287.2. Changes

- Improve handling of getaddrinfo() on AIX (Tom)
  This fixes a problem with starting the statistics collector, among other things.
- Fix “failed to re-find parent key” errors in VACUUM (Tom)
- Fix bugs affecting multi-gigabyte hash indexes (Tom)
- Fix error when constructing an ARRAY[] made up of multiple empty elements (Tom)
- to_number() and to_char(numeric) are now STABLE, not IMMUTABLE, for new initdb installs (Tom)
  This is because lc_numeric can potentially change the output of these functions.
- Improve index usage of regular expressions that use parentheses (Tom)
  This improves psql \d performance also.

E.288. Release 7.4.14

Release date: 2006-10-16

This release contains a variety of fixes from 7.4.13. For information about new features in the 7.4 major release, see Section E.302.

E.288.1. Migration to Version 7.4.14

A dump/restore is not required for those running 7.4.X. However, if you are upgrading from a version earlier than 7.4.11, see Section E.291.
**E.288.2. Changes**

- Fix core dump when an untyped literal is taken as ANYARRAY
- Fix `string_to_array()` to handle overlapping matches for the separator string
  
  For example, `string_to_array('123xx456xxx789', 'xx')`.
- Fix corner cases in pattern matching for psql’s `\d` commands
- Fix index-corrupting bugs in `/contrib/ltree` (Teodor)
- Fix backslash escaping in `/contrib/dbmirror`
- Adjust regression tests for recent changes in US DST laws

---

**E.289. Release 7.4.13**

**Release date:** 2006-05-23

This release contains a variety of fixes from 7.4.12, including patches for extremely serious security issues. For information about new features in the 7.4 major release, see Section E.302.

---

**E.289.1. Migration to Version 7.4.13**

A dump/restore is not required for those running 7.4.X. However, if you are upgrading from a version earlier than 7.4.11, see Section E.291.

Full security against the SQL-injection attacks described in CVE-2006-2313 and CVE-2006-2314 might require changes in application code. If you have applications that embed untrustworthy strings into SQL commands, you should examine them as soon as possible to ensure that they are using recommended escaping techniques. In most cases, applications should be using subroutines provided by libraries or drivers (such as `libpq`'s `PQescapeStringConn()`) to perform string escaping, rather than relying on **ad hoc** code to do it.

---

**E.289.2. Changes**

- Change the server to reject invalidly-encoded multibyte characters in all cases (Tatsuo, Tom)
  
  While PostgreSQL has been moving in this direction for some time, the checks are now applied uniformly to all encodings and all textual input, and are now always errors not merely warnings. This change defends against SQL-injection attacks of the type described in CVE-2006-2313.
- Reject unsafe uses of `\'` in string literals
  
  As a server-side defense against SQL-injection attacks of the type described in CVE-2006-2314, the server now only accepts `"` and not `\'` as a representation of ASCII single quote in SQL string literals. By default, `\'` is rejected only when `client_encoding` is set to a client-only encoding (SJIS, BIG5,
Appendix E. Release Notes

GBK, GB18030, or UHC), which is the scenario in which SQL injection is possible. A new configuration parameter `backslash_quote` is available to adjust this behavior when needed. Note that full security against CVE-2006-2314 might require client-side changes; the purpose of `backslash_quote` is in part to make it obvious that insecure clients are insecure.

- **Modify libpq’s string-escaping routines to be aware of encoding considerations and standard_conforming_strings**

  This fixes libpq-using applications for the security issues described in CVE-2006-2313 and CVE-2006-2314, and also future-proofs them against the planned changeover to SQL-standard string literal syntax. Applications that use multiple PostgreSQL connections concurrently should migrate to `PQescapeStringConn()` and `PQescapeByteaConn()` to ensure that escaping is done correctly for the settings in use in each database connection. Applications that do string escaping “by hand” should be modified to rely on library routines instead.

- **Fix some incorrect encoding conversion functions**

  - `win1251_to_iso`, `alt_to_iso`, `euc_tw_to_big5`, `euc_tw_to_mic`, `mic_to_euc_tw` were all broken to varying extents.

- **Clean up stray remaining uses of `\'` in strings (Bruce, Jan)**

- **Fix bug that sometimes caused OR’d index scans to miss rows they should have returned**

- **Fix WAL replay for case where a btree index has been truncated**

- **Fix `SIMILAR TO` for patterns involving `|` (Tom)**

- **Fix server to use custom DH SSL parameters correctly (Michael Fuhr)**

- **Fix for Bonjour on Intel Macs (Ashley Clark)**

- **Fix various minor memory leaks**

---

E.290. Release 7.4.12

**Release date:** 2006-02-14

This release contains a variety of fixes from 7.4.11. For information about new features in the 7.4 major release, see Section E.302.

E.290.1. Migration to Version 7.4.12

A dump/restore is not required for those running 7.4.X. However, if you are upgrading from a version earlier than 7.4.11, see Section E.291.

E.290.2. Changes

- **Fix potential crash in `SET SESSION AUTHORIZATION` (CVE-2006-0553)**
Appendix E. Release Notes

An unprivileged user could crash the server process, resulting in momentary denial of service to other users, if the server has been compiled with Asserts enabled (which is not the default). Thanks to Akio Ishida for reporting this problem.

- Fix bug with row visibility logic in self-inserted rows (Tom)

Under rare circumstances a row inserted by the current command could be seen as already valid, when it should not be. Repairs bug created in 7.4.9 and 7.3.11 releases.

- Fix race condition that could lead to “file already exists” errors during pg_clog file creation (Tom)

- Properly check DOM::a in place of v parameters in prepared statements (Neil)

- Fix to allow restoring dumps that have cross-schema references to custom operators (Tom)

- Portability fix for testing presence of finite and isinf during configure (Tom)

E.291. Release 7.4.11

Release date: 2006-01-09

This release contains a variety of fixes from 7.4.10. For information about new features in the 7.4 major release, see Section E.302.

E.291.1. Migration to Version 7.4.11

A dump/restore is not required for those running 7.4.X. However, if you are upgrading from a version earlier than 7.4.8, see Section E.294. Also, you might need to REINDEX indexes on textual columns after updating, if you are affected by the locale or plperl issues described below.

E.291.2. Changes

- Fix for protocol-level Describe messages issued outside a transaction or in a failed transaction (Tom)

- Fix character string comparison for locales that consider different character combinations as equal, such as Hungarian (Tom)

  This might require REINDEX to fix existing indexes on textual columns.

- Set locale environment variables during postmaster startup to ensure that plperl won’t change the locale later

  This fixes a problem that occurred if the postmaster was started with environment variables specifying a different locale than what initdb had been told. Under these conditions, any use of plperl was likely to lead to corrupt indexes. You might need REINDEX to fix existing indexes on textual columns if this has happened to you.

- Fix longstanding bug in strpos() and regular expression handling in certain rarely used Asian multi-byte character sets (Tatsuo)
Appendix E. Release Notes

- Fix bug in /contrib/pgcrypto gen_salt, which caused it not to use all available salt space for MD5 and XDES algorithms (Marko Kreen, Solar Designer)
  Salts for Blowfish and standard DES are unaffected.
- Fix /contrib/dblink to throw an error, rather than crashing, when the number of columns specified is different from what’s actually returned by the query (Joe)

E.292. Release 7.4.10

Release date: 2005-12-12

This release contains a variety of fixes from 7.4.9. For information about new features in the 7.4 major release, see Section E.302.

E.292.1. Migration to Version 7.4.10

A dump/restore is not required for those running 7.4.X. However, if you are upgrading from a version earlier than 7.4.8, see Section E.294.

E.292.2. Changes

- Fix race condition in transaction log management
  There was a narrow window in which an I/O operation could be initiated for the wrong page, leading to an Assert failure or data corruption.
- Prevent failure if client sends Bind protocol message when current transaction is already aborted
- /contrib/ltree fixes (Teodor)
- AIX and HPUX compile fixes (Tom)
- Fix longstanding planning error for outer joins
  This bug sometimes caused a bogus error “RIGHT JOIN is only supported with merge-joinable join conditions”.
- Prevent core dump in pg_autovacuum when a table has been dropped

E.293. Release 7.4.9

Release date: 2005-10-04

This release contains a variety of fixes from 7.4.8. For information about new features in the 7.4 major release, see Section E.302.
E.293.1. Migration to Version 7.4.9

A dump/restore is not required for those running 7.4.X. However, if you are upgrading from a version earlier than 7.4.8, see Section E.294.

E.293.2. Changes

• Fix error that allowed VACUUM to remove ctid chains too soon, and add more checking in code that follows ctid links
  This fixes a long-standing problem that could cause crashes in very rare circumstances.
• Fix CHAR() to properly pad spaces to the specified length when using a multiple-byte character set
  (Yoshiyuki Asaba)
  In prior releases, the padding of CHAR() was incorrect because it only padded to the specified number of bytes without considering how many characters were stored.
• Fix the sense of the test for read-only transaction in COPY
  The code formerly prohibited COPY TO, where it should prohibit COPY FROM.
• Fix planning problem with outer-join ON clauses that reference only the inner-side relation
• Further fixes for x FULL JOIN y ON true corner cases
• Make array_in and array_recv more paranoid about validating their OID parameter
• Fix missing rows in queries like UPDATE a=... WHERE a... with GiST index on column a
• Improve robustness of datetime parsing
• Improve checking for partially-written WAL pages
• Improve robustness of signal handling when SSL is enabled
• Don’t try to open more than max_files_per_process files during postmaster startup
• Various memory leakage fixes
• Various portability improvements
• Fix PL/pgSQL to handle var := var correctly when the variable is of pass-by-reference type
• Update contrib/tsearch2 to use current Snowball code

E.294. Release 7.4.8

Release date: 2005-05-09

This release contains a variety of fixes from 7.4.7, including several security-related issues. For information about new features in the 7.4 major release, see Section E.302.
E.294.1. Migration to Version 7.4.8

A dump/restore is not required for those running 7.4.X. However, it is one possible way of handling two significant security problems that have been found in the initial contents of 7.4.X system catalogs. A dump/initdb/reload sequence using 7.4.8’s initdb will automatically correct these problems.

The larger security problem is that the built-in character set encoding conversion functions can be invoked from SQL commands by unprivileged users, but the functions were not designed for such use and are not secure against malicious choices of arguments. The fix involves changing the declared parameter list of these functions so that they can no longer be invoked from SQL commands. (This does not affect their normal use by the encoding conversion machinery.)

The lesser problem is that the contrib/tsearch2 module creates several functions that are misdeclared to return internal when they do not accept internal arguments. This breaks type safety for all functions using internal arguments.

It is strongly recommended that all installations repair these errors, either by initdb or by following the manual repair procedures given below. The errors at least allow unprivileged database users to crash their server process, and might allow unprivileged users to gain the privileges of a database superuser.

If you wish not to do an initdb, perform the following procedures instead. As the database superuser, do:

```
BEGIN;
UPDATE pg_proc SET proargtypes[3] = 'internal'::regtype
WHERE pronamespace = 11 AND pronargs = 5
   AND proargtypes[2] = 'cstring'::regtype;
-- The command should report having updated 90 rows;
-- if not, rollback and investigate instead of committing!
COMMIT;
```

Next, if you have installed contrib/tsearch2, do:

```
BEGIN;
UPDATE pg_proc SET proargtypes[0] = 'internal'::regtype
WHERE oid IN ('dex_init(text)'::regprocedure,
              'snb_en_init(text)'::regprocedure,
              'snb_ru_init(text)'::regprocedure,
              'spell_init(text)'::regprocedure,
              'syn_init(text)'::regprocedure
);           
-- The command should report having updated 5 rows;
-- if not, rollback and investigate instead of committing!
COMMIT;
```

If this command fails with a message like “function "dex_init(text)" does not exist”, then either tsearch2 is not installed in this database, or you already did the update.

The above procedures must be carried out in each database of an installation, including template1, and ideally including template0 as well. If you do not fix the template databases then any subsequently created databases will contain the same errors. template1 can be fixed in the same way as any other database, but fixing template0 requires additional steps. First, from any database issue:

```
UPDATE pg_database SET datallowconn = true WHERE datname = 'template0';
```
Appendix E. Release Notes

Next connect to `template0` and perform the above repair procedures. Finally, do:

```
-- re-freeze template0:
VACUUM FREEZE;
-- and protect it against future alterations:
UPDATE pg_database SET datallowconn = false WHERE datname = 'template0';
```

### E.294.2. Changes

- Change encoding function signature to prevent misuse
- Change `contrib/tsearch2` to avoid unsafe use of `INTERNAL` function results
- Repair ancient race condition that allowed a transaction to be seen as committed for some purposes (e.g., `SELECT FOR UPDATE`) slightly sooner than for other purposes
  This is an extremely serious bug since it could lead to apparent data inconsistencies being briefly visible to applications.
- Repair race condition between relation extension and `VACUUM`
  This could theoretically have caused loss of a page’s worth of freshly-inserted data, although the scenario seems of very low probability. There are no known cases of it having caused more than an Assert failure.
- Fix comparisons of `TIME WITH TIME ZONE` values
  The comparison code was wrong in the case where the `--enable-integer-datetimes` configuration switch had been used. NOTE: if you have an index on a `TIME WITH TIME ZONE` column, it will need to be `REINDEXed` after installing this update, because the fix corrects the sort order of column values.
- Fix `EXTRACT(EPOCH)` for `TIME WITH TIME ZONE` values
- Fix mis-display of negative fractional seconds in `INTERVAL` values
  This error only occurred when the `--enable-integer-datetimes` configuration switch had been used.
- Ensure operations done during backend shutdown are counted by statistics collector
  This is expected to resolve reports of `pg_autovacuum` not vacuuming the system catalogs often enough — it was not being told about catalog deletions caused by temporary table removal during backend exit.
- Additional buffer overrun checks in `plpgsql` (Neil)
- Fix `pg_dump` to dump trigger names containing `%` correctly (Neil)
- Fix `contrib/pgcrypto` for newer OpenSSL builds (Marko Kreen)
- Still more 64-bit fixes for `contrib/intagg`
- Prevent incorrect optimization of functions returning `RECORD`
- Prevent `to_char(interval)` from dumping core for month-related formats
Appendix E. Release Notes

- Prevent crash on `COALESCE(NULL,NULL)`
- Fix `array_map` to call PL functions correctly
- Fix permission checking in `ALTER DATABASE RENAME`
- Fix `ALTER LANGUAGE RENAME`
- Make `RemoveFromWaitQueue` clean up after itself
  This fixes a lock management error that would only be visible if a transaction was kicked out of a wait for a lock (typically by query cancel) and then the holder of the lock released it within a very narrow window.
- Fix problem with untyped parameter appearing in `INSERT ... SELECT`
- Fix `CLUSTER` failure after `ALTER TABLE SET WITHOUT OIDS`

### E.295. Release 7.4.7

**Release date:** 2005-01-31

This release contains a variety of fixes from 7.4.6, including several security-related issues. For information about new features in the 7.4 major release, see Section E.302.

### E.295.1. Migration to Version 7.4.7

A dump/restore is not required for those running 7.4.X.

### E.295.2. Changes

- Disallow `LOAD` to non-superusers
  On platforms that will automatically execute initialization functions of a shared library (this includes at least Windows and ELF-based Unixen), `LOAD` can be used to make the server execute arbitrary code. Thanks to NGS Software for reporting this.
- Check that creator of an aggregate function has the right to execute the specified transition functions
  This oversight made it possible to bypass denial of EXECUTE permission on a function.
- Fix security and 64-bit issues in contrib/intagg
- Add needed STRICT marking to some contrib functions (Kris Jurka)
- Avoid buffer overrun when `plpgsql` cursor declaration has too many parameters (Neil)
- Fix planning error for `FULL` and `RIGHT` outer joins
  The result of the join was mistakenly supposed to be sorted the same as the left input. This could not only deliver mis-sorted output to the user, but in case of nested merge joins could give outright wrong answers.
• Fix plperl for quote marks in tuple fields
• Fix display of negative intervals in SQL and GERMAN datestyles
• Make age(timestamptz) do calculation in local timezone not GMT

E.296. Release 7.4.6
Release date: 2004-10-22
This release contains a variety of fixes from 7.4.5. For information about new features in the 7.4 major release, see Section E.302.

E.296.1. Migration to Version 7.4.6
A dump/restore is not required for those running 7.4.X.

E.296.2. Changes
• Repair possible failure to update hint bits on disk
  Under rare circumstances this oversight could lead to “could not access transaction status” failures, which qualifies it as a potential-data-loss bug.
• Ensure that hashed outer join does not miss tuples
  Very large left joins using a hash join plan could fail to output unmatched left-side rows given just the right data distribution.
• Disallow running pg_ctl as root
  This is to guard against any possible security issues.
• Avoid using temp files in /tmp in make_oidjoins_check
  This has been reported as a security issue, though it’s hardly worthy of concern since there is no reason for non-developers to use this script anyway.
• Prevent forced backend shutdown from re-emitting prior command result
  In rare cases, a client might think that its last command had succeeded when it really had been aborted by forced database shutdown.
• Repair bug in pg_stat_get_backend_idset
  This could lead to misbehavior in some of the system-statistics views.
• Fix small memory leak in postmaster
• Fix “expected both swapped tables to have TOAST tables” bug
  This could arise in cases such as CLUSTER after ALTER TABLE DROP COLUMN.
• Prevent pg_ctl restart from adding -D multiple times
• Fix problem with NULL values in GiST indexes
• :: is no longer interpreted as a variable in an ECPG prepare statement

E.297. Release 7.4.5

Release date: 2004-08-18

This release contains one serious bug fix over 7.4.4. For information about new features in the 7.4 major release, see Section E.302.

E.297.1. Migration to Version 7.4.5

A dump/restore is not required for those running 7.4.X.

E.297.2. Changes

• Repair possible crash during concurrent B-tree index insertions
  This patch fixes a rare case in which concurrent insertions into a B-tree index could result in a server panic. No permanent damage would result, but it’s still worth a re-release. The bug does not exist in pre-7.4 releases.

E.298. Release 7.4.4

Release date: 2004-08-16

This release contains a variety of fixes from 7.4.3. For information about new features in the 7.4 major release, see Section E.302.

E.298.1. Migration to Version 7.4.4

A dump/restore is not required for those running 7.4.X.

E.298.2. Changes

• Prevent possible loss of committed transactions during crash
  Due to insufficient interlocking between transaction commit and checkpointing, it was possible for transactions committed just before the most recent checkpoint to be lost, in whole or in part, following a database crash and restart. This is a serious bug that has existed since PostgreSQL 7.1.
• Check HAVING restriction before evaluating result list of an aggregate plan
• Avoid crash when session’s current user ID is deleted
• Fix hashed crosstab for zero-rows case (Joe)
• Force cache update after renaming a column in a foreign key
• Pretty-print UNION queries correctly
• Make psql handle \r\n newlines properly in COPY IN
• pg_dump handled ACLs with grant options incorrectly
• Fix thread support for OS X and Solaris
• Updated JDBC driver (build 215) with various fixes
• ECPG fixes
• Translation updates (various contributors)

E.299. Release 7.4.3

Release date: 2004-06-14

This release contains a variety of fixes from 7.4.2. For information about new features in the 7.4 major release, see Section E.302.

E.299.1. Migration to Version 7.4.3

A dump/restore is not required for those running 7.4.X.

E.299.2. Changes

• Fix temporary memory leak when using non-hashed aggregates (Tom)
• ECPG fixes, including some for Informix compatibility (Michael)
• Fixes for compiling with thread-safety, particularly Solaris (Bruce)
• Fix error in COPY IN termination when using the old network protocol (ljb)
• Several important fixes in pg_autovacuum, including fixes for large tables, unsigned oids, stability, temp tables, and debug mode (Matthew T. O’Connor)
• Fix problem with reading tar-format dumps on NetBSD and BSD/OS (Bruce)
• Several JDBC fixes
• Fix ALTER SEQUENCE RESTART where last_value equals the restart value (Tom)
• Repair failure to recalculate nested sub-selects (Tom)
• Fix problems with non-constant expressions in LIMIT/OFFSET
• Support FULL JOIN with no join clause, such as X FULL JOIN Y ON TRUE (Tom)
• Fix another zero-column table bug (Tom)
• Improve handling of non-qualified identifiers in GROUP BY clauses in sub-selects (Tom)
  Select-list aliases within the sub-select will now take precedence over names from outer query levels.
• Do not generate “NATURAL CROSS JOIN” when decompiling rules (Tom)
• Add checks for invalid field length in binary COPY (Tom)
  This fixes a difficult-to-exploit security hole.
• Avoid locking conflict between ANALYZE and LISTEN/NOTIFY
• Numerous translation updates (various contributors)

E.300. Release 7.4.2

Release date: 2004-03-08

This release contains a variety of fixes from 7.4.1. For information about new features in the 7.4 major release, see Section E.302.

E.300.1. Migration to Version 7.4.2

A dump/restore is not required for those running 7.4.X. However, it might be advisable as the easiest method of incorporating fixes for two errors that have been found in the initial contents of 7.4.X system catalogs. A dump/initdb/reload sequence using 7.4.2’s initdb will automatically correct these problems.

The more severe of the two errors is that data type anyarray has the wrong alignment label; this is a problem because the pg_statistic system catalog uses anyarray columns. The mislabeling can cause planner misestimations and even crashes when planning queries that involve WHERE clauses on double-aligned columns (such as float8 and timestamp). It is strongly recommended that all installations repair this error, either by initdb or by following the manual repair procedure given below.

The lesser error is that the system view pg_settings ought to be marked as having public update access, to allow UPDATE pg_settings to be used as a substitute for SET. This can also be fixed either by initdb or manually, but it is not necessary to fix unless you want to use UPDATE pg_settings.

If you wish not to do an initdb, the following procedure will work for fixing pg_statistic. As the database superuser, do:

```
-- clear out old data in pg_statistic:
DELETE FROM pg_statistic;
VACUUM pg_statistic;
-- this should update 1 row:
UPDATE pg_type SET typalign = 'd' WHERE oid = 2277;
-- this should update 6 rows:
UPDATE pg_attribute SET attalign = 'd' WHERE atttypeid = 2277;
--
-- At this point you MUST start a fresh backend to avoid a crash!
```
Appendix E. Release Notes

--
-- repopulate pg_statistic:
ANALYZE;

This can be done in a live database, but beware that all backends running in the altered database must be
restarted before it is safe to repopulate pg_statistic.

To repair the pg_settings error, simply do:

GRANT SELECT, UPDATE ON pg_settings TO PUBLIC;

The above procedures must be carried out in each database of an installation, including template1, and
ideally including template0 as well. If you do not fix the template databases then any subsequently
created databases will contain the same errors. template1 can be fixed in the same way as any other
database, but fixing template0 requires additional steps. First, from any database issue:

UPDATE pg_database SET datallowconn = true WHERE datname = 'template0';

Next connect to template0 and perform the above repair procedures. Finally, do:

-- re-freeze template0:
VACUUM FREEZE;
-- and protect it against future alterations:
UPDATE pg_database SET datallowconn = false WHERE datname = 'template0';

E.300.2. Changes

Release 7.4.2 incorporates all the fixes included in release 7.3.6, plus the following fixes:

- Fix pg_statistics alignment bug that could crash optimizer
  See above for details about this problem.
- Allow non-super users to update pg_settings
- Fix several optimizer bugs, most of which led to “variable not found in subplan target lists” errors
- Avoid out-of-memory failure during startup of large multiple index scan
- Fix multibyte problem that could lead to “out of memory” error during COPY IN
- Fix problems with SELECT INTO/CREATE TABLE AS from tables without OIDs
- Fix problems with alter_table regression test during parallel testing
- Fix problems with hitting open file limit, especially on OS X (Tom)
- Partial fix for Turkish-locale issues
  initdb will succeed now in Turkish locale, but there are still some inconveniences associated with the
  i/I problem.
- Make pg_dump set client encoding on restore
• Other minor pg_dump fixes
• Allow ecpg to again use C keywords as column names (Michael)
• Added \texttt{ecpg} \texttt{WHENEVER \ NOT\_FOUND} to \texttt{SELECT/INSERT/UPDATE/DELETE} (Michael)
• Fix ecpg crash for queries calling set-returning functions (Michael)
• Various other ecpg fixes (Michael)
• Fixes for Borland compiler
• Thread build improvements (Bruce)
• Various other build fixes
• Various JDBC fixes

**E.301. Release 7.4.1**

\textbf{Release date:} 2003-12-22

This release contains a variety of fixes from 7.4. For information about new features in the 7.4 major release, see Section E.302.

**E.301.1. Migration to Version 7.4.1**

A dump/restore is \textit{not} required for those running 7.4.

If you want to install the fixes in the information schema you need to reload it into the database. This is either accomplished by initializing a new cluster by running \texttt{initdb}, or by running the following sequence of SQL commands in each database (ideally including \texttt{template1}) as a superuser in \texttt{psql}, after installing the new release:

\begin{verbatim}
DROP SCHEMA information_schema CASCADE;
\i /usr/local/pgsql/share/information_schema.sql
\end{verbatim}

Substitute your installation path in the second command.

**E.301.2. Changes**

• Fixed bug in \texttt{CREATE SCHEMA} parsing in ECPG (Michael)
• Fix compile error when \texttt{--enable-thread-safety} and \texttt{--with-perl} are used together (Peter)
• Fix for subqueries that used hash joins (Tom)
  
  Certain subqueries that used hash joins would crash because of improperly shared structures.
• Fix free space map compaction bug (Tom)
  
  This fixes a bug where compaction of the free space map could lead to a database server shutdown.
Appendix E. Release Notes

- Fix for Borland compiler build of libpq (Bruce)
- Fix `netmask()` and `hostmask()` to return the maximum-length masklen (Tom)
  Fix these functions to return values consistent with pre-7.4 releases.
- Several contrib/pg_autovacuum fixes
  Fixes include improper variable initialization, missing vacuum after `TRUNCATE`, and duration computation overflow for long vacuums.
- Allow compile of contrib/cube under Cygwin (Jason Tishler)
- Fix Solaris use of password file when no passwords are defined (Tom)
  Fix crash on Solaris caused by use of any type of password authentication when no passwords were defined.
- JDBC fix for thread problems, other fixes
- Fix for `bytea` index lookups (Joe)
- Fix information schema for bit data types (Peter)
- Force `zero_damaged_pages` to be on during recovery from WAL
- Prevent some obscure cases of “variable not in subplan target lists”
- Make `PQescapeBytea` and `byteaout` consistent with each other (Joe)
- Escape `bytea` output for bytes > 0x7e(Joe)
  If different client encodings are used for `bytea` output and input, it is possible for `bytea` values to be corrupted by the differing encodings. This fix escapes all bytes that might be affected.
- Added missing `SPI_finish()` calls to `dblink`’s `get_tuple_of_interest()` (Joe)
- New Czech FAQ
- Fix information schema view `constraint_column_usage` for foreign keys (Peter)
- ECPG fixes (Michael)
- Fix bug with multiple `IN` subqueries and joins in the subqueries (Tom)
- Allow `COUNT('x')` to work (Tom)
- Install ECPG include files for Informix compatibility into separate directory (Peter)
  Some names of ECPG include files for Informix compatibility conflicted with operating system include files. By installing them in their own directory, name conflicts have been reduced.
- Fix SSL memory leak (Neil)
  This release fixes a bug in 7.4 where SSL didn’t free all memory it allocated.
- Prevent `pg_service.conf` from using service name as default dbname (Bruce)
- Fix local ident authentication on FreeBSD (Tom)
Appenix E. Release Notes

E.302. Release 7.4

Release date: 2003-11-17

E.302.1. Overview

Major changes in this release:

**IN/NOT IN subqueries are now much more efficient**

In previous releases, IN/NOT IN subqueries were joined to the upper query by sequentially scanning the subquery looking for a match. The 7.4 code uses the same sophisticated techniques used by ordinary joins and so is much faster. An IN will now usually be as fast as or faster than an equivalent EXISTS subquery; this reverses the conventional wisdom that applied to previous releases.

**Improved GROUP BY processing by using hash buckets**

In previous releases, rows to be grouped had to be sorted first. The 7.4 code can do GROUP BY without sorting, by accumulating results into a hash table with one entry per group. It will still use the sort technique, however, if the hash table is estimated to be too large to fit in sort_mem.

**New multikey hash join capability**

In previous releases, hash joins could only occur on single keys. This release allows multicolunm hash joins.

**Queries using the explicit JOIN syntax are now better optimized**

Prior releases evaluated queries using the explicit JOIN syntax only in the order implied by the syntax. 7.4 allows full optimization of these queries, meaning the optimizer considers all possible join orderings and chooses the most efficient. Outer joins, however, must still follow the declared ordering.

**Faster and more powerful regular expression code**

The entire regular expression module has been replaced with a new version by Henry Spencer, originally written for Tcl. The code greatly improves performance and supports several flavors of regular expressions.

**Function-inlining for simple SQL functions**

Simple SQL functions can now be inlined by including their SQL in the main query. This improves performance by eliminating per-call overhead. That means simple SQL functions now behave like macros.

**Full support for IPv6 connections and IPv6 address data types**

Previous releases allowed only IPv4 connections, and the IP data types only supported IPv4 addresses. This release adds full IPv6 support in both of these areas.

**Major improvements in SSL performance and reliability**

Several people very familiar with the SSL API have overhauled our SSL code to improve SSL key negotiation and error recovery.
Appendix E. Release Notes

Make free space map efficiently reuse empty index pages, and other free space management improvements

In previous releases, B-tree index pages that were left empty because of deleted rows could only be reused by rows with index values similar to the rows originally indexed on that page. In 7.4, VACUUM records empty index pages and allows them to be reused for any future index rows.

SQL-standard information schema

The information schema provides a standardized and stable way to access information about the schema objects defined in a database.

Cursors conform more closely to the SQL standard

The commands FETCH and MOVE have been overhauled to conform more closely to the SQL standard.

Cursors can exist outside transactions

These cursors are also called holdable cursors.

New client-to-server protocol

The new protocol adds error codes, more status information, faster startup, better support for binary data transmission, parameter values separated from SQL commands, prepared statements available at the protocol level, and cleaner recovery from COPY failures. The older protocol is still supported by both server and clients.

libpq and ECPG applications are now fully thread-safe

While previous libpq releases already supported threads, this release improves thread safety by fixing some non-thread-safe code that was used during database connection startup. The configure option --enable-thread-safety must be used to enable this feature.

New version of full-text indexing

A new full-text indexing suite is available in contrib/tsearch2.

New autovacuum tool

The new autovacuum tool in contrib/autovacuum monitors the database statistics tables for INSERT/UPDATE/DELETE activity and automatically vacuums tables when needed.

Array handling has been improved and moved into the server core

Many array limitations have been removed, and arrays behave more like fully-supported data types.

E.302.2. Migration to Version 7.4

A dump/restore using pg_dump is required for those wishing to migrate data from any previous release. Observe the following incompatibilities:

- The server-side autocommit setting was removed and reimplemented in client applications and languages. Server-side autocommit was causing too many problems with languages and applications that wanted to control their own autocommit behavior, so autocommit was removed from the server and added to individual client APIs as appropriate.
- Error message wording has changed substantially in this release. Significant effort was invested to make the messages more consistent and user-oriented. If your applications try to detect different error
conditions by parsing the error message, you are strongly encouraged to use the new error code facility instead.

- Inner joins using the explicit `JOIN` syntax might behave differently because they are now better optimized.

- A number of server configuration parameters have been renamed for clarity, primarily those related to logging.

- `FETCH 0` or `MOVE 0` now does nothing. In prior releases, `FETCH 0` would fetch all remaining rows, and `MOVE 0` would move to the end of the cursor.

- `FETCH` and `MOVE` now return the actual number of rows fetched/moved, or zero if at the beginning/end of the cursor. Prior releases would return the row count passed to the command, not the number of rows actually fetched or moved.

- `COPY` now can process files that use carriage-return or carriage-return/line-feed end-of-line sequences. Literal carriage-returns and line-feeds are no longer accepted in data values; use `\r` and `\n` instead.

- Trailing spaces are now trimmed when converting from type `char(n)` to `varchar(n)` or `text`. This is what most people always expected to happen anyway.

- The data type `float(p)` now measures `p` in binary digits, not decimal digits. The new behavior follows the SQL standard.

- Ambiguous date values now must match the ordering specified by the `datestyle` setting. In prior releases, a date specification of `10/20/03` was interpreted as a date in October even if `datestyle` specified that the day should be first. 7.4 will throw an error if a date specification is invalid for the current setting of `datestyle`.

- The functions `oidrand`, `oidsrand`, and `userfntest` have been removed. These functions were determined to be no longer useful.

- String literals specifying time-varying date/time values, such as `'now'` or `'today'` will no longer work as expected in column default expressions; they now cause the time of the table creation to be the default, not the time of the insertion. Functions such as `now()`, `current_timestamp`, or `current_date` should be used instead.

  In previous releases, there was special code so that strings such as `'now'` were interpreted at `INSERT` time and not at table creation time, but this work around didn’t cover all cases. Release 7.4 now requires that defaults be defined properly using functions such as `now()` or `current_timestamp`. These will work in all situations.

- The dollar sign (`$`) is no longer allowed in operator names. It can instead be a non-first character in identifiers. This was done to improve compatibility with other database systems, and to avoid syntax problems when parameter placeholders (`$n`) are written adjacent to operators.

### E.302.3. Changes

Below you will find a detailed account of the changes between release 7.4 and the previous major release.
E.302.3.1. Server Operation Changes

- Allow IPv6 server connections (Nigel Kukard, Johan Jordaan, Bruce, Tom, Kurt Roeckx, Andrew Dunstan)
- Fix SSL to handle errors cleanly (Nathan Mueller)
  In prior releases, certain SSL API error reports were not handled correctly. This release fixes those problems.
- SSL protocol security and performance improvements (Sean Chittenden)
  SSL key renegotiation was happening too frequently, causing poor SSL performance. Also, initial key handling was improved.
- Print lock information when a deadlock is detected (Tom)
  This allows easier debugging of deadlock situations.
- Update /tmp socket modification times regularly to avoid their removal (Tom)
  This should help prevent /tmp directory cleaner administration scripts from removing server socket files.
- Enable PAM for Mac OS X (Aaron Hillegass)
- Make B-tree indexes fully WAL-safe (Tom)
  In prior releases, under certain rare cases, a server crash could cause B-tree indexes to become corrupt. This release removes those last few rare cases.
- Allow B-tree index compaction and empty page reuse (Tom)
- Fix inconsistent index lookups during split of first root page (Tom)
  In prior releases, when a single-page index split into two pages, there was a brief period when another database session could miss seeing an index entry. This release fixes that rare failure case.
- Improve free space map allocation logic (Tom)
- Preserve free space information between server restarts (Tom)
  In prior releases, the free space map was not saved when the postmaster was stopped, so newly started servers had no free space information. This release saves the free space map, and reloads it when the server is restarted.
- Add start time to \texttt{pg\_stat\_activity} (Neil)
- New code to detect corrupt disk pages; erase with \texttt{zero\_damaged\_pages} (Tom)
- New client/server protocol: faster, no username length limit, allow clean exit from \texttt{COPY} (Tom)
- Add transaction status, table ID, column ID to client/server protocol (Tom)
- Add binary I/O to client/server protocol (Tom)
- Remove autocommit server setting; move to client applications (Tom)
- New error message wording, error codes, and three levels of error detail (Tom, Joe, Peter)
E.302.3.2. Performance Improvements

- Add hashing for `GROUP BY` aggregates (Tom)
- Make nested-loop joins be smarter about multicolmn indexes (Tom)
- Allow multikey hash joins (Tom)
- Improve constant folding (Tom)
- Add ability to inline simple SQL functions (Tom)
- Reduce memory usage for queries using complex functions (Tom)
  
  In prior releases, functions returning allocated memory would not free it until the query completed. This release allows the freeing of function-allocated memory when the function call completes, reducing the total memory used by functions.
- Improve GEQO optimizer performance (Tom)
  
  This release fixes several inefficiencies in the way the GEQO optimizer manages potential query paths.
- Allow `IN`/`NOT IN` to be handled via hash tables (Tom)
- Improve `NOT IN (subquery)` performance (Tom)
- Allow most `IN` subqueries to be processed as joins (Tom)
- Pattern matching operations can use indexes regardless of locale (Peter)
  
  There is no way for non-ASCII locales to use the standard indexes for `LIKE` comparisons. This release adds a way to create a special index for `LIKE`.
- Allow the postmaster to preload libraries using `preload_libraries` (Joe)
  
  For shared libraries that require a long time to load, this option is available so the library can be preloaded in the postmaster and inherited by all database sessions.
- Improve optimizer cost computations, particularly for subqueries (Tom)
- Avoid sort when subquery `ORDER BY` matches upper query (Tom)
- Deduce that `WHERE a.x = b.y AND b.y = 42` also means `a.x = 42` (Tom)
- Allow hash/merge joins on complex joins (Tom)
- Allow hash joins for more data types (Tom)
- Allow join optimization of explicit inner joins, disable with `join_collapse_limit` (Tom)
- Add parameter `from_collapse_limit` to control conversion of subqueries to joins (Tom)
- Use faster and more powerful regular expression code from Tcl (Henry Spencer, Tom)
- Use bit-mapped relation sets in the optimizer (Tom)
- Improve connection startup time (Tom)
  
  The new client/server protocol requires fewer network packets to start a database session.
- Improve trigger/constraint performance (Stephan)
- Improve speed of `col IN (const, const, const, ...)` (Tom)
- Fix hash indexes which were broken in rare cases (Tom)
Appendix E. Release Notes

- Improve hash index concurrency and speed (Tom)
  Prior releases suffered from poor hash index performance, particularly for high concurrency situations. This release fixes that, and the development group is interested in reports comparing B-tree and hash index performance.
- Align shared buffers on 32-byte boundary for copy speed improvement (Manfred Spraul)
  Certain CPU's perform faster data copies when addresses are 32-byte aligned.
- Data type numeric reimplemented for better performance (Tom)
  numeric used to be stored in base 100. The new code uses base 10000, for significantly better performance.

E.302.3.3. Server Configuration Changes

- Rename server parameter server_min_messages to log_min_messages (Bruce)
  This was done so most parameters that control the server logs begin with log_.
- Rename show_*_stats to log_*_stats (Bruce)
- Rename show_source_port to log_source_port (Bruce)
- Rename hostname_lookup to log_hostname (Bruce)
- Add checkpoint_warning to warn of excessive checkpointing (Bruce)
  In prior releases, it was difficult to determine if checkpoint was happening too frequently. This feature adds a warning to the server logs when excessive checkpointing happens.
- New read-only server parameters for localization (Tom)
- Change debug server log messages to output as DEBUG rather than LOG (Bruce)
- Prevent server log variables from being turned off by non-superusers (Bruce)
  This is a security feature so non-superusers cannot disable logging that was enabled by the administrator.
- log_min_messages/client_min_messages now controls debug_* output (Bruce)
  This centralizes client debug information so all debug output can be sent to either the client or server logs.
- Add Mac OS X Rendezvous server support (Chris Campbell)
  This allows Mac OS X hosts to query the network for available PostgreSQL servers.
- Add ability to print only slow statements using log_min_duration_statement (Christopher)
  This is an often requested debugging feature that allows administrators to see only slow queries in their server logs.
- Allow pg_hba.conf to accept netmasks in CIDR format (Andrew Dunstan)
  This allows administrators to merge the host IP address and netmask fields into a single CIDR field in pg_hba.conf.
- New read-only parameter is_superuser (Tom)
Appendix E. Release Notes

- New parameter `log_errorVerbosity` to control error detail (Tom)
  This works with the new error reporting feature to supply additional error information like hints, file names and line numbers.

- `postgres --describe-config` now dumps server config variables (Aizaz Ahmed, Peter)
  This option is useful for administration tools that need to know the configuration variable names and their minimums, maximums, defaults, and descriptions.

- Add new columns in `pg_settings`: `context, type, source, min_val, max_val` (Joe)

- Make default `shared_buffers 1000` and `max_connections 100`, if possible (Tom)
  Prior versions defaulted to 64 shared buffers so PostgreSQL would start on even very old systems. This release tests the amount of shared memory allowed by the platform and selects more reasonable default values if possible. Of course, users are still encouraged to evaluate their resource load and size `shared_buffers` accordingly.

- New `pg_hba.conf` record type `hostnossl` to prevent SSL connections (Jon Jensen)
  In prior releases, there was no way to prevent SSL connections if both the client and server supported SSL. This option allows that capability.

- Remove parameter `geqo_random_seed` (Tom)

- Add server parameter `regex_flavor` to control regular expression processing (Tom)

- Make `pg_ctl` better handle nonstandard ports (Greg)

E.302.3.4. Query Changes

- New SQL-standard information schema (Peter)

- Add read-only transactions (Peter)

- Print key name and value in foreign-key violation messages (Dmitry Tkach)

- Allow users to see their own queries in `pg_stat_activity` (Kevin Brown)
  In prior releases, only the superuser could see query strings using `pg_stat_activity`. Now ordinary users can see their own query strings.

- Fix aggregates in subqueries to match SQL standard (Tom)
  The SQL standard says that an aggregate function appearing within a nested subquery belongs to the outer query if its argument contains only outer-query variables. Prior PostgreSQL releases did not handle this fine point correctly.

- Add option to prevent auto-addition of tables referenced in query (Nigel J. Andrews)
  By default, tables mentioned in the query are automatically added to the `FROM` clause if they are not already there. This is compatible with historic POSTGRES behavior but is contrary to the SQL standard. This option allows selecting standard-compatible behavior.

- Allow `UPDATE ... SET col = DEFAULT` (Rod)
  This allows `UPDATE` to set a column to its declared default value.

- Allow expressions to be used in `LIMIT/OFFSET` (Tom)
In prior releases, LIMIT/OFFSET could only use constants, not expressions.

- Implement `CREATE TABLE AS EXECUTE` (Neil, Peter)

### E.302.3.5. Object Manipulation Changes

- Make `CREATE SEQUENCE` grammar more conforming to SQL:2003 (Neil)
- Add statement-level triggers (Neil)
  While this allows a trigger to fire at the end of a statement, it does not allow the trigger to access all rows modified by the statement. This capability is planned for a future release.
- Add check constraints for domains (Rod)
  This greatly increases the usefulness of domains by allowing them to use check constraints.
- Add `ALTER DOMAIN` (Rod)
  This allows manipulation of existing domains.
- Fix several zero-column table bugs (Tom)
  PostgreSQL supports zero-column tables. This fixes various bugs that occur when using such tables.
- Have `ALTER TABLE ... ADD PRIMARY KEY add not-null constraint` (Rod)
  In prior releases, `ALTER TABLE ... ADD PRIMARY KEY` would add a unique index, but not a not-null constraint. That is fixed in this release.
- Add `ALTER TABLE ... WITHOUT OIDS` (Rod)
  This allows control over whether new and updated rows will have an OID column. This is most useful for saving storage space.
- Add `ALTER SEQUENCE` to modify minimum, maximum, increment, cache, cycle values (Rod)
- Add `ALTER TABLE ... CLUSTER ON` (Alvaro Herrera)
  This command is used by `pg_dump` to record the cluster column for each table previously clustered. This information is used by database-wide cluster to cluster all previously clustered tables.
- Improve automatic type casting for domains (Rod, Tom)
- Allow dollar signs in identifiers, except as first character (Tom)
- Disallow dollar signs in operator names, so $x=1$ works (Tom)
- Allow copying table schema using `LIKE subtable`, also SQL:2003 feature `INCLUDING DEFAULTS` (Rod)
- Add `WITH GRANT OPTION` clause to `GRANT` (Peter)
  This enabled `GRANT` to give other users the ability to grant privileges on an object.

### E.302.3.6. Utility Command Changes

- Add `ON COMMIT` clause to `CREATE TABLE` for temporary tables (Gavin)
Appendix E. Release Notes

This adds the ability for a table to be dropped or all rows deleted on transaction commit.

- **Allow cursors outside transactions using** `WITH HOLD` (Neil)
  
  In previous releases, cursors were removed at the end of the transaction that created them. Cursors can now be created with the `WITH HOLD` option, which allows them to continue to be accessed after the creating transaction has committed.

- **`FETCH 0` and `MOVE 0` now do nothing** (Bruce)
  
  In previous releases, `FETCH 0` fetched all remaining rows, and `MOVE 0` moved to the end of the cursor.

- **Cause `FETCH` and `MOVE` to return the number of rows fetched/moved, or zero if at the beginning/end of cursor, per SQL standard (Bruce)**
  
  In prior releases, the row count returned by `FETCH` and `MOVE` did not accurately reflect the number of rows processed.

- **Properly handle `SCROLL` with cursors, or report an error** (Neil)
  
  Allowing random access (both forward and backward scrolling) to some kinds of queries cannot be done without some additional work. If `SCROLL` is specified when the cursor is created, this additional work will be performed. Furthermore, if the cursor has been created with `NO SCROLL`, no random access is allowed.

- **Implement SQL-compatible options** `FIRST`, `LAST`, `ABSOLUTE n`, `RELATIVE n` for `FETCH` and `MOVE` (Tom)

- **Allow `EXPLAIN` on DECLARE CURSOR** (Tom)

- **Allow `CLUSTER` to use index marked as pre-clustered by default** (Alvaro Herrera)

- **Allow `CLUSTER` to cluster all tables** (Alvaro Herrera)
  
  This allows all previously clustered tables in a database to be reclustered with a single command.

- **Prevent `CLUSTER` on partial indexes** (Tom)

- **Allow DOS and Mac line-endings in `COPY` files** (Bruce)

- **Disallow literal carriage return as a data value, backslash-carriage-return and `\r` are still allowed** (Bruce)

- **`COPY` changes (binary, `\.`)** (Tom)

- **Recover from `COPY` failure cleanly** (Tom)

- **Prevent possible memory leaks in `COPY`** (Tom)

- **Make `TRUNCATE` transaction-safe** (Rod)
  
  `TRUNCATE` can now be used inside a transaction. If the transaction aborts, the changes made by the `TRUNCATE` are automatically rolled back.

- **Allow prepare/bind of utility commands like `FETCH` and `EXPLAIN`** (Tom)

- **Add `EXPLAIN EXECUTE`** (Neil)

- **Improve `VACUUM` performance on indexes by reducing WAL traffic** (Tom)

- **Functional indexes have been generalized into indexes on expressions** (Tom)
  
  In prior releases, functional indexes only supported a simple function applied to one or more column names. This release allows any type of scalar expression.
Appendix E. Release Notes

• Have `SHOW TRANSACTION ISOLATION` match input to `SET TRANSACTION ISOLATION` (Tom)

• Have `COMMENT ON DATABASE` on nonlocal database generate a warning, rather than an error (Rod)
  Database comments are stored in database-local tables so comments on a database have to be stored in each database.

• Improve reliability of `LISTEN/NOTIFY` (Tom)

• Allow `REINDEX` to reliably reindex nonshared system catalog indexes (Tom)
  This allows system tables to be reindexed without the requirement of a standalone session, which was necessary in previous releases. The only tables that now require a standalone session for reindexing are the global system tables `pg_database`, `pg_shadow`, and `pg_group`.

E.302.3.7. Data Type and Function Changes

• New server parameter `extra_float_digits` to control precision display of floating-point numbers (Pedro Ferreira, Tom)
  This controls output precision which was causing regression testing problems.

• Allow `+1300` as a numeric time-zone specifier, for FJST (Tom)

• Remove rarely used functions `oidrand`, `oidsrand`, and `userfntest` functions (Neil)

• Add `md5()` function to main server, already in `contrib/pgcrypto` (Joe)
  An MD5 function was frequently requested. For more complex encryption capabilities, use `contrib/pgcrypto`.

• Increase date range of `timestamp` (John Cochran)

• Change `EXTRACT(EPOCH FROM timestamp)` so `timestamp` without time zone is assumed to be in local time, not GMT (Tom)

• Trap division by zero in case the operating system doesn’t prevent it (Tom)

• Change the numeric data type internally to base 10000 (Tom)

• New `hostmask()` function (Greg Wickham)

• Fixes for `to_char()` and `to_timestamp()` (Karel)

• Allow functions that can take any argument data type and return any data type, using `anyelement` and `anyarray` (Joe)
  This allows the creation of functions that can work with any data type.

• Arrays can now be specified as `ARRAY[1,2,3]`, `ARRAY[['a','b'],['c','d']]`, or `ARRAY[ARRAY[ARRAY[2]]]` (Joe)

• Allow proper comparisons for arrays, including `ORDER BY` and `DISTINCT` support (Joe)

• Allow indexes on array columns (Joe)

• Allow array concatenation with `||` (Joe)

• Allow `WHERE` qualification `expr op ANY/SOME/ALL (array_expr)` (Joe)
This allows arrays to behave like a list of values, for purposes like
\[
\text{SELECT * FROM tab WHERE col IN (array_val)}.
\]

- New array functions `array_append`, `array_cat`, `array_lower`, `array_prepend`, `array_to_string`, `array_upper`, `string_to_array` (Joe)
- Allow user defined aggregates to use polymorphic functions (Joe)
- Allow assignments to empty arrays (Joe)
- Allow 60 in seconds fields of `time`, `timestamp`, and `interval` input values (Tom)
  Sixty-second values are needed for leap seconds.
- Allow `cidr` data type to be cast to `text` (Tom)
-Disallow invalid time zone names in `SET TIME ZONE`
- Trim trailing spaces when `char` is cast to `varchar` or `text` (Tom)
- Make `float(p)` measure the precision `p` in binary digits, not decimal digits (Tom)
- Add IPv6 support to the `inet` and `cidr` data types (Michael Graff)
- Add `family()` function to report whether address is IPv4 or IPv6 (Michael Graff)
- Have `SHOW` `datestyle` generate output similar to that used by `SET datestyle` (Tom)
- Make `EXTRACT(TIMEZONE)` and `SET/SHOW TIME ZONE` follow the SQL convention for the sign of time zone offsets, i.e., positive is east from UTC (Tom)
- Fix `date_trunc('quarter', ...)` (Böjthe Zoltán)
  Prior releases returned an incorrect value for this function call.
- Make `initcap()` more compatible with Oracle (Mike Nolan)
  `initcap()` now uppercases a letter appearing after any non-alphanumeric character, rather than only after whitespace.
- Allow only `datestyle` field order for date values not in ISO-8601 format (Greg)
- Add new `datestyle` values `MDY`, `DMY`, and `YMD` to set input field order; honor US and European for backward compatibility (Tom)
- String literals like ‘now’ or ‘today’ will no longer work as a column default. Use functions such as `now()`, `current_timestamp` instead. (change required for prepared statements) (Tom)
- Treat NaN as larger than any other value in `min()`/`max()` (Tom)
  NaN was already sorted after ordinary numeric values for most purposes, but `min()` and `max()` didn’t get this right.
- Prevent interval from suppressing :00 seconds display
- New functions `pg_get_triggerdef(prettyprint)` and `pg_conversion_is_visible()` (Christopher)
- Allow time to be specified as 040506 or 0405 (Tom)
- Input date order must now be `YYYY-MM-DD` (with 4-digit year) or match `datestyle`
- Make `pg_get_constraintdef` support unique, primary-key, and check constraints (Christopher)
E.302.3.8. Server-Side Language Changes

- Prevent PL/pgSQL crash when `RETURN NEXT` is used on a zero-row record variable (Tom)
- Make PL/Python’s `spi_execute` interface handle null values properly (Andrew Bosma)
- Allow PL/pgSQL to declare variables of composite types without `%ROWTYPE` (Tom)
- Fix PL/Python’s `_quote()` function to handle big integers
- Make PL/Python an untrusted language, now called `plpythonu` (Kevin Jacobs, Tom)
  
  The Python language no longer supports a restricted execution environment, so the trusted version of PL/Python was removed. If this situation changes, a version of PL/Python that can be used by non-superusers will be readded.
- Allow polymorphic PL/pgSQL functions (Joe, Tom)
- Allow polymorphic SQL functions (Joe)
- Improved compiled function caching mechanism in PL/pgSQL with full support for polymorphism (Joe)
- Add new parameter `$0` in PL/pgSQL representing the function’s actual return type (Joe)
- Allow PL/Tcl and PL/Python to use the same trigger on multiple tables (Tom)
- Fixed PL/Tcl’s `spi_prepare` to accept fully qualified type names in the parameter type list (Jan)

E.302.3.9. `psql` Changes

- Add `\pset pager always` to always use pager (Greg)
  
  This forces the pager to be used even if the number of rows is less than the screen height. This is valuable for rows that wrap across several screen rows.
- Improve tab completion (Rod, Ross Reedstrom, Ian Barwick)
- Reorder `\?` help into groupings (Harald Armin Massa, Bruce)
- Add backslash commands for listing schemas, casts, and conversions (Christopher)
- `\encoding` now changes based on the server parameter `client_encoding` (Tom)
  
  In previous versions, `\encoding` was not aware of encoding changes made using `SET client_encoding`.
- Save editor buffer into readline history (Ross)
  
  When `\e` is used to edit a query, the result is saved in the readline history for retrieval using the up arrow.
- Improve `\d` display (Christopher)
- Enhance HTML mode to be more standards-conforming (Greg)
- New `\set AUTOCOMMIT off` capability (Tom)
  
  This takes the place of the removed server parameter `autocommit`.
- New `\set VERBOSITY` to control error detail (Tom)
This controls the new error reporting details.

- New prompt escape sequence %x to show transaction status (Tom)
- Long options for psql are now available on all platforms

### E.302.3.10. pg_dump Changes

- Multiple pg_dump fixes, including tar format and large objects
- Allow pg_dump to dump specific schemas (Neil)
- Make pg_dump preserve column storage characteristics (Christopher)
  
  This preserves `ALTER TABLE ... SET STORAGE` information.
- Make pg_dump preserve `CLUSTER` characteristics (Christopher)
- Have pg_dumpall use `GRANT/REVOKE` to dump database-level privileges (Tom)
- Allow pg_dumpall to support the options `-a, -s, -x` of pg_dump (Tom)
- Prevent pg_dump from lowercasing identifiers specified on the command line (Tom)
- pg_dump options `--use-set-session-authorization` and `--no-reconnect` now do nothing, all dumps use `SET SESSION AUTHORIZATION`

  pg_dump no longer reconnects to switch users, but instead always uses `SET SESSION AUTHORIZATION`. This will reduce password prompting during restores.
- Long options for pg_dump are now available on all platforms

  PostgreSQL now includes its own long-option processing routines.

### E.302.3.11. libpq Changes

- Add function `PQfreemem` for freeing memory on Windows, suggested for NOTIFY (Bruce)
  
  Windows requires that memory allocated in a library be freed by a function in the same library, hence `free()` doesn’t work for freeing memory allocated by libpq. `PQfreemem` is the proper way to free libpq memory, especially on Windows, and is recommended for other platforms as well.
- Document service capability, and add sample file (Bruce)

  This allows clients to look up connection information in a central file on the client machine.
- Make `PQsetdbLogin` have the same defaults as `PQconnectdb` (Tom)
- Allow libpq to cleanly fail when result sets are too large (Tom)
- Improve performance of function `PQunescapeBytea` (Ben Lamb)
- Allow thread-safe libpq with `configure` option `--enable-thread-safety` (Lee Kindness, Philip Yarra)
- Allow function `pqInternalNotice` to accept a format string and arguments instead of just a preformatted message (Tom, Sean Chittenden)
Appendix E. Release Notes

- Control SSL negotiation with `sslmode` values `disable`, `allow`, `prefer`, and `require` (Jon Jensen)
- Allow new error codes and levels of text (Tom)
- Allow access to the underlying table and column of a query result (Tom)
  This is helpful for query-builder applications that want to know the underlying table and column names associated with a specific result set.
- Allow access to the current transaction status (Tom)
- Add ability to pass binary data directly to the server (Tom)
- Add function `PQexecPrepared` and `PQsendQueryPrepared` functions which perform bind/execute of previously prepared statements (Tom)

E.302.3.12. JDBC Changes

- Allow `setNull` on updateable result sets
- Allow `executeBatch` on a prepared statement (Barry)
- Support SSL connections (Barry)
- Handle schema names in result sets (Paul Sorenson)
- Add refcursor support (Nic Ferrier)

E.302.3.13. Miscellaneous Interface Changes

- Prevent possible memory leak or core dump during libpqtc1 shutdown (Tom)
- Add Informix compatibility to ECPG (Michael)
  This allows ECPG to process embedded C programs that were written using certain Informix extensions.
- Add type `decimal` to ECPG that is fixed length, for Informix (Michael)
- Allow thread-safe embedded SQL programs with `configure` option `--enable-thread-safety` (Lee Kindness, Bruce)
  This allows multiple threads to access the database at the same time.
- Moved Python client PyGreSQL to http://www.pygresql.org (Marc)

E.302.3.14. Source Code Changes

- Prevent need for separate platform geometry regression result files (Tom)
- Improved PPC locking primitive (Reinhard Max)
- New function `palloc0` to allocate and clear memory (Bruce)
- Fix locking code for s390x CPU (64-bit) (Tom)
• Allow OpenBSD to use local ident credentials (William Ahern)
• Make query plan trees read-only to executor (Tom)
• Add Darwin startup scripts (David Wheeler)
• Allow libpq to compile with Borland C++ compiler (Lester Godwin, Karl Waclawek)
• Use our own version of getopt_long() if needed (Peter)
• Convert administration scripts to C (Peter)
• Bison >= 1.85 is now required to build the PostgreSQL grammar, if building from CVS
• Merge documentation into one book (Peter)
• Add Windows compatibility functions (Bruce)
• Allow client interfaces to compile under MinGW (Bruce)
• New ereport() function for error reporting (Tom)
• Support Intel compiler on Linux (Peter)
• Improve Linux startup scripts (Slawomir Sudnik, Darko Prenosil)
• Add support for AMD Opteron and Itanium (Jeffrey W. Baker, Bruce)
• Remove --enable-recode option from configure
  This was no longer needed now that we have CREATE CONVERSION.
• Generate a compile error if spinlock code is not found (Bruce)
  Platforms without spinlock code will now fail to compile, rather than silently using semaphores. This
  failure can be disabled with a new configure option.

E.302.3.15. Contrib Changes

• Change dbmirror license to BSD
• Improve earthdistance (Bruno Wolff III)
• Portability improvements to pgcrypto (Marko Kreen)
• Prevent crash in xml (John Gray, Michael Richards)
• Update oracle
• Update mysql
• Update cube (Bruno Wolff III)
• Update earthdistance to use cube (Bruno Wolff III)
• Update btree_gist (Oleg)
• New tsearch2 full-text search module (Oleg, Teodor)
• Add hash-based crosstab function to tablefuncs (Joe)
• Add serial column to order connectby() siblings in tablefuncs (Nabil Sayegh, Joe)
• Add named persistent connections to dblink (Shridhar Daithanka)
Appendix E. Release Notes

• New pg_autovacuum allows automatic VACUUM (Matthew T. O’Connor)
• Make pgbench honor environment variables PGHOST, PGPORT, PGUSER (Tatsuo)
• Improve intarray (Teodor Sigaev)
• Improve pgstattuple (Rod)
• Fix bug in metaphone() in fuzzystrmatch
• Improve adddepend (Rod)
• Update spi/timetravel (Böjthe Zoltán)
• Fix dbase -s option and improve non-ASCII handling (Thomas Behr, Márcio Smiderle)
• Remove array module because features now included by default (Joe)

E.303. Release 7.3.21

Release date: 2008-01-07

This release contains a variety of fixes from 7.3.20, including fixes for significant security issues. This is expected to be the last PostgreSQL release in the 7.3.X series. Users are encouraged to update to a newer release branch soon.

E.303.1. Migration to Version 7.3.21

A dump/restore is not required for those running 7.3.X. However, if you are upgrading from a version earlier than 7.3.13, see Section E.311.

E.303.2. Changes

• Prevent functions in indexes from executing with the privileges of the user running VACUUM, ANALYZE, etc (Tom)

Functions used in index expressions and partial-index predicates are evaluated whenever a new table entry is made. It has long been understood that this poses a risk of trojan-horse code execution if one modifies a table owned by an untrustworthy user. (Note that triggers, defaults, check constraints, etc. pose the same type of risk.) But functions in indexes pose extra danger because they will be executed by routine maintenance operations such as VACUUM FULL, which are commonly performed automatically under a superuser account. For example, a nefarious user can execute code with superuser privileges by setting up a trojan-horse index definition and waiting for the next routine vacuum. The fix arranges for standard maintenance operations (including VACUUM, ANALYZE, REINDEX, and CLUSTER) to execute as the table owner rather than the calling user, using the same privilege-switching mechanism already used for SECURITY DEFINER functions. To prevent bypassing this security measure, execution of SET SESSION AUTHORIZATION and SET ROLE is now forbidden within a SECURITY DEFINER context. (CVE-2007-6600)
Appendix E. Release Notes

• Require non-superusers who use /contrib/dblink to use only password authentication, as a security measure (Joe)

  The fix that appeared for this in 7.3.20 was incomplete, as it plugged the hole for only some dblink functions. (CVE-2007-6601, CVE-2007-3278)

• Fix potential crash in translate() when using a multibyte database encoding (Tom)

• Make contrib/tablefunc's crosstab() handle NULL rowid as a category in its own right, rather than crashing (Joe)

• Require a specific version of Autoconf to be used when re-generating the configure script (Peter)

  This affects developers and packagers only. The change was made to prevent accidental use of untested combinations of Autoconf and PostgreSQL versions. You can remove the version check if you really want to use a different Autoconf version, but it's your responsibility whether the result works or not.

E.304. Release 7.3.20

Release date: 2007-09-17

This release contains fixes from 7.3.19.

E.304.1. Migration to Version 7.3.20

A dump/restore is not required for those running 7.3.X. However, if you are upgrading from a version earlier than 7.3.13, see Section E.311.

E.304.2. Changes

• Prevent index corruption when a transaction inserts rows and then aborts close to the end of a concurrent VACUUM on the same table (Tom)

• Make CREATE DOMAIN ... DEFAULT NULL work properly (Tom)

• Fix crash when log_min_error_statement logging runs out of memory (Tom)

• Require non-superusers who use /contrib/dblink to use only password authentication, as a security measure (Joe)

E.305. Release 7.3.19

Release date: 2007-04-23

This release contains fixes from 7.3.18, including a security fix.
E.305.1. Migration to Version 7.3.19

A dump/restore is not required for those running 7.3.X. However, if you are upgrading from a version earlier than 7.3.13, see Section E.311.

E.305.2. Changes

- Support explicit placement of the temporary-table schema within `search_path`, and disable searching it for functions and operators (Tom)
  This is needed to allow a security-definer function to set a truly secure value of `search_path`. Without it, an unprivileged SQL user can use temporary objects to execute code with the privileges of the security-definer function (CVE-2007-2138). See `CREATE FUNCTION` for more information.
- Fix potential-data-corruption bug in how `VACUUM FULL` handles `UPDATE` chains (Tom, Pavan Deolasee)

E.306. Release 7.3.18

Release date: 2007-02-05
This release contains a variety of fixes from 7.3.17, including a security fix.

E.306.1. Migration to Version 7.3.18

A dump/restore is not required for those running 7.3.X. However, if you are upgrading from a version earlier than 7.3.13, see Section E.311.

E.306.2. Changes

- Remove security vulnerability that allowed connected users to read backend memory (Tom)
  The vulnerability involves changing the data type of a table column used in a SQL function (CVE-2007-0555). This error can easily be exploited to cause a backend crash, and in principle might be used to read database content that the user should not be able to access.
- Fix rare bug wherein btree index page splits could fail due to choosing an infeasible split point (Heikki Linnakangas)
- Tighten security of multi-byte character processing for UTF8 sequences over three bytes long (Tom)
E.307. Release 7.3.17

Release date: 2007-01-08

This release contains a variety of fixes from 7.3.16.

E.307.1. Migration to Version 7.3.17

A dump/restore is not required for those running 7.3.X. However, if you are upgrading from a version earlier than 7.3.13, see Section E.311.

E.307.2. Changes

- `to_number()` and `to_char(numeric)` are now **STABLE**, not **IMMUTABLE**, for new `initdb` installs (Tom)
  
  This is because `lc_numeric` can potentially change the output of these functions.
- Improve index usage of regular expressions that use parentheses (Tom)
  
  This improves `psql \d` performance also.

E.308. Release 7.3.16

Release date: 2006-10-16

This release contains a variety of fixes from 7.3.15.

E.308.1. Migration to Version 7.3.16

A dump/restore is not required for those running 7.3.X. However, if you are upgrading from a version earlier than 7.3.13, see Section E.311.

E.308.2. Changes

- Fix corner cases in pattern matching for `psql`’s `\d` commands
- Fix index-corrupting bugs in `/contrib/ltrie` (Teodor)
- Back-port 7.4 spinlock code to improve performance and support 64-bit architectures better
- Fix SSL-related memory leak in `libpq`
- Fix backslash escaping in `/contrib/dbmirror`
- Adjust regression tests for recent changes in US DST laws
Appendix E. Release Notes

E.309. Release 7.3.15

Release date: 2006-05-23

This release contains a variety of fixes from 7.3.14, including patches for extremely serious security issues.

E.309.1. Migration to Version 7.3.15

A dump/restore is not required for those running 7.3.X. However, if you are upgrading from a version earlier than 7.3.13, see Section E.311.

Full security against the SQL-injection attacks described in CVE-2006-2313 and CVE-2006-2314 might require changes in application code. If you have applications that embed untrustworthy strings into SQL commands, you should examine them as soon as possible to ensure that they are using recommended escaping techniques. In most cases, applications should be using subroutines provided by libraries or drivers (such as libpq's PQescapeStringConn) to perform string escaping, rather than relying on ad hoc code to do it.

E.309.2. Changes

- Change the server to reject invalidly-encoded multibyte characters in all cases (Tatsuo, Tom)
  While PostgreSQL has been moving in this direction for some time, the checks are now applied uniformly to all encodings and all textual input, and are now always errors not merely warnings. This change defends against SQL-injection attacks of the type described in CVE-2006-2313.

- Reject unsafe uses of \\
  As a server-side defense against SQL-injection attacks of the type described in CVE-2006-2314, the server now only accepts " and not \ as a representation of ASCII single quote in SQL string literals. By default, \ is rejected only when client_encoding is set to a client-only encoding (SJIS, BIG5, GBK, GB18030, or UHC), which is the scenario in which SQL injection is possible. A new configuration parameter backslash_quote is available to adjust this behavior when needed. Note that full security against CVE-2006-2314 might require client-side changes; the purpose of backslash_quote is in part to make it obvious that insecure clients are insecure.

- Modify libpq's string-escaping routines to be aware of encoding considerations
  This fixes libpq-using applications for the security issues described in CVE-2006-2313 and CVE-2006-2314. Applications that use multiple PostgreSQL connections concurrently should migrate to PQescapeStringConn() and PQescapeByteaConn() to ensure that escaping is done correctly for the settings in use in each database connection. Applications that do string escaping "by hand" should be modified to rely on library routines instead.

- Fix some incorrect encoding conversion functions
  win1251_to_iso, alt_to_iso, euc_tw_to_big5, euc_tw_to_mic, mic_to_euc_tw were all broken to varying extents.

- Clean up stray remaining uses of \ in strings (Bruce, Jan)

- Fix server to use custom DH SSL parameters correctly (Michael Fuhr)
Appendix E. Release Notes

• Fix various minor memory leaks

E.310. Release 7.3.14

Release date: 2006-02-14
This release contains a variety of fixes from 7.3.13.

E.310.1. Migration to Version 7.3.14

A dump/restore is not required for those running 7.3.X. However, if you are upgrading from a version earlier than 7.3.13, see Section E.311.

E.310.2. Changes

• Fix potential crash in SET SESSION AUTHORIZATION (CVE-2006-0553)
  An unprivileged user could crash the server process, resulting in momentary denial of service to other users, if the server has been compiled with Asserts enabled (which is not the default). Thanks to Akio Ishida for reporting this problem.
• Fix bug with row visibility logic in self-inserted rows (Tom)
  Under rare circumstances a row inserted by the current command could be seen as already valid, when it should not be. Repairs bug created in 7.3.11 release.
• Fix race condition that could lead to “file already exists” errors during pg_clog file creation (Tom)
• Fix to allow restoring dumps that have cross-schema references to custom operators (Tom)
• Portability fix for testing presence of finite and isinf during configure (Tom)

E.311. Release 7.3.13

Release date: 2006-01-09
This release contains a variety of fixes from 7.3.12.

E.311.1. Migration to Version 7.3.13

A dump/restore is not required for those running 7.3.X. However, if you are upgrading from a version earlier than 7.3.10, see Section E.314. Also, you might need to REINDEX indexes on textual columns after updating, if you are affected by the locale or plperl issues described below.
E.311.2. Changes

- Fix character string comparison for locales that consider different character combinations as equal, such as Hungarian (Tom)
  This might require `REINDEX` to fix existing indexes on textual columns.
- Set locale environment variables during postmaster startup to ensure that `plperl` won’t change the locale later
  This fixes a problem that occurred if the postmaster was started with environment variables specifying a different locale than what `initdb` had been told. Under these conditions, any use of `plperl` was likely to lead to corrupt indexes. You might need `REINDEX` to fix existing indexes on textual columns if this has happened to you.
- Fix longstanding bug in `strpos()` and regular expression handling in certain rarely used Asian multi-byte character sets (Tatsuo)
- Fix bug in `/contrib/pgcrypto gen_salt`, which caused it not to use all available salt space for MD5 and XDES algorithms (Marko Kreen, Solar Designer)
  Salts for Blowfish and standard DES are unaffected.
- Fix `/contrib/dblink` to throw an error, rather than crashing, when the number of columns specified is different from what’s actually returned by the query (Joe)

E.312. Release 7.3.12

**Release date:** 2005-12-12

This release contains a variety of fixes from 7.3.11.

E.312.1. Migration to Version 7.3.12

A dump/restore is not required for those running 7.3.X. However, if you are upgrading from a version earlier than 7.3.10, see Section E.314.

E.312.2. Changes

- Fix race condition in transaction log management
  There was a narrow window in which an I/O operation could be initiated for the wrong page, leading to an Assert failure or data corruption.
- `/contrib/ltree` fixes (Teodor)
- Fix longstanding planning error for outer joins
This bug sometimes caused a bogus error “RIGHT JOIN is only supported with merge-joinable join conditions”.

- Prevent core dump in pg_autovacuum when a table has been dropped

### E.313. Release 7.3.11

**Release date:** 2005-10-04

This release contains a variety of fixes from 7.3.10.

#### E.313.1. Migration to Version 7.3.11

A dump/restore is not required for those running 7.3.X. However, if you are upgrading from a version earlier than 7.3.10, see Section E.314.

#### E.313.2. Changes

- Fix error that allowed `VACUUM` to remove `ctid` chains too soon, and add more checking in code that follows `ctid` links
  
  This fixes a long-standing problem that could cause crashes in very rare circumstances.

- Fix `CHAR()` to properly pad spaces to the specified length when using a multiple-byte character set (Yoshiyuki Asaba)
  
  In prior releases, the padding of `CHAR()` was incorrect because it only padded to the specified number of bytes without considering how many characters were stored.

- Fix missing rows in queries like `UPDATE a=... WHERE a...` with GiST index on column `a`

- Improve checking for partially-written WAL pages

- Improve robustness of signal handling when SSL is enabled

- Various memory leakage fixes

- Various portability improvements

- Fix PL/pgSQL to handle `var := var` correctly when the variable is of pass-by-reference type

### E.314. Release 7.3.10

**Release date:** 2005-05-09

This release contains a variety of fixes from 7.3.9, including several security-related issues.
E.314.1. Migration to Version 7.3.10

A dump/restore is not required for those running 7.3.X. However, it is one possible way of handling a significant security problem that has been found in the initial contents of 7.3.X system catalogs. A dump/initdb/reload sequence using 7.3.10’s initdb will automatically correct this problem.

The security problem is that the built-in character set encoding conversion functions can be invoked from SQL commands by unprivileged users, but the functions were not designed for such use and are not secure against malicious choices of arguments. The fix involves changing the declared parameter list of these functions so that they can no longer be invoked from SQL commands. (This does not affect their normal use by the encoding conversion machinery.) It is strongly recommended that all installations repair this error, either by initdb or by following the manual repair procedure given below. The error at least allows unprivileged database users to crash their server process, and might allow unprivileged users to gain the privileges of a database superuser.

If you wish not to do an initdb, perform the following procedure instead. As the database superuser, do:

\[
\text{BEGIN;} \\
\text{UPDATE pg_proc SET proargtypes[3] = 'internal'::regtype} \\
\text{WHERE pronamespace = 11 AND pronargs = 5} \\
\quad \text{AND proargtypes[2] = 'cstring'::regtype;} \\
\quad \text{-- The command should report having updated 90 rows;} \\
\quad \text{-- if not, rollback and investigate instead of committing!} \\
\text{COMMIT;} \\
\]

The above procedure must be carried out in each database of an installation, including template1, and ideally including template0 as well. If you do not fix the template databases then any subsequently created databases will contain the same error. template1 can be fixed in the same way as any other database, but fixing template0 requires additional steps. First, from any database issue:

\[
\text{UPDATE pg_database SET datallowconn = true WHERE datname = 'template0';} \\
\]

Next connect to template0 and perform the above repair procedure. Finally, do:

\[
\text{-- re-freeze template0:} \\
\text{VACUUM FREEZE;} \\
\text{-- and protect it against future alterations:} \\
\text{UPDATE pg_database SET datallowconn = false WHERE datname = 'template0';} \\
\]

E.314.2. Changes

- Change encoding function signature to prevent misuse
- Repair ancient race condition that allowed a transaction to be seen as committed for some purposes (eg SELECT FOR UPDATE) slightly sooner than for other purposes

This is an extremely serious bug since it could lead to apparent data inconsistencies being briefly visible to applications.
• Repair race condition between relation extension and VACUUM
  This could theoretically have caused loss of a page’s worth of freshly-inserted data, although the sce-
  nario seems of very low probability. There are no known cases of it having caused more than an Assert
  failure.
• Fix comparisons of TIME WITH TIME ZONE values
  The comparison code was wrong in the case where the --enable-integer-datetimes configuration switch had been used. NOTE: if you have an index on a TIME WITH TIME ZONE column, it will need to be REINDEXed after installing this update, because the fix corrects the sort order of column values.
• Fix EXTRACT(EPOCH) for TIME WITH TIME ZONE values
• Fix mis-display of negative fractional seconds in INTERVAL values
  This error only occurred when the --enable-integer-datetimes configuration switch had been used.
• Additional buffer overrun checks in plpgsql (Neil)
• Fix pg_dump to dump trigger names containing % correctly (Neil)
• Prevent to_char(interval) from dumping core for month-related formats
• Fix contrib/pgcrypto for newer OpenSSL builds (Marko Kreen)
• Still more 64-bit fixes for contrib/intagg
• Prevent incorrect optimization of functions returning RECORD

E.315. Release 7.3.9

Release date: 2005-01-31
This release contains a variety of fixes from 7.3.8, including several security-related issues.

E.315.1. Migration to Version 7.3.9
A dump/restore is not required for those running 7.3.X.

E.315.2. Changes

• Disallow LOAD to non-superusers
  On platforms that will automatically execute initialization functions of a shared library (this includes at least Windows and ELF-based Unixen), LOAD can be used to make the server execute arbitrary code. Thanks to NGS Software for reporting this.
• Check that creator of an aggregate function has the right to execute the specified transition functions
  This oversight made it possible to bypass denial of EXECUTE permission on a function.
Appendix E. Release Notes

- Fix security and 64-bit issues in contrib/intagg
- Add needed STRICT marking to some contrib functions (Kris Jurka)
- Avoid buffer overrun when plpgsql cursor declaration has too many parameters (Neil)
- Fix planning error for FULL and RIGHT outer joins
  The result of the join was mistakenly supposed to be sorted the same as the left input. This could not only deliver mis-sorted output to the user, but in case of nested merge joins could give outright wrong answers.
- Fix plperl for quote marks in tuple fields
- Fix display of negative intervals in SQL and GERMAN datestyles

E.316. Release 7.3.8

Release date: 2004-10-22
This release contains a variety of fixes from 7.3.7.

E.316.1. Migration to Version 7.3.8

A dump/restore is not required for those running 7.3.X.

E.316.2. Changes

- Repair possible failure to update hint bits on disk
  Under rare circumstances this oversight could lead to “could not access transaction status” failures, which qualifies it as a potential-data-loss bug.
- Ensure that hashed outer join does not miss tuples
  Very large left joins using a hash join plan could fail to output unmatched left-side rows given just the right data distribution.
- Disallow running pg_ctl as root
  This is to guard against any possible security issues.
- Avoid using temp files in /tmp in make_oidjoins_check
  This has been reported as a security issue, though it’s hardly worthy of concern since there is no reason for non-developers to use this script anyway.
E.317. Release 7.3.7

Release date: 2004-08-16
This release contains one critical fix over 7.3.6, and some minor items.

E.317.1. Migration to Version 7.3.7
A dump/restore is not required for those running 7.3.X.

E.317.2. Changes

• Prevent possible loss of committed transactions during crash
  Due to insufficient interlocking between transaction commit and checkpointing, it was possible for transactions committed just before the most recent checkpoint to be lost, in whole or in part, following a database crash and restart. This is a serious bug that has existed since PostgreSQL 7.1.
• Remove asymmetrical word processing in tsearch (Teodor)
• Properly schema-qualify function names when pg_dump’ing a CAST

E.318. Release 7.3.6

Release date: 2004-03-02
This release contains a variety of fixes from 7.3.5.

E.318.1. Migration to Version 7.3.6
A dump/restore is not required for those running 7.3.*.

E.318.2. Changes

• Revert erroneous changes in rule permissions checking
  A patch applied in 7.3.3 to fix a corner case in rule permissions checks turns out to have disabled rule-related permissions checks in many not-so-corner cases. This would for example allow users to insert into views they weren’t supposed to have permission to insert into. We have therefore reverted the 7.3.3 patch. The original bug will be fixed in 8.0.
• Repair incorrect order of operations in GetNewTransactionId()
  This bug could result in failure under out-of-disk-space conditions, including inability to restart even after disk space is freed.
Ensure configure selects -fno-strict-aliasing even when an external value for CFLAGS is supplied

On some platforms, building with -fstrict-aliasing causes bugs.

Make pg_restore handle 64-bit off_t correctly

This bug prevented proper restoration from archive files exceeding 4 GB.

Make contrib/dblink not assume that local and remote type OIDs match (Joe)

Quote connectby()'s start_with argument properly (Joe)

Don’t crash when a rowtype argument to a plpgsql function is NULL

Avoid generating invalid character encoding sequences in corner cases when planning LIKE operations

Ensure text_position() cannot scan past end of source string in multibyte cases (Korea PostgreSQL Users’ Group)

Fix index optimization and selectivity estimates for LIKE operations on bytea columns (Joe)

---

**E.319. Release 7.3.5**

**Release date:** 2003-12-03

This has a variety of fixes from 7.3.4.

**E.319.1. Migration to Version 7.3.5**

A dump/restore is *not* required for those running 7.3.*.

**E.319.2. Changes**

- Force zero_damaged_pages to be on during recovery from WAL
- Prevent some obscure cases of “variable not in subplan target lists”
- Force stats processes to detach from shared memory, ensuring cleaner shutdown
- Make PQescapeBytea and byteaout consistent with each other (Joe)
- Added missing SPI_finish() calls to dblink’s get_tuple_of_interest() (Joe)
- Fix for possible foreign key violation when rule rewrites INSERT (Jan)
- Support qualified type names in PL/Tcl’s spi_prepare command (Jan)
- Make pg_dump handle a procedural language handler located in pg_catalog
- Make pg_dump handle cases where a custom opclass is in another schema
- Make pg_dump dump binary-compatible casts correctly (Jan)
- Fix insertion of expressions containing subqueries into rule bodies
- Fix incorrect argument processing in clusterdb script (Anand Ranganathan)
• Fix problems with dropped columns in plpython triggers
• Repair problems with to_char() reading past end of its input string (Karel)
• Fix GB18030 mapping errors (Tatsuo)
• Fix several problems with SSL error handling and asynchronous SSL I/O
• Remove ability to bind a list of values to a single parameter in JDBC (prevents possible SQL-injection attacks)
• Fix some errors in HAVE_INT64_TIMESTAMP code paths
• Fix corner case for btree search in parallel with first root page split

E.320. Release 7.3.4

Release date: 2003-07-24
This has a variety of fixes from 7.3.3.

E.320.1. Migration to Version 7.3.4
A dump/restore is not required for those running 7.3.*.

E.320.2. Changes

• Repair breakage in timestamp-to-date conversion for dates before 2000
• Prevent rare possibility of server startup failure (Tom)
• Fix bugs in interval-to-time conversion (Tom)
• Add constraint names in a few places in pg_dump (Rod)
• Improve performance of functions with many parameters (Tom)
• Fix to_ascii() buffer overruns (Tom)
• Prevent restore of database comments from throwing an error (Tom)
• Work around buggy strxfrm() present in some Solaris releases (Tom)
• Properly escape jdbc setObject() strings to improve security (Barry)

E.321. Release 7.3.3

Release date: 2003-05-22
This release contains a variety of fixes for version 7.3.2.
Appendix E. Release Notes

E.321.1. Migration to Version 7.3.3

A dump/restore is not required for those running version 7.3.*.

E.321.2. Changes

- Repair sometimes-incorrect computation of StartUpID after a crash
- Avoid slowness with lots of deferred triggers in one transaction (Stephan)
- Don’t lock referenced row when UPDATE doesn’t change foreign key’s value (Jan)
- Use -fPIC not -fpic on Sparc (Tom Callaway)
- Repair lack of schema-awareness in contrib/reindexdb
- Fix contrib/intarray error for zero-element result array (Teodor)
- Ensure createuser script will exit on control-C (Oliver)
- Fix errors when the type of a dropped column has itself been dropped
- CHECKPOINT does not cause database panic on failure in noncritical steps
- Accept 60 in seconds fields of timestamp, time, interval input values
- Issue notice, not error, if TIMESTAMP, TIME, or INTERVAL precision too large
- Fix abstime-to-time cast function (fix is not applied unless you initdb)
- Fix pg_proc entry for timestamptz (fix is not applied unless you initdb)
- Make EXTRACT(EPOCH FROM timestamp without time zone) treat input as local time
- ‘now’::timestamptz gave wrong answer if timezone changed earlier in transaction
- HAVE_INT64_TIMESTAMP code for time with timezone overwrote its input
- Accept GLOBAL TEMP/TEMPORARY as a synonym for TEMPORARY
- Avoid improper schema-privilege-check failure in foreign-key triggers
- Fix bugs in foreign-key triggers for SET DEFAULT action
- Fix incorrect time-qual check in row fetch for UPDATE and DELETE triggers
- Foreign-key clauses were parsed but ignored in ALTER TABLE ADD COLUMN
- Fix createlang script breakage for case where handler function already exists
- Fix misbehavior on zero-column tables in pg_dump, COPY, ANALYZE, other places
- Fix misbehavior of func_error() on type names containing '%%'
- Fix misbehavior of replace() on strings containing '%%'
- Regular-expression patterns containing certain multibyte characters failed
- Account correctly for NULLs in more cases in join size estimation
- Avoid conflict with system definition of isblank() function or macro
- Fix failure to convert large code point values in EUC_TW conversions (Tatsuo)
• Fix error recovery for \texttt{SSL\_read/SSL\_write} calls
• Don’t do early constant-folding of type coercion expressions
• Validate page header fields immediately after reading in any page
• Repair incorrect check for ungrouped variables in unnamed joins
• Fix buffer overrun in \texttt{to\_ascii} (Guido Notari)
• \texttt{contrib/ltree} fixes (Teodor)
• Fix core dump in deadlock detection on machines where \texttt{char} is unsigned
• Avoid running out of buffers in many-way indexscan (bug introduced in 7.3)
• Fix planner’s selectivity estimation functions to handle domains properly
• Fix \texttt{dbmirror} memory-allocation bug (Steven Singer)
• Prevent infinite loop in \texttt{ln(\texttt{numeric})} due to roundoff error
• \texttt{GROUP} \texttt{BY} got confused if there were multiple equal \texttt{GROUP BY} items
• Fix bad plan when inherited \texttt{UPDATE/DELETE} references another inherited table
• Prevent clustering on incomplete (partial or non-NULL-storing) indexes
• Service shutdown request at proper time if it arrives while still starting up
• Fix left-links in temporary indexes (could make backwards scans miss entries)
• Fix incorrect handling of client\_encoding setting in postgresql.conf (Tatsuo)
• Fix failure to respond to \texttt{pg\_ctl stop \textasciitilde m fast} after Async\_NotifyHandler runs
• Fix SPI for case where rule contains multiple statements of the same type
• Fix problem with checking for wrong type of access privilege in rule query
• Fix problem with \texttt{EXCEPT} in \texttt{CREATE RULE}
• Prevent problem with dropping temp tables having serial columns
• Fix replace\_vars\_with\_subplan\_refs failure in complex views
• Fix regexp slowness in single-byte encodings (Tatsuo)
• Allow qualified type names in \texttt{CREATE CAST} and \texttt{DROP CAST}
• Accept \texttt{SETOF type[]}, which formerly had to be written \texttt{SETOF \_type}
• Fix \texttt{pg\_dump} core dump in some cases with procedural languages
• Force ISO datestyle in \texttt{pg\_dump} output, for portability (Oliver)
• \texttt{pg\_dump} failed to handle error return from \texttt{lo\_read} (Oleg Drokin)
• \texttt{pg\_dumpall} failed with groups having no members (Nick Eskelinen)
• \texttt{pg\_dumpall} failed to recognize --globals-only switch
• \texttt{pg\_restore} failed to restore blobs if \texttt{-X disable-triggers} is specified
• Repair intrafunction memory leak in \texttt{plpgsql}
• \texttt{plsql\_elog} command dumped core if given wrong parameters (Ian Harding)
• \texttt{plpython} used wrong value of \texttt{atttypmod} (Brad McLean)
Appendix E. Release Notes

- Fix improper quoting of boolean values in Python interface (D’Arcy)
- Added `addDataType()` method to PGConnection interface for JDBC
- Fixed various problems with updateable ResultSets for JDBC (Shawn Green)
- Fixed various problems with DatabaseMetaData for JDBC (Kris Jurka, Peter Royal)
- Fixed problem with parsing table ACLs in JDBC
- Better error message for character set conversion problems in JDBC

E.322. Release 7.3.2

**Release date:** 2003-02-04

This release contains a variety of fixes for version 7.3.1.

E.322.1. Migration to Version 7.3.2

A dump/restore is not required for those running version 7.3.*.

E.322.2. Changes

- Restore creation of OID column in CREATE TABLE AS / SELECT INTO
- Fix `pg_dump` core dump when dumping views having comments
- Dump DEFERRABLE/INITIALLY DEFERRED constraints properly
- Fix UPDATE when child table’s column numbering differs from parent
- Increase default value of `max_fsm_relations`
- Fix problem when fetching backwards in a cursor for a single-row query
- Make backward fetch work properly with cursor on SELECT DISTINCT query
- Fix problems with loading `pg_dump` files containing contrib/lo usage
- Fix problem with all-numeric user names
- Fix possible memory leak and core dump during disconnect in libpgtcl
- Make plpython’s `spi_execute` command handle nulls properly (Andrew Bosma)
- Adjust plpython error reporting so that its regression test passes again
- Work with bison 1.875
- Handle mixed-case names properly in plpgsql’s `%type` (Neil)
- Fix core dump in pltcl when executing a query rewritten by a rule
- Repair array subscript overruns (per report from Yichen Xie)
• Reduce MAX_TIME_PRECISION from 13 to 10 in floating-point case
• Correctly case-fold variable names in per-database and per-user settings
• Fix coredump in plpgsql’s RETURN NEXT when SELECT into record returns no rows
• Fix outdated use of pg_type.typprtlen in python client interface
• Correctly handle fractional seconds in timestamps in JDBC driver
• Improve performance of getImportedKeys() in JDBC
• Make shared-library symlinks work standardly on HPUX (Giles)
• Repair inconsistent rounding behavior for timestamp, time, interval
• SSL negotiation fixes (Nathan Mueller)
• Make libpq’s ~/.pgpass feature work when connecting with PQconnectDB
• Update my2pg, ora2pg
• Translation updates
• Add casts between types lo and oid in contrib/lo
• fastpath code now checks for privilege to call function

E.323. Release 7.3.1

Release date: 2002-12-18
This release contains a variety of fixes for version 7.3.

E.323.1. Migration to Version 7.3.1

A dump/restore is not required for those running version 7.3. However, it should be noted that the main PostgreSQL interface library, libpq, has a new major version number for this release, which might require recompilation of client code in certain cases.

E.323.2. Changes

• Fix a core dump of COPY TO when client/server encodings don’t match (Tom)
• Allow pg_dump to work with pre-7.2 servers (Philip)
• contrib/adddepend fixes (Tom)
• Fix problem with deletion of per-user/per-database config settings (Tom)
• contrib/vacuumlo fix (Tom)
• Allow ‘password’ encryption even when pg_shadow contains MD5 passwords (Bruce)
• contrib/dbmirror fix (Steven Singer)
Appendix E. Release Notes

- Optimizer fixes (Tom)
- contrib/tsearch fixes (Teodor Sigaev, Magnus)
- Allow locale names to be mixed case (Nicolai Tufar)
- Increment libpq library’s major version number (Bruce)
- pg_hba.conf error reporting fixes (Bruce, Neil)
- Add SCO Openserver 5.0.4 as a supported platform (Bruce)
- Prevent EXPLAIN from crashing server (Tom)
- SSL fixes (Nathan Mueller)
- Prevent composite column creation via ALTER TABLE (Tom)

E.324. Release 7.3

Release date: 2002-11-27

E.324.1. Overview

Major changes in this release:

Schemas

Schemas allow users to create objects in separate namespaces, so two people or applications can have tables with the same name. There is also a public schema for shared tables. Table/index creation can be restricted by removing privileges on the public schema.

Drop Column

PostgreSQL now supports the ALTER TABLE ... DROP COLUMN functionality.

Table Functions

Functions returning multiple rows and/or multiple columns are now much easier to use than before. You can call such a “table function” in the SELECT FROM clause, treating its output like a table. Also, PL/pgSQL functions can now return sets.

Prepared Queries

PostgreSQL now supports prepared queries, for improved performance.

Dependency Tracking

PostgreSQL now records object dependencies, which allows improvements in many areas. DROP statements now take either CASCADE or RESTRICT to control whether dependent objects are also dropped.

Privileges

Functions and procedural languages now have privileges, and functions can be defined to run with the privileges of their creator.
Internationalization

Both multibyte and locale support are now always enabled.

Logging

A variety of logging options have been enhanced.

Interfaces

A large number of interfaces have been moved to http://gborg.postgresql.org where they can be developed and released independently.

Functions/Identifiers

By default, functions can now take up to 32 parameters, and identifiers can be up to 63 bytes long. Also, \texttt{OPAQUE} is now deprecated: there are specific “pseudo-datatypes” to represent each of the former meanings of \texttt{OPAQUE} in function argument and result types.

E.324.2. Migration to Version 7.3

A dump/restore using \texttt{pg_dump} is required for those wishing to migrate data from any previous release. If your application examines the system catalogs, additional changes will be required due to the introduction of schemas in 7.3; for more information, see: http://developer.postgresql.org/~momjian/upgrade_tips_7.3.

Observe the following incompatibilities:

- Pre-6.3 clients are no longer supported.
- \texttt{pg_hba.conf} now has a column for the user name and additional features. Existing files need to be adjusted.
- Several \texttt{postgresql.conf} logging parameters have been renamed.
- \texttt{LIMIT \#,\#} has been disabled; use \texttt{LIMIT \# OFFSET \#}.
- \texttt{INSERT} statements with column lists must specify a value for each specified column. For example, \texttt{INSERT INTO tab (col1, col2) VALUES ('val1')} is now invalid. It’s still allowed to supply fewer columns than expected if the \texttt{INSERT} does not have a column list.
- \texttt{serial} columns are no longer automatically \texttt{UNIQUE}; thus, an index will not automatically be created.
- A \texttt{SET} command inside an aborted transaction is now rolled back.
- \texttt{COPY} no longer considers missing trailing columns to be null. All columns need to be specified. (However, one can achieve a similar effect by specifying a column list in the \texttt{COPY} command.)
- The data type \texttt{timestamp} is now equivalent to \texttt{timestamp without time zone}, instead of \texttt{timestamp with time zone}.
- Pre-7.3 databases loaded into 7.3 will not have the new object dependencies for \texttt{serial} columns, unique constraints, and foreign keys. See the directory \texttt{contrib/adddepend/} for a detailed description and a script that will add such dependencies.
- An empty string ("") is no longer allowed as the input into an integer field. Formerly, it was silently interpreted as 0.
E.324.3. Changes

E.324.3.1. Server Operation

• Add pg_locks view to show locks (Neil)
• Security fixes for password negotiation memory allocation (Neil)
• Remove support for version 0 FE/BE protocol (PostgreSQL 6.2 and earlier) (Tom)
• Reserve the last few backend slots for superusers, add parameter superuser_reserved_connections to control this (Nigel J. Andrews)

E.324.3.2. Performance

• Improve startup by calling localtime() only once (Tom)
• Cache system catalog information in flat files for faster startup (Tom)
• Improve caching of index information (Tom)
• Optimizer improvements (Tom, Fernando Nasser)
• Catalog caches now store failed lookups (Tom)
• Hash function improvements (Neil)
• Improve performance of query tokenization and network handling (Peter)
• Speed improvement for large object restore (Mario Weilguni)
• Mark expired index entries on first lookup, saving later heap fetches (Tom)
• Avoid excessive NULL bitmap padding (Manfred Koizar)
• Add BSD-licensed qsort() for Solaris, for performance (Bruce)
• Reduce per-row overhead by four bytes (Manfred Koizar)
• Fix GEQO optimizer bug (Neil Conway)
• Make WITHOUT OID actually save four bytes per row (Manfred Koizar)
• Add default_statistics_target variable to specify ANALYZE buckets (Neil)
• Use local buffer cache for temporary tables so no WAL overhead (Tom)
• Improve free space map performance on large tables (Stephen Marshall, Tom)
• Improved WAL write concurrency (Tom)

E.324.3.3. Privileges

• Add privileges on functions and procedural languages (Peter)
• Add OWNER to CREATE DATABASE so superusers can create databases on behalf of unprivileged users (Gavin Sherry, Tom)
Appendix E. Release Notes

- Add new object privilege bits EXECUTE and USAGE (Tom)
- Add SET SESSION AUTHORIZATION DEFAULT and RESET SESSION AUTHORIZATION (Tom)
- Allow functions to be executed with the privilege of the function owner (Peter)

E.324.3.4. Server Configuration

- Server log messages now tagged with LOG, not DEBUG (Bruce)
- Add user column to pg_hba.conf (Bruce)
- Have log_connections output two lines in log file (Tom)
- Remove debug_level from postgresql.conf, now server_min_messages (Bruce)
- New ALTER DATABASE/USER ... SET command for per-user/database initialization (Peter)
- New parameters server_min_messages and client_min_messages to control which messages are sent to the server logs or client applications (Bruce)
- Allow pg_hba.conf to specify lists of users/databases separated by commas, group names prepended with +, and file names prepended with @ (Bruce)
- Remove secondary password file capability and pg_password utility (Bruce)
- Add variable db_user_namespace for database-local user names (Bruce)
- SSL improvements (Bear Giles)
- Make encryption of stored passwords the default (Bruce)
- Allow pg_statistics to be reset by calling pg_stat_reset() (Christopher)
- Add log_duration parameter (Bruce)
- Rename debug_print_query to log_statement (Bruce)
- Rename show_query_stats to show_statement_stats (Bruce)
- Add param log_min_error_statement to print commands to logs on error (Gavin)

E.324.3.5. Queries

- Make cursors insensitive, meaning their contents do not change (Tom)
- Disable LIMIT #,# syntax; now only LIMIT # OFFSET # supported (Bruce)
- Increase identifier length to 63 (Neil, Bruce)
- UNION fixes for merging >= 3 columns of different lengths (Tom)
- Add DEFAULT key word to INSERT, e.g., INSERT ... (... DEFAULT, ...) (Rod)
- Allow views to have default values using ALTER COLUMN ... SET DEFAULT (Neil)
- Fail on INSERTs with column lists that don’t supply all column values, e.g., INSERT INTO tab (col1, col2) VALUES (’val1’); (Rod)
Appendix E. Release Notes

- Fix for join aliases (Tom)
- Fix for FULL OUTER JOINs (Tom)
- Improve reporting of invalid identifier and location (Tom, Gavin)
- Fix OPEN cursor(args) (Tom)
- Allow 'ctid' to be used in a view and currtid(viewname) (Hiroshi)
- Fix for CREATE TABLE AS with UNION (Tom)
- SQL99 syntax improvements (Thomas)
- Add statement_timeout variable to cancel queries (Bruce)
- Allow prepared queries with PREPARE/EXECUTE (Neil)
- Allow FOR UPDATE to appear after LIMIT/OFFSET (Bruce)
- Add variable autocommit (Tom, David Van Wie)

E.324.3.6. Object Manipulation

- Make equals signs optional in CREATE DATABASE (Gavin Sherry)
- Make ALTER TABLE OWNER change index ownership too (Neil)
- New ALTER TABLE tabname ALTER COLUMN colname SET STORAGE controls TOAST storage, compression (John Gray)
- Add schema support, CREATE/DROP SCHEMA (Tom)
- Create schema for temporary tables (Tom)
- Add variable search_path for schema search (Tom)
- Add ALTER TABLE SET/DROP NOT NULL (Christopher)
- New CREATE FUNCTION volatility levels (Tom)
- Make rule names unique only per table (Tom)
- Add 'ON tablename' clause to DROP RULE and COMMENT ON RULE (Tom)
- Add ALTER TRIGGER RENAME (Joe)
- New current_schema() and current_schemas() inquiry functions (Tom)
- Allow functions to return multiple rows (table functions) (Joe)
- Make WITH optional in CREATE DATABASE, for consistency (Bruce)
- Add object dependency tracking (Rod, Tom)
- Add RESTRICT/CASCADE to DROP commands (Rod)
- Add ALTER TABLE DROP for non-CHECK CONSTRAINT (Rod)
- Autodestroy sequence on DROP of table with SERIAL (Rod)
- Prevent column dropping if column is used by foreign key (Rod)
- Automatically drop constraints/functions when object is dropped (Rod)
• Add CREATE/DROP OPERATOR CLASS (Bill Studenmund, Tom)
• Add ALTER TABLE DROP COLUMN (Christopher, Tom, Hiroshi)
• Prevent inherited columns from being removed or renamed (Alvaro Herrera)
• Fix foreign key constraints to not error on intermediate database states (Stephan)
• Propagate column or table renaming to foreign key constraints
• Add CREATE OR REPLACE VIEW (Gavin, Neil, Tom)
• Add CREATE OR REPLACE RULE (Gavin, Neil, Tom)
• Have rules execute alphabetically, returning more predictable values (Tom)
• Triggers are now fired in alphabetical order (Tom)
• Add /contrib/adddepend to handle pre-7.3 object dependencies (Rod)
• Allow better casting when inserting/updating values (Tom)

E.324.3.7. Utility Commands

• Have COPY TO output embedded carriage returns and newlines as \r and \n (Tom)
• Allow DELIMITER in COPY FROM to be 8-bit clean (Tatsuo)
• Make pg_dump use ALTER TABLE ADD PRIMARY KEY, for performance (Neil)
• Disable brackets in multistatement rules (Bruce)
• Disable VACUUM from being called inside a function (Bruce)
• Allow dropdb and other scripts to use identifiers with spaces (Bruce)
• Restrict database comment changes to the current database
• Allow comments on operators, independent of the underlying function (Rod)
• Rollback SET commands in aborted transactions (Tom)
• EXPLAIN now outputs as a query (Tom)
• Display condition expressions and sort keys in EXPLAIN (Tom)
• Add 'SET LOCAL var = value' to set configuration variables for a single transaction (Tom)
• Allow ANALYZE to run in a transaction (Bruce)
• Improve COPY syntax using new WITH clauses, keep backward compatibility (Bruce)
• Fix pg_dump to consistently output tags in non-ASCII dumps (Bruce)
• Make foreign key constraints clearer in dump file (Rod)
• Add COMMENT ON CONSTRAINT (Rod)
• Allow COPY TO/FROM to specify column names (Brent Verner)
• Dump UNIQUE and PRIMARY KEY constraints as ALTER TABLE (Rod)
• Have SHOW output a query result (Joe)
• Generate failure on short COPY lines rather than pad NULLs (Neil)
• Fix CLUSTER to preserve all table attributes (Alvaro Herrera)
• New pg_settings table to view/modify GUC settings (Joe)
• Add smart quoting, portability improvements to pg_dump output (Peter)
• Dump serial columns out as SERIAL (Tom)
• Enable large file support, >2G for pg_dump (Peter, Philip Warner, Bruce)
• Disallow TRUNCATE on tables that are involved in referential constraints (Rod)
• Have TRUNCATE also auto-truncate the toast table of the relation (Tom)
• Add clusterdb utility that will auto-cluster an entire database based on previous CLUSTER operations (Alvaro Herrera)
• Overhaul pg_dumpall (Peter)
• Allow REINDEX of TOAST tables (Tom)
• Implemented START TRANSACTION, per SQL99 (Neil)
• Fix rare index corruption when a page split affects bulk delete (Tom)
• Fix ALTER TABLE ... ADD COLUMN for inheritance (Alvaro Herrera)

**E.324.3.8. Data Types and Functions**

• Fix factorial(0) to return 1 (Bruce)
• Date/time/timezone improvements (Thomas)
• Fix for array slice extraction (Tom)
• Fix extract/date_part to report proper microseconds for timestamp (Tatsuo)
• Allow text_substr() and bytea_substr() to read TOAST values more efficiently (John Gray)
• Add domain support (Rod)
• Make WITHOUT TIME ZONE the default for TIMESTAMPS and TIME data types (Thomas)
• Allow alternate storage scheme of 64-bit integers for date/time types using --enable-integer-datetime times in configure (Thomas)
• Make timezone(timestamptz) return timestamp rather than a string (Thomas)
• Allow fractional seconds in date/time types for dates prior to 1BC (Thomas)
• Limit timestamp data types to 6 decimal places of precision (Thomas)
• Change timezone conversion functions from timetz() to timezone() (Thomas)
• Add configuration variables datatime and timezone (Tom)
• Add OVERLAY(), which allows substitution of a substring in a string (Thomas)
• Add SIMILAR TO (Thomas, Tom)
• Add regular expression SUBSTRING(string FROM pat FOR escape) (Thomas)
• Add LOCALTIME and LOCALTIMESTAMP functions (Thomas)
Appendix E. Release Notes

- Add named composite types using CREATE TYPE typename AS (column) (Joe)
- Allow composite type definition in the table alias clause (Joe)
- Add new API to simplify creation of C language table functions (Joe)
- Remove ODBC-compatible empty parentheses from calls to SQL99 functions for which these parentheses do not match the standard (Thomas)
- Allow macaddr data type to accept 12 hex digits with no separators (Mike Wyer)
- Add CREATE/DROP CAST (Peter)
- Add IS DISTINCT FROM operator (Thomas)
- Add SQL99 TREAT() function, synonym for CAST() (Thomas)
- Add pg_backend_pid() to output backend pid (Bruce)
- Add IS OF / IS NOT OF type predicate (Thomas)
- Allow bit string constants without fully-specified length (Thomas)
- Allow conversion between 8-byte integers and bit strings (Thomas)
- Implement hex literal conversion to bit string literal (Thomas)
- Allow table functions to appear in the FROM clause (Joe)
- Increase maximum number of function parameters to 32 (Bruce)
- No longer automatically create index for SERIAL column (Tom)
- Add current_database() (Rod)
- Fix cash_words() to not overflow buffer (Tom)
- Add functions replace(), split_part(), to_hex() (Joe)
- Fix LIKE for bytea as a right-hand argument (Joe)
- Prevent crashes caused by SELECT cash_out(2) (Tom)
- Fix to_char(1,’FM999.99’) to return a period (Karel)
- Fix trigger/type/language functions returning OPAQUE to return proper type (Tom)

E.324.3.9. Internationalization

- Add additional encodings: Korean (JOHAB), Thai (WIN874), Vietnamese (TCVN), Arabic (WIN1256), Simplified Chinese (GBK), Korean (UHC) (Eiji Tokuya)
- Enable locale support by default (Peter)
- Add locale variables (Peter)
- Escape bytes >= 0x7f for multibyte in PQescapeBytea/PQunescapeBytea (Tatsuo)
- Add locale awareness to regular expression character classes
- Enable multibyte support by default (Tatsuo)
- Add GB18030 multibyte support (Bill Huang)
Appendix E. Release Notes

- Add CREATE/DROP CONVERSION, allowing loadable encodings (Tatsuo, Kaori)
- Add pg_conversion table (Tatsuo)
- Add SQL99 CONVERT() function (Tatsuo)
- pg_dumpall, pg_controldata, and pg_resetxlog now national-language aware (Peter)
- New and updated translations

E.324.3.10. Server-side Languages

- Allow recursive SQL function (Peter)
- Change PL/Tcl build to use configured compiler and Makefile.shlib (Peter)
- Overhaul the PL/pgSQL FOUND variable to be more Oracle-compatible (Neil, Tom)
- Allow PL/pgSQL to handle quoted identifiers (Tom)
- Allow set-returning PL/pgSQL functions (Neil)
- Make PL/pgSQL schema-aware (Joe)
- Remove some memory leaks (Nigel J. Andrews, Tom)

E.324.3.11. psql

- Don’t lowercase psql \connect database name for 7.2.0 compatibility (Tom)
- Add psql \timing to time user queries (Greg Sabino Mullane)
- Have psql \d show index information (Greg Sabino Mullane)
- New psql \dD shows domains (Jonathan Eisler)
- Allow psql to show rules on views (Paul ?)
- Fix for psql variable substitution (Tom)
- Allow psql \d to show temporary table structure (Tom)
- Allow psql \d to show foreign keys (Rod)
- Fix \? to honor \pset pager (Bruce)
- Have psql reports its version number on startup (Tom)
- Allow \copy to specify column names (Tom)

E.324.3.12. libpq

- Add ~/.pgpass to store host/user password combinations (Alvaro Herrera)
- Add PQunescapeBytea() function to libpq (Patrick Welche)
- Fix for sending large queries over non-blocking connections (Bernhard Herzog)
Appendix E. Release Notes

- Fix for libpq using timers on Win9X (David Ford)
- Allow libpq notify to handle servers with different-length identifiers (Tom)
- Add libpq PQescapeString() and PQescapeBytea() to Windows (Bruce)
- Fix for SSL with non-blocking connections (Jack Bates)
- Add libpq connection timeout parameter (Denis A Ustimenko)

E.324.3.13. JDBC

- Allow JDBC to compile with JDK 1.4 (Dave)
- Add JDBC 3 support (Barry)
- Allows JDBC to set loglevel by adding ?loglevel=X to the connection URL (Barry)
- Add Driver.info() message that prints out the version number (Barry)
- Add updateable result sets (Raghu Nidagal, Dave)
- Add support for callable statements (Paul Bethe)
- Add query cancel capability
- Add refresh row (Dave)
- Fix MD5 encryption handling for multibyte servers (Jun Kawai)
- Add support for prepared statements (Barry)

E.324.3.14. Miscellaneous Interfaces

- Fixed ECPG bug concerning octal numbers in single quotes (Michael)
- Move src/interfaces/libpgeasy to http://gborg.postgresql.org (Marc, Bruce)
- Improve Python interface (Elliot Lee, Andrew Johnson, Greg Copeland)
- Add libpgtcl connection close event (Gerhard Hintermayer)
- Move src/interfaces/libpq++ to http://gborg.postgresql.org (Marc, Bruce)
- Move src/interfaces/odbc to http://gborg.postgresql.org (Marc)
- Move src/interfaces/libpgeasy to http://gborg.postgresql.org (Marc, Bruce)
- Move src/interfaces/perl5 to http://gborg.postgresql.org (Marc, Bruce)
- Remove src/bin/pgaccess from main tree, now at http://www.pgaccess.org (Bruce)
- Add pg_on_connection_loss command to libpgtcl (Gerhard Hintermayer, Tom)
E.324.3.15. Source Code

- Fix for parallel make (Peter)
- AIX fixes for linking Tcl (Andreas Zeugswetter)
- Allow PL/Perl to build under Cygwin (Jason Tishler)
- Improve MIPS compiles (Peter, Oliver Elphick)
- Require Autoconf version 2.53 (Peter)
- Require readline and zlib by default in configure (Peter)
- Allow Solaris to use Intimate Shared Memory (ISM), for performance (Scott Brunza, P.J. Josh Rovero)
- Always enable syslog in compile, remove --enable-syslog option (Tatsuo)
- Always enable multibyte in compile, remove --enable-multibyte option (Tatsuo)
- Always enable locale in compile, remove --enable-locale option (Peter)
- Fix for Win9x DLL creation (Magnus Naeslund)
- Fix for link() usage by WAL code on Windows, BeOS (Jason Tishler)
- Add sys/types.h to c.h, remove from main files (Peter, Bruce)
- Fix AIX hang on SMP machines (Tomoyuki Nijjima)
- AIX SMP hang fix (Tomoyuki Nijjima)
- Fix pre-1970 date handling on newer glibc libraries (Tom)
- Fix PowerPC SMP locking (Tom)
- Prevent gcc -ffast-math from being used (Peter, Tom)
- Bison &ge; 1.50 now required for developer builds
- Kerberos 5 support now builds with Heimdal (Peter)
- Add appendix in the User’s Guide which lists SQL features (Thomas)
- Improve loadable module linking to use RTLD_NOW (Tom)
- New error levels WARNING, INFO, LOG, DEBUG[1-5] (Bruce)
- New src/port directory holds replaced libc functions (Peter, Bruce)
- New pg_namespace system catalog for schemas (Tom)
- Add pg_class.relnamespace for schemas (Tom)
- Add pg_type.typnamespace for schemas (Tom)
- Add pg_proc.pronamespace for schemas (Tom)
- Restructure aggregates to have pg_proc entries (Tom)
- System relations now have their own namespace, pg_* test not required (Fernando Nasser)
- Rename TOAST index names to be *_index rather than *_idx (Neil)
- Add namespaces for operators, opclasses (Tom)
- Add additional checks to server control file (Thomas)
Appendix E. Release Notes

- New Polish FAQ (Marcin Mazurek)
- Add Posix semaphore support (Tom)
- Document need for reindex (Bruce)
- Rename some internal identifiers to simplify Windows compile (Jan, Katherine Ward)
- Add documentation on computing disk space (Bruce)
- Remove KSQO from GUC (Bruce)
- Fix memory leak in rtree (Kenneth Been)
- Modify a few error messages for consistency (Bruce)
- Remove unused system table columns (Peter)
- Make system columns NOT NULL where appropriate (Tom)
- Clean up use of sprintf in favor of snprintf() (Neil, Jukka Holappa)
- Remove OPAQUE and create specific subtypes (Tom)
- Cleanups in array internal handling (Joe, Tom)
- Disallow pg_atoi("") (Bruce)
- Remove parameter wal_files because WAL files are now recycled (Bruce)
- Add version numbers to heap pages (Tom)

E.324.3.16. Contrib

- Allow inet arrays in /contrib/array (Neil)
- GiST fixes (Teodor Sigaev, Neil)
- Upgrade /contrib/mysql
- Add /contrib/dbsize which shows table sizes without vacuum (Peter)
- Add /contrib/intagg, integer aggregator routines (mlw)
- Improve /contrib/oid2name (Neil, Bruce)
- Improve /contrib/tsearch (Oleg, Teodor Sigaev)
- Cleanups of /contrib/rserver (Alexey V. Borzov)
- Update /contrib/oracle conversion utility (Gilles Darold)
- Update /contrib/dblink (Joe)
- Improve options supported by /contrib/vacuumlo (Mario Weilguni)
- Improvements to /contrib/intarray (Oleg, Teodor Sigaev, Andrey Oktyabrski)
- Add /contrib/reindexdb utility (Shaun Thomas)
- Add indexing to /contrib/isbn_issn (Dan Weston)
- Add /contrib/dbmirror (Steven Singer)
- Improve /contrib/pgbench (Neil)
Appendix E. Release Notes

• Add /contrib/tablefunc table function examples (Joe)
• Add /contrib/ltree data type for tree structures (Teodor Sigaev, Oleg Bartunov)
• Move /contrib/pg_controldata, pg_resetxlog into main tree (Bruce)
• Fixes to /contrib/cube (Bruno Wolff)
• Improve /contrib/fulltextindex (Christopher)

E.325. Release 7.2.8

Release date: 2005-05-09
This release contains a variety of fixes from 7.2.7, including one security-related issue.

E.325.1. Migration to Version 7.2.8
A dump/restore is not required for those running 7.2.X.

E.325.2. Changes

• Repair ancient race condition that allowed a transaction to be seen as committed for some purposes (eg SELECT FOR UPDATE) slightly sooner than for other purposes
  This is an extremely serious bug since it could lead to apparent data inconsistencies being briefly visible to applications.
• Repair race condition between relation extension and VACUUM
  This could theoretically have caused loss of a page’s worth of freshly-inserted data, although the scenario seems of very low probability. There are no known cases of it having caused more than an Assert failure.
• Fix EXTRACT (EPOCH) for TIME WITH TIME ZONE values
• Additional buffer overrun checks in plpgsql (Neil)
• Fix pg_dump to dump index names and trigger names containing % correctly (Neil)
• Prevent to_char(interval) from dumping core for month-related formats
• Fix contrib/pgcrypto for newer OpenSSL builds (Marko Kreen)

E.326. Release 7.2.7

Release date: 2005-01-31
Appendix E. Release Notes

This release contains a variety of fixes from 7.2.6, including several security-related issues.

E.326.1. Migration to Version 7.2.7

A dump/restore is not required for those running 7.2.X.

E.326.2. Changes

• Disallow LOAD to non-superusers
  On platforms that will automatically execute initialization functions of a shared library (this includes at least Windows and ELF-based Unixen), LOAD can be used to make the server execute arbitrary code. Thanks to NGS Software for reporting this.

• Add needed STRICT marking to some contrib functions (Kris Jurka)

• Avoid buffer overrun when plpgsql cursor declaration has too many parameters (Neil)

• Fix planning error for FULL and RIGHT outer joins
  The result of the join was mistakenly supposed to be sorted the same as the left input. This could not only deliver mis-sorted output to the user, but in case of nested merge joins could give outright wrong answers.

• Fix display of negative intervals in SQL and GERMAN datestyles

E.327. Release 7.2.6

Release date: 2004-10-22
This release contains a variety of fixes from 7.2.5.

E.327.1. Migration to Version 7.2.6

A dump/restore is not required for those running 7.2.X.

E.327.2. Changes

• Repair possible failure to update hint bits on disk
  Under rare circumstances this oversight could lead to “could not access transaction status” failures, which qualifies it as a potential-data-loss bug.

• Ensure that hashed outer join does not miss tuples
Very large left joins using a hash join plan could fail to output unmatched left-side rows given just the right data distribution.

- Disallow running `pg_ctl` as root
  This is to guard against any possible security issues.
- Avoid using temp files in `/tmp` in `make_oidjoins_check`
  This has been reported as a security issue, though it’s hardly worthy of concern since there is no reason for non-developers to use this script anyway.
- Update to newer versions of Bison

### E.328. Release 7.2.5

**Release date:** 2004-08-16

This release contains a variety of fixes from 7.2.4.

#### E.328.1. Migration to Version 7.2.5

A dump/restore is not required for those running 7.2.X.

#### E.328.2. Changes

- Prevent possible loss of committed transactions during crash
  Due to insufficient interlocking between transaction commit and checkpointing, it was possible for transactions committed just before the most recent checkpoint to be lost, in whole or in part, following a database crash and restart. This is a serious bug that has existed since PostgreSQL 7.1.
- Fix corner case for btree search in parallel with first root page split
- Fix buffer overrun in `to_ascii` (Guido Notari)
- Fix core dump in deadlock detection on machines where char is unsigned
- Fix failure to respond to `pg_ctl` stop -m fast after `Async_NotifyHandler` runs
- Repair memory leaks in `pg_dump`
- Avoid conflict with system definition of `isblank()` function or macro

### E.329. Release 7.2.4

**Release date:** 2003-01-30

This release contains a variety of fixes for version 7.2.3, including fixes to prevent possible data loss.
Appendix E. Release Notes

E.329.1. Migration to Version 7.2.4

A dump/restore is not required for those running version 7.2.*.

E.329.2. Changes

• Fix some additional cases of VACUUM "No one parent tuple was found" error
• Prevent VACUUM from being called inside a function (Bruce)
• Ensure pg_clog updates are sync’d to disk before marking checkpoint complete
• Avoid integer overflow during large hash joins
• Make GROUP commands work when pg_group.grolist is large enough to be toasted
• Fix errors in datetime tables; some timezone names weren’t being recognized
• Fix integer overflows in circle_poly(), path_encode(), path_add() (Neil)
• Repair long-standing logic errors in lseg_eq(), lseg_ne(), lseg_center()

E.330. Release 7.2.3

Release date: 2002-10-01

This release contains a variety of fixes for version 7.2.2, including fixes to prevent possible data loss.

E.330.1. Migration to Version 7.2.3

A dump/restore is not required for those running version 7.2.*.

E.330.2. Changes

• Prevent possible compressed transaction log loss (Tom)
• Prevent non-superuser from increasing most recent vacuum info (Tom)
• Handle pre-1970 date values in newer versions of glibc (Tom)
• Fix possible hang during server shutdown
• Prevent spinlock hangs on SMP PPC machines (Tomoyuki Niijima)
• Fix pg_dump to properly dump FULL JOIN USING (Tom)
E.331. Release 7.2.2

Release date: 2002-08-23

This release contains a variety of fixes for version 7.2.1.

E.331.1. Migration to Version 7.2.2

A dump/restore is not required for those running version 7.2.*.

E.331.2. Changes

- Allow EXECUTE of "CREATE TABLE AS ... SELECT" in PL/pgSQL (Tom)
- Fix for compressed transaction log id wraparound (Tom)
- Fix PQescapeBytea/PQunescapeBytea so that they handle bytes > 0x7f (Tatsuo)
- Fix for psql and pg_dump crashing when invoked with non-existent long options (Tatsuo)
- Fix crash when invoking geometric operators (Tom)
- Allow OPEN cursor(args) (Tom)
- Fix for rtree_gist index build (Teodor)
- Fix for dumping user-defined aggregates (Tom)
- contrib/intarray fixes (Oleg)
- Fix for complex UNION/EXCEPT/INTERSECT queries using parens (Tom)
- Fix to pg_convert (Tatsuo)
- Fix for crash with long DATA strings (Thomas, Neil)
- Fix for repeat(), lpad(), rpad() and long strings (Neil)

E.332. Release 7.2.1

Release date: 2002-03-21

This release contains a variety of fixes for version 7.2.

E.332.1. Migration to Version 7.2.1

A dump/restore is not required for those running version 7.2.
### E.332.2. Changes

- Ensure that sequence counters do not go backwards after a crash (Tom)
- Fix pgaccess kanji-conversion key binding (Tatsuo)
- Optimizer improvements (Tom)
- Cash I/O improvements (Tom)
- New Russian FAQ
- Compile fix for missing AuthBlockSig (Heiko)
- Additional time zones and time zone fixes (Thomas)
- Allow psql \connect to handle mixed case database and user names (Tom)
- Return proper OID on command completion even with ON INSERT rules (Tom)
- Allow COPY FROM to use 8-bit DELIMITERS (Tatsuo)
- Fix bug in extract/date_part for milliseconds/microseconds (Tatsuo)
- Improve handling of multiple UNIONs with different lengths (Tom)
- contrib/btree_gist improvements (Teodor Sigaev)
- contrib/tsearch dictionary improvements, see README.tsearch for an additional installation step (Thomas T. Thai, Teodor Sigaev)
- Fix for array subscripts handling (Tom)
- Allow EXECUTE of "CREATE TABLE AS ... SELECT" in PL/pgSQL (Tom)

### E.333. Release 7.2

**Release date:** 2002-02-04

#### E.333.1. Overview

This release improves PostgreSQL for use in high-volume applications.

**Major changes in this release:**

**VACUUM**

Vacuuming no longer locks tables, thus allowing normal user access during the vacuum. A new `VACUUM FULL` command does old-style vacuum by locking the table and shrinking the on-disk copy of the table.

**Transactions**

There is no longer a problem with installations that exceed four billion transactions.
Appendix E. Release Notes

OIDs
OIDs are now optional. Users can now create tables without OIDs for cases where OID usage is excessive.

Optimizer
The system now computes histogram column statistics during `ANALYZE`, allowing much better optimizer choices.

Security
A new MD5 encryption option allows more secure storage and transfer of passwords. A new Unix-domain socket authentication option is available on Linux and BSD systems.

Statistics
Administrators can use the new table access statistics module to get fine-grained information about table and index usage.

Internationalization
Program and library messages can now be displayed in several languages.

E.333.2. Migration to Version 7.2
A dump/restore using `pg_dump` is required for those wishing to migrate data from any previous release. Observe the following incompatibilities:

- The semantics of the `VACUUM` command have changed in this release. You might wish to update your maintenance procedures accordingly.
- In this release, comparisons using `=` NULL will always return false (or NULL, more precisely). Previous releases automatically transformed this syntax to `IS NULL`. The old behavior can be re-enabled using a `postgresql.conf` parameter.
- The `pg_hba.conf` and `pg_ident.conf` configuration is now only reloaded after receiving a SIGHUP signal, not with each connection.
- The function `octet_length()` now returns the uncompressed data length.
- The date/time value ‘current’ is no longer available. You will need to rewrite your applications.
- The `timestamp()`, `time()`, and `interval()` functions are no longer available. Instead of `timestamp()`, use `timestamp ’string’` or `CAST`.

The `SELECT ... LIMIT #,#` syntax will be removed in the next release. You should change your queries to use separate `LIMIT` and `OFFSET` clauses, e.g. `LIMIT 10 OFFSET 20`. 
E.333.3. Changes

E.333.3.1. Server Operation

- Create temporary files in a separate directory (Bruce)
- Delete orphaned temporary files on postmaster startup (Bruce)
- Added unique indexes to some system tables (Tom)
- System table operator reorganization (Oleg Bartunov, Teodor Sigaev, Tom)
- Renamed pg_log to pg_clog (Tom)
- Enable SIGTERM, SIGQUIT to kill backends (Jan)
- Removed compile-time limit on number of backends (Tom)
- Better cleanup for semaphore resource failure (Tatsuo, Tom)
- Allow safe transaction ID wraparound (Tom)
- Removed OIDs from some system tables (Tom)
- Removed "triggered data change violation" error check (Tom)
- SPI portal creation of prepared/saved plans (Jan)
- Allow SPI column functions to work for system columns (Tom)
- Long value compression improvement (Tom)
- Statistics collector for table, index access (Jan)
- Truncate extra-long sequence names to a reasonable value (Tom)
- Measure transaction times in milliseconds (Thomas)
- Fix TID sequential scans (Hiroshi)
- Superuser ID now fixed at 1 (Peter E)
- New pg_ctl "reload" option (Tom)

E.333.3.2. Performance

- Optimizer improvements (Tom)
- New histogram column statistics for optimizer (Tom)
- Reuse write-ahead log files rather than discarding them (Tom)
- Cache improvements (Tom)
- IS NULL, IS NOT NULL optimizer improvement (Tom)
- Improve lock manager to reduce lock contention (Tom)
- Keep relcache entries for index access support functions (Tom)
- Allow better selectivity with NaN and infinities in NUMERIC (Tom)
Appendix E. Release Notes

- R-tree performance improvements (Kenneth Been)
- B-tree splits more efficient (Tom)

E.333.3.3. Privileges

- Change UPDATE, DELETE privileges to be distinct (Peter E)
- New REFERENCES, TRIGGER privileges (Peter E)
- Allow GRANT/REVOKE to/from more than one user at a time (Peter E)
- New has_table_privilege() function (Joe Conway)
- Allow non-superuser to vacuum database (Tom)
- New SET SESSION AUTHORIZATION command (Peter E)
- Fix bug in privilege modifications on newly created tables (Tom)
- Disallow access to pg_statistic for non-superuser, add user-accessible views (Tom)

E.333.3.4. Client Authentication

- Fork postmaster before doing authentication to prevent hangs (Peter E)
- Add ident authentication over Unix domain sockets on Linux, *BSD (Helge Bahmann, Oliver Elphick, Teodor Sigaev, Bruce)
- Add a password authentication method that uses MD5 encryption (Bruce)
- Allow encryption of stored passwords using MD5 (Bruce)
- PAM authentication (Dominic J. Eidson)
- Load pg_hba.conf and pg_ident.conf only on startup and SIGHUP (Bruce)

E.333.3.5. Server Configuration

- Interpretation of some time zone abbreviations as Australian rather than North American now settable at runtime (Bruce)
- New parameter to set default transaction isolation level (Peter E)
- New parameter to enable conversion of "expr = NULL" into "expr IS NULL", off by default (Peter E)
- New parameter to control memory usage by VACUUM (Tom)
- New parameter to set client authentication timeout (Tom)
- New parameter to set maximum number of open files (Tom)
E.333.3.6. Queries

- Statements added by INSERT rules now execute after the INSERT (Jan)
- Prevent unadorned relation names in target list (Bruce)
- NULLs now sort after all normal values in ORDER BY (Tom)
- New IS UNKNOWN, IS NOT UNKNOWN Boolean tests (Tom)
- New SHARE UPDATE EXCLUSIVE lock mode (Tom)
- New EXPLAIN ANALYZE command that shows run times and row counts (Martijn van Oosterhout)
- Fix problem with LIMIT and subqueries (Tom)
- Fix for LIMIT, DISTINCT ON pushed into subqueries (Tom)
- Fix nested EXCEPT/INTERSECT (Tom)

E.333.3.7. Schema Manipulation

- Fix SERIAL in temporary tables (Bruce)
- Allow temporary sequences (Bruce)
- Sequences now use int8 internally (Tom)
- New SERIAL8 creates int8 columns with sequences, default still SERIAL4 (Tom)
- Make OIDs optional using WITHOUT OIDS (Tom)
- Add %TYPE syntax to CREATE TYPE (Ian Lance Taylor)
- Add ALTER TABLE / DROP CONSTRAINT for CHECK constraints (Christopher Kings-Lynne)
- New CREATE OR REPLACE FUNCTION to alter existing function (preserving the function OID) (Gavin Sherry)
- Add ALTER TABLE / ADD [ UNIQUE | PRIMARY ] (Christopher Kings-Lynne)
- Allow column renaming in views
- Make ALTER TABLE / RENAME COLUMN update column names of indexes (Brent Verner)
- Fix for ALTER TABLE / ADD CONSTRAINT ... CHECK with inherited tables (Stephan Szabo)
- ALTER TABLE RENAME update foreign-key trigger arguments correctly (Brent Verner)
- DROP AGGREGATE and COMMENT ON AGGREGATE now accept an aggtype (Tom)
- Add automatic return type data casting for SQL functions (Tom)
- Allow GiST indexes to handle NULLs and multikey indexes (Oleg Bartunov, Teodor Sigaev, Tom)
- Enable partial indexes (Martijn van Oosterhout)
E.333.3.8. Utility Commands

- Add RESET ALL, SHOW ALL (Marko Kreen)
- CREATE/ALTER USER/GROUP now allow options in any order (Vince)
- Add LOCK A, B, C functionality (Neil Padgett)
- New ENCRYPTED/UNENCRYPTED option to CREATE/ALTER USER (Bruce)
- New light-weight VACUUM does not lock table; old semantics are available as VACUUM FULL (Tom)
- Disable COPY TO/FROM on views (Bruce)
- COPY DELIMITERS string must be exactly one character (Tom)
- VACUUM warning about index tuples fewer than heap now only appears when appropriate (Martijn van Oosterhout)
- Fix privilege checks for CREATE INDEX (Tom)
- Disallow inappropriate use of CREATE/DROP INDEX/TRIGGER/VIEW (Tom)

E.333.3.9. Data Types and Functions

- SUM(), AVG(), COUNT() now uses int8 internally for speed (Tom)
- Add convert(), convert2() (Tatsuo)
- New function bit_length() (Peter E)
- Make the "n" in CHAR(n)/VARCHAR(n) represents letters, not bytes (Tatsuo)
- CHAR(), VARCHAR() now reject strings that are too long (Peter E)
- BIT VARYING now rejects bit strings that are too long (Peter E)
- BIT now rejects bit strings that do not match declared size (Peter E)
- INET, CIDR text conversion functions (Alex Pilosov)
- INET, CIDR operators << and <<= indexable (Alex Pilosov)
- Bytea \\
  now requires valid three digit octal number
- Bytea comparison improvements, now supports =, <>, >, >=, <, and <=
- Bytea now supports B-tree indexes
- Bytea now supports LIKE, LIKE...ESCAPE, NOT LIKE, NOT LIKE...ESCAPE
- Bytea now supports concatenation
- New bytea functions: position, substring, trim, btrim, and length
- New encode() function mode, "escaped", converts minimally escaped bytea to/from text
- Add pg_database_encoding_max_length() (Tatsuo)
- Add pg_client_encoding() function (Tatsuo)
- now() returns time with millisecond precision (Thomas)
Appendix E. Release Notes

- New TIMESTAMP WITHOUT TIMEZONE data type (Thomas)
- Add ISO date/time specification with "T", yyyy-mm-ddThh:mm:ss (Thomas)
- New xid/int comparison functions (Hiroshi)
- Add precision to TIME, TIMESTAMP, and INTERVAL data types (Thomas)
- Modify type coercion logic to attempt binary-compatible functions first (Tom)
- New encode() function installed by default (Marko Kreen)
- Improved to_*() conversion functions (Karel Zak)
- Optimize LIKE/ILIKE when using single-byte encodings (Tatsuo)
- New functions in contrib/pgcrypto: crypt(), hmac(), encrypt(), gen_salt() (Marko Kreen)
- Correct description of translate() function (Bruce)
- Add INTERVAL argument for SET TIME ZONE (Thomas)
- Add INTERVAL YEAR TO MONTH (etc.) syntax (Thomas)
- Optimize length functions when using single-byte encodings (Tatsuo)
- Fix path_inter, path_distance, path_length, dist_ppath to handle closed paths (Curtis Barrett, Tom)
- octet_length(text) now returns non-compressed length (Tatsuo, Bruce)
- Handle "July" full name in date/time literals (Greg Sabino Mullane)
- Some datatype() function calls now evaluated differently
- Add support for Julian and ISO time specifications (Thomas)

E.333.3.10. Internationalization

- National language support in psql, pg_dump, libpq, and server (Peter E)
- Message translations in Chinese (simplified, traditional), Czech, French, German, Hungarian, Russian, Swedish (Peter E, Serguei A. Mokhov, Karel Zak, Weiping He, Zhenbang Wei, Kovacs Zoltan)
- Make trim, ltrim, rtrim, btrim, lpad, rpad, translate multibyte aware (Tatsuo)
- Add LATIN5,6,7,8,9,10 support (Tatsuo)
- Add ISO 8859-5,6,7,8 support (Tatsuo)
- Correct LATIN5 to mean ISO-8859-9, not ISO-8859-5 (Tatsuo)
- Make mic2ascii() non-ASCII aware (Tatsuo)
- Reject invalid multibyte character sequences (Tatsuo)

E.333.3.11. PL/pgSQL

- Now uses portals for SELECT loops, allowing huge result sets (Jan)
- CURSOR and REFCURSOR support (Jan)
Appendix E. Release Notes

- Can now return open cursors (Jan)
- Add ELSEIF (Klaus Reger)
- Improve PL/pgSQL error reporting, including location of error (Tom)
- Allow IS or FOR key words in cursor declaration, for compatibility (Bruce)
- Fix for SELECT ... FOR UPDATE (Tom)
- Fix for PERFORM returning multiple rows (Tom)
- Make PL/pgSQL use the server’s type coercion code (Tom)
- Memory leak fix (Jan, Tom)
- Make trailing semicolon optional (Tom)

E.333.3.12. PL/Perl

- New untrusted PL/Perl (Alex Pilosov)
- PL/Perl is now built on some platforms even if libperl is not shared (Peter E)

E.333.3.13. PL/Tcl

- Now reports errorInfo (Vsevolod Lobko)
- Add spi_lastoid function (bob@redivi.com)

E.333.3.14. PL/Python

- ...is new (Andrew Bosma)

E.333.3.15. psql

- \d displays indexes in unique, primary groupings (Christopher Kings-Lynne)
- Allow trailing semicolons in backslash commands (Greg Sabino Mullane)
- Read password from /dev/tty if possible
- Force new password prompt when changing user and database (Tatsuo, Tom)
- Format the correct number of columns for Unicode (Patrice)

E.333.3.16. libpq

- New function PQescapeString() to escape quotes in command strings (Florian Weimer)
Appendix E. Release Notes

- New function PQescapeBytea() escapes binary strings for use as SQL string literals

**E.333.3.17. JDBC**

- Return OID of INSERT (Ken K)
- Handle more data types (Ken K)
- Handle single quotes and newlines in strings (Ken K)
- Handle NULL variables (Ken K)
- Fix for time zone handling (Barry Lind)
- Improved Druid support
- Allow eight-bit characters with non-multibyte server (Barry Lind)
- Support BIT, BINARY types (Ned Wolpert)
- Reduce memory usage (Michael Stephens, Dave Cramer)
- Update DatabaseMetaData (Peter E)
- Add DatabaseMetaData.getCatalogs() (Peter E)
- Encoding fixes (Anders Bengtsson)
- Get/setCatalog methods (Jason Davies)
- DatabaseMetaData.getColumns() now returns column defaults (Jason Davies)
- DatabaseMetaData.getColumns() performance improvement (Jeroen van Vianen)
- Some JDBC1 and JDBC2 merging (Anders Bengtsson)
- Transaction performance improvements (Barry Lind)
- Array fixes (Greg Zoller)
- Serialize addition
- Fix batch processing (Rene Pijlman)
- ExecSQL method reorganization (Anders Bengtsson)
- GetColumn() fixes (Jeroen van Vianen)
- Fix isWriteable() function (Rene Pijlman)
- Improved passage of JDBC2 conformance tests (Rene Pijlman)
- Add bytea type capability (Barry Lind)
- Add isNullable() (Rene Pijlman)
- JDBC date/time test suite fixes (Liam Stewart)
- Fix for SELECT 'id' AS xxx FROM table (Dave Cramer)
- Fix DatabaseMetaData to show precision properly (Mark Lillywhite)
- New getImported/getExported keys (Jason Davies)
- MD5 password encryption support (Jeremy Wohl)
• Fix to actually use type cache (Ned Wolpert)

**E.333.3.18. ODBC**

• Remove query size limit (Hiroshi)
• Remove text field size limit (Hiroshi)
• Fix for SQLPrimaryKeys in multibyte mode (Hiroshi)
• Allow ODBC procedure calls (Hiroshi)
• Improve boolean handing (Aidan Mountford)
• Most configuration options now settable via DSN (Hiroshi)
• Multibyte, performance fixes (Hiroshi)
• Allow driver to be used with iODBC or unixODBC (Peter E)
• MD5 password encryption support (Bruce)
• Add more compatibility functions to odbc.sql (Peter E)

**E.333.3.19. ECPG**

• EXECUTE ... INTO implemented (Christof Petig)
• Multiple row descriptor support (e.g. CARDINALITY) (Christof Petig)
• Fix for GRANT parameters (Lee Kindness)
• Fix INITIALLY DEFERRED bug
• Various bug fixes (Michael, Christof Petig)
• Auto allocation for indicator variable arrays (int *ind_p=NULL)
• Auto allocation for string arrays (char **foo_pp=NULL)
• ECPGfree_auto_mem fixed
• All function names with external linkage are now prefixed by ECPG
• Fixes for arrays of structures (Michael)

**E.333.3.20. Misc. Interfaces**

• Python fix fetchone() (Gerhard Haring)
• Use UTF, Unicode in Tcl where appropriate (Vsevolod Lobko, Reinhard Max)
• Add Tcl COPY TO/FROM (ljb)
• Prevent output of default index op class in pg_dump (Tom)
• Fix libpgeasy memory leak (Bruce)
E.333.3.21. Build and Install

- Configure, dynamic loader, and shared library fixes (Peter E)
- Fixes in QNX 4 port (Bernd Tegge)
- Fixes in Cygwin and Windows ports (Jason Tishler, Gerhard Haring, Dmitry Yurtaev, Darko Prenosil, Mikhail Terekhov)
- Fix for Windows socket communication failures (Magnus, Mikhail Terekhov)
- Hurd compile fix (Oliver Elphick)
- BeOS fixes (Cyril Velter)
- Remove configure --enable-unicode-conversion, now enabled by multibyte (Tatsuo)
- AIX fixes (Tatsuo, Andreas)
- Fix parallel make (Peter E)
- Install SQL language manual pages into OS-specific directories (Peter E)
- Rename config.h to pg_config.h (Peter E)
- Reorganize installation layout of header files (Peter E)

E.333.3.22. Source Code

- Remove SEP_CHAR (Bruce)
- New GUC hooks (Tom)
- Merge GUC and command line handling (Marko Kreen)
- Remove EXTEND INDEX (Martijn van Oosterhout, Tom)
- New pgjindent utility to indent java code (Bruce)
- Remove define of true/false when compiling under C++ (Leandro Fanzone, Tom)
- pgindent fixes (Bruce, Tom)
- Replace strcmp() with strcasecmp() where appropriate (Peter E)
- Dynahash portability improvements (Tom)
- Add 'volatile' usage in spinlock structures
- Improve signal handling logic (Tom)

E.333.3.23. Contrib

- New contrib/rtree_gist (Oleg Bartunov, Teodor Sigaev)
- New contrib/tsearch full-text indexing (Oleg, Teodor Sigaev)
- Add contrib/dblink for remote database access (Joe Conway)
• contrib/ora2pg Oracle conversion utility (Gilles Darold)
• contrib/xml XML conversion utility (John Gray)
• contrib/fulltextindex fixes (Christopher Kings-Lynne)
• New contrib/fuzzystrmatch with levenshtein and metaphone, soundex merged (Joe Conway)
• Add contrib/intarray boolean queries, binary search, fixes (Oleg Bartunov)
• New pg_upgrade utility (Bruce)
• Add new pg_resetxlog options (Bruce, Tom)

E.334. Release 7.1.3

Release date: 2001-08-15

E.334.1. Migration to Version 7.1.3
A dump/restore is not required for those running 7.1.X.

E.334.2. Changes

Remove unused WAL segments of large transactions (Tom)
Multiaction rule fix (Tom)
PL/pgSQL memory allocation fix (Jan)
VACUUM buffer fix (Tom)
Regression test fixes (Tom)
pg_dump fixes for GRANT/REVOKE/comments on views, user-defined types (Tom)
Fix subselects with DISTINCT ON or LIMIT (Tom)
BeOS fix
Disable COPY TO/FROM a view (Tom)
Cygwin build (Jason Tishler)

E.335. Release 7.1.2

Release date: 2001-05-11
This has one fix from 7.1.1.
E.335.1. Migration to Version 7.1.2
A dump/restore is *not* required for those running 7.1.X.

E.335.2. Changes

Fix PL/pgSQL SELECTs when returning no rows
Fix for psql backslash core dump
Referential integrity privilege fix
Optimizer fixes
pg_dump cleanups

E.336. Release 7.1.1

Release date: 2001-05-05
This has a variety of fixes from 7.1.

E.336.1. Migration to Version 7.1.1
A dump/restore is *not* required for those running 7.1.

E.336.2. Changes

Fix for numeric MODULO operator (Tom)
pg_dump fixes (Philip)
pg_dump can dump 7.0 databases (Philip)
readline 4.2 fixes (Peter E)
JOIN fixes (Tom)
AIX, MSWIN, VAX, N32K fixes (Tom)
Multibytes fixes (Tom)
Unicode fixes (Tatsuo)
Optimizer improvements (Tom)
Fix for whole rows in functions (Tom)
Fix for pg_ctl and option strings with spaces (Peter E)
ODBC fixes (Hirosi)
EXTRACT can now take string argument (Thomas)
Python fixes (Darcy)
E.337. Release 7.1

**Release date:** 2001-04-13

This release focuses on removing limitations that have existed in the PostgreSQL code for many years.

Major changes in this release:

**Write-ahead Log (WAL)**

To maintain database consistency in case of an operating system crash, previous releases of PostgreSQL have forced all data modifications to disk before each transaction commit. With WAL, only one log file must be flushed to disk, greatly improving performance. If you have been using -F in previous releases to disable disk flushes, you might want to consider discontinuing its use.

**TOAST**

TOAST - Previous releases had a compiled-in row length limit, typically 8k - 32k. This limit made storage of long text fields difficult. With TOAST, long rows of any length can be stored with good performance.

**Outer Joins**

We now support outer joins. The UNION/NOT IN workaround for outer joins is no longer required. We use the SQL92 outer join syntax.

**Function Manager**

The previous C function manager did not handle null values properly, nor did it support 64-bit CPU’s (Alpha). The new function manager does. You can continue using your old custom functions, but you might want to rewrite them in the future to use the new function manager call interface.

**Complex Queries**

A large number of complex queries that were unsupported in previous releases now work. Many combinations of views, aggregates, UNION, LIMIT, cursors, subqueries, and inherited tables now work properly. Inherited tables are now accessed by default. Subqueries in FROM are now supported.

**E.337.1. Migration to Version 7.1**

A dump/restore using pg_dump is required for those wishing to migrate data from any previous release.

**E.337.2. Changes**

**Bug Fixes**

--------

Many multibyte/Unicode/locale fixes (Tatsuo and others)
More reliable ALTER TABLE RENAME (Tom)
Kerberos V fixes (David Wragg)
Fix for INSERT INTO...SELECT where targetlist has subqueries (Tom)
Prompt username/password on standard error (Bruce)
Large objects inv_read/inv_write fixes (Tom)
Fixes for to_char(), to_date(), to_ascii(), and to_timestamp() (Karel, Daniel Baldoni)
Prevent query expressions from leaking memory (Tom)
Allow UPDATE of arrays elements (Tom)
Wake up lock waiters during cancel (Hiroshi)
Fix rare cursor crash when using hash join (Tom)
Fix for DROP TABLE/INDEX in rolled-back transaction (Hiroshi)
Fix psql crash from \l+ if MULTIBYTE enabled (Peter E)
Fix truncation of rule names during CREATE VIEW (Ross Reedstrom)
Fix PL/perl (Alex Kapranoff)
Disallow LOCK on views (Mark Hollomon)
Disallow INSERT/UPDATE/DELETE on views (Mark Hollomon)
Disallow DROP RULE, CREATE INDEX, TRUNCATE on views (Mark Hollomon)
Allow PL/pgSQL accept non-ASCII identifiers (Tatsuo)
Allow views to proper handle GROUP BY, aggregates, DISTINCT (Tom)
Fix rare failure with TRUNCATE command (Tom)
Allow UNION/INTERSECT/EXCEPT to be used with ALL, subqueries, views,
DISTINCT, ORDER BY, SELECT...INTO (Tom)
Fix parser failures during aborted transactions (Tom)
Allow temporary relations to properly clean up indexes (Bruce)
Fix VACUUM problem with moving rows in same page (Tom)
Modify pg_dump to better handle user-defined items in template1 (Philip)
Allow LIMIT in VIEW (Tom)
Require cursor FETCH to honor LIMIT (Tom)
Allow PRIMARY/FOREIGN Key definitions on inherited columns (Stephan)
Allow ORDER BY, LIMIT in subqueries (Tom)
Allow UNION in CREATE RULE (Tom)
Make ALTER/DROP TABLE rollback-able (Vadim, Tom)
Store initdb collation in pg_control so collation cannot be changed (Tom)
Fix INSERT...SELECT with rules (Tom)
Fix FOR UPDATE inside views and subselects (Tom)
Fix OVERLAPS operators conform to SQL92 spec regarding NULLs (Tom)
Fix lpad() and rpad() to handle length less than input string (Tom)
Fix use of NOTIFY in some rules (Tom)
Overhaul btree code (Tom)
Fix NOT NULL use in Pl/pgSQL variables (Tom)
Overhaul GIST code (Oleg)
Fix CLUSTER to preserve constraints and column default (Tom)
Improved deadlock detection handling (Tom)
Allow multiple SERIAL columns in a table (Tom)
Prevent occasional index corruption (Vadim)

Enhancements
-------------
Add OUTER JOINs (Tom)
Function manager overhaul (Tom)
Allow ALTER TABLE RENAME on indexes (Tom)
Improve CLUSTER (Tom)
Improve ps status display for more platforms (Peter E, Marc)
Improve CREATE FUNCTION failure message (Ross)
JDBC improvements (Peter, Travis Bauer, Christopher Cain, William Webber,
Gunnar)
Grand Unified Configuration scheme/GUC. Many options can now be set in
data/postgresql.conf, postmaster/postgres flags, or SET commands (Peter E)
Improved handling of file descriptor cache (Tom)
Appendix E. Release Notes

New warning code about auto-created table alias entries (Bruce)
Overhaul initdb process (Tom, Peter E)
Overhaul of inherited tables; inherited tables now accessed by default;
  new ONLY key word prevents it (Chris Bitmead, Tom)
ODBC cleanups/improvements (Nick Gorham, Stephan Szabo, Zoltan Kovacs,
  Michael Fork)
Allow renaming of temp tables (Tom)
Overhaul memory manager contexts (Tom)
pg_dumpall uses CREATE USER or CREATE GROUP rather using COPY (Peter E)
Overhaul pg_dump (Philip Warner)
Allow pg_hba.conf secondary password file to specify only username (Peter E)
Allow TEMPORARY or TEMP key word when creating temporary tables (Bruce)
New memory leak checker (Karel)
New SET SESSION CHARACTERISTICS (Thomas)
Allow nested block comments (Thomas)
Add WITHOUT TIME ZONE type qualifier (Thomas)
New ALTER TABLE ADD CONSTRAINT (Stephan)
Use NUMERIC accumulators for INTEGER aggregates (Tom)
Overhaul aggregate code (Tom)
New VARIANCE and STDDEV() aggregates
Improve dependency ordering of pg_dump (Philip)
New pg_restore command (Philip)
New pg_dump tar output option (Philip)
New pg_dump of large objects (Philip)
New ESCAPE option to LIKE (Thomas)
New case-insensitive LIKE - ILIKE (Thomas)
Allow functional indexes to use binary-compatible type (Tom)
Allow SQL functions to be used in more contexts (Tom)
New pg_config utility (Peter E)
New PL/pgSQL EXECUTE command which allows dynamic SQL and utility statements
  (Jan)
New PL/pgSQL GET DIAGNOSTICS statement for SPI value access (Jan)
New quote_identifiers() and quote_literal() functions (Jan)
New ALTER TABLE table OWNER TO user command (Mark Hollomon)
Allow subselects in FROM, i.e. FROM (SELECT ...) [AS] alias (Tom)
Update PyGreSQL to version 3.1 (D’Arcy)
Store tables as files named by OID (Vadim)
New SQL function setval(seq,val,bool) for use in pg_dump (Philip)
Require DROP VIEW to remove views, no DROP TABLE (Mark)
Allow DROP VIEW view1, view2 (Mark)
Allow multiple objects in DROP INDEX, DROP RULE, and DROP TYPE (Tom)
Allow automatic conversion to/from Unicode (Tatsuo, Eiji)
New /contrib/pgcrypto hashing functions (Marko Kreen)
New pg_dumpall --globals-only option (Peter E)
New CHECKPOINT command for WAL which creates new WAL log file (Vadim)
New AT TIME ZONE syntax (Thomas)
Allow location of Unix domain socket to be configurable (David J. MacKenzie)
Allow postmaster to listen on a specific IP address (David J. MacKenzie)
Allow socket path name to be specified in hostname by using leading slash
  (David J. MacKenzie)
Allow CREATE DATABASE to specify template database (Tom)
New utility to convert MySQL schema dumps to SQL92 and PostgreSQL (Thomas)
New /contrib/rserv replication toolkit (Vadim)
Appendix E. Release Notes

New file format for COPY BINARY (Tom)
New /contrib/oid2name to map numeric files to table names (B Palmer)
New "idle in transaction" ps status message (Marc)
Update to pgaccess 0.98.7 (Constantin Teodorescu)
pg_ctl now defaults to -w (wait) on shutdown, new -l (log) option
Add rudimentary dependency checking to pg_dump (Philip)

Types
-----
Fix INET/CIDR type ordering and add new functions (Tom)
Make OID behave as an unsigned type (Tom)
Allow BIGINT as synonym for INT8 (Peter E)
New int2 and int8 comparison operators (Tom)
New BIT and BIT VARYING types (Adriaan Joubert, Tom, Peter E)
CHAR() no longer faster than VARCHAR() because of TOAST (Tom)
New GIST seg/cube examples (Gene Selkov)
Improved round(numeric) handling (Tom)
Fix CIDR output formatting (Tom)
New CIDR abbrev() function (Tom)

Performance
------------
Write-Ahead Log (WAL) to provide crash recovery with less performance
overhead (Vadim)
ANALYZE stage of VACUUM no longer exclusively locks table (Bruce)
Reduced file seeks (Denis Perchine)
Improve BTREE code for duplicate keys (Tom)
Store all large objects in a single table (Denis Perchine, Tom)
Improve memory allocation performance (Karel, Tom)

Source Code
------------
New function manager call conventions (Tom)
SGI portability fixes (David Kaelbling)
New configure --enable-syslog option (Peter E)
New BSDI README (Bruce)
configure script moved to top level, not /src (Peter E)
Makefile/configuration/compilation overhaul (Peter E)
New configure --with-python option (Peter E)
Solaris cleanups (Peter E)
Overhaul /contrib Makefiles (Karel)
New OpenSSL configuration option (Magnus, Peter E)
AIX fixes (Andreas)
QNX fixes (Maurizio)
New heap_open(), heap_openr() API (Tom)
Remove colon and semi-colon operators (Thomas)
New pg_class.relkind value for views (Mark Hollomon)
Rename ictar() to ictar() (Karel)
New documentation for btrim(), ascii(), chr(), repeat() (Karel)
Fixes for NT/Cygwin (Pete Forman)
AIX port fixes (Andreas)
New BeOS port (David Reid, Cyril Velter)
Add proofreader’s changes to docs (Addison-Wesley, Bruce)
New Alpha spinlock code (Adriaan Joubert, Compaq)
UnixWare port overhaul (Peter E)
New Darwin/Mac OS X port (Peter Bierman, Bruce Hartzler)
New FreeBSD Alpha port (Alfred)
Overhaul shared memory segments (Tom)
Add IBM S/390 support (Neale Ferguson)
Moved macmanuf to /contrib (Larry Rosenman)
Syslog improvements (Larry Rosenman)
New template0 database that contains no user additions (Tom)
New /contrib/cube and /contrib/seg GIST sample code (Gene Selkov)
Allow NetBSD’s libedit instead of readline (Peter)
Improved assembly language source code format (Bruce)
New contrib/pg_logger
New --template option to createdb
New contrib/pg_control utility (Oliver)
New FreeBSD tools ipc_check, start-scripts/freebsd

E.338. Release 7.0.3

Release date: 2000-11-11

This has a variety of fixes from 7.0.2.

E.338.1. Migration to Version 7.0.3

A dump/restore is not required for those running 7.0.*.

E.338.2. Changes

Jdbc fixes (Peter)
Large object fix (Tom)
Fix lean in COPY WITH OIDS leak (Tom)
Fix backwards-index-scan (Tom)
Fix SELECT ... FOR UPDATE so it checks for duplicate keys (Hiroshi)
Add --enable-syslog to configure (Marc)
Fix abort transaction at backend exit in rare cases (Tom)
Fix for psq1 \l+ when multibyte enabled (Tatsuo)
Allow PL/pgSQL to accept non ascii identifiers (Tatsuo)
Make vacuum always flush buffers (Tom)
Fix to allow cancel while waiting for a lock (Hiroshi)
Fix for memory allocation problem in user authentication code (Tom)
Remove bogus use of int4out() (Tom)
Fixes for multiple subqueries in COALESCE or BETWEEN (Tom)
Fix for failure of triggers on heap open in certain cases (Jeroen van Vianen)
Appendix E. Release Notes

Fix for erroneous selectivity of not-equals (Tom)
Fix for erroneous use of strcmp() (Tom)
Fix for bug where storage manager accesses items beyond end of file (Tom)
Fix to include kernel errno message in all smgr elog messages (Tom)
Fix for '.' not in PATH at build time (SL Baur)
Fix for out-of-file-descriptors error (Tom)
Fix to make pg_dump dump 'iscachable' flag for functions (Tom)
Fix for subselect in targetlist of Append node (Tom)
Fix for mergejoin plans (Tom)
Fix TRUNCATE failure on relations with indexes (Tom)
Avoid database-wide restart on write error (Hiroshi)
Fix nodeMaterial to honor chgParam by recomputing its output (Tom)
Fix VACUUM problem with moving chain of update row versions when source and destination of a row version lie on the same page (Tom)
Fix user.c CommandCounterIncrement (Tom)
Fix for AM/PM boundary problem in to_char() (Karel Zak)
Fix TIME aggregate handling (Tom)
Fix to_char() to avoid coredump on NULL input (Tom)
Buffer fix (Tom)
Fix for inserting/copying longer multibyte strings into char() data types (Tatsuo)
Fix for crash of backend, on abort (Tom)

E.339. Release 7.0.2

Release date: 2000-06-05
This is a repackaging of 7.0.1 with added documentation.

E.339.1. Migration to Version 7.0.2
A dump/restore is not required for those running 7.*.

E.339.2. Changes
Added documentation to tarball.
E.340. Release 7.0.1

Release date: 2000-06-01
This is a cleanup release for 7.0.

E.340.1. Migration to Version 7.0.1
A dump/restore is not required for those running 7.0.

E.340.2. Changes
Fix many CLUSTER failures (Tom)
Allow ALTER TABLE RENAME works on indexes (Tom)
Fix psql to handle datetime->timestamp and timespan->interval (Bruce)
New configure --with-setproctitle switch to use setproctitle() (Marc, Bruce)
Fix the off by one errors in ResultSet from 6.5.3, and more.
jdbc ResultSet fixes (Joseph Shraibman)
optimizer tunings (Tom)
Fix create user for pgaccess
Fix for UNLISTEN failure
IRIX fixes (David Kaelbling)
QNIX fixes (Andreas Kardos)
Reduce COPY IN lock level (Tom)
Change libpqeasy to use PQconnectdb() style parameters (Bruce)
Fix pg_dump to handle OID indexes (Tom)
Fix small memory leak (Tom)
Solaris fix for createdb/dropdb (Tatsuo)
Fix for non-blocking connections (Alfred Perlstein)
Fix improper recovery after RENAME TABLE failures (Tom)
Copy pg_ident.conf.sample into /lib directory in install (Bruce)
Add SJIS UDC (NEC selection IBM kanji) support (Eiji Tokuya)
Fix too long syslog message (Tatsuo)
Fix problem with quoted indexes that are too long (Tom)
JDBC ResultSet.getTimestamp() fix (Gregory Krasnow & Floyd Marinescu)
ecpg changes (Michael)

E.341. Release 7.0

Release date: 2000-05-08
This release contains improvements in many areas, demonstrating the continued growth of PostgreSQL. There are more improvements and fixes in 7.0 than in any previous release. The developers have confidence that this is the best release yet; we do our best to put out only solid releases, and this one is no exception.
Major changes in this release:

Foreign Keys

Foreign keys are now implemented, with the exception of PARTIAL MATCH foreign keys. Many users have been asking for this feature, and we are pleased to offer it.

Optimizer Overhaul

Continuing on work started a year ago, the optimizer has been improved, allowing better query plan selection and faster performance with less memory usage.

Updated psql

psql, our interactive terminal monitor, has been updated with a variety of new features. See the psql manual page for details.

Join Syntax

SQL92 join syntax is now supported, though only as INNER JOIN for this release. JOIN, NATURAL JOIN, JOIN/USING, and JOIN/ON are available, as are column correlation names.

E.341.1. Migration to Version 7.0

A dump/restore using pg_dump is required for those wishing to migrate data from any previous release of PostgreSQL. For those upgrading from 6.5.*, you can instead use pg_upgrade to upgrade to this release; however, a full dump/reload installation is always the most robust method for upgrades.

Interface and compatibility issues to consider for the new release include:

- The date/time types datetime and timespan have been superseded by the SQL92-defined types timestamp and interval. Although there has been some effort to ease the transition by allowing PostgreSQL to recognize the deprecated type names and translate them to the new type names, this mechanism cannot be completely transparent to your existing application.
- The optimizer has been substantially improved in the area of query cost estimation. In some cases, this will result in decreased query times as the optimizer makes a better choice for the preferred plan. However, in a small number of cases, usually involving pathological distributions of data, your query times might go up. If you are dealing with large amounts of data, you might want to check your queries to verify performance.
- The JDBC and ODBC interfaces have been upgraded and extended.
- The string function CHAR_LENGTH is now a native function. Previous versions translated this into a call to LENGTH, which could result in ambiguity with other types implementing LENGTH such as the geometric types.

E.341.2. Changes

Bug Fixes

-------

Prevent function calls exceeding maximum number of arguments (Tom)
Improve CASE construct (Tom)
Appendix E. Release Notes

Fix SELECT coalesce(f1,0) FROM int4_tbl GROUP BY f1 (Tom)
Fix SELECT sentence.words[0] FROM sentence GROUP BY sentence.words[0] (Tom)
Fix GROUP BY scan bug (Tom)
Improvements in SQL grammar processing (Tom)
Fix for views involved in INSERT ... SELECT ... (Tom)
Fix for SELECT a/2, a/2 FROM test_missing_target GROUP BY a/2 (Tom)
Fix for subselects in INSERT ... SELECT (Tom)
Prevent INSERT ... SELECT ... ORDER BY (Tom)
Fixes for relations greater than 2GB, including vacuum
Improve propagating system table changes to other backends (Tom)
Improve propagating user table changes to other backends (Tom)
Fix handling of temp tables in complex situations (Bruce, Tom)
Allow table locking at table open, improving concurrent reliability (Tom)
Properly quote sequence names in pg_dump (Ross J. Reedstrom)
Prevent DROP DATABASE while others accessing
Prevent any rows from being returned by GROUP BY if no rows processed (Tom)
Fix COUNT(1) FROM table WHERE ...’ if no rows matching WHERE (Tom)
Fix pg_upgrade so it works for MVCC (Tom)
Fix for SELECT ... WHERE x IN (SELECT ... HAVING SUM(x) > 1) (Tom)
Fix for "f1 datetime DEFAULT 'now'" (Tom)
Fix problems with CURRENT_DATE used in DEFAULT (Tom)
Allow comment-only lines, and ;;; lines too. (Tom)
Improve recovery after failed disk writes, disk full (Hiroshi)
Fix cases where table is mentioned in FROM but not joined (Tom)
Allow HAVING clause without aggregate functions (Tom)
Fix for "---" comment and no trailing newline, as seen in perl interface
Improve pg_dump failure error reports (Bruce)
Allow sorts and hashes to exceed 2GB file sizes (Tom)
Fix for pg_dump dumping of inherited rules (Tom)
Fix for NULL handling comparisons (Tom)
Fix inconsistent state caused by failed CREATE/DROP commands (Hiroshi)
Fix for dbname with dash
Prevent DROP INDEX from interfering with other backends (Tom)
Fix file descriptor leak in verify_password() (Tom)
Fix for "Unable to identify an operator =$" problem (Tom)
Fix ODBC so no segfault if CommLog and Debug enabled (Dirk Niggemann)
Fix for recursive exit call (Massimo)
Fix for extra-long timezones (Jeroen van Vianen)
Make pg_dump preserve primary key information (Peter E)
Prevent databases with single quotes (Peter E)
Prevent DROP DATABASE inside transaction (Peter E)
ecpg memory leak fixes (Stephen Birch)
Fix for SELECT null::text, SELECT int4fac(null) and SELECT 2 + (null) (Tom)
Y2K timestamp fix (Massimo)
Fix for VACUUM 'HEAP_MOVED_IN was not expected' errors (Tom)
Fix for views with tables/columns containing spaces (Tom)
Prevent privileges on indexes (Peter E)
Fix for spinlock stuck problem when error is generated (Hiroshi)
Fix ipcclean on Linux
Fix handling of NULL constraint conditions (Tom)
Fix memory leak in odbc driver (Nick Gorham)
Fix for privilege check on UNION tables (Tom)
Fix to allow SELECT ‘a’ LIKE ‘a’ (Tom)
Appendix E. Release Notes

Fix for SELECT 1 + NULL (Tom)
Fixes to CHAR
Fix log() on numeric type (Tom)
Deprecate ‘:’ and ‘;’ operators
Allow vacuum of temporary tables
Disallow inherited columns with the same name as new columns
Recover or force failure when disk space is exhausted (Hiroshi)
Fix INSERT INTO ... SELECT with AS columns matching result columns
Fix INSERT ... SELECT ... GROUP BY groups by target columns not source columns (Tom)
Fix CREATE TABLE test (a char(5) DEFAULT text ", b int4) with INSERT (Tom)
Fix UNION with LIMIT
Fix CREATE TABLE x AS SELECT 1 UNION SELECT 2
Fix CREATE TABLE test(col char(2) DEFAULT user)
Fix mismatched types in CREATE TABLE ... DEFAULT
Fix SELECT * FROM pg_class where oid in (0,-1)
Fix SELECT COUNT('asdf') FROM pg_class WHERE oid=12
Prevent user who can create databases can modifying pg_database table (Peter E)
Fix btree to give a useful elog when key > 1/2 (page - overhead) (Tom)
Fix INSERT of 0.0 into DECIMAL(4,4) field (Tom)

Enhancements
------------
New CLI interface include file sqlcli.h, based on SQL3/SQL98
Remove all limits on query length, row length limit still exists (Tom)
Update jdbc protocol to 2.0 (Jens Glaser <jens@jens.de>)
Add TRUNCATE command to quickly truncate relation (Mike Mascari)
Fix to give super user and createdb user proper update catalog rights (Peter E)
Allow ecpg bool variables to have NULL values (Christof)
Issue ecpg error if NULL value for variable with no NULL indicator (Christof)
Allow ^C to cancel COPY command (Massimo)
Add SET FSYNC and SHOW PG_OPTIONS commands(Massimo)
Function name overloading for dynamically-loaded C functions (Frankpitt)
Add CmdTuples() to libpq++ (Vince)
New CREATE CONSTRAINT TRIGGER and SET CONSTRAINTS commands(Jan)
Allow CREATE FUNCTION/WITH clause to be used for all language types
configuure --enable-debug adds -g (Peter E)
configure --disable-debug removes -g (Peter E)
Allow more complex default expressions (Tom)
First real FOREIGN KEY constraint trigger functionality (Jan)
Add FOREIGN KEY ... MATCH FULL ... ON DELETE CASCADE (Jan)
Add FOREIGN KEY ... MATCH <unspecified> referential actions (Don Baccus)
Allow WHERE restriction on ctid (physical heap location) (Hiroshi)
Move pgiinterface from contrib to interface directory, rename to pgeasy (Bruce)
Change pgeasy connectdb() parameter ordering (Bruce)
Requiere SELECT DISTINCT target list to have all ORDER BY columns (Tom)
Add Oracle’s COMMENT ON command (Mike Mascari <mascarim@yahoo.com>)
lipq’s PQsetNoticeProcessor function now returns previous hook(Peter E)
Prevent PQsetNoticeProcessor from being set to NULL (Peter E)
Make USING in COPY optional (Bruce)
Allow subselects in the target list (Tom)
Allow subselects on the left side of comparison operators (Tom)
New parallel regression test (Jan)
Change backend-side COPY to write files with permissions 644 not 666 (Tom)
Appendix E. Release Notes

Force permissions on PGDATA directory to be secure, even if it exists (Tom)
Added psql LASTOID variable to return last inserted oid (Peter E)
Allow concurrent vacuum and remove pg_vlock vacuum lock file (Tom)
Add privilege check for vacuum (Peter E)
New libpq functions to allow asynchronous connections: PQconnectStart(),
    PQconnectPoll(), PQresetStart(), PQresetPoll(), PQsetenvStart(),
    PQsetenvPoll(), PQsetenvAbort (Ewan Mellor)
New libpq PQsetenv() function (Ewan Mellor)
create/alter user extension (Peter E)
New postmaster.pid and postmaster.opts under $PGDATA (Tatsuo)
New scripts for create/drop user/db (Peter E)
Major psql overhaul (Peter E)
Add const to libpq interface (Peter E)
New libpq function PQoidValue (Peter E)
Show specific non-aggregate causing problem with GROUP BY (Tom)
Make changes to pg_shadow recreate pg_pwd file (Peter E)
Add aggregate(DISTINCT ...) (Tom)
Allow flag to control COPY input/output of NULLs (Peter E)
Make postgres user have a password by default (Peter E)
Add CREATE/ALTER/DROP GROUP (Peter E)
All administration scripts now support --long options (Peter E, Karel)
Vacuumdb script now supports --all option (Peter E)
ecp new portable FETCH syntax
Add ecpg EXEC SQL IFDEF, EXEC SQL IFNDEF, EXEC SQL ELSE, EXEC SQL ELIF
    and EXEC SQL ENDDIF directives
Add pg_ctl script to control backend start-up (Tatsuo)
Add postmaster.opts.default file to store start-up flags (Tatsuo)
Allow --with-mb=SQL_ASCII
Increase maximum number of index keys to 16 (Bruce)
Increase maximum number of function arguments to 16 (Bruce)
Allow configuration of maximum number of index keys and arguments (Bruce)
Allow unprivileged users to change their passwords (Peter E)
Password authentication enabled; required for new users (Peter E)
Disallow dropping a user who owns a database (Peter E)
Change initdb option --with-mb to --enable-multibyte
Add option for initdb to prompts for superuser password (Peter E)
Allow complex type casts like col::numeric(9,2) and col::int2::float8 (Tom)
Updated user interfaces on initdb, initlocation, pg_dump, ipcclean (Peter E)
New pg_char_to_encoding() and pg_encoding_to_char() functions (Tatsuo)
libpq non-blocking mode (Alfred Perlstein)
Improve conversion of types in casts that don’t specify a length
New piperl internal programming language (Mark Hollomon)
Allow COPY IN to read file that do not end with a newline (Tom)
Indicate when long identifiers are truncated (Tom)
Allow aggregates to use type equivalency (Peter E)
Add Oracle’s to_char(), to_date(), to_datetime(), to_timestamp(), to_number()
    conversion functions (Karel Zak <zakkr@zf.jcu.cz>)
Add SELECT DISTINCT ON (expr [, expr ...]) targetlist ... (Tom)
Check to be sure ORDER BY is compatible with the DISTINCT operation (Tom)
Add NUMERIC and int8 types to ODBC
Improve EXPLAIN results for Append, Group, Agg, Unique (Tom)
Add ALTER TABLE ... ADD FOREIGN KEY (Stephan Szabo)
Allow SELECT .. FOR UPDATE in PL/pgSQL (Hiroshi)
Enable backward sequential scan even after reaching EOF (Hiroshi)
Add btree indexing of boolean values, >= and <= (Don Baccus)
Print current line number when COPY FROM fails (Massimo)
Recognize POSIX time zone e.g. "PST+8" and "GMT-8" (Thomas)
Add DEC as synonym for DECIMAL (Thomas)
Add SESSION_USER as SQL92 key word, same as CURRENT_USER (Thomas)
Implement SQL92 column aliases (aka correlation names) (Thomas)
Implement SQL92 join syntax (Thomas)
Make INTERVAL reserved word allowed as a column identifier (Thomas)
Implement REINDEX command (Hiroshi)
Accept ALL in aggregate function SUM(ALL col) (Tom)
Prevent GROUP BY from using column aliases (Tom)
New psql \encoding option (Tatsuo)
Allow PQrequestCancel() to terminate when in waiting-for-lock state (Hiroshi)
Allow negation of a negative number in all cases
Add ecpg descriptors (Christof, Michael)
Allow CREATE VIEW v AS SELECT f1::char(8) FROM tbl
Allow casts with length, like foo::char(8)
New libpq functions PQsetClientEncoding(), PQclientEncoding() (Tatsuo)
Add support for SJIS user defined characters (Tatsuo)
Larger views/rules supported
Make libpq’s PQconndefaults() thread-safe (Tom)
Disable // as comment to be ANSI conforming, should use -- (Tom)
Allow column aliases on views CREATE VIEW name (collist)
Fixes for views with subqueries (Tom)
Allow UPDATE table SET fid = (SELECT ...) (Tom)
SET command options no longer require quotes
Update pgaccess to 0.98.6
New SET SEED command
New pg_options.sample file
New SET FSYNC command (Massimo)
Allow pg_descriptions when creating tables
Allow pg_descriptions when creating types, columns, and functions
Allow psql \copy to allow delimiters (Peter E)
Allow psql to print nulls as distinct from "" [null] (Peter E)

Types
-----
Many array fixes (Tom)
Allow bare column names to be subscripted as arrays (Tom)
Improve type casting of int and float constants (Tom)
Cleanups for int8 inputs, range checking, and type conversion (Tom)
Fix for SELECT timespan('21:11:26':time) (Tom)
netmask('x.x.x.x/0') is 255.255.255.255 instead of 0.0.0.0 (Oleg Sharoiko)
Add btree index on NUMERIC (Jan)
Perl fix for large objects containing NUL characters (Douglas Thomson)
ODBC fix for large objects (free)
Fix indexing of cidr data type
Fix for Ethernet MAC addresses (macaddr type) comparisons
Fix for date/time types when overflows happened in computations (Tom)
Allow array on int8 (Peter E)
Fix for rounding/overflow of NUMERIC type, like NUMERIC(4,4) (Tom)
Allow NUMERIC1 arrays
Fix bugs in NUMERIC ceil() and floor() functions (Tom)
Make char_length()/octet_length including trailing blanks (Tom)
Made abstime/reftime use int4 instead of time_t (Peter E)
New lztext data type for compressed text fields
Revise code to handle coercion of int and float constants (Tom)
Start at new code to implement a BIT and BIT VARYING type (Adriaan Joubert)
NUMERIC now accepts scientific notation (Tom)
NUMERIC to int4 rounds (Tom)
Convert float4/8 to NUMERIC properly (Tom)
Allow type conversion with NUMERIC (Thomas)
Make ISO date style (2000-02-16 09:33) the default (Thomas)
Add NATIONAL CHAR [ VARYING ] (Thomas)
Allow NUMERIC round and trunc to accept negative scales (Tom)
New TIME WITH TIME ZONE type (Thomas)
Add MAX()/MIN() on time type (Thomas)
Add abs(), mod(), fac() for int8 (Thomas)
Rename functions to round(), sqrt(), cbrt(), pow() for float8 (Thomas)
Add transcendental math functions (e.g. sin(), acos()) for float8 (Thomas)
Add exp() and ln() for NUMERIC type
Rename NUMERIC power() to pow() (Thomas)
Improved TRANSLATE() function (Edwin Ramirez, Tom)
Allow X=-Y operators (Tom)
Allow SELECT float8(COUNT(*))/ (SELECT COUNT(*) FROM t) FROM t GROUP BY f1; (Tom)
Allow LOCATE to use indexes in regular expression searches (Tom)
Allow creation of functional indexes to use default types

Performance
------------
Prevent exponential space consumption with many AND’s and OR’s (Tom)
Collect attribute selectivity values for system columns (Tom)
Reduce memory usage of aggregates (Tom)
Fix for LIKE optimization to use indexes with multibyte encodings (Tom)
Fix r-tree index optimizer selectivity (Thomas)
Improve optimizer selectivity computations and functions (Tom)
Optimize btree searching for cases where many equal keys exist (Tom)
Enable fast LIKE index processing only if index present (Tom)
Re-use free space on index pages with duplicates (Tom)
Improve hash join processing (Tom)
Prevent descending sort if result is already sorted (Hiroshi)
Allow commuting of index scan query qualifications (Tom)
Prefer index scans in cases where ORDER BY/GROUP BY is required (Tom)
Allocate large memory requests in fix-sized chunks for performance (Tom)
Fix vacuum’s performance by reducing memory allocation requests (Tom)
Implement constant-expression simplification (Bernard Frankpitt, Tom)
Use secondary columns to be used to determine start of index scan (Hiroshi)
Prevent quadruple use of disk space when doing internal sorting (Tom)
Faster sorting by calling fewer functions (Tom)
Create system indexes to match all system caches (Bruce, Hiroshi)
Make system caches use system indexes (Bruce)
Make all system indexes unique (Bruce)
Improve pg_statistics management for VACUUM speed improvement (Tom)
Flush backend cache less frequently (Tom, Hiroshi)
COPY now reuses previous memory allocation, improving performance (Tom)
Appendix E. Release Notes

Improves optimization cost estimation (Tom)
Improve optimizer estimate of range queries x > lowbound AND x < highbound (Tom)
Use DNF instead of CNF where appropriate (Tom, Taral)
Further cleanup for OR-of-AND WHERE-clauses (Tom)
Make use of index in OR clauses (x = 1 AND y = 2) OR (x = 2 AND y = 4) (Tom)
Smarter optimizer computations for random index page access (Tom)
New SET variable to control optimizer costs (Tom)
Optimizer queries based on LIMIT, OFFSET, and EXISTS qualifications (Tom)
Reduce optimizer internal housekeeping of join paths for speedup (Tom)
Major subquery speedup (Tom)
Fewer fsync writes when fsync is not disabled (Tom)
Improved LIKE optimizer estimates (Tom)
Prevent fsync in SELECT-only queries (Vadim)
Make index creation use psort code, because it is now faster (Tom)
Allow creation of sort temp tables >1 Gig

Source Tree Changes
-------------------
Fix for linux PPC compile (Tom)
New generic expression-tree-walker subroutine (Tom)
Change form() to varargform() to prevent portability problems (Bruce)
Improved range checking for large integers on Alphas (Tom)
Clean up #include in /include directory (Bruce)
Add scripts for checking includes (Bruce)
Remove un-needed #include’s from *.c files (Bruce)
Change #include’s to use <> and "" as appropriate (Bruce)
Enable Windows compilation of libpq (Tom)
Alpha spinlock fix from Uncle George <gatgul@voicenet.com>
Overhaul of optimizer data structures (Tom)
Fix to cygipc library (Yutaka Tanida)
Allow psql only on newer Cygwin snapshots (Dan)
New catalog version number (Tom)
Add Linux ARM (Bruce)
Rename heap_replace to heap_update (Dr. Andreas Kardos)
Update for QNX (Dr. Andreas Kardos)
New platform-specific regression handling (Tom)
Rename oid8 -> oidvector and int28 -> int2vector (Bruce)
Included all yacc and lex files into the distribution (Peter E.)
Remove lextest, no longer needed (Peter E)
Fix for libpq and psql on Windows (Magnus)
Internally change datetime and timespan into timestamp and interval (Thomas)
Fix for plpgsql on BSD/OS (Bruce)
Add SQL_ASCII test case to the regression test (Tatsuo)
configure --with-mb now deprecated (Tatsuo)
NT fixes (Bruce)
NetBSD fixes (Johnny C. Lam <lamj@stat.cmu.edu>)
Fixes for Alpha compiles (Bruce)
New multibyte encodings (Bruce)
E.342. Release 6.5.3

Release date: 1999-10-13

This is basically a cleanup release for 6.5.2. We have added a new PgAccess that was missing in 6.5.2, and installed an NT-specific fix.

E.342.1. Migration to Version 6.5.3

A dump/restore is not required for those running 6.5.*.

E.342.2. Changes

Updated version of pgaccess 0.98
NT-specific patch
Fix dumping rules on inherited tables

E.343. Release 6.5.2

Release date: 1999-09-15

This is basically a cleanup release for 6.5.1. We have fixed a variety of problems reported by 6.5.1 users.

E.343.1. Migration to Version 6.5.2

A dump/restore is not required for those running 6.5.*.

E.343.2. Changes

subselect+CASE fixes(Tom)
Add SHLIB_LINK setting for solaris_i386 and solaris_sparc ports(Daren Sefcik)
Fixes for CASE in WHERE join clauses(Tom)
Fix BTScan abort(Tom)
Repair the check for redundant UNIQUE and PRIMARY KEY indexes(Thomas)
Improve it so that it checks for multicolumn constraints(Thomas)
Fix for Windows making problem with MB enabled(Hiroki Kataoka)
Allow BSD yacc and bison to compile pl code(Bruce)
Fix SET NAMES working
int8 fixes(Thomas)
Fix vacuum's memory consumption(Hiroshi,Tatsuo)
Reduce the total memory consumption of vacuum(Tom)
Fix for timestamp(datetime)
Appendix E. Release Notes

Rule deparsing bugfixes (Tom)
Fix quoting problems in mkMakefile.tcldefs.sh.in and mkMakefile.tkdefs.sh.in (Tom)
This is to re-use space on index pages freed by vacuum (Vadim)
document -x for pg_dump (Bruce)
Fix for unary operators in rule deparser (Tom)
Comment out FileUnlink of excess segments during mdtruncate () (Tom)
IRIX linking fix from Yu Cao >yucao@falcon.kla-tencor.com<
Repair logic error in LIKE: should not return LIKE_ABORT
when reach end of pattern before end of text (Tom)
Repair incorrect cleanup of heap memory allocation during transaction abort (Tom)
Updated version of pgaccess 0.98

E.344. Release 6.5.1

Release date: 1999-07-15
This is basically a cleanup release for 6.5. We have fixed a variety of problems reported by 6.5 users.

E.344.1. Migration to Version 6.5.1

A dump/restore is not required for those running 6.5.

E.344.2. Changes

Add NT README file
Portability fixes for linux_ppc, IRIX, linux_alpha, OpenBSD, alpha
Remove QUERY_LIMIT, use SELECT...LIMIT
Fix for EXPLAIN on inheritance (Tom)
Patch to allow vacuum on multisegment tables (Hiroshi)
R-Tree optimizer selectivity fix (Tom)
ACL file descriptor leak fix (Atsushi Ogawa)
New expression subtree code (Tom)
Avoid disk writes for read-only transactions (Vadim)
Fix for removal of temp tables if last transaction was aborted (Bruce)
Fix to prevent too large row from being created (Bruce)
plpgsql fixes
Allow port numbers 32k - 64k (Bruce)
Add ^ precedence (Bruce)
Rename sort files called pg_temp to pg_sorttemp (Bruce)
Fix for microseconds in time values (Tom)
Tutorial source cleanup
New linux_m68k port
Fix for sorting of NULL’s in some cases (Tom)
Shared library dependencies fixed (Tom)
Fixed glitches affecting GROUP BY in subselects (Tom)
E.345. Release 6.5

Release date: 1999-06-09

This release marks a major step in the development team’s mastery of the source code we inherited from Berkeley. You will see we are now easily adding major features, thanks to the increasing size and experience of our world-wide development team.

Here is a brief summary of the more notable changes:

Multiversion concurrency control (MVCC)

This removes our old table-level locking, and replaces it with a locking system that is superior to most commercial database systems. In a traditional system, each row that is modified is locked until committed, preventing reads by other users. MVCC uses the natural multiversion nature of PostgreSQL to allow readers to continue reading consistent data during writer activity. Writers continue to use the compact pg_log transaction system. This is all performed without having to allocate a lock for every row like traditional database systems. So, basically, we no longer are restricted by simple table-level locking; we have something better than row-level locking.

Hot backups from pg_dump

pg_dump takes advantage of the new MVCC features to give a consistent database dump/backup while the database stays online and available for queries.

Numeric data type

We now have a true numeric data type, with user-specified precision.

Temporary tables

Temporary tables are guaranteed to have unique names within a database session, and are destroyed on session exit.

New SQL features

We now have CASE, INTERSECT, and EXCEPT statement support. We have new LIMIT/OFFSET, SET TRANSACTION ISOLATION LEVEL, SELECT ... FOR UPDATE, and an improved LOCK TABLE command.

Speedups

We continue to speed up PostgreSQL, thanks to the variety of talents within our team. We have sped up memory allocation, optimization, table joins, and row transfer routines.

Ports

We continue to expand our port list, this time including Windows NT/ix86 and NetBSD/arm32.
Appendix E. Release Notes

Interfaces

Most interfaces have new versions, and existing functionality has been improved.

Documentation

New and updated material is present throughout the documentation. New FAQs have been contributed for SGI and AIX platforms. The Tutorial has introductory information on SQL from Stefan Simkovics. For the User’s Guide, there are reference pages covering the postmaster and more utility programs, and a new appendix contains details on date/time behavior. The Administrator’s Guide has a new chapter on troubleshooting from Tom Lane. And the Programmer’s Guide has a description of query processing, also from Stefan, and details on obtaining the PostgreSQL source tree via anonymous CVS and CVSup.

E.345.1. Migration to Version 6.5

A dump/restore using pg_dump is required for those wishing to migrate data from any previous release of PostgreSQL. pg_upgrade can not be used to upgrade to this release because the on-disk structure of the tables has changed compared to previous releases.

The new Multiversion Concurrency Control (MVCC) features can give somewhat different behaviors in multiuser environments. Read and understand the following section to ensure that your existing applications will give you the behavior you need.

E.345.1.1. Multiversion Concurrency Control

Because readers in 6.5 don’t lock data, regardless of transaction isolation level, data read by one transaction can be overwritten by another. In other words, if a row is returned by SELECT it doesn’t mean that this row really exists at the time it is returned (i.e. sometime after the statement or transaction began) nor that the row is protected from being deleted or updated by concurrent transactions before the current transaction does a commit or rollback.

To ensure the actual existence of a row and protect it against concurrent updates one must use SELECT FOR UPDATE or an appropriate LOCK TABLE statement. This should be taken into account when porting applications from previous releases of PostgreSQL and other environments.

Keep the above in mind if you are using contrib/refint.* triggers for referential integrity. Additional techniques are required now. One way is to use LOCK parent_table IN SHARE ROW EXCLUSIVE MODE command if a transaction is going to update/delete a primary key and use LOCK parent_table IN SHARE MODE command if a transaction is going to update/insert a foreign key.

Note: Note that if you run a transaction in SERIALIZABLE mode then you must execute the LOCK commands above before execution of any DML statement (SELECT/INSERT/DELETE/UPDATE/FETCH/COPY_TO) in the transaction.

These inconveniences will disappear in the future when the ability to read dirty (uncommitted) data (regardless of isolation level) and true referential integrity will be implemented.
Appendix E. Release Notes

E.345.2. Changes

Bug Fixes
---------
Fix text<>float8 and text<>float4 conversion functions (Thomas)
Fix for creating tables with mixed-case constraints (Billy)
Change exp()/pow() behavior to generate error on underflow/overflow (Jan)
Fix bug in pg_dump -z
Memory overrun cleanups (Tatsuo)
Fix for lo_import crash (Tatsuo)
Adjust handling of data type names to suppress double quotes (Thomas)
Use type coercion for matching columns and DEFAULT (Thomas)
Fix deadlock so it only checks once after one second of sleep (Bruce)
Fixes for aggregates and PL/pgsql (Hiroshi)
Fix for subquery crash (Vadim)
Fix for libpq function PQfnumber and case-insensitive names (Bahman Rafatjoo)
Fix for large object write-in-middle, no extra block, memory consumption (Tatsuo)
Fix for pg_dump -d or -D and quote special characters in INSERT
Repair serious problems with dynahash (Tom)
Fix INET/ CIDR portability problems
Fix problem with selectivity error in ALTER TABLE ADD COLUMN (Bruce)
Fix executor so mergejoin of different column types works (Tom)
Fix for Alpha OR selectivity bug
Fix OR index selectivity problem (Bruce)
Fix so \d shows proper length for char() / varchar() (Ryan)
Fix tutorial code (Clark)
Improve destroyuser checking (Oliver)
Fix for Kerberos (Rodney McDuff)
Fix for dropping database while dirty buffers (Bruce)
Fix so sequence nextval() can be case-sensitive (Bruce)
Fix != operator
Drop buffers before destroying database files (Bruce)
Fix case where executor evaluates functions twice (Tatsuo)
Allow sequence nextval actions to be case-sensitive (Bruce)
Fix optimizer indexing not working for negative numbers (Bruce)
Fix for memory leak in executor with fjiaNull
Fix for aggregate memory leaks (Erik Riedel)
Allow user name containing a dash to grant privileges
Cleanup of NULL in inet types
Clean up system table bugs (Tom)
Fix problems of PAGER and \? command (Masaaki Sakaida)
Reduce default multisegment file size limit to 1GB (Peter)
Fix for dumping of CREATE OPERATOR (Tom)
Fix for backward scanning of cursors (Hiroshi Inoue)
Fix for COPY FROM STDIN when using \i (Tom)
Fix for subselect is compared inside an expression (Jan)
Fix handling of error reporting while returning rows (Tom)
Fix problems with reference to array types (Tom, Jan)
Prevent UPDATE SET oid (Jan)
Fix pg_dump so -t option can handle case-sensitive tablenames
Fixes for GROUP BY in special cases (Tom, Jan)
Fix for memory leak in failed queries (Tom)
Appendix E. Release Notes

DEFAULT now supports mixed-case identifiers (Tom)
Fix for multisegment uses of DROP/RENAME table, indexes (Ole Gjerde)
Disable use of pg_dump with both -o and -d options (Bruce)
Allow pg_dump to properly dump group privileges (Bruce)
Fix GROUP BY in INSERT INTO table SELECT * FROM table2 (Jan)
Fix for computations in views (Jan)
Fix for aggregates on array indexes (Tom)
Fix for DEFAULT handles single quotes in value requiring too many quotes
Fix security problem with non-super users importing/exporting large objects (Tom)
Rollback of transaction that creates table cleaned up properly (Tom)
Fix to allow long table and column names to generate proper serial names (Tom)

Enhancements
-----------
Add "vacuumdb" utility
Speed up libpq by allocating memory better (Tom)
EXPLAIN all indexes used (Tom)
Implement CASE, COALESCE, NULLIF expression (Thomas)
New pg_dump table output format (Constantin)
Add string min()/max() functions (Thomas)
Extend new type coercion techniques to aggregates (Thomas)
New moddatetime contrib (Terry)
Update to pgaccess 0.96 (Constantin)
Add routines for single-byte "char" type (Thomas)
Improved substr() function (Thomas)
Improved multibyte handling (Tatsuo)
Multiversion concurrency control/MVCC (Vadim)
New Serialized mode (Vadim)
Fix for tables over 2gigs (Peter)
New SET TRANSACTION ISOLATION LEVEL (Vadim)
New LOCK TABLE IN ... MODE (Vadim)
Update ODBC driver (Byron)
New NUMERIC data type (Jan)
New SELECT FOR UPDATE (Vadim)
Handle "NaN" and "Infinity" for input values (Jan)
Improved date/year handling (Thomas)
Improved handling of backend connections (Magnus)
New options ELOG_TIMESTAMPS and USE_SYSLOG options for log files (Massimo)
New TCL_ARRAYS option (Massimo)
New INTERSECT and EXCEPT (Stefan)
New pg_index.indisprimary for primary key tracking (D’Arcy)
New pg_dump option to allow dropping of tables before creation (Brook)
Speedup of row output routines (Tom)
New READ COMMITTED isolation level (Vadim)
New TEMP tables/indexes (Bruce)
Prevent sorting if result is already sorted (Jan)
New memory allocation optimization (Jan)
Allow psql to do \p\g (Bruce)
Allow multiple rule actions (Jan)
Added LIMIT/OFFSET functionality (Jan)
Improve optimizer when joining a large number of tables (Bruce)
New intro to SQL from S. Simkovics’ Master’s Thesis (Stefan, Thomas)
New intro to backend processing from S. Simkovics’ Master’s Thesis (Stefan)
Appendix E. Release Notes

Improved int8 support (Ryan Bradetich, Thomas, Tom)
New routines to convert between int8 and text/varchar types (Thomas)
New bushy plans, where meta-tables are joined (Bruce)
Enable right-hand queries by default (Bruce)
Allow reliable maximum number of backends to be set at configure time
  (--with-maxbackends and postmaster switch (-N backends)) (Tom)
GEQO default now 10 tables because of optimizer speedups (Tom)
Allow NULL=Var for MS-SQL portability (Michael, Bruce)
Modify contrib check_primary_key() so either "automatic" or "dependent" (Anand)
Allow psql \d on a view show query (Ryan)
Speedup for LIKE (Bruce)
Ecpp fixes/features, see src/interfaces/ecpg/ChangeLog file (Michael)
JDBC fixes/features, see src/interfaces/jdbc/CHANGELOG (Peter)
Make % operator have precedence like / (Bruce)
Add new postgres -O option to allow system table structure changes (Bruce)
Update contrib/pginterface/findoidjoins script (Tom)
Major speedup in vacuum of deleted rows with indexes (Vadim)
Allow non-SQL functions to run different versions based on arguments (Tom)
Add -E option that shows actual queries sent by \dt and friends (Masaaki Sakaida)
Add version number in start-up banners for psql (Masaaki Sakaida)
New contrib/vacuumlo removes large objects not referenced (Peter)
New initialization for table sizes so non-vacuumed tables perform better (Tom)
Improve error messages when a connection is rejected (Tom)
Support for arrays of char() and varchar() fields (Massimo)
Overhaul of hash code to increase reliability and performance (Tom)
Update to PyGreSQL 2.4 (D'Arcy)
Changed debug options so -d4 and -d5 produce different node displays (Jan)
New pg_options: pretty_plan, pretty_parse, pretty_rewritten (Jan)
Better optimization statistics for system table access (Tom)
Better handling of non-default block sizes (Massimo)
Improve GEQO optimizer memory consumption (Tom)
UNION now supports ORDER BY of columns not in target list (Jan)
Major libpq++ improvements (Vince Vielhaber)
pdump now uses -z (ACL’s) as default (Bruce)
backend cache, memory speedups (Tom)
have pg_dump do everything in one snapshot transaction (Vadim)
fix for large object memory leakage, fix for pg_dumping (Tom)
INET type now respects netmask for comparisons
Make VACUUM ANALYZE only use a readlock (Vadim)
Allow VIEWS on UNIONS (Jan)
pdump now can generate consistent snapshots on active databases (Vadim)

Source Tree Changes
-------------------
Improve port matching (Tom)
Portability fixes for SunOS
Add Windows NT backend port and enable dynamic loading (Magnus and Daniel Horak)
New port to Cobalt Qube (Mips) running Linux (Tatsuo)
Port to NetBSD/m68k (Mr. Mutsuki Nakajima)
Port to NetBSD/sun3 (Mr. Mutsuki Nakajima)
Port to NetBSD/macosppc (Toshimi Aoki)
Fix for tcl/tk configuration (Vince)
Removed CURRENT key word for rule queries (Jan)
NT dynamic loading now works (Daniel Horak)
Add ARM32 support (Andrew McMurry)
Better support for HP-UX 11 and UnixWare
Improve file handling to be more uniform, prevent file descriptor leak (Tom)
New install commands for pipgsql (Jan)

E.346. Release 6.4.2

Release date: 1998-12-20
The 6.4.1 release was improperly packaged. This also has one additional bug fix.

E.346.1. Migration to Version 6.4.2
A dump/restore is not required for those running 6.4.*.

E.346.2. Changes
Fix for datetime constant problem on some platforms (Thomas)

E.347. Release 6.4.1

Release date: 1998-12-18
This is basically a cleanup release for 6.4. We have fixed a variety of problems reported by 6.4 users.

E.347.1. Migration to Version 6.4.1
A dump/restore is not required for those running 6.4.

E.347.2. Changes
Add pg_dump -N flag to force double quotes around identifiers. This is the default (Thomas)
Fix for NOT in where clause causing crash (Bruce)
EXPLAIN VERBOSE coredump fix (Vadim)
Fix shared-library problems on Linux
Fix test for table existence to allow mixed-case and whitespace in the table name (Thomas)
Fix a couple of pg_dump bugs
Configure matches template/.similar entries better (Tom)
Change builtin function names from SPI_* to spi_*
OR WHERE clause fix (Vadim)
Fixes for mixed-case table names (Billy)
contrib/linux/postgres.init.csh/sh fix (Thomas)
libpq memory overrun fix
SunOS fixes (Tom)
Change exp() behavior to generate error on underflow (Thomas)
pg_dump fixes for memory leak, inheritance constraints, layout change
update pgaccess to 0.93
Fix prototype for 64-bit platforms
Multibyte fixes (Tatsuo)
New ecpg man page
Fix memory overruns (Tatsuo)
Fix for lo_import() crash (Bruce)
Better search for install program (Tom)
Timezone fixes (Tom)
HP-UX fixes (Tom)
Use implicit type coercion for matching DEFAULT values (Thomas)
Add routines to help with single-byte (internal) character type (Thomas)
Compilation of libpq for Windows fixes (Magnus)
Upgrade to PyGreSQL 2.2 (D’Arcy)

E.348. Release 6.4

Release date: 1998-10-30

There are many new features and improvements in this release. Thanks to our developers and maintainers, nearly every aspect of the system has received some attention since the previous release. Here is a brief, incomplete summary:

- Views and rules are now functional thanks to extensive new code in the rewrite rules system from Jan Wieck. He also wrote a chapter on it for the Programmer’s Guide.
- Jan also contributed a second procedural language, PL/pgSQL, to go with the original PL/pgTCL procedural language he contributed last release.
- We have optional multiple-byte character set support from Tatsuo Ishii to complement our existing locale support.
- Client/server communications has been cleaned up, with better support for asynchronous messages and interrupts thanks to Tom Lane.
- The parser will now perform automatic type coercion to match arguments to available operators and functions, and to match columns and expressions with target columns. This uses a generic mechanism
which supports the type extensibility features of PostgreSQL. There is a new chapter in the User’s Guide which covers this topic.

- Three new data types have been added. Two types, inet and cidr, support various forms of IP network, subnet, and machine addressing. There is now an 8-byte integer type available on some platforms. See the chapter on data types in the User’s Guide for details. A fourth type, serial, is now supported by the parser as an amalgam of the int4 type, a sequence, and a unique index.

- Several more SQL92-compatible syntax features have been added, including INSERT DEFAULT VALUES

- The automatic configuration and installation system has received some attention, and should be more robust for more platforms than it has ever been.

### E.348.1. Migration to Version 6.4

A dump/restore using pg_dump or pg_dumpall is required for those wishing to migrate data from any previous release of PostgreSQL.

### E.348.2. Changes

**Bug Fixes**

----------

Fix for a tiny memory leak in PQsetdb/PQfinish (Bryan)
Remove char2-16 data types, use char/varchar (Darren)
Pqfn not handles a NOTICE message (Anders)
Reduced busywaiting overhead for spinlocks with many backends (dg)
Stuck spinlock detection (dg)
Fix up "ISO-style" timespan decoding and encoding (Thomas)
Fix problem with table drop after rollback of transaction (Vadim)
Change error message and remove non-functional update message (Vadim)
Fix for COPY array checking
Fix for SELECT 1 UNION SELECT NULL
Fix for buffer leaks in large object calls (Pascal)
Change owner from oid to int4 type (Bruce)
Fix a bug in the oracle compatibility functions btrim() ltrim() and rtrim() (Massimo)
Prevent file descriptor leaks in failed COPY’s (Bruce)
Fix memory leak in libpq/cgi’s pg_select (Constantin)
Fix problems with username/passwords over 8 characters (Tom)
Fix problems with handling of asynchronous NOTIFY in backend (Tom)
Fix of many bad system table entries (Tom)

**Enhancements**

----------

Upgrade ecpg and ecpglib, see src/interfaces/ecpc/ChangeLog (Michael)
Show the index used in an EXPLAIN (Zeugswetter)
EXPLAIN invokes rule system and shows plan(s) for rewritten queries (Jan)
Multibyte awareness of many data types and functions, via configure (Tatsuo)
Appendix E. Release Notes

New configure --with-mb option (Tatsuo)
New initdb --pgencoding option (Tatsuo)
New createdb -E multibyte option (Tatsuo)
Select version(); now returns PostgreSQL version (Jeroen)
libpq now allows asynchronous clients (Tom)
Allow cancel from client of backend query (Tom)
psql now cancels query with Control-C (Tom)
libpq users need not issue dummy queries to get NOTIFY messages (Tom)
NOTIFY now sends sender’s PID, so you can tell whether it was your own (Tom)
PQresult struct now includes associated error message, if any (Tom)
Define "tz_hour" and "tz_minute" arguments to date_part() (Thomas)
Add routines to convert between varchar and bpchar (Thomas)
Add routines to allow sizing of varchar and bpchar into target columns (Thomas)
Add bit flags to support timezonehour and minute in data retrieval (Thomas)
Allow more variations on valid floating point numbers (e.g. ".1", "1e6") (Thomas)
Fixes for unary minus parsing with leading spaces (Thomas)
Implement TIMEZONE_HOUR, TIMEZONE_MINUTE per SQL92 specs (Thomas)
Check for and properly ignore FOREIGN KEY column constraints (Thomas)
Define USER as synonym for CURRENT_USER per SQL92 specs (Thomas)
Enable HAVING clause but no fixes elsewhere yet.
Make "char" type a synonym for "char(1)" (actually implemented as bpchar) (Thomas)
Save string type if specified for DEFAULT clause handling (Thomas)
Coerce operations involving different data types (Thomas)
Allow some index use for columns of different types (Thomas)
Add capabilities for automatic type conversion (Thomas)
Cleanups for large objects, so file is truncated on open (Peter)
Readline cleanups (Tom)
Allow psql \f \ to make spaces as delimiter (Bruce)
Pass pg_attribute.attypmod to the frontend for column field lengths (Tom, Bruce)
Msql compatibility library in /contrib (Aldrin)
Remove the requirement that ORDER/GROUP BY clause identifiers be included in the target list (David)
Convert columns to match columns in UNION clauses (Thomas)
Remove fork() / exec() and only do fork() (Bruce)
Jdbc cleanups (Peter)
Show backend status on ps command line (only works on some platforms) (Bruce)
Pg_hba.conf now has a sameuser option in the database field
Make lo_unlink take oid param, not int4
New DISABLE_COMPLEX_MACRO for compilers that cannot handle our macros (Bruce)
Libpq now handles NOTIFY as a Tcl event, need not send dummy queries (Tom)
libpq cleanups (Tom)
Add -error option to libpq's pg_result command (Tom)
New locale patch, see docs/README/locale (Oleg)
Fix for pg_dump so CONSTRAINT and CHECK syntax is correct (ccb)
New contrib/lo code for large object orphan removal (Peter)
New psq1 command "SET CLIENT_ENCODING TO 'encoding'" for multibytes
feature, see /doc/README.mb (Tatsuo)
contrib/noupdate code to revoke update permission on a column
libpq can now be compiled on Windows (Magnus)
Add PQsetdbLogin() in libpq
New 8-byte integer type, checked by configure for OS support (Thomas)
Better support for quoted table/column names (Thomas)
Surround table and column names with double-quotes in pg_dump (Thomas)
Appendix E. Release Notes

PQreset() now works with passwords(Tom)
Handle case of GROUP BY target list column number out of range(David)
Allow UNION in subselects
Add auto-size to screen to \d? commands(Bruce)
Use UNION to show all \d? results in one query(Bruce)
Add \d? field search feature(Bruce)
Pg_dump issues fewer \connect requests(Tom)
Make pg_dump -z flag work better, document it in manual page(Tom)
Add HAVING clause with full support for subselects and unions(Stephan)
Full text indexing routines in contrib/fulltextindex(Maarten)
Transaction ids now stored in shared memory(Vadim)
New PGCLIENTENCODING when issuing COPY command(Tatsuio)
Support for SQL92 syntax "SET NAMES"(Tatsuio)
Support for LATIN2-5(Tatsuio)
Add UNICODE regression test case(Tatsuio)
Lock manager cleanup, new locking modes for LLL(Vadim)
Allow index use with OR clauses(Bruce)
Allows "SELECT NULL ORDER BY 1;"
Explain VERBOSE prints the plan, and now pretty-prints the plan to the postmaster log file(Bruce)
Add indexes display to \d command(Bruce)
Allow GROUP BY on functions(David)
New pg_class.relkind for large objects(Bruce)
New way to send libpq NOTICE messages to a different location(Tom)
New \w write command to psql(Bruce)
New /contrib/findoidjoins scans oid columns to find join relationships(Bruce)
Allow binary-compatible indexes to be considered when checking for valid Indexes for restriction clauses containing a constant(Thomas)
New ISBN/ISSN code in /contrib/isbn_issn
Allow NOT LIKE, IN, NOT IN, BETWEEN, and NOT BETWEEN constraint(Thomas)
New rewrite system fixes many problems with rules and views(Jan)
  * Rules on relations work
  * Event qualifications on insert/update/delete work
  * New OLD variable to reference CURRENT, CURRENT will be remove in future
  * Update rules can reference NEW and OLD in rule qualifications/actions
  * Insert/update/delete rules on views work
  * Multiple rule actions are now supported, surrounded by parentheses
  * Regular users can create rules/views on tables they have RULE permits
  * Rules and views inherit the privileges of the creator
  * No rules at the column level
  * No UPDATE NEW/OLD rules
  * New pg_tables, pg_indexes, pg_rules and pg_views system views
  * Only a single action on SELECT rules
  * Total rewrite overhaul, perhaps for 6.5
  * handle subselects
  * handle aggregates on views
  * handle insert into select from view works
System indexes are now multikey(Bruce)
Oidint2, oidint4, and oidname types are removed(Bruce)
Use system cache for more system table lookups(Bruce)
New backend programming language PL/pgSQL in backend/pl(Jan)
New SERIAL data type, auto-creates sequence/index(Thomas)
Enable assert checking without a recompile(Massimo)
Appendix E. Release Notes

User lock enhancements (Massimo)
New setval() command to set sequence value (Massimo)
Auto-remove unix socket file on start-up if no postmaster running (Massimo)
Conditional trace package (Massimo)
New UNLISTEN command (Massimo)
psql and libpq now compile under Windows using win32.mak (Magnus)
Lo_read no longer stores trailing NULL (Bruce)
Identifiers are now truncated to 31 characters internally (Bruce)
Createuser options now available on the command line
Code for 64-bit integer supported added, configure tested, int8 type (Thomas)
Prevent file descriptor leak from failed COPY (Bruce)
New pg_upgrade command (Bruce)
Updated /contrib directories (Massimo)
New CREATE TABLE DEFAULT VALUES statement available (Thomas)
New INSERT INTO TABLE DEFAULT VALUES statement available (Thomas)
New DECLARE and FETCH feature (Thomas)
libpq’s internal structures now not exported (Tom)
Allow up to 8 key indexes (Bruce)
Remove ARCHIVE key word, that is no longer used (Thomas)
pg_dump -n flag to suppress quotes around identifiers
disable system columns for views (Jan)
new INET and CIDR types for network addresses (TomH, Paul)
no more double quotes in psql output
pg_dump now dumps views (Terry)
new SET QUERY_LIMIT (Tatsuo, Jan)

Source Tree Changes
-------------------
/contrib cleanup (Jun)
Inline some small functions called for every row (Bruce)
Alpha/linux fixes
HP-UX cleanups (Tom)
Multibyte regression tests (Soonmyung.)
Remove --disabled options from configure
Define PGDOC to use POSTGRESDIR by default
Make regression optional
Remove extra braces code to pgindent (Bruce)
Add bsdi shared library support (Bruce)
New --without-CXX support configure option (Brook)
New FAQ_CVS
Update backend flowchart in tools/backend (Bruce)
Change atttypmod from int16 to int32 (Bruce, Tom)
Getrusage() fix for platforms that do not have it (Tom)
Add PQconnectdb, PGUSER, PGPASSWORD to libpq man page
NS32K platform fixes (Phil Nelson, John Buller)
SCO 7/UnixWare 2.x fixes (Billy, others)
Sparc/Solaris 2.5 fixes (Ryan)
Pgbuiltin.3 is obsolete, move to doc files (Thomas)
Even more documentation (Thomas)
Nextstep support (Jacek)
Aix support (David)
pinterface manual page (Bruce)
shared libraries all have version numbers
merged all OS-specific shared library defines into one file
smarter TCL/TK configuration checking (Billy)
smarter perl configuration (Brook)
configure uses supplied install-sh if no install script found (Tom)
new Makefile.shlib for shared library configuration (Tom)

E.349. Release 6.3.2

Release date: 1998-04-07

This is a bug-fix release for 6.3.x. Refer to the release notes for version 6.3 for a more complete summary of new features.

Summary:

• Repairs automatic configuration support for some platforms, including Linux, from breakage inadvertently introduced in version 6.3.1.
• Correctly handles function calls on the left side of BETWEEN and LIKE clauses.

A dump/restore is NOT required for those running 6.3 or 6.3.1. A make distclean, make, and make install is all that is required. This last step should be performed while the postmaster is not running. You should re-link any custom applications that use PostgreSQL libraries.

For upgrades from pre-6.3 installations, refer to the installation and migration instructions for version 6.3.

E.349.1. Changes

Configure detection improvements for tcl/tk (Brook Milligan, Alvin)
Manual page improvements (Bruce)
BETWEEN and LIKE fix (Thomas)
fix for psql \connect used by pg_dump (Oliver Elphick)
New odbc driver
pgaccess, version 0.86
qsort removed, now uses libc version, cleanups (Jeroen)
fix for buffer over-runs detected (Maurice Gittens)
fix for buffer overrun in libpgtcl (Randy Kunkee)
fix for UNION with DISTINCT or ORDER BY (Bruce)
gettimeofday configure check (Doug Winterburn)
Fix "indexes not used" bug (Vadim)
docs additions (Thomas)
Fix for backend memory leak (Bruce)
libreadline cleanup (Erwan MAS)
Remove DISTDIR (Bruce)
Makefile dependency cleanup (Jeroen van Vianen)
ASSERT fixes (Bruce)
E.350. Release 6.3.1

Release date: 1998-03-23

Summary:

- Additional support for multibyte character sets.
- Repair byte ordering for mixed-endian clients and servers.
- Minor updates to allowed SQL syntax.
- Improvements to the configuration autodetection for installation.

A dump/restore is NOT required for those running 6.3. A make distclean, make, and make install is all that is required. This last step should be performed while the postmaster is not running. You should re-link any custom applications that use PostgreSQL libraries.

For upgrades from pre-6.3 installations, refer to the installation and migration instructions for version 6.3.

E.350.1. Changes

ecpg cleanup/fixes, now version 1.1 (Michael Meskes)
pg_user cleanup (Bruce)
large object fix for pg_dump and tclsh (alvin)
LIKE fix for multiple adjacent underscores
fix for redefining builtin functions (Thomas)
ultrix4 cleanup
upgrade to pg_access 0.83
updated CLUSTER manual page
multibyte character set support, see doc/README.mb (Tatsuo)
configure --with-pgport fix
pg_ident fix
big-endian fix for backend communications (Kataoka)
SUBSTR() and substring() fix (Jan)
several jdbc fixes (Peter)
libpgtcl improvements, see libpgtcl/README (Randy Kunkee)
Fix for "Datasize = 0" error (Vadim)
Prevent \ do from wrapping (Bruce)
Remove duplicate Russian character set entries
Sunos4 cleanup
Allow optional TABLE key word in LOCK and SELECT INTO (Thomas)
CREATE SEQUENCE options to allow a negative integer (Thomas)
Add "PASSWORD" as an allowed column identifier (Thomas)
Add checks for UNION target fields (Bruce)
Fix Alpha port (Dwayne Bailey)
Fix for text arrays containing quotes (Doug Gibson)
E.351. Release 6.3

Release date: 1998-03-01

There are many new features and improvements in this release. Here is a brief, incomplete summary:

- Many new SQL features, including full SQL92 subselect capability (everything is here but target-list subselects).
- Support for client-side environment variables to specify time zone and date style.
- Socket interface for client/server connection. This is the default now so you might need to start postmaster with the -i flag.
- Better password authorization mechanisms. Default table privileges have changed.
- Old-style time travel has been removed. Performance has been improved.

Note: Bruce Momjian wrote the following notes to introduce the new release.

There are some general 6.3 issues that I want to mention. These are only the big items that cannot be described in one sentence. A review of the detailed changes list is still needed.

First, we now have subselects. Now that we have them, I would like to mention that without subselects, SQL is a very limited language. Subselects are a major feature, and you should review your code for places where subselects provide a better solution for your queries. I think you will find that there are more uses for subselects than you might think. Vadim has put us on the big SQL map with subselects, and fully functional ones too. The only thing you cannot do with subselects is to use them in the target list.

Second, 6.3 uses Unix domain sockets rather than TCP/IP by default. To enable connections from other machines, you have to use the new postmaster -i option, and of course edit pg_hba.conf. Also, for this reason, the format of pg_hba.conf has changed.

Third, char() fields will now allow faster access than varchar() or text. Specifically, the text and varchar() have a penalty for access to any columns after the first column of this type. char() used to also have this access penalty, but it no longer does. This might suggest that you redesign some of your tables, especially if you have short character columns that you have defined as varchar() or text. This and other changes make 6.3 even faster than earlier releases.

We now have passwords definable independent of any Unix file. There are new SQL USER commands. See the Administrator's Guide for more information. There is a new table, pg_shadow, which is used to store user information and user passwords, and it by default only SELECT-able by the postgres super-user. pg_user is now a view of pg_shadow, and is SELECT-able by PUBLIC. You should keep using pg_user in your application without changes.
Appendix E. Release Notes

User-created tables now no longer have SELECT privilege to PUBLIC by default. This was done because the ANSI standard requires it. You can of course GRANT any privileges you want after the table is created. System tables continue to be SELECT-able by PUBLIC.

We also have real deadlock detection code. No more sixty-second timeouts. And the new locking code implements a FIFO better, so there should be less resource starvation during heavy use.

Many complaints have been made about inadequate documentation in previous releases. Thomas has put much effort into many new manuals for this release. Check out the doc/ directory.

For performance reasons, time travel is gone, but can be implemented using triggers (see pgsql/contrib/spi/README). Please check out the new \d command for types, operators, etc. Also, views have their own privileges now, not based on the underlying tables, so privileges on them have to be set separately. Check /pgsql/interfaces for some new ways to talk to PostgreSQL.

This is the first release that really required an explanation for existing users. In many ways, this was necessary because the new release removes many limitations, and the work-arounds people were using are no longer needed.

E.351.1. Migration to Version 6.3

A dump/restore using pg_dump or pg_dumpall is required for those wishing to migrate data from any previous release of PostgreSQL.

E.351.2. Changes

Bug Fixes

Fix binary cursors broken by MOVE implementation (Vadim)
Fix for tcl library crash (Jan)
Fix for array handling, from Gerhard Hintermayer
Fix acl error, and remove duplicate pqtrace (Bruce)
Fix psql \e for empty file (Bruce)
Fix for textcat on varchar() fields (Bruce)
Fix for DBT Sendproc (Zeugswetter Andres)
Fix vacuum analyze syntax problem (Bruce)
Fix for international identifiers (Tatsu)
Fix aggregates on inherited tables (Bruce)
Fix substr() for out-of-bounds data
Fix for select 1=1 or 2=2, select 1=1 and 2=2, and select sum(2+2) (Bruce)
Fix notty output to show status result. -q option still turns it off (Bruce)
Fix for count(*), aggs with views and multiple tables and sum(3) (Bruce)
Fix cluster (Bruce)
Fix for PQtrace start/stop several times (Bruce)
Fix a variety of locking problems like newer lock waiters getting lock before older waiters, and having readlock people not share locks if a writer is waiting for a lock, and waiting writers not getting priority over waiting readers (Bruce)
Fix crashes in psql when executing queries from external files (James)
Fix problem with multiple order by columns, with the first one having
Appendix E. Release Notes

NULL values (Jeroen)
Use correct hash table support functions for float8 and int4 (Thomas)
Re-enable JOIN= option in CREATE OPERATOR statement (Thomas)
Change precedence for boolean operators to match expected behavior (Thomas)
Generate elog(ERROR) on over-large integer (Bruce)
Allow multiple-argument functions in constraint clauses (Thomas)
Check boolean input literals for 'true', 'false', 'yes', 'no', '1', '0'
and throw elog(ERROR) if unrecognized (Thomas)

Major large objects fix
Fix for GROUP BY showing duplicates (Vadim)
Fix for index scans in MergeJoin (Vadim)

Enhancements
-------------
Subselects with EXISTS, IN, ALL, ANY key words (Vadim, Bruce, Thomas)
New User Manual (Thomas, others)
Speedup by inlining some frequently-called functions
Real deadlock detection, no more timeouts (Bruce)
Add SQL92 "constants" CURRENT_DATE, CURRENT_TIME, CURRENT_TIMESTAMP,
CURRENT_USER (Thomas)
Modify constraint syntax to be SQL92-compliant (Thomas)
Implement SQL92 PRIMARY KEY and UNIQUE clauses using indexes (Thomas)
Recognize SQL92 syntax for FOREIGN KEY. Throw elog notice (Thomas)
Allow NOT NULL UNIQUE constraint clause (each allowed separately before) (Thomas)
Allow PostgreSQL-style casting ("::") of non-constants (Thomas)
Add support for SQL3 TRUE and FALSE boolean constants (Thomas)
Support SQL92 syntax for IS TRUE/IS FALSE/IS NOT TRUE/IS NOT FALSE (Thomas)
Allow shorter strings for boolean literals (e.g. "t", "tr", "tru") (Thomas)
Allow SQL92 delimited identifiers (Thomas)
Implement SQL92 binary and hexadecimal string decoding (b'10' and x'1F') (Thomas)
Support SQL92 syntax for type coercion of literal strings
(e.g. "DATETIME 'now'") (Thomas)
Add conversions for int2, int4, and OID types to and from text (Thomas)
Use shared lock when building indexes (Vadim)
Free memory allocated for a user query inside transaction block after
this query is done, was turned off in <= 6.2.1 (Vadim)
New SQL statement CREATE PROCEDURAL LANGUAGE (Jan)
New PostgreSQL Procedural Language (PL) backend interface (Jan)
Rename pg_dump -H option to -h (Bruce)
Add Java support for passwords, European dates (Peter)
Use indexes for LIKE and ~, !~ operations (Bruce)
Add hash functions for datetime and timespan (Thomas)
Time Travel removed (Vadim, Bruce)
Add paging for \d and \z, and fix \i (Bruce)
Add Unix domain socket support to backend and to frontend library (Goran)
Implement CREATE DATABASE/WITH LOCATION and initlocation utility (Thomas)
Allow more SQL92 and/or PostgreSQL reserved words as column identifiers (Thomas)
Augment support for SQL92 SET TIME ZONE... (Thomas)
SET/SHOW/RESET TIME ZONE uses TZ backend environment variable (Thomas)
Implement SET keyword = DEFAULT and SET TIME ZONE DEFAULT (Thomas)
Enable SET TIME ZONE using TZ environment variable (Thomas)
Add PGDATESTYLE environment variable to frontend and backend initialization (Thomas)
Add PGTZ, PGCOSTHEAP, PGCOSTINDEX, PGRPLANS, PGGEQO
Appendix E. Release Notes

frontend library initialization environment variables (Thomas)
Regression tests time zone automatically set with "setenv PGTZ PST8PDT" (Thomas)
Add **pg_description** table for info on tables, columns, operators, types, and aggregates (Bruce)
Increase 16 char limit on system table/index names to 32 characters (Bruce)
Rename system indexes (Bruce)
Add ‘GERMAN’ option to SET DATESTYLE (Thomas)
Define an "ISO-style" timespan output format with "hh:mm:ss" fields (Thomas)
Allow fractional values for delta times (e.g. ‘2.5 days’) (Thomas)
Validate numeric input more carefully for delta times (Thomas)
Implement day of year as possible input to date_part() (Thomas)
Define timespan_finite() and text_timespan() functions (Thomas)
Remove archive stuff (Bruce)
Allow for a pg_password authentication database that is separate from the system password file (Todd)
Dump ACLs, GRANT, REVOKE privileges (Matt)
Define text, varchar, and bpchar string length functions (Thomas)
Fix Query handling for inheritance, and cost computations (Bruce)
Implement CREATE TABLE/AS SELECT (alternative to SELECT/INTO) (Thomas)
Allow NOT, IS NULL, IS NOT NULL in constraints (Thomas)
Implement UNIONS for SELECT (Bruce)
Add UNION, GROUP, DISTINCT to INSERT (Bruce)
varchar() stores only necessary bytes on disk (Bruce)
Fix for BLOBs (Peter)
Mega-Patch for JDBC...see README_6.3 for list of changes (Peter)
Remove unused "option" from PQconnectdb() 
New LOCK command and lock manual page describing deadlocks (Bruce)
Add new psql \da, \dd, \df, \do, \dS, and \dT commands (Bruce)
Enhance psql \z to show sequences (Bruce)
Show NOT NULL and DEFAULT in psql \d table (Bruce)
New psql .psqlrc file start-up (Andrew)
Modify sample start-up script in contrib/linux to show syslog (Thomas)
New types for IP and MAC addresses in contrib/ip_and_mac (TomH)
Unix system time conversions with date/time types in contrib/unixdate (Thomas)
Update of contrib stuff (Massimo)
Add Unix socket support to DBD::Pg (Goran)
New python interface (PyGreSQL 2.0) (D’Arcy)
New frontend/backend protocol has a version number, network byte order (Phil)
Security features in pg_hba.conf enhanced and documented, many cleanups (Phil)
CHAR() now faster access than VARCHAR() or TEXT
ecpg embedded SQL preprocessor
Reduce system column overhead (Vadmin)
Remove pg_time table (Vadim)
Add pg_type attribute to identify types that need length (bpchar, varchar)
Add report of offending line when COPY command fails
Allow VIEW privileges to be set separately from the underlying tables.
   For security, use GRANT/REVOKE on views as appropriate (Jan)
Tables now have no default GRANT SELECT TO PUBLIC. You must explicitly grant such privileges.
Clean up tutorial examples (Darren)

Source Tree Changes
-------------------

3300
Appendix E. Release Notes

Add new html development tools, and flow chart in /tools/backend
Fix for SCO compiles
Stratus computer port Robert Gillies
Added support for shlib for BSD44-derived & i386_solaris
Make configure more automated(Brook)
Add script to check regression test results
Break parser functions into smaller files, group together(Bruce)
Rename heap_create to heap_create_and_catalog, rename heap_creatr
  to heap_create()(Bruce)
Sparc/Linux patch for locking(TomS)
Remove PORTNAME and reorganize port-specific stuff(Marc)
Add optimizer README file(Bruce)
Remove some recursion in optimizer and clean up some code there(Bruce)
Fix for NetBSD locking(Henry)
Fix for libptcl make(Tatsuo)
AIX patch(Darren)
Change IS TRUE, IS FALSE, ... to expressions using "=" rather than
  function calls to istrue() or isfalse() to allow optimization(Thomas)
Various fixes NetBSD/Sparc related(TomH)
Alpha linux locking(Travis,Ryan)
Change elog(WARN) to elog(ERROR)(Bruce)
FAQ for FreeBSD(Marc)
Bring in the PostODBC source tree as part of our standard distribution(Marc)
A minor patch for HP/UX 10 vs 9(Stan)
New pg_attribute.atttypmod for type-specific info like varchar length(Bruce)
UnixWare patches(Billy)
New i386 'lock' for spinlock asm(Billy)
Support for multiplexed backends is removed
Start an OpenBSD port
Start an AUX port
Start a Cygnus port
Add string functions to regression suite(Thomas)
Expand a few function names formerly truncated to 16 characters(Thomas)
Remove un-needed malloc() calls and replace with palloc()(Bruce)

E.352. Release 6.2.1

Release date: 1997-10-17

6.2.1 is a bug-fix and usability release on 6.2.

Summary:

- Allow strings to span lines, per SQL92.
- Include example trigger function for inserting user names on table updates.
This is a minor bug-fix release on 6.2. For upgrades from pre-6.2 systems, a full dump/reload is required. Refer to the 6.2 release notes for instructions.

**E.352.1. Migration from version 6.2 to version 6.2.1**

This is a minor bug-fix release. A dump/reload is not required from version 6.2, but is required from any release prior to 6.2.

In upgrading from version 6.2, if you choose to dump/reload you will find that \text{avg(money)} is now calculated correctly. All other bug fixes take effect upon updating the executables.

Another way to avoid dump/reload is to use the following SQL command from \texttt{psql} to update the existing system table:

\begin{verbatim}
update pg_aggregate set aggfinalfn = 'cash_div_flt8'
    where aggname = 'avg' and aggbasetype = 790;
\end{verbatim}

This will need to be done to every existing database, including template1.

**E.352.2. Changes**

- Allow \text{TIME} and \text{TYPE} column names (Thomas)
- Allow larger range of true/false as boolean values (Thomas)
- Support output of "now" and "current" (Thomas)
- Handle \text{DEFAULT} with \text{INSERT} of \text{NULL} properly (Vadim)
- Fix for relation reference counts problem in buffer manager (Vadim)
- Allow strings to span lines, like ANSI (Thomas)
- Fix for backward cursor with \text{ORDER} \text{BY} (Vadim)
- Fix \text{avg(cash)} computation (Thomas)
- Fix for specifying a column twice in \text{ORDER/GROUP BY} (Vadim)
- Documented new \texttt{libpq} function to return affected rows, \texttt{PQcmdTuples} (Bruce)
- Trigger function for inserting user names for \text{INSERT/UPDATE} (Brook Milligan)

**E.353. Release 6.2**

**Release date:** 1997-10-02

A dump/restore is required for those wishing to migrate data from previous releases of PostgreSQL.

**E.353.1. Migration from version 6.1 to version 6.2**

This migration requires a complete dump of the 6.1 database and a restore of the database in 6.2.

Note that the \texttt{pg_dump} and \texttt{pg_dumpall} utility from 6.2 should be used to dump the 6.1 database.
E.353.2. Migration from version 1.x to version 6.2

Those migrating from earlier 1.* releases should first upgrade to 1.09 because the COPY output format was improved from the 1.02 release.

E.353.3. Changes

Bug Fixes

--------
Fix problems with pg_dump for inheritance, sequences, archive tables (Bruce)
Fix compile errors on overflow due to shifts, unsigned, and bad prototypes from Solaris (Diab Jerius)
Fix bugs in geometric line arithmetic (bad intersection calculations) (Thomas)
Check for geometric intersections at endpoints to avoid rounding ugliness (Thomas)
Catch non-functional delete attempts (Vadim)
Change time function names to be more consistent (Michael Reifenberg)
Check for zero divides (Michael Reifenberg)
Fix very old bug which made rows changed/inserted by a command visible to the command itself (so we had multiple update of updated rows, etc.) (Vadim)
Fix for SELECT null, 'fail' FROM pg_am (Patrick)
SELECT NULL as EMPTY_FIELD now allowed (Patrick)
Remove un-needed signal stuff from contrib/pginterface
Fix OR (where x != 1 or x isnull didn't return rows with x NULL) (Vadim)
Fix time_cmp function (Vadim)
Fix handling of functions with non-attribute first argument in WHERE clauses (Vadim)
Fix GROUP BY when order of entries is different from order in target list (Vadim)
Fix pg_dump for aggregates without sfunc1 (Vadim)

Enhancements

--------
Default genetic optimizer GEQO parameter is now 8 (Bruce)
Allow use parameters in target list having aggregates in functions (Vadim)
Added JDBC driver as an interface (Adrian & Peter)
pg_password utility
Return number of rows inserted/affected by INSERT/UPDATE/DELETE etc. (Vadim)
Triggers implemented with CREATE TRIGGER (SQL3) (Vadim)
SPI (Server Programming Interface) allows execution of queries inside C-functions (Vadim)
NOT NULL implemented (SQL92) (Robson Paniago de Miranda)
Include reserved words for string handling, outer joins, and unions (Thomas)
Implement extended comments ("/* ... */") using exclusive states (Thomas)
Add "/" single-line comments (Bruce)
Remove some restrictions on characters in operator names (Thomas)
DEFAULT and CONSTRAINT for tables implemented (SQL92) (Vadim & Thomas)
Add text concatenation operator and function (SQL92) (Thomas)
Support WITH TIME ZONE syntax (SQL92) (Thomas)
Support INTERVAL unit TO unit syntax (SQL92) (Thomas)
Define types DOUBLE PRECISION, INTERVAL, CHARACTER,
Appendix E. Release Notes

Define type FLOAT(p) and rudimentary DECIMAL(p,s), NUMERIC(p,s) (SQL92) (Thomas)
Define EXTRACT(), POSITION(), SUBSTRING(), and TRIM() (SQL92) (Thomas)
Define CURRENT_DATE, CURRENT_TIME, CURRENT_TIMESTAMP (SQL92) (Thomas)
Add syntax and warnings for UNION, HAVING, INNER and OUTER JOIN (SQL92) (Thomas)
Add more reserved words, mostly for SQL92 compliance (Thomas)
Allow hh:mm:ss time entry for timespan/reptime types (Thomas)
Add center() routines for lseg, path, polygon (Thomas)
Add distance() routines for circle-polygon, polygon-polygon (Thomas)
Check explicitly for points and polygons contained within polygons using an axis-crossing algorithm (Thomas)
Add routine to convert circle-box (Thomas)
Merge conflicting operators for different geometric data types (Thomas)
Replace distance operator "<===" with "<-->" (Thomas)
Replace "above" operator "!^" with ">^" and "below" operator "!|" with "<^" (Thomas)
Add routines for text trimming on both ends, substring, and string position (Thomas)
Added conversion routines circle(box) and poly(circle) (Thomas)
Allow internal sorts to be stored in memory rather than in files (Bruce & Vadim)
Allow functions and operators on internally-identical types to succeed (Bruce)
Speed up backend start-up after profiling analysis (Bruce)
Inline frequently called functions for performance (Bruce)
Reduce open() calls (Bruce)
psql: Add PAGER for \h and \?,\C fix
Fix for psql pager when no tty (Bruce)
New entab utility (Bruce)
General trigger functions for referential integrity (Vadim)
General trigger functions for time travel (Vadim)
General trigger functions for AUTOINCREMENT.IDENTITY feature (Vadim)
MOVE implementation (Vadim)

Source Tree Changes
-------------------
HP-UX 10 patches (Vladimir Turin)
Added SCO support, (Daniel Harris)
MkLinux patches (Tatsuo Ishii)
Change geometric box terminology from "length" to "width" (Thomas)
Deprecate temporary unstored slope fields in geometric code (Thomas)
Remove restart instructions from INSTALL (Bruce)
Look in /usr/ucb first for install (Bruce)
Fix c++ copy example code (Thomas)
Add -o to psql manual page (Bruce)
Prevent rename unallocated string length from being copied into database (Bruce)
Cleanup for NAMEDATALEN use (Bruce)
Fix pg_proc names over 15 chars in output (Bruce)
Add strNcpy() function (Bruce)
remove some (void) casts that are unnecessary (Bruce)
new interfaces directory (Marc)
Replace fopen() calls with calls to fd.c functions (Bruce)
Make functions static where possible (Bruce)
enclose unused functions in #ifdef NOT_USED (Bruce)
Remove call to diffmtime() in timestamp support to fix SunOS (Bruce & Thomas)
Changes for Digital Unix
Portability fix for pg_dumpall (Bruce)
Appendix E. Release Notes

Rename pg_attribute.attnvals to attdispersion (Bruce)
"intro/unix" manual page now "pgintro" (Bruce)
"built-in" manual page now "pgbuiltin" (Bruce)
"drop" manual page now "drop_table" (Bruce)
Add "create_trigger", "drop_trigger" manual pages (Thomas)
Add constraints regression test (Vadim & Thomas)
Add comments syntax regression test (Thomas)
Add PGINDENT and support program (Bruce)
Massive commit to run PGINDENT on all *.c and *.h files (Bruce)
Files moved to /src/tools directory (Bruce)
SPI and Trigger programming guides (Vadim & D’Arcy)

E.354. Release 6.1.1

Release date: 1997-07-22

E.354.1. Migration from version 6.1 to version 6.1.1

This is a minor bug-fix release. A dump/reload is not required from version 6.1, but is required from any release prior to 6.1. Refer to the release notes for 6.1 for more details.

E.354.2. Changes

fix for SET with options (Thomas)
allow pg_dump/pg_dumpall to preserve ownership of all tables/objects (Bruce)
new psql \connect option allows changing usernames without changing databases
fix for initdb --debug option (Yoshihiko Ichikawa)
lextest cleanup (Bruce)
hash fixes (Vadim)
fix date/time month boundary arithmetic (Thomas)
fix timezone daylight handling for some ports (Thomas, Bruce, Tatsuo)
timestamp overhauled to use standard functions (Thomas)
other code cleanup in date/time routines (Thomas)
psql’s \d now case-insensitive (Bruce)
psql’s backslash commands can now have trailing semicolon (Bruce)
fix memory leak in psql when using \g (Bruce)
major fix for endian handling of communication to server (Thomas, Tatsuo)
Fix for Solaris assembler and include files (Yoshihiko Ichikawa)
allow underscores in usernames (Bruce)
pg_dumpall now returns proper status, portability fix (Bruce)
E.355. Release 6.1

Release date: 1997-06-08

The regression tests have been adapted and extensively modified for the 6.1 release of PostgreSQL.

Three new data types (datetime, timespan, and circle) have been added to the native set of PostgreSQL types. Points, boxes, paths, and polygons have had their output formats made consistent across the data types. The polygon output in misc.out has only been spot-checked for correctness relative to the original regression output.

PostgreSQL 6.1 introduces a new, alternate optimizer which uses genetic algorithms. These algorithms introduce a random behavior in the ordering of query results when the query contains multiple qualifiers or multiple tables (giving the optimizer a choice on order of evaluation). Several regression tests have been modified to explicitly order the results, and hence are insensitive to optimizer choices. A few regression tests are for data types which are inherently unordered (e.g. points and time intervals) and tests involving those types are explicitly bracketed with set geqo to 'off' and reset geqo.

The interpretation of array specifiers (the curly braces around atomic values) appears to have changed sometime after the original regression tests were generated. The current ./expected/*.out files reflect this new interpretation, which might not be correct!

The float8 regression test fails on at least some platforms. This is due to differences in implementations of pow() and exp() and the signaling mechanisms used for overflow and underflow conditions.

The “random” results in the random test should cause the “random” test to be “failed”, since the regression tests are evaluated using a simple diff. However, “random” does not seem to produce random results on my test machine (Linux/gcc/i686).

E.355.1. Migration to Version 6.1

This migration requires a complete dump of the 6.0 database and a restore of the database in 6.1.

Those migrating from earlier 1.* releases should first upgrade to 1.09 because the COPY output format was improved from the 1.02 release.

E.355.2. Changes

Bug Fixes
-------
packet length checking in library routines
lock manager priority patch
check for under/over flow of float8(Bruce)
multitable join fix(Vadim)
SIGPIPE crash fix(Darren)
large object fixes(Sven)
allow btree indexes to handle NULLs(Vadim)
timezone fixes(D’Arcy)
select SUM(x) can return NULL on no rows(Thomas)
internal optimizer, executor bug fixes(Vadim)
fix problem where inner loop in < or <= has no rows(Vadim)
prevent re-commuting join index clauses (Vadim)
fix join clauses for multiple tables (Vadim)
fix hash, hashjoin for arrays (Vadim)
fix btree for abstime type (Vadim)
large object fixes (Raymond)
fix buffer leak in hash indexes (Vadim)
fix rtree for use in inner scan (Vadim)
fix gist for use in inner scan, cleanups (Vadim, Andrea)
avoid unnecessary local buffers allocation (Vadim, Massimo)
fix local buffers leak in transaction aborts (Vadim)
fix file manager memory leaks, cleanups (Vadim, Massimo)
fix storage manager memory leaks (Vadim)
fix btree duplicates handling (Vadim)
fix deleted rows reincarnation caused by vacuum (Vadim)
fix SELECT varchar()/char() INTO TABLE made zero-length fields (Bruce)
many psql, pg_dump, and libpq memory leaks fixed using Purify (Igor)

Enhancements
-------------
attribute optimization statistics (Bruce)
much faster new btree bulk load code (Paul)
BTree UNIQUE added to bulk load code (Vadim)
new lock debug code (Massimo)
massive changes to libpq++ (Leo)
new GEQO optimizer speeds table multitable optimization (Martin)
new WARN message for non-unique insert into unique key (Marc)
update x=-3, no spaces, now valid (Bruce)
remove case-sensitive identifier handling (Bruce, Thomas, Dan)
debug backend now pretty-prints tree (Darren)
new Oracle character functions (Edmund)
new plaintext password functions (Dan)
no such class or insufficient privilege changed to distinct messages (Dan)
new ANSI timestamp function (Dan)
new ANSI Time and Date types (Thomas)
move large chunks of data in backend (Martin)
multicolumn btree indexes (Vadim)
new SET var TO value command (Martin)
update transaction status on reads (Dan)
new locale settings for character types (Oleg)
new SEQUENCE serial number generator (Vadim)
GROUP BY function now possible (Vadim)
re-organize regression test (Thomas, Marc)
new optimizer operation weights (Vadim)
new psql \z grant/permit option (Marc)
new MONEY data type (D’Arcy, Thomas)
tcp socket communication speed improved (Vadim)
new VACUUM option for attribute statistics, and for certain columns (Vadim)
many geometric type improvements (Thomas, Keith)
additional regression tests (Thomas)
new datestyle variable (Thomas, Vadim, Martin)
more comparison operators for sorting types (Thomas)
new conversion functions (Thomas)
new more compact btree format (Vadim)
Appendix E. Release Notes

allow pg_dumpall to preserve database ownership (Bruce)
new SET GEQO=# and R_PLANS variable (Vadim)
old (!GEQO) optimizer can use right-sided plans (Vadim)
typechecking improvement in SQL parser (Bruce)
new SET, SHOW, RESET commands (Thomas, Vadim)
new \connect database USER option
new destroydb -i option (Igor)
new \dt and \di psql commands (Darren)
SELECT "\n" now escapes newline (A. Duursma)
nor geometry conversion functions from old format (Thomas)

Source tree changes

new configuration script (Marc)
readline configuration option added (Marc)
OS-specific configuration options removed (Marc)
new OS-specific template files (Marc)
no more need to edit Makefile.global (Marc)
re-arrange include files (Marc)
nextstep patches (Gregor Hoffleit)
removed Windows-specific code (Bruce)
removed postmaster -e option, now only postgres -e option (Bruce)
merge duplicate library code in front/backends (Martin)
now works with eBones, international Kerberos (Jun)
more shared library support
C++ include file cleanup (Bruce)
warn about buggy flex (Bruce)
DGIUX, Ultrix, IRIX, AIX portability fixes

E.356. Release 6.0

Release date: 1997-01-29
A dump/restore is required for those wishing to migrate data from previous releases of PostgreSQL.

E.356.1. Migration from version 1.09 to version 6.0
This migration requires a complete dump of the 1.09 database and a restore of the database in 6.0.

E.356.2. Migration from pre-1.09 to version 6.0
Those migrating from earlier 1.* releases should first upgrade to 1.09 because the COPY output format was improved from the 1.02 release.
E.356.3. Changes

Bug Fixes
--------
ALTER TABLE bug - running postgres process needs to re-read table definition
Allow vacuum to be run on one table or entire database (Bruce)
Array fixes
Fix array over-runs of memory writes (Kurt)
Fix elusive btree range/non-range bug (Dan)
Fix for hash indexes on some types like time and date
Fix for pg_log size explosion
Fix permissions on lo_export() (Bruce)
Fix uninitialized reads of memory (Kurt)
Fixed ALTER TABLE ... char(3) bug (Bruce)
Fixed a few small memory leaks
Fixed EXPLAIN handling of options and changed full_path option name
Fixed output of group acl privileges
Memory leaks (hunt and destroy with tools like Purify) (Kurt)
Minor improvements to rules system
NOTIFY fixes
New asserts for run-checking
Overhauled parser/analyze code to properly report errors and increase speed
Pg_dump -d now handles NULL’s properly (Bruce)
Prevent SELECT NULL from crashing server (Bruce)
Properly report errors when INSERT ... SELECT columns did not match
Properly report errors when insert column names were not correct
psql \g filename now works (Bruce)
psql fixed problem with multiple statements on one line with multiple outputs
Removed duplicate system OIDs
SELECT * INTO TABLE . GROUP/ORDER BY gives unlink error if table exists (Bruce)
Several fixes for queries that crashed the backend
Starting quote in insert string errors (Bruce)
Submitting an empty query now returns empty status, not just " " query (Bruce)

Enhancements
------------
Add EXPLAIN manual page (Bruce)
Add UNIQUE index capability (Dan)
Add hostname/user level access control rather than just hostname and user
Add synonym of != for <> (Bruce)
Allow "select oid, * from table"
Allow BY,ORDER BY to specify columns by number, or by non-alias table.column (Bruce)
Allow COPY from the frontend (Bryan)
Allow GROUP BY to use alias column name (Bruce)
Allow actual compression, not just reuse on the same page (Vadim)
Allow installation-configuration option to auto-add all local users (Bryan)
Allow libpq to distinguish between text value " and null (Bruce)
Allow non-postgres users with createdb privs to destroy db’s
Allow restriction on who can create C functions (Bryan)
Allow restriction on who can do backend COPY (Bryan)
Can shrink tables, pg_time and pg_log (Vadim & Erich)
Change debug level 2 to print queries only, changed debug heading layout (Bruce)
Appendix E. Release Notes

Change default decimal constant representation from float4 to float8 (Bruce)
European date format now set when postmaster is started
Execute lowercase function names if not found with exact case
Fixes for aggregate/GROUP processing, allow ‘select sum(func(x),sum(x+y) from z’
Gist now included in the distribution (Marc)
Ident authentication of local users (Bryan)
Implement BETWEEN qualifier (Bruce)
Implement IN qualifier (Bruce)
libpq has PQgetisnull() (Bruce)
libpq++ improvements
New options to initdb (Bryan)
Pg_dump allow dump of OIDs (Bruce)
Pg_dump create indexes after tables are loaded for speed (Bruce)
Pg_dumpall dumps all databases, and the user table
Pqinterface additions for NULL values (Bruce)
Prevent postmaster from being run as root
psql \h and \? is now readable (Bruce)
psql allow backslashed, semicolons anywhere on the line (Bruce)
psql changed command prompt for lines in query or in quotes (Bruce)
psql char(3) now displays as (bp)char in \d output (Bruce)
psql return code now more accurate (Bryan)
psql updated help syntax (Bruce)
Re-visit and fix vacuum (Vadim)
Reduce size of regression diffs, remove timezone name difference (Bruce)
Remove compile-time parameters to enable binary distributions (Bryan)
Reverse meaning of HBA masks (Bryan)
Secure Authentication of local users (Bryan)
Speed up vacuum (Vadim)
Vacuum now had VERBOSE option (Bruce)

Source tree changes
-------------------
All functions now have prototypes that are compared against the calls
Allow asserts to be disabled easily from Makefile.global (Bruce)
Change oid constants used in code to #define names
Decoupled sparc and solaris defines (Kurt)
Gcc -Wall compiles cleanly with warnings only from unfixable constructs
Major include file reorganization/reduction (Marc)
Make now stops on compile failure (Bryan)
Makefile restructuring (Bryan, Marc)
Merge bsdi_2_1 to bsdi (Bruce)
Monitor program removed
Name change from Postgres95 to PostgreSQL
New config.h file (Marc, Bryan)
PG_VERSION now set to 6.0 and used by postmaster
Portability additions, including Ultrix, DG/UX, AIX, and Solaris
Replaced the number of #define’s, centralized #define’s
Remove duplicate OIDS in system tables (Dan)
Remove duplicate system catalog info or report mismatches (Dan)
Removed many os-specific #define’s
Restructured object file generation/location (Bryan, Marc)
Restructured port-specific file locations (Bryan, Marc)
Unused/uninitialized variables corrected
E.357. Release 1.09

**Release date:** 1996-11-04

Sorry, we didn’t keep track of changes from 1.02 to 1.09. Some of the changes listed in 6.0 were actually included in the 1.02.1 to 1.09 releases.

E.358. Release 1.02

**Release date:** 1996-08-01

E.358.1. Migration from version 1.02 to version 1.02.1

Here is a new migration file for 1.02.1. It includes the 'copy' change and a script to convert old ASCII files.

**Note:** The following notes are for the benefit of users who want to migrate databases from Postgres95 1.01 and 1.02 to Postgres95 1.02.1.

If you are starting afresh with Postgres95 1.02.1 and do not need to migrate old databases, you do not need to read any further.

In order to upgrade older Postgres95 version 1.01 or 1.02 databases to version 1.02.1, the following steps are required:

1. Start up a new 1.02.1 postmaster
2. Add the new built-in functions and operators of 1.02.1 to 1.01 or 1.02 databases. This is done by running the new 1.02.1 server against your own 1.01 or 1.02 database and applying the queries attached at the end of the file. This can be done easily through psql. If your 1.01 or 1.02 database is named testdb and you have cut the commands from the end of this file and saved them in addfunc.sql:
   ```
   $ psql testdb -f addfunc.sql
   ```
   Those upgrading 1.02 databases will get a warning when executing the last two statements in the file because they are already present in 1.02. This is not a cause for concern.

E.358.2. Dump/Reload Procedure

If you are trying to reload a pg_dump or text-mode, `copy tablename to stdout` generated with a previous version, you will need to run the attached `sed` script on the ASCII file before loading it into the
database. The old format used `.` as end-of-data, while `\.` is now the end-of-data marker. Also, empty strings are now loaded in as " rather than NULL. See the copy manual page for full details.

```
sed 's/\./\./g' <in_file >out_file
```

If you are loading an older binary copy or non-stdout copy, there is no end-of-data character, and hence no conversion necessary.

```
-- following lines added by agc to reflect the case-insensitive
-- regexp searching for varchar (in 1.02), and bpchar (in 1.02.1)
cREATE OPERATOR ~* (leftarg = bpchar, rightarg = text, procedure = texticregexeq);
cREATE OPERATOR !~* (leftarg = bpchar, rightarg = text, procedure = texticregexne);
cREATE OPERATOR ~* (leftarg = varchar, rightarg = text, procedure = texticregexeq);
cREATE OPERATOR !~* (leftarg = varchar, rightarg = text, procedure = texticregexne);
```

### E.358.3. Changes

**Source code maintenance and development**
* worldwide team of volunteers
* the source tree now in CVS at ftp.ki.net

**Enhancements**
* `psql` (and underlying `libpq` library) now has many more options for formatting output, including HTML
* `pg_dump` now output the schema and/or the data, with many fixes to enhance completeness.
* `psql` used in place of `monitor` in administration shell scripts. `monitor` to be deprecated in next release.
* date/time functions enhanced
* NULL insert/update/comparison fixed/enhanced
* TCL/TK lib and shell fixed to work with both tck7.4/tk4.0 and tcl7.5/tk4.1

**Bug Fixes (almost too numerous to mention)**
* indexes
* storage management
* check for NULL pointer before dereferencing
* Makefile fixes

**New Ports**
* added SolarisX86 port
* added BSD/OS 2.1 port
* added DG/UX port
E.359. Release 1.01

Release date: 1996-02-23

E.359.1. Migration from version 1.0 to version 1.01

The following notes are for the benefit of users who want to migrate databases from Postgres95 1.0 to Postgres95 1.01.

If you are starting afresh with Postgres95 1.01 and do not need to migrate old databases, you do not need to read any further.

In order to Postgres95 version 1.01 with databases created with Postgres95 version 1.0, the following steps are required:

1. Set the definition of NAMEDATALEN in src/Makefile.global to 16 and OIDNAMELEN to 20.
2. Decide whether you want to use Host based authentication.
   a. If you do, you must create a file name pg_hba in your top-level data directory (typically the value of your $PGDATA). src/libpq/pg_hba shows an example syntax.
   b. If you do not want host-based authentication, you can comment out the line:

   ```
   HBA = 1
   in src/Makefile.global
   ```

   Note that host-based authentication is turned on by default, and if you do not take steps A or B above, the out-of-the-box 1.01 will not allow you to connect to 1.0 databases.
3. Compile and install 1.01, but DO NOT do the initdb step.
4. Before doing anything else, terminate your 1.0 postmaster, and backup your existing $PGDATA directory.
5. Set your PGDATA environment variable to your 1.0 databases, but set up path up so that 1.01 binaries are being used.
6. Modify the file $PGDATA/PG_VERSION from 5.0 to 5.1
7. Start up a new 1.01 postmaster
8. Add the new built-in functions and operators of 1.01 to 1.0 databases. This is done by running the new 1.01 server against your own 1.0 database and applying the queries attached and saving in the file 1.0_to_1.01.sql. This can be done easily through psql. If your 1.0 database is name testdb:

   ```bash
   % psql testdb -f 1.0_to_1.01.sql
   ```

   and then execute the following commands (cut and paste from here):

   -- add builtin functions that are new to 1.01

   ```sql
   create function int4eqoid (int4, oid) returns bool as 'foo'
   language 'internal';
   create function oideqint4 (oid, int4) returns bool as 'foo'
   language 'internal';
   create function char2icregexeq (char2, text) returns bool as 'foo'
   language 'internal';
   ```
create function char2icregexne (char2, text) returns bool as 'foo'
language 'internal';
create function char4icregexeq (char4, text) returns bool as 'foo'
language 'internal';
create function char4icregexne (char4, text) returns bool as 'foo'
language 'internal';
create function char8icregexeq (char8, text) returns bool as 'foo'
language 'internal';
create function char8icregexne (char8, text) returns bool as 'foo'
language 'internal';
create function char16icregexeq (char16, text) returns bool as 'foo'
language 'internal';
create function char16icregexne (char16, text) returns bool as 'foo'
language 'internal';
create function texticregexeq (text, text) returns bool as 'foo'
language 'internal';
create function texticregexne (text, text) returns bool as 'foo'
language 'internal';

-- add builtin functions that are new to 1.01
create operator = (leftarg = int4, rightarg = oid, procedure = int4eqoid);
create operator = (leftarg = oid, rightarg = int4, procedure = oideqint4);
create operator ~* (leftarg = char2, rightarg = text, procedure = char2icregexeq);
create operator !~* (leftarg = char2, rightarg = text, procedure = char2icregexne);
create operator ~* (leftarg = char4, rightarg = text, procedure = char4icregexeq);
create operator !~* (leftarg = char4, rightarg = text, procedure = char4icregexne);
create operator ~* (leftarg = char8, rightarg = text, procedure = char8icregexeq);
create operator !~* (leftarg = char8, rightarg = text, procedure = char8icregexne);
create operator ~* (leftarg = char16, rightarg = text, procedure = char16icregexeq);
create operator !~* (leftarg = char16, rightarg = text, procedure = char16icregexne);
create operator ~* (leftarg = text, rightarg = text, procedure = texticregexeq);
create operator !~* (leftarg = text, rightarg = text, procedure = texticregexne);

E.359.2. Changes

Incompatibilities:
* 1.01 is backwards compatible with 1.0 database provided the user
  follow the steps outlined in the MIGRATION_from_1.0_to_1.01 file.
  If those steps are not taken, 1.01 is not compatible with 1.0 database.

Enhancements:
* added PQdisplayTuples() to libpq and changed monitor and psql to use it
* added NeXT port (requires SysVIPC implementation)
* added CAST .. AS ... syntax
* added ASC and DESC key words
* added 'internal' as a possible language for CREATE FUNCTION
  internal functions are C functions which have been statically linked
  into the postgres backend.
* a new type "name" has been added for system identifiers (table names,
Appendix E. Release Notes

attribute names, etc.) This replaces the old char16 type. The
of name is set by the NAMEDATALEN #define in src/Makefile.global
* a readable reference manual that describes the query language.
* added host-based access control. A configuration file ($PGDATA/pg_hba)
is used to hold the configuration data. If host-based access control
is not desired, comment out HBA=1 in src/Makefile.global.
* changed regex handling to be uniform use of Henry Spencer’s regex code
regardless of platform. The regex code is included in the distribution
* added functions and operators for case-insensitive regular expressions.
The operators are ~* and !~*.
* pg_dump uses COPY instead of SELECT loop for better performance

Bug fixes:
* fixed an optimizer bug that was causing core dumps when
  functions calls were used in comparisons in the WHERE clause
* changed all uses of getuid to geteuid so that effective uids are used
* psql now returns non-zero status on errors when using -c
* applied public patches 1-14

E.360. Release 1.0

Release date: 1995-09-05

E.360.1. Changes

Copyright change:
* The copyright of Postgres 1.0 has been loosened to be freely modifiable
  and modifiable for any purpose. Please read the COPYRIGHT file.
  Thanks to Professor Michael Stonebraker for making this possible.

Incompatibilities:
* date formats have to be MM-DD-YYYY (or DD-MM-YYYY if you’re using
  EUROPEAN STYLE). This follows SQL-92 specs.
* "delimiters" is now a key word

Enhancements:
* sql LIKE syntax has been added
* copy command now takes an optional USING DELIMITER specification.
  delimiters can be any single-character string.
* IRIX 5.3 port has been added.
  Thanks to Paul Walmsley and others.
* updated pg_dump to work with new libpq
* \d has been added psql
  Thanks to Keith Parks
* regexp performance for architectures that use POSIX regex has been
  improved due to caching of precompiled patterns.
Appendix E. Release Notes

Thanks to Alistair Crooks
* a new version of libpq++
  Thanks to William Wanders

Bug fixes:
* arbitrary userids can be specified in the createuser script
* \c to connect to other databases in psql now works.
* bad pg_proc entry for float4inc() is fixed
* users with usecreatedb field set can now create databases without
  having to be usesuper
* remove access control entries when the entry no longer has any
  privileges
* fixed non-portable datetimes implementation
* added kerberos flags to the src/backend/Makefile
* libpq now works with kerberos
* typographic errors in the user manual have been corrected.
* btrees with multiple index never worked, now we tell you they don’t
  work when you try to use them

E.361. Postgres95 Release 0.03

Release date: 1995-07-21

E.361.1. Changes

Incompatible changes:
* BETA-0.3 IS INCOMPATIBLE WITH DATABASES CREATED WITH PREVIOUS VERSIONS
  (due to system catalog changes and indexing structure changes).
* double-quote (") is deprecated as a quoting character for string literals;
  you need to convert them to single quotes (').
* name of aggregates (eg. int4sum) are renamed in accordance with the
  SQL standard (eg. sum).
* CHANGE ACL syntax is replaced by GRANT/REVOKE syntax.
* float literals (eg. 3.14) are now of type float4 (instead of float8 in
  previous releases); you might have to do typecasting if you depend on it
  being of type float8. If you neglect to do the typecasting and you assign
  a float literal to a field of type float8, you might get incorrect values
  stored!
* LIBPQ has been totally revamped so that frontend applications
  can connect to multiple backends
* the usesysid field in pg_user has been changed from int2 to int4 to
  allow wider range of Unix user ids.
* the netbsd/freebsd/bsd o/s ports have been consolidated into a
  single BSD44-derived port. (thanks to Alistair Crooks)

SQL standard-compliance (the following details changes that makes postgres95
Appendix E. Release Notes

more compliant to the SQL-92 standard):
* the following SQL types are now built-in: smallint, int(eger), float, real, char(N), varchar(N), date and time.

The following are aliases to existing postgres types:

smallint -> int2
integer, int -> int4
float, real -> float4

char(N) and varchar(N) are implemented as truncated text types. In addition, char(N) does blank-padding.
* single-quote (') is used for quoting string literals; " (in addition to ") is supported as means of inserting a single quote in a string
* SQL standard aggregate names (MAX, MIN, AVG, SUM, COUNT) are used
(Also, aggregates can now be overloaded, i.e. you can define your own MAX aggregate to take in a user-defined type.)
* CHANGE ACL removed. GRANT/REVOKE syntax added.
  - Privileges can be given to a group using the "GROUP" key word.
    For example:
    GRANT SELECT ON foobar TO GROUP my_group;
The key word 'PUBLIC' is also supported to mean all users.

  Privileges can only be granted or revoked to one user or group at a time.

"WITH GRANT OPTION" is not supported. Only class owners can change access control.
  - The default access control is to grant users readonly access. You must explicitly grant insert/update access to users. To change this, modify the line in
    src/backend/utils/acl.h
  that defines ACL_WORLD_DEFAULT

Bug fixes:
* the bug where aggregates of empty tables were not run has been fixed. Now, aggregates run on empty tables will return the initial conditions of the aggregates. Thus, COUNT of an empty table will now properly return 0. MAX/MIN of an empty table will return a row of value NULL.
* allow the use of \; inside the monitor
* the LISTEN/NOTIFY asynchronous notification mechanism now work
* NOTIFY in rule action bodies now work
* hash indexes work, and access methods in general should perform better. creation of large btree indexes should be much faster. (thanks to Paul Aoki)

Other changes and enhancements:
* addition of an EXPLAIN statement used for explaining the query execution plan (eg. "EXPLAIN SELECT * FROM EMP" prints out the execution plan for the query).
* WARN and NOTICE messages no longer have timestamps on them. To turn on timestamps of error messages, uncomment the line in
  src/backend/utils/elog.h:
  /* define ELOG_TIMESTAMPS */
* On an access control violation, the message
Either no such class or insufficient privilege will be given. This is the same message that is returned when a class is not found. This dissuades non-privileged users from guessing the existence of privileged classes.

* some additional system catalog changes have been made that are not visible to the user.

libpgtcl changes:
* The -oid option has been added to the "pg_result" tcl command. pg_result -oid returns oid of the last row inserted. If the last command was not an INSERT, then pg_result -oid returns "".
* the large object interface is available as pg_lo* tcl commands: pg_lo_open, pg_lo_close, pg_lo_creat, etc.

Portability enhancements and New Ports:
* flex/lex problems have been cleared up. Now, you should be able to use flex instead of lex on any platforms. We no longer make assumptions of what lexer you use based on the platform you use.
* The Linux-ELF port is now supported. Various configuration have been tested: The following configuration is known to work:
  kernel 1.2.10, gcc 2.6.3, libc 4.7.2, flex 2.5.2, bison 1.24 with everything in ELF format,

New utilities:
* ipcclean added to the distribution
  ipcclean usually does not need to be run, but if your backend crashes and leaves shared memory segments hanging around, ipcclean will clean them up for you.

New documentation:
* the user manual has been revised and libpq documentation added.

---

E.362. Postgres95 Release 0.02

Release date: 1995-05-25

E.362.1. Changes

Incompatible changes:
* The SQL statement for creating a database is ‘CREATE DATABASE’ instead of ‘CREATEDB’. Similarly, dropping a database is ‘DROP DATABASE’ instead of ‘DESTROYDB’. However, the names of the executables ‘createdb’ and ‘destroydb’ remain the same.

New tools:
* pgperl - a Perl (4.036) interface to Postgres95
* pg_dump - a utility for dumping out a postgres database into a
  script file containing query commands. The script files are in an ASCII
  format and can be used to reconstruct the database, even on other
  machines and other architectures. (Also good for converting
  a Postgres 4.2 database to Postgres95 database.)

The following ports have been incorporated into postgres95-beta-0.02:
* the NetBSD port by Alistair Crooks
* the AIX port by Mike Tung
* the Windows NT port by Jon Forrest (more stuff but not done yet)
* the Linux ELF port by Brian Gallew

The following bugs have been fixed in postgres95-beta-0.02:
* new lines not escaped in COPY OUT and problem with COPY OUT when first
  attribute is a ‘.’
* cannot type return to use the default user id in createuser
* SELECT DISTINCT on big tables crashes
* Linux installation problems
* monitor doesn’t allow use of ‘localhost’ as PGHOST
* psql core dumps when doing "c or \l
* the "pgtclsh" target missing from src/bin/pgtclsh/Makefile
* libpgtcl has a hard-wired default port number
* SELECT DISTINCT INTO TABLE hangs
* CREATE TYPE doesn’t accept ‘variable’ as the internallength
* wrong result using more than 1 aggregate in a SELECT

E.363. Postgres95 Release 0.01

Release date: 1995-05-01

Initial release.
Appendix F. Additional Supplied Modules

This appendix and the next one contain information regarding the modules that can be found in the `contrib` directory of the PostgreSQL distribution. These include porting tools, analysis utilities, and plug-in features that are not part of the core PostgreSQL system, mainly because they address a limited audience or are too experimental to be part of the main source tree. This does not preclude their usefulness.

This appendix covers extensions and other server plug-in modules found in `contrib`. Appendix G covers utility programs.

When building from the source distribution, these components are not built automatically, unless you build the "world" target (see step 2). You can build and install all of them by running:

```
make
make install
```

in the `contrib` directory of a configured source tree; or to build and install just one selected module, do the same in that module’s subdirectory. Many of the modules have regression tests, which can be executed by running:

```
make check
```

before installation or

```
make installcheck
```

once you have a PostgreSQL server running.

If you are using a pre-packaged version of PostgreSQL, these modules are typically made available as a separate subpackage, such as `postgresql-contrib`.

Many modules supply new user-defined functions, operators, or types. To make use of one of these modules, after you have installed the code you need to register the new SQL objects in the database system. In PostgreSQL 9.1 and later, this is done by executing a `CREATE EXTENSION` command. In a fresh database, you can simply do

```
CREATE EXTENSION module_name;
```

This command must be run by a database superuser. This registers the new SQL objects in the current database only, so you need to run this command in each database that you want the module’s facilities to be available in. Alternatively, run it in database `template1` so that the extension will be copied into subsequently-created databases by default.

Many modules allow you to install their objects in a schema of your choice. To do that, add `SCHEMA schema_name` to the `CREATE EXTENSION` command. By default, the objects will be placed in your current creation target schema, which in turn defaults to `public`.

If your database was brought forward by dump and reload from a pre-9.1 version of PostgreSQL, and you had been using the pre-9.1 version of the module in it, you should instead do

```
CREATE EXTENSION module_name FROM unpackaged;
```
This will update the pre-9.1 objects of the module into a proper extension object. Future updates to the module will be managed by ALTER EXTENSION. For more information about extension updates, see Section 36.15.

Note, however, that some of these modules are not “extensions” in this sense, but are loaded into the server in some other way, for instance by way of shared_preload_libraries. See the documentation of each module for details.

F.1. adminpack

adminpack provides a number of support functions which pgAdmin and other administration and management tools can use to provide additional functionality, such as remote management of server log files. Use of all these functions is restricted to superusers.

The functions shown in Table F-1 provide write access to files on the machine hosting the server. (See also the functions in Table 9-86, which provide read-only access.) Only files within the database cluster directory can be accessed, but either a relative or absolute path is allowable.

<table>
<thead>
<tr>
<th>Name</th>
<th>Return Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>pg_catalog.pg_file_write(filename text, data text, append boolean)</code></td>
<td>bigint</td>
<td>Write, or append to, a text file</td>
</tr>
<tr>
<td><code>pg_catalog.pg_file_rename(oldname text, newname text [, archivename text])</code></td>
<td>boolean</td>
<td>Rename a file</td>
</tr>
<tr>
<td><code>pg_catalog.pg_file_unlink(filename text)</code></td>
<td>boolean</td>
<td>Remove a file</td>
</tr>
<tr>
<td><code>pg_catalog.pg_logdir_ls()</code></td>
<td>setof record</td>
<td>List the log files in the log_directory directory</td>
</tr>
</tbody>
</table>

`pg_file_write` writes the specified data into the file named by filename. If `append` is false, the file must not already exist. If `append` is true, the file can already exist, and will be appended to if so. Returns the number of bytes written.

`pg_file_rename` renames a file. If `archivename` is omitted or NULL, it simply renames `oldname` to `newname` (which must not already exist). If `archivename` is provided, it first renames `newname` to `archivename` (which must not already exist), and then renames `oldname` to `newname`. In event of failure of the second rename step, it will try to rename `archivename` back to `newname` before reporting the error. Returns true on success, false if the source file(s) are not present or not writable; other cases throw errors.

`pg_file_unlink` removes the specified file. Returns true on success, false if the specified file is not present or the `unlink()` call fails; other cases throw errors.

`pg_logdir_ls` returns the start timestamps and path names of all the log files in the log_directory directory. The `log_filename` parameter must have its default setting (postgresql-%Y-%m-%d_%H%M%S.log) to use this function.

The functions shown in Table F-2 are deprecated and should not be used in new applications; instead
use those shown in Table 9-77 and Table 9-86. These functions are provided in `adminpack` only for compatibility with old versions of pgAdmin.

Table F-2. Deprecated `adminpack` Functions

<table>
<thead>
<tr>
<th>Name</th>
<th>Return Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>pg_catalog.pg_file_read(filename text, offset bigint, nbytes bigint)</code></td>
<td><code>text</code></td>
<td>Alternate name for <code>pg_read_file()</code></td>
</tr>
<tr>
<td><code>pg_catalog.pg_file_length(filename text)</code></td>
<td><code>bigint</code></td>
<td>Same as size column returned by <code>pg_stat_file()</code></td>
</tr>
<tr>
<td><code>pg_catalog.pg_logfile_rotate()</code></td>
<td><code>integer</code></td>
<td>Alternate name for <code>pg_rotate_logfile()</code>, but note that it returns integer 0 or 1 rather than boolean</td>
</tr>
</tbody>
</table>

### F.2. auth_delay

`auth_delay` causes the server to pause briefly before reporting authentication failure, to make brute-force attacks on database passwords more difficult. Note that it does nothing to prevent denial-of-service attacks, and may even exacerbate them, since processes that are waiting before reporting authentication failure will still consume connection slots.

In order to function, this module must be loaded via `shared_preload_libraries` in `postgresql.conf`.

#### F.2.1. Configuration Parameters

`auth_delay.milliseconds(int)`

The number of milliseconds to wait before reporting an authentication failure. The default is 0.

These parameters must be set in `postgresql.conf`. Typical usage might be:

```sql
# postgresql.conf
shared_preload_libraries = 'auth_delay'
auth_delay.milliseconds = '500'
```

#### F.2.2. Author

KaiGai Kohei <kaigai@ak.jp.nec.com>
F.3. auto_explain

The auto_explain module provides a means for logging execution plans of slow statements automatically, without having to run EXPLAIN by hand. This is especially helpful for tracking down un-optimized queries in large applications.

The module provides no SQL-accessible functions. To use it, simply load it into the server. You can load it into an individual session:

```
LOAD 'auto_explain';
```

(You must be superuser to do that.) More typical usage is to preload it into some or all sessions by including auto_explain in session_preload_libraries or shared_preload_libraries in postgresql.conf. Then you can track unexpectedly slow queries no matter when they happen. Of course there is a price in overhead for that.

F.3.1. Configuration Parameters

There are several configuration parameters that control the behavior of auto_explain. Note that the default behavior is to do nothing, so you must set at least auto_explain.log_min_duration if you want any results.

```
auto_explain.log_min_duration (integer)
```

auto_explain.log_min_duration is the minimum statement execution time, in milliseconds, that will cause the statement’s plan to be logged. Setting this to zero logs all plans. Minus-one (the default) disables logging of plans. For example, if you set it to 250ms then all statements that run 250ms or longer will be logged. Only superusers can change this setting.

```
auto_explain.log_analyze (boolean)
```

auto_explain.log_analyze causes EXPLAIN ANALYZE output, rather than just EXPLAIN output, to be printed when an execution plan is logged. This parameter is off by default. Only superusers can change this setting.

**Note:** When this parameter is on, per-plan-node timing occurs for all statements executed, whether or not they run long enough to actually get logged. This can have an extremely negative impact on performance. Turning off auto_explain.log_timing ameliorates the performance cost, at the price of obtaining less information.

```
auto_explain.log_buffers (boolean)
```

auto_explain.log_buffers controls whether buffer usage statistics are printed when an execution plan is logged; it’s equivalent to the BUFFERS option of EXPLAIN. This parameter has no effect unless auto_explain.log_analyze is enabled. This parameter is off by default. Only superusers can change this setting.

```
auto_explain.log_timing (boolean)
```

auto_explain.log_timing controls whether per-node timing information is printed when an execution plan is logged; it’s equivalent to the TIMING option of EXPLAIN. The overhead of repeatedly
reading the system clock can slow down queries significantly on some systems, so it may be useful to set this parameter to off when only actual row counts, and not exact times, are needed. This parameter has no effect unless `auto_explain.log_analyze` is enabled. This parameter is on by default. Only superusers can change this setting.

`auto_explain.log_triggers` (boolean)

`auto_explain.log_triggers` causes trigger execution statistics to be included when an execution plan is logged. This parameter has no effect unless `auto_explain.log_analyze` is enabled. This parameter is off by default. Only superusers can change this setting.

`auto_explain.log_verbose` (boolean)

`auto_explain.log_verbose` controls whether verbose details are printed when an execution plan is logged; it’s equivalent to the `VERBOSE` option of `EXPLAIN`. This parameter is off by default. Only superusers can change this setting.

`auto_explain.log_format` (enum)

`auto_explain.log_format` selects the `EXPLAIN` output format to be used. The allowed values are `text`, `xml`, `json`, and `yaml`. The default is `text`. Only superusers can change this setting.

`auto_explain.log_nested_statements` (boolean)

`auto_explain.log_nested_statements` causes nested statements (statements executed inside a function) to be considered for logging. When it is off, only top-level query plans are logged. This parameter is off by default. Only superusers can change this setting.

`auto_explain.sample_rate` (real)

`auto_explain.sample_rate` causes `auto_explain` to only explain a fraction of the statements in each session. The default is 1, meaning explain all the queries. In case of nested statements, either all will be explained or none. Only superusers can change this setting.

In ordinary usage, these parameters are set in `postgresql.conf`, although superusers can alter them on-the-fly within their own sessions. Typical usage might be:

```
# postgresql.conf
session_preload_libraries = 'auto_explain'
auto_explain.log_min_duration = '3s'
```

### F.3.2. Example

```
postgres=# LOAD 'auto_explain';
postgres=# SET auto_explain.log_min_duration = 0;
postgres=# SET auto_explain.log_analyze = true;
postgres=# SELECT count(*)
       FROM pg_class, pg_index
       WHERE oid = indrelid AND indisunique;
```

This might produce log output such as:

```
LOG: duration: 3.651 ms plan:
  Query Text: SELECT count(*)
```

3324
F.3.3. Author

Takahiro Itagaki <itagaki.takahiro@oss.ntt.co.jp>

F.4. bloom

bloom provides an index access method based on Bloom filters\(^1\).

A Bloom filter is a space-efficient data structure that is used to test whether an element is a member of a set. In the case of an index access method, it allows fast exclusion of non-matching tuples via signatures whose size is determined at index creation.

A signature is a lossy representation of the indexed attribute(s), and as such is prone to reporting false positives; that is, it may be reported that an element is in the set, when it is not. So index search results must always be rechecked using the actual attribute values from the heap entry. Larger signatures reduce the odds of a false positive and thus reduce the number of useless heap visits, but of course also make the index larger and hence slower to scan.

This type of index is most useful when a table has many attributes and queries test arbitrary combinations of them. A traditional btree index is faster than a bloom index, but it can require many btree indexes to support all possible queries where one needs only a single bloom index. Note however that bloom indexes only support equality queries, whereas btree indexes can also perform inequality and range searches.

F.4.1. Parameters

A bloom index accepts the following parameters in its WITH clause:

length

Length of each signature (index entry) in bits. It is rounded up to the nearest multiple of 16. The default is 80 bits and the maximum is 4096.

\(^1\) http://en.wikipedia.org/wiki/Bloom_filter
Appendix F. Additional Supplied Modules

Number of bits generated for each index column. Each parameter’s name refers to the number of the index column that it controls. The default is 2 bits and maximum is 4095. Parameters for index columns not actually used are ignored.

F.4.2. Examples

This is an example of creating a bloom index:

```sql
CREATE INDEX bloomidx ON tbloom USING bloom (i1,i2,i3)
  WITH (length=80, col1=2, col2=2, col3=4);
```

The index is created with a signature length of 80 bits, with attributes i1 and i2 mapped to 2 bits, and attribute i3 mapped to 4 bits. We could have omitted the `length`, `col1`, and `col2` specifications since those have the default values.

Here is a more complete example of bloom index definition and usage, as well as a comparison with equivalent btree indexes. The bloom index is considerably smaller than the btree index, and can perform better.

```sql
=# CREATE TABLE tbloom AS
    SELECT
      (random() * 1000000)::int as i1,
      (random() * 1000000)::int as i2,
      (random() * 1000000)::int as i3,
      (random() * 1000000)::int as i4,
      (random() * 1000000)::int as i5,
      (random() * 1000000)::int as i6
    FROM
      generate_series(1,1000000);

=# CREATE INDEX bloomidx ON tbloom USING bloom (i1, i2, i3, i4, i5, i6);
CREATE INDEX
=# SELECT pg_size_pretty(pg_relation_size('bloomidx'));
pg_size_pretty
----------------
153 MB
(1 row)

=# CREATE index btreeidx ON tbloom (i1, i2, i3, i4, i5, i6);
CREATE INDEX
=# SELECT pg_size_pretty(pg_relation_size('btreeidx'));
pg_size_pretty
----------------
387 MB
(1 row)

A sequential scan over this large table takes a long time:

=# EXPLAIN ANALYZE SELECT * FROM tbloom WHERE i2 = 898732 AND i5 = 123451;
QUERY PLAN
```

---

3326
Appendix F. Additional Supplied Modules

So the planner will usually select an index scan if possible. With a btree index, we get results like this:

```sql
=# EXPLAIN ANALYZE SELECT * FROM tbloom WHERE i2 = 898732 AND i5 = 123451;
```

```
QUERY PLAN
--------------------------------------------------------------------------------------------------------------------------------
| Seq Scan on tbloom (cost=0.00..213694.08 rows=1 width=24) (actual time=1445.438..1445.438 rows=0 loops=1)
  | Filter: ((i2 = 898732) AND (i5 = 123451))
  | Rows Removed by Filter: 10000000
  | Planning time: 0.177 ms
  | Execution time: 1445.473 ms
(5 rows)
```

Bloom is better than btree in handling this type of search:

```sql
=# EXPLAIN ANALYZE SELECT * FROM tbloom WHERE i2 = 898732 AND i5 = 123451;
```

```
QUERY PLAN
---------------------------------------------------------------------------------------------------------------------------
| Bitmap Heap Scan on tbloom (cost=178435.39..178439.41 rows=1 width=24) (actual time=76.698..76.698 rows=0 loops=1)
  | Recheck Cond: ((i2 = 898732) AND (i5 = 123451))
  | Rows Removed by Index Recheck: 2439
  | Heap Blocks: exact=2408
  | -> Bitmap Index Scan on bloomidx (cost=0.00..178435.39 rows=1 width=0) (actual time=72.455..72.455 rows=2439 loops=1)
  |   Index Cond: ((i2 = 898732) AND (i5 = 123451))
| Planning time: 0.475 ms
| Execution time: 76.778 ms
(8 rows)
```

Note the relatively large number of false positives: 2439 rows were selected to be visited in the heap, but none actually matched the query. We could reduce that by specifying a larger signature length. In this example, creating the index with `length=200` reduced the number of false positives to 55; but it doubled the index size (to 306 MB) and ended up being slower for this query (125 ms overall).

Now, the main problem with the btree search is that btree is inefficient when the search conditions do not constrain the leading index column(s). A better strategy for btree is to create a separate index on each column. Then the planner will choose something like this:

```sql
=# EXPLAIN ANALYZE SELECT * FROM tbloom WHERE i2 = 898732 AND i5 = 123451;
```

```
QUERY PLAN
------------------------------------------------------------------------------------------------------------------------------
| Bitmap Heap Scan on tbloom (cost=9.29..13.30 rows=1 width=24) (actual time=0.148..0.148 rows=0 loops=1)
  | Recheck Cond: ((i5 = 123451) AND (i2 = 898732))
  | -> BitmapAnd (cost=9.29..9.29 rows=1 width=0) (actual time=0.145..0.145 rows=0 loops=1)
    | -> Bitmap Index Scan on tbloom_i5_idx (cost=0.00..4.52 rows=11 width=0) (actual time=0.089..0.089 rows=10 loops=1)
    |   Index Cond: ((i2 = 898732) AND (i5 = 123451))
| Planning time: 0.475 ms
| Execution time: 76.778 ms
(8 rows)
```
Index Cond: (i5 = 123451)
-> Bitmap Index Scan on tbloom_i2_idx  
   (cost=0.00..4.52 rows=11 width=0)  (actual time=0.048..0.048 rows=8 loops=1)
  Index Cond: (i2 = 898732)
Planning time: 2.049 ms
Execution time: 0.280 ms
(9 rows)

Although this query runs much faster than with either of the single indexes, we pay a large penalty in
index size. Each of the single-column btree indexes occupies 214 MB, so the total space needed is over
1.2GB, more than 8 times the space used by the bloom index.

F.4.3. Operator Class Interface

An operator class for bloom indexes requires only a hash function for the indexed data type and an equality
operator for searching. This example shows the operator class definition for the text data type:

    CREATE OPERATOR CLASS text_ops
    DEFAULT FOR TYPE text USING bloom AS
        OPERATOR 1 =(text, text),
        FUNCTION 1 hashtext(text);

F.4.4. Limitations

- Only operator classes for int4 and text are included with the module.
- Only the = operator is supported for search. But it is possible to add support for arrays with union and
  intersection operations in the future.
- bloom access method doesn’t support UNIQUE indexes.
- bloom access method doesn’t support searching for NULL values.

Appendix F: Additional Supplied Modules

F.5. btree_gin

btree_gin provides sample GIN operator classes that implement B-tree equivalent behavior for the data types int2, int4, int8, float4, float8, timestamp with time zone, timestamp without time zone, time with time zone, time without time zone, date, interval, oid, money, "char", varchar, text, bytea, bit, varbit, macaddr, inet, and cidr.

In general, these operator classes will not outperform the equivalent standard B-tree index methods, and they lack one major feature of the standard B-tree code: the ability to enforce uniqueness. However, they are useful for GIN testing and as a base for developing other GIN operator classes. Also, for queries that test both a GIN-indexable column and a B-tree-indexable column, it might be more efficient to create a multicolumn GIN index that uses one of these operator classes than to create two separate indexes that would have to be combined via bitmap ANDing.

F.5.1. Example Usage

CREATE TABLE test (a int4);
-- create index
CREATE INDEX testidx ON test USING GIN (a);
-- query
SELECT * FROM test WHERE a < 10;

F.5.2. Authors

Teodor Sigaev (<teodor@stack.net>) and Oleg Bartunov (<oleg@sai.msu.su>). See http://www.sai.msu.su/~megera/oddmuse/index.cgi/Gin for additional information.

F.6. btree_gist

btree_gist provides GiST index operator classes that implement B-tree equivalent behavior for the data types int2, int4, int8, float4, float8, numeric, timestamp with time zone, timestamp without time zone, time with time zone, time without time zone, date, interval, oid, money, char, varchar, text, bytea, bit, varbit, macaddr, inet, and cidr.

In general, these operator classes will not outperform the equivalent standard B-tree index methods, and they lack one major feature of the standard B-tree code: the ability to enforce uniqueness. However, they provide some other features that are not available with a B-tree index, as described below. Also, these operator classes are useful when a multicolumn GiST index is needed, wherein some of the columns are of data types that are only indexable with GiST but other columns are just simple data types. Lastly, these operator classes are useful for GiST testing and as a base for developing other GiST operator classes.

In addition to the typical B-tree search operators, btree_gist also provides index support for <> (“not equals”). This may be useful in combination with an exclusion constraint, as described below.

Also, for data types for which there is a natural distance metric, btree_gist defines a distance operator <->, and provides GiST index support for nearest-neighbor searches using this operator. Distance opera-
tors are provided for int2, int4, int8, float4, float8, timestamp with time zone, timestamp without time zone, time without time zone, date, interval, oid, and money.

F.6.1. Example Usage

Simple example using btree_gist instead of btree:

```sql
CREATE TABLE test (a int4);
-- create index
CREATE INDEX testidx ON test USING GIST (a);
-- query
SELECT * FROM test WHERE a < 10;
-- nearest-neighbor search: find the ten entries closest to "42"
SELECT *, a <-> 42 AS dist FROM test ORDER BY a <-> 42 LIMIT 10;
```

Use an exclusion constraint to enforce the rule that a cage at a zoo can contain only one kind of animal:

```sql
=> CREATE TABLE zoo (cage INTEGER,
                    animal TEXT,
                    EXCLUDE USING GIST (cage WITH =, animal WITH <>)
                    )

=> INSERT INTO zoo VALUES(123, 'zebra');
INSERT 0 1
=> INSERT INTO zoo VALUES(123, 'zebra');
INSERT 0 1
=> INSERT INTO zoo VALUES(123, 'lion');
ERROR: conflicting key value violates exclusion constraint "zoo_cage_animal_excl"
DETAIL: Key (cage, animal)=(123, lion) conflicts with existing key (cage, animal)=(123, zebra).
=> INSERT INTO zoo VALUES(124, 'lion');
INSERT 0 1
```

F.6.2. Authors

Teodor Sigaev (<teodor@stack.net>), Oleg Bartunov (<oleg@sai.msu.su>), and Janko Richter (<jankorichter@yahoo.de>). See http://www.sai.msu.su/~megera/postgres/gist/ for additional information.

F.7. chkpass

This module implements a data type chkpass that is designed for storing encrypted passwords. Each password is automatically converted to encrypted form upon entry, and is always stored encrypted. To compare, simply compare against a clear text password and the comparison function will encrypt it before comparing.
There are provisions in the code to report an error if the password is determined to be easily crackable. However, this is currently just a stub that does nothing.

If you precede an input string with a colon, it is assumed to be an already-encrypted password, and is stored without further encryption. This allows entry of previously-encrypted passwords.

On output, a colon is prepended. This makes it possible to dump and reload passwords without re-encrypting them. If you want the encrypted password without the colon then use the raw() function. This allows you to use the type with things like Apache’s Auth_PostgreSQL module.

The encryption uses the standard Unix function crypt(), and so it suffers from all the usual limitations of that function; notably that only the first eight characters of a password are considered.

Note that the chkpass data type is not indexable.

Sample usage:

```
CREATE TABLE test (p chkpass);
INSERT 0 1
SELECT * FROM test;
      p
--------
:GvkgpXdOrE3ko
(1 row)

SELECT raw(p) FROM test;
     raw
--------
GvkgpXdOrE3ko
(1 row)

SELECT p = 'hello' FROM test;
   ?column?
-------
   t
(1 row)

SELECT p = 'goodbye' FROM test;
  ?column?
--------
   f
(1 row)
```

F.7.1. Author

D’Arcy J.M. Cain (<darcy@druid.net>)
F.8. citext

The citext module provides a case-insensitive character string type, citext. Essentially, it internally calls lower when comparing values. Otherwise, it behaves almost exactly like text.

F.8.1. Rationale

The standard approach to doing case-insensitive matches in PostgreSQL has been to use the lower function when comparing values, for example

```
SELECT * FROM tab WHERE lower(col) = LOWER(?);
```

This works reasonably well, but has a number of drawbacks:

- It makes your SQL statements verbose, and you always have to remember to use lower on both the column and the query value.
- It won’t use an index, unless you create a functional index using lower.
- If you declare a column as UNIQUE or PRIMARY KEY, the implicitly generated index is case-sensitive. So it’s useless for case-insensitive searches, and it won’t enforce uniqueness case-insensitively.

The citext data type allows you to eliminate calls to lower in SQL queries, and allows a primary key to be case-insensitive. citext is locale-aware, just like text, which means that the matching of upper case and lower case characters is dependent on the rules of the database’s LC_CTYPE setting. Again, this behavior is identical to the use of lower in queries. But because it’s done transparently by the data type, you don’t have to remember to do anything special in your queries.

F.8.2. How to Use It

Here’s a simple example of usage:

```
CREATE TABLE users (  
    nick CITEXT PRIMARY KEY,  
    pass TEXT NOT NULL  
 );

INSERT INTO users VALUES ( 'larry', md5(random()::text) );
INSERT INTO users VALUES ( 'Tom', md5(random()::text) );
INSERT INTO users VALUES ( 'Damian', md5(random()::text) );
INSERT INTO users VALUES ( 'NEAL', md5(random()::text) );
INSERT INTO users VALUES ( 'Bjørn', md5(random()::text) );

SELECT * FROM users WHERE nick = 'Larry';
```

The SELECT statement will return one tuple, even though the nick column was set to larry and the query was for Larry.
F.8.3. String Comparison Behavior

citext performs comparisons by converting each string to lower case (as though lower were called) and then comparing the results normally. Thus, for example, two strings are considered equal if lower would produce identical results for them.

In order to emulate a case-insensitive collation as closely as possible, there are citext-specific versions of a number of string-processing operators and functions. So, for example, the regular expression operators ~ and ~* exhibit the same behavior when applied to citext: they both match case-insensitively. The same is true for !~ and !~*, as well as for the LIKE operators ~~ and ~*, and !~~ and !~~*. If you’d like to match case-sensitively, you can cast the operator’s arguments to text.

Similarly, all of the following functions perform matching case-insensitively if their arguments are citext:

- regexp_matches()
- regexp_replace()
- regexp_split_to_array()
- regexp_split_to_table()
- replace()
- split_part()
- strpos()
- translate()

For the regexp functions, if you want to match case-sensitively, you can specify the “c” flag to force a case-sensitive match. Otherwise, you must cast to text before using one of these functions if you want case-sensitive behavior.

F.8.4. Limitations

- citext’s case-folding behavior depends on the LC_CTYPE setting of your database. How it compares values is therefore determined when the database is created. It is not truly case-insensitive in the terms defined by the Unicode standard. Effectively, what this means is that, as long as you’re happy with your collation, you should be happy with citext’s comparisons. But if you have data in different languages stored in your database, users of one language may find their query results are not as expected if the collation is for another language.

- As of PostgreSQL 9.1, you can attach a COLLATE specification to citext columns or data values. Currently, citext operators will honor a non-default COLLATE specification while comparing case-folded strings, but the initial folding to lower case is always done according to the database’s LC_CTYPE setting (that is, as though COLLATE "default." were given). This may be changed in a future release so that both steps follow the input COLLATE specification.

- citext is not as efficient as text because the operator functions and the B-tree comparison functions must make copies of the data and convert it to lower case for comparisons. It is, however, slightly more efficient than using lower to get case-insensitive matching.
Appendix F. Additional Supplied Modules

- **citext** doesn’t help much if you need data to compare case-sensitively in some contexts and case-insensitively in other contexts. The standard answer is to use the **text** type and manually use the **lower** function when you need to compare case-insensitively; this works all right if case-insensitive comparison is needed only infrequently. If you need case-insensitive behavior most of the time and case-sensitive infrequently, consider storing the data as **citext** and explicitly casting the column to **text** when you want case-sensitive comparison. In either situation, you will need two indexes if you want both types of searches to be fast.

- The schema containing the **citext** operators must be in the current **search_path** (typically **public**); if it is not, the normal case-sensitive **text** operators will be invoked instead.

F.8.5. Author

David E. Wheeler <david@kineticode.com>
Inspired by the original **citext** module by Donald Fraser.

F.9. cube

This module implements a data type **cube** for representing multidimensional cubes.

F.9.1. Syntax

Table F-3 shows the valid external representations for the **cube** type. x, y, etc. denote floating-point numbers.

<table>
<thead>
<tr>
<th>External Syntax</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>x</td>
<td>A one-dimensional point (or, zero-length one-dimensional interval)</td>
</tr>
<tr>
<td>(x)</td>
<td>Same as above</td>
</tr>
<tr>
<td>x1, x2, ..., xn</td>
<td>A point in n-dimensional space, represented internally as a zero-volume cube</td>
</tr>
<tr>
<td>(x1, x2, ..., xn)</td>
<td>Same as above</td>
</tr>
<tr>
<td>(x), (y)</td>
<td>A one-dimensional interval starting at x and ending at y or vice versa; the order does not matter</td>
</tr>
<tr>
<td>[ (x), (y) ]</td>
<td>Same as above</td>
</tr>
<tr>
<td>(x1, ..., xn), (y1, ..., yn)</td>
<td>An n-dimensional cube represented by a pair of its diagonally opposite corners</td>
</tr>
<tr>
<td>[(x1, ..., xn), (y1, ..., yn)]</td>
<td>Same as above</td>
</tr>
</tbody>
</table>

It does not matter which order the opposite corners of a cube are entered in. The **cube** functions automat-
ically swap values if needed to create a uniform “lower left — upper right” internal representation. When the corners coincide, \texttt{cube} stores only one corner along with an “is point” flag to avoid wasting space.

White space is ignored on input, so \([ (x), (y) ]\) is the same as \([ (x), (y) ]\).

**F.9.2. Precision**

Values are stored internally as 64-bit floating point numbers. This means that numbers with more than about 16 significant digits will be truncated.

**F.9.3. Usage**

Table F-4 shows the operators provided for type \texttt{cube}.

<table>
<thead>
<tr>
<th>Operator</th>
<th>Result</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(a = b)</td>
<td>\text{boolean}</td>
<td>The cubes (a) and (b) are identical.</td>
</tr>
<tr>
<td>(a &amp;&amp; b)</td>
<td>\text{boolean}</td>
<td>The cubes (a) and (b) overlap.</td>
</tr>
<tr>
<td>(a \emptysupset b)</td>
<td>\text{boolean}</td>
<td>The cube (a) contains the cube (b).</td>
</tr>
<tr>
<td>(a &lt;\emptysupset b)</td>
<td>\text{boolean}</td>
<td>The cube (a) is contained in the cube (b).</td>
</tr>
<tr>
<td>(a &lt; b)</td>
<td>\text{boolean}</td>
<td>The cube (a) is less than the cube (b).</td>
</tr>
<tr>
<td>(a \leq b)</td>
<td>\text{boolean}</td>
<td>The cube (a) is less than or equal to the cube (b).</td>
</tr>
<tr>

<td>Chebyshev (L-inf metric) distance between a and b.</td>
<td><code>cube(1,2) == '(1),(2)'</code></td>
</tr>
</tbody>
</table>

(Before PostgreSQL 8.2, the containment operators `@>` and `<@` were respectively called `@` and `~`. These names are still available, but are deprecated and will eventually be retired. Notice that the old names are reversed from the convention formerly followed by the core geometric data types!)

The scalar ordering operators (<, =, etc) do not make a lot of sense for any practical purpose but sorting. These operators first compare the first coordinates, and if those are equal, compare the second coordinates, etc. They exist mainly to support the b-tree index operator class for cube, which can be useful for example if you would like a UNIQUE constraint on a cube column.

The `cube` module also provides a GiST index operator class for cube values. A `cube` GiST index can be used to search for values using the =, &&, @>, and <@ operators in WHERE clauses.

In addition, a `cube` GiST index can be used to find nearest neighbors using the metric operators `<->`, `<#>`, and `<=>` in ORDER BY clauses. For example, the nearest neighbor of the 3-D point (0.5, 0.5, 0.5) could be found efficiently with:

```
SELECT c FROM test ORDER BY c <-> cube(array[0.5,0.5,0.5]) LIMIT 1;
```

The `~>` operator can also be used in this way to efficiently retrieve the first few values sorted by a selected coordinate. For example, to get the first few cubes ordered by the first coordinate (lower left corner) ascending one could use the following query:

```
SELECT c FROM test ORDER BY c ~> 1 LIMIT 5;
```

And to get 2-D cubes ordered by the first coordinate of the upper right corner descending:

```
SELECT c FROM test ORDER BY c ~> 3 DESC LIMIT 5;
```

Table F-5 shows the available functions.

### Table F-5. Cube Functions

<table>

</table>
Appendix F. Additional Supplied Modules

<table>
<thead>
<tr>
<th>Function</th>
<th>Result</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>cube_enlarge(cube, r double, n integer)</td>
<td>cube</td>
<td>Increases the size of the cube by the specified radius ( r ) in at least ( n ) dimensions. If the radius is negative the cube is shrunk instead. All defined dimensions are changed by the radius ( r ). Lower-left coordinates are decreased by ( r ) and upper-right coordinates are increased by ( r ). If a lower-left coordinate is increased to more than the corresponding upper-right coordinate (this can only happen when ( r &lt; 0 )) than both coordinates are set to their average. If ( n ) is greater than the number of defined dimensions and the cube is being enlarged (( r &gt; 0 )), then extra dimensions are added to make ( n ) altogether; 0 is used as the initial value for the extra coordinates. This function is useful for creating bounding boxes around a point for searching for nearby points.</td>
<td>cube_enlarge('(1,2),(3,4)', 0.5, 3) == '(0.5,1.5,-0.5),(3.5,4.5,0.5)'</td>
</tr>
</tbody>
</table>

F.9.4. Defaults

I believe this union:

```sql
select cube_union('0,2,5', (2,3,1)', '0');
cube_union
-------------------
(0, 0, 0),(2, 5, 2)
(1 row)
```

does not contradict common sense, neither does the intersection
select cube_inter(’(0,-1),(1,1)’, ’(-2),(2)’);
cube_inter
-------------
(0, 0), (1, 0)
(1 row)

In all binary operations on differently-dimensional cubes, I assume the lower-dimensional one to be a
Cartesian projection, i.e., having zeroes in place of coordinates omitted in the string representation. The
above examples are equivalent to:

cube_union(’(0,5,2),(2,3,1)’, ’(0,0,0),(0,0,0)’);
cube_inter(’(0,-1),(1,1)’, ’(-2,0),(2,0)’);

The following containment predicate uses the point syntax, while in fact the second argument is internally
represented by a box. This syntax makes it unnecessary to define a separate point type and functions for
(box,point) predicates.

select cube_contains(’(0,0),(1,1)’, ’0.5,0.5’);
cube_contains
--------------
t
(1 row)

F.9.5. Notes

For examples of usage, see the regression test sql/cube.sql.

To make it harder for people to break things, there is a limit of 100 on the number of dimensions of cubes.
This is set in cubedata.h if you need something bigger.

F.9.6. Credits

Original author: Gene Selkov, Jr. <selkovjr@mcs.anl.gov>, Mathematics and Computer Science Di-
vision, Argonne National Laboratory.

My thanks are primarily to Prof. Joe Hellerstein (http://db.cs.berkeley.edu/jmh/) for elucidating the gist of
the GiST (http://gist.cs.berkeley.edu/), and to his former student Andy Dong for his example written for
Illustra. I am also grateful to all Postgres developers, present and past, for enabling myself to create my
own world and live undisturbed in it. And I would like to acknowledge my gratitude to Argonne Lab and
to the U.S. Department of Energy for the years of faithful support of my database research.

Minor updates to this package were made by Bruno Wolff III <bruno@wolff.to> in August/September
of 2002. These include changing the precision from single precision to double precision and adding some
new functions.

Additional updates were made by Joshua Reich <josh@root.net> in July 2006. These include
cube(float8[], float8[]) and cleaning up the code to use the V1 call protocol instead of the
deprecated V0 protocol.

F.10. dblink

dblink is a module that supports connections to other PostgreSQL databases from within a database session.

See also postgres_fdw, which provides roughly the same functionality using a more modern and standards-compliant infrastructure.

dblink_connect

Name

dblink_connect — opens a persistent connection to a remote database

Synopsis

dblink_connect(text connstr) returns text
dblink_connect(text connname, text connstr) returns text

Description

dblink_connect() establishes a connection to a remote PostgreSQL database. The server and database to be contacted are identified through a standard libpq connection string. Optionally, a name can be assigned to the connection. Multiple named connections can be open at once, but only one unnamed connection is permitted at a time. The connection will persist until closed or until the database session is ended.

The connection string may also be the name of an existing foreign server. It is recommended to use the foreign-data wrapper dblink_fdw when defining the foreign server. See the example below, as well as CREATE SERVER and CREATE USER MAPPING.

Arguments

connname

The name to use for this connection; if omitted, an unnamed connection is opened, replacing any existing unnamed connection.

connstr

libpq-style connection info string, for example hostaddr=127.0.0.1 port=5432 dbname=mydb user=postgres password=mypassword options=-csearch_path=. For details see Section 32.1.1. Alternatively, the name of a foreign server.
Return Value

Returns status, which is always **OK** (since any error causes the function to throw an error instead of returning).

Notes

If untrusted users have access to a database that has not adopted a secure schema usage pattern, begin each session by removing publicly-writable schemas from `search_path`. One could, for example, add `options=-csearch_path=` to `connstr`. This consideration is not specific to `dblink`; it applies to every interface for executing arbitrary SQL commands.

Only superusers may use `dblink_connect` to create non-password-authenticated connections. If non-superusers need this capability, use `dblink_connect_u` instead.

It is unwise to choose connection names that contain equal signs, as this opens a risk of confusion with connection info strings in other `dblink` functions.

Examples

```
SELECT dblink_connect('dbname=postgres options=-csearch_path=');
  dblink_connect
             ------------
      OK
(1 row)

SELECT dblink_connect('myconn', 'dbname=postgres options=-csearch_path=');
  dblink_connect
             ------------
      OK
(1 row)
```

```
-- FOREIGN DATA WRAPPER functionality
-- Note: local connection must require password authentication for this to work properly
-- Otherwise, you will receive the following error from dblink_connect():
--                     ----------------------------------------------
--      ERROR: password is required
--      DETAIL: Non-superuser cannot connect if the server does not request a password.
--      HINT: Target server's authentication method must be changed.

CREATE SERVER fdtest FOREIGN DATA WRAPPER dblink_fdw OPTIONS (hostaddr '127.0.0.1', dbname
CREATE USER regress_dblink_user WITH PASSWORD 'secret';
CREATE USER MAPPING FOR regress_dblink_user SERVER fdtest OPTIONS (user 'regress_dblink_user',
GRANT USAGE ON FOREIGN SERVER fdtest TO regress_dblink_user;
GRANT SELECT ON TABLE foo TO regress_dblink_user;

\set ORIGINAL_USER :USER
\c - regress_dblink_user
SELECT dblink_connect('myconn', 'fdtest');
```
dblink_connect
----------------
OK (1 row)

SELECT * FROM dblink('myconn', 'SELECT * FROM foo') AS t(a int, b text, c text[]);

<table>
<thead>
<tr>
<th>a</th>
<th>b</th>
<th>c</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>a</td>
<td>{a0, b0, c0}</td>

dblink_connect_u

**Name**

dblink_connect_u — opens a persistent connection to a remote database, insecurely

**Synopsis**

dblink_connect_u(text connstr) returns text
dblink_connect_u(text conname, text connstr) returns text

**Description**

dblink_connect_u() is identical to dblink_connect(), except that it will allow non-superusers to connect using any authentication method.

If the remote server selects an authentication method that does not involve a password, then impersonation and subsequent escalation of privileges can occur, because the session will appear to have originated from the user as which the local PostgreSQL server runs. Also, even if the remote server does demand a password, it is possible for the password to be supplied from the server environment, such as a ~/.pgpass file belonging to the server’s user. This opens not only a risk of impersonation, but the possibility of exposing a password to an untrustworthy remote server. Therefore, dblink_connect_u() is initially installed with all privileges revoked from PUBLIC, making it un-callable except by superusers. In some situations it may be appropriate to grant EXECUTE permission for dblink_connect_u() to specific users who are considered trustworthy, but this should be done with care. It is also recommended that any ~/.pgpass file belonging to the server’s user not contain any records specifying a wildcard host name.

For further details see dblink_connect().
dblink_disconnect

Name
dblink_disconnect — closes a persistent connection to a remote database

Synopsis
dblink_disconnect() returns text
dblink_disconnect(text connname) returns text

Description
dblink_disconnect() closes a connection previously opened by dblink_connect(). The form with no arguments closes an unnamed connection.

Arguments
connname

The name of a named connection to be closed.

Return Value
Returns status, which is always OK (since any error causes the function to throw an error instead of returning).

Examples
SELECT dblink_disconnect();
   dblink_disconnect
--------------------
   OK
   (1 row)

SELECT dblink_disconnect('myconn');
   dblink_disconnect
--------------------
   OK
   (1 row)
**dblink**

**Name**

dblink — executes a query in a remote database

**Synopsis**

dblink(text connname, text sql [, bool fail_on_error]) returns setof record
dblink(text connstr, text sql [, bool fail_on_error]) returns setof record
dblink(text sql [, bool fail_on_error]) returns setof record

**Description**

dblink executes a query (usually a SELECT, but it can be any SQL statement that returns rows) in a remote database.

When two text arguments are given, the first one is first looked up as a persistent connection’s name; if found, the command is executed on that connection. If not found, the first argument is treated as a connection info string as for dblink_connect, and the indicated connection is made just for the duration of this command.

**Arguments**

connname

Name of the connection to use; omit this parameter to use the unnamed connection.

connstr

A connection info string, as previously described for dblink_connect.

sql

The SQL query that you wish to execute in the remote database, for example select * from foo.

fail_on_error

If true (the default when omitted) then an error thrown on the remote side of the connection causes an error to also be thrown locally. If false, the remote error is locally reported as a NOTICE, and the function returns no rows.

**Return Value**

The function returns the row(s) produced by the query. Since dblink can be used with any query, it is declared to return record, rather than specifying any particular set of columns. This means that you must
specify the expected set of columns in the calling query — otherwise PostgreSQL would not know what to expect. Here is an example:

```sql
SELECT *
  FROM dblink('dbname=mydb options=-csearch_path=,'
             'select proname, prosrc from pg_proc')
  AS t1(proname name, prosrc text)
WHERE proname LIKE 'bytea%';
```

The “alias” part of the FROM clause must specify the column names and types that the function will return. (Specifying column names in an alias is actually standard SQL syntax, but specifying column types is a PostgreSQL extension.) This allows the system to understand what * should expand to, and what `proname` in the WHERE clause refers to, in advance of trying to execute the function. At run time, an error will be thrown if the actual query result from the remote database does not have the same number of columns shown in the FROM clause. The column names need not match, however, and `dblink` does not insist on exact type matches either. It will succeed so long as the returned data strings are valid input for the column type declared in the FROM clause.

**Notes**

A convenient way to use `dblink` with predetermined queries is to create a view. This allows the column type information to be buried in the view, instead of having to spell it out in every query. For example,

```sql
CREATE VIEW myremote_pg_proc AS
  SELECT *
    FROM dblink('dbname=postgres options=-csearch_path=','
                'select proname, prosrc from pg_proc')
    AS t1(proname name, prosrc text);

SELECT * FROM myremote_pg_proc WHERE proname LIKE 'bytea%';
```

**Examples**

```sql
SELECT * FROM dblink('dbname=postgres options=-csearch_path=','
                      'select proname, prosrc from pg_proc')
    AS t1(proname name, prosrc text) WHERE proname LIKE 'bytea%';
```

<table>
<thead>

dblink_exec

Name

dblink_exec — executes a command in a remote database

Synopsis

dblink_exec(text connname, text sql [, bool fail_on_error]) returns text
dblink_exec(text connstr, text sql [, bool fail_on_error]) returns text
dblink_exec(text sql [, bool fail_on_error]) returns text

Description

dblink_exec executes a command (that is, any SQL statement that doesn’t return rows) in a remote
database.

When two text arguments are given, the first one is first looked up as a persistent connection’s name;
if found, the command is executed on that connection. If not found, the first argument is treated as a
connection info string as for dblink_connect, and the indicated connection is made just for the duration
of this command.

Arguments

connname
    Name of the connection to use; omit this parameter to use the unnamed connection.

connstr
    A connection info string, as previously described for dblink_connect.

sql
    The SQL command that you wish to execute in the remote database, for example insert into
too values(0,'a',"a0","b0","c0").

fail_on_error
    If true (the default when omitted) then an error thrown on the remote side of the connection causes
an error to also be thrown locally. If false, the remote error is locally reported as a NOTICE, and the
function’s return value is set to ERROR.

Return Value

Returns status, either the command’s status string or ERROR.
Examples

SELECT dblink_connect('dbname=dblink_test_standby');
  dblink_connect
  ----------------
  OK
  (1 row)

SELECT dblink_exec('insert into foo values(21,"z","{"a0","b0","c0"}");');
  dblink_exec
  ------------------
  INSERT 943366 1
  (1 row)

SELECT dblink_connect('myconn', 'dbname=regression');
  dblink_connect
  ----------------
  OK
  (1 row)

SELECT dblink_exec('myconn', 'insert into foo values(21,"z","{"a0","b0","c0"}");');
  dblink_exec
  ------------------
  INSERT 6432584 1
  (1 row)

SELECT dblink_exec('myconn', 'insert into pg_class values ("foo")',false);
  NOTICE: sql error
  DETAIL: ERROR: null value in column "relnamespace" violates not-null constraint
  dblink_exec
  -------------
  ERROR
  (1 row)
**dblink_open**

**Name**

`dblink_open` — opens a cursor in a remote database

**Synopsis**

`dblink_open(text cursorname, text sql [, bool fail_on_error]) returns text`

`dblink_open(text connname, text cursorname, text sql [, bool fail_on_error]) returns text`

**Description**

`dblink_open()` opens a cursor in a remote database. The cursor can subsequently be manipulated with `dblink_fetch()` and `dblink_close()`.

**Arguments**

- **connname**
  
  Name of the connection to use; omit this parameter to use the unnamed connection.

- **cursorname**
  
  The name to assign to this cursor.

- **sql**
  
  The `SELECT` statement that you wish to execute in the remote database, for example `select * from pg_class`.

- **fail_on_error**
  
  If true (the default when omitted) then an error thrown on the remote side of the connection causes an error to also be thrown locally. If false, the remote error is locally reported as a NOTICE, and the function’s return value is set to `ERROR`.

**Return Value**

Returns status, either `OK` or `ERROR`.

**Notes**

Since a cursor can only persist within a transaction, `dblink_open` starts an explicit transaction block (`BEGIN`) on the remote side, if the remote side was not already within a transaction. This transaction will be closed again when the matching `dblink_close` is executed. Note that if you use `dblink_exec`
to change data between `dblink_open` and `dblink_close`, and then an error occurs or you use `dblink_disconnect` before `dblink_close`, your change will be lost because the transaction will be aborted.

### Examples

```sql
SELECT dblink_connect('dbname=postgres options=-csearch_path=');
-- dblink_connect
-----------
OK
1 row

SELECT dblink_open('foo', 'select proname, prosrc from pg_proc');
-- dblink_open
----------
OK
1 row
```
**dblink_fetch**

**Name**

`dblink_fetch` — returns rows from an open cursor in a remote database

**Synopsis**

```sql
dblink_fetch(text cursorname, int howmany [, bool fail_on_error]) returns setof record
```

**Description**

`dblink_fetch` fetches rows from a cursor previously established by `dblink_open`.

**Arguments**

- **connname**
  
  Name of the connection to use; omit this parameter to use the unnamed connection.

- **cursorname**
  
  The name of the cursor to fetch from.

- **howmany**
  
  The maximum number of rows to retrieve. The next `howmany` rows are fetched, starting at the current cursor position, moving forward. Once the cursor has reached its end, no more rows are produced.

- **fail_on_error**
  
  If true (the default when omitted) then an error thrown on the remote side of the connection causes an error to also be thrown locally. If false, the remote error is locally reported as a NOTICE, and the function returns no rows.

**Return Value**

The function returns the row(s) fetched from the cursor. To use this function, you will need to specify the expected set of columns, as previously discussed for `dblink`.

**Notes**

On a mismatch between the number of return columns specified in the `FROM` clause, and the actual number of columns returned by the remote cursor, an error will be thrown. In this event, the remote cursor is still
advanced by as many rows as it would have been if the error had not occurred. The same is true for any other error occurring in the local query after the remote FETCH has been done.

Examples

```sql
SELECT dblink_connect('dbname=postgres options=-c search_path=');
  dblink_connect
----------
    OK
(1 row)

SELECT dblink_open('foo', 'select proname, prosrc from pg_proc where proname like "bytea%"';
  dblink_open
----------
    OK
(1 row)

SELECT * FROM dblink_fetch('foo', 5) AS (funcname name, source text);
  funcname | source
----------+----------
      byteacat | byteacat
     byteacmp | byteacmp
     byteaeq | byteaeq
      byteage | byteage
      byteagt | byteagt
(5 rows)

SELECT * FROM dblink_fetch('foo', 5) AS (funcname name, source text);
  funcname | source
----------+----------
      byteain | byteain
      byteale | byteale
     bytealike | bytealike
     bytealt | bytealt
      byteane | byteane
(5 rows)

SELECT * FROM dblink_fetch('foo', 5) AS (funcname name, source text);
  funcname | source
----------+----------
     byteanlike | byteanlike
      byteaout | byteaout
(2 rows)

SELECT * FROM dblink_fetch('foo', 5) AS (funcname name, source text);
  funcname | source
----------+----------
(0 rows)
```
dblink_close

Name
dblink_close — closes a cursor in a remote database

Synopsis
dblink_close(text cursorname [, bool fail_on_error]) returns text
dblink_close(text connname, text cursorname [, bool fail_on_error]) returns text

Description
dblink_close closes a cursor previously opened with dblink_open.

Arguments
connname
   Name of the connection to use; omit this parameter to use the unnamed connection.
cursorname
   The name of the cursor to close.
fail_on_error
   If true (the default when omitted) then an error thrown on the remote side of the connection causes
   an error to also be thrown locally. If false, the remote error is locally reported as a NOTICE, and the
   function’s return value is set to ERROR.

Return Value
Returns status, either OK or ERROR.

Notes
If dblink_open started an explicit transaction block, and this is the last remaining open cursor in this
connection, dblink_close will issue the matching COMMIT.

Examples
SELECT dblink_connect('dbname=postgres options=-csearch_path=');
dblink_connect
--

OK
(1 row)

SELECT dblink_open('foo', 'select proname, prosrc from pg_proc');
  dblink_open
--------------
  OK
  (1 row)

SELECT dblink_close('foo');
  dblink_close
--------------
  OK
  (1 row)
dblink_get_connections

Name
dblink_get_connections — returns the names of all open named dblink connections

Synopsis
dblink_get_connections() returns text[]

Description
dblink_get_connections returns an array of the names of all open named dblink connections.

Return Value
Returns a text array of connection names, or NULL if none.

Examples
SELECT dblink_get_connections();
dblink_error_message

Name

dblink_error_message — gets last error message on the named connection

Synopsis

dblink_error_message(text connname) returns text

Description

dblink_error_message fetches the most recent remote error message for a given connection.

Arguments

connname

    Name of the connection to use.

Return Value

Returns last error message, or an empty string if there has been no error in this connection.

Examples

SELECT dblink_error_message('dtest1');
**dblink_send_query**

**Name**

`dblink_send_query` — sends an async query to a remote database

**Synopsis**

`dblink_send_query(text connname, text sql) returns int`

**Description**

`dblink_send_query` sends a query to be executed asynchronously, that is, without immediately waiting for the result. There must not be an async query already in progress on the connection.

After successfully dispatching an async query, completion status can be checked with `dblink_is_busy`, and the results are ultimately collected with `dblink_get_result`. It is also possible to attempt to cancel an active async query using `dblink_cancel_query`.

**Arguments**

- **connname**
  
  Name of the connection to use.

- **sql**
  
  The SQL statement that you wish to execute in the remote database, for example `select * from pg_class`.

**Return Value**

Returns 1 if the query was successfully dispatched, 0 otherwise.

**Examples**

```sql
SELECT dblink_send_query('dtest1', 'SELECT * FROM foo WHERE f1 < 3');
```
dl ink_is_busy

Name
dlink_is_busy — checks if connection is busy with an async query

Synopsis
dlink_is_busy(text connname) returns int

Description
dlink_is_busy tests whether an async query is in progress.

Arguments
connname
   Name of the connection to check.

Return Value
Returns 1 if connection is busy, 0 if it is not busy. If this function returns 0, it is guaranteed that
dlink_get_result will not block.

Examples
SELECT dlink_is_busy('dtest1');
dblink_get_notify

Name
dblink_get_notify — retrieve async notifications on a connection

Synopsis
dblink_get_notify() returns setof (notify_name text, be_pid int, extra text)
dblink_get_notify(text connname) returns setof (notify_name text, be_pid int, extra text)

Description
dblink_get_notify retrieves notifications on either the unnamed connection, or on a named connection if specified. To receive notifications via dblink, LISTEN must first be issued, using dblink_exec. For details see LISTEN and NOTIFY.

Arguments

connname

The name of a named connection to get notifications on.

Return Value

Returns setof (notify_name text, be_pid int, extra text), or an empty set if none.

Examples

SELECT dblink_exec('LISTEN virtual');
   dblink_exec
          --------
         LISTEN
            (1 row)

SELECT * FROM dblink_get_notify();
   notify_name | be_pid | extra
-------------+--------+-------
            +---------+
(0 rows)

NOTIFY virtual;
NOTIFY
<table>
<thead>
<tr>
<th>notify_name</th>
<th>be_pid</th>
<th>extra</th>
</tr>
</thead>
<tbody>
<tr>
<td>virtual</td>
<td>1229</td>
<td></td>
</tr>
</tbody>
</table>

(1 row)
**dblink_get_result**

**Name**

`dblink_get_result` — gets an async query result

**Synopsis**

`dblink_get_result` takes a connection name and returns a result set of records.

**Description**

The `dblink_get_result` function collects the results of an asynchronous query previously sent with `dblink_send_query`. If the query is not already completed, `dblink_get_result` will wait until it is.

**Arguments**

- `connname`
  
  Name of the connection to use.

- `fail_on_error`
  
  If true (the default when omitted) then an error thrown on the remote side of the connection causes an error to also be thrown locally. If false, the remote error is locally reported as a NOTICE, and the function returns no rows.

**Return Value**

For an async query (that is, a SQL statement returning rows), the function returns the row(s) produced by the query. To use this function, you will need to specify the expected set of columns, as previously discussed for `dblink`.

For an async command (that is, a SQL statement not returning rows), the function returns a single row with a single text column containing the command’s status string. It is still necessary to specify that the result will have a single text column in the calling `FROM` clause.

**Notes**

This function must be called if `dblink_send_query` returned 1. It must be called once for each query sent, and one additional time to obtain an empty set result, before the connection can be used again.

When using `dblink_send_query` and `dblink_get_result`, `dblink` fetches the entire remote query result before returning any of it to the local query processor. If the query returns a large number of rows, this can result in transient memory bloat in the local session. It may be better to open such a query as a
cursor with `dblink_open` and then fetch a manageable number of rows at a time. Alternatively, use plain `dblink()`, which avoids memory bloat by spooling large result sets to disk.

**Examples**

```sql
contrib_regression=# SELECT dblink_connect('dtest1', 'dbname=contrib_regression');
      dblink_connect
----------------
        OK
(1 row)

contrib_regression=# SELECT * FROM
dcontrib_regression=# dblink_send_query('dtest1', 'select * from foo where f1 < 3') AS t1;
-----
   1
(1 row)

contrib_regression=# SELECT * FROM dblink_get_result('dtest1') AS t1(f1 int, f2 text, f3 text[]);
      f1 |    f2 | f3
--------+-------+----------
      0 |     a | {a0,b0,c0}
      1 |     b | {a1,b1,c1}
      2 |     c | {a2,b2,c2}
(3 rows)

contrib_regression=# SELECT * FROM dblink_get_result('dtest1') AS t1(f1 int, f2 text, f3 text[]);
      f1 |    f2 | f3
--------+-------+----------
      0 |     a | {a0,b0,c0}
      1 |     b | {a1,b1,c1}
      2 |     c | {a2,b2,c2}
(3 rows)

contrib_regression=# SELECT * FROM dblink_get_result('dtest1') AS t1(f1 int, f2 text, f3 text[]);
      f1 |    f2 | f3
--------+-------+----------
      7 |     h | {a7,b7,c7}
      8 |     i | {a8,b8,c8}
(3 rows)
```
<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>j</td>
<td>{a9,b9,c9}</td>
</tr>
<tr>
<td>10</td>
<td>k</td>
<td>{a10,b10,c10}</td>
</tr>
</tbody>
</table>

(4 rows)

contrib_regression=# SELECT * FROM dblink_get_result('dtest1') AS t1(f1 int, f2 text, f3 text);

<table>
<thead>
<tr>
<th>f1</th>
<th>f2</th>
<th>f3</th>
</tr>
</thead>
</table>

(0 rows)
dblink_cancel_query

Name

$dblink_cancel_query$ — cancels any active query on the named connection

Synopsis

dblink_cancel_query(text connname) returns text

Description

dblink_cancel_query attempts to cancel any query that is in progress on the named connection. Note that this is not certain to succeed (since, for example, the remote query might already have finished). A cancel request simply improves the odds that the query will fail soon. You must still complete the normal query protocol, for example by calling $dblink_get_result$.

Arguments

connname
   Name of the connection to use.

Return Value

Returns OK if the cancel request has been sent, or the text of an error message on failure.

Examples

SELECT dblink_cancel_query('dtest1');
**dblink_get_pkey**

**Name**

`dblink_get_pkey` — returns the positions and field names of a relation’s primary key fields

**Synopsis**

`dblink_get_pkey(text relname) returns setof dblink_pkey_results`

**Description**

`dblink_get_pkey` provides information about the primary key of a relation in the local database. This is sometimes useful in generating queries to be sent to remote databases.

**Arguments**

`relname`

Name of a local relation, for example `foo` or `myschema.mytab`. Include double quotes if the name is mixed-case or contains special characters, for example `"FooBar"`; without quotes, the string will be folded to lower case.

**Return Value**

Returns one row for each primary key field, or no rows if the relation has no primary key. The result row type is defined as

```
CREATE TYPE dblink_pkey_results AS (position int, colname text);
```

The `position` column simply runs from 1 to `N`; it is the number of the field within the primary key, not the number within the table’s columns.

**Examples**

```sql
CREATE TABLE foobar (  
  f1 int,  
  f2 int,  
  f3 int,  
  PRIMARY KEY (f1, f2, f3)  
);  
CREATE TABLE
```
SELECT * FROM dblink_get_pkey('foobar');

<table>
<thead>
<tr>
<th>position</th>
<th>colname</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>f1</td>
</tr>
<tr>
<td>2</td>
<td>f2</td>
</tr>
<tr>
<td>3</td>
<td>f3</td>
</tr>
</tbody>
</table>

(3 rows)
**dblink_build_sql_insert**

**Name**

dblink_build_sql_insert — builds an INSERT statement using a local tuple, replacing the primary key field values with alternative supplied values

**Synopsis**

dblink_build_sql_insert(text relname, int2vector primary_key_attnums, integer num_primary_key_atts, text[] src_pk_att_vals_array, text[] tgt_pk_att_vals_array) returns text

**Description**

dblink_build_sql_insert can be useful in doing selective replication of a local table to a remote database. It selects a row from the local table based on primary key, and then builds a SQL INSERT command that will duplicate that row, but with the primary key values replaced by the values in the last argument. (To make an exact copy of the row, just specify the same values for the last two arguments.)

**Arguments**

 relname

 Name of a local relation, for example foo or myschema.mytab. Include double quotes if the name is mixed-case or contains special characters, for example "FooBar"; without quotes, the string will be folded to lower case.

 primary_key_attnums

 Attribute numbers (1-based) of the primary key fields, for example 1 2.

 num_primary_key_atts

 The number of primary key fields.

 src_pk_att_vals_array

 Values of the primary key fields to be used to look up the local tuple. Each field is represented in text form. An error is thrown if there is no local row with these primary key values.

 tgt_pk_att_vals_array

 Values of the primary key fields to be placed in the resulting INSERT command. Each field is represented in text form.
Return Value

Returns the requested SQL statement as text.

Notes

As of PostgreSQL 9.0, the attribute numbers in primary_key_attnums are interpreted as logical column numbers, corresponding to the column’s position in SELECT * FROM relname. Previous versions interpreted the numbers as physical column positions. There is a difference if any column(s) to the left of the indicated column have been dropped during the lifetime of the table.

Examples

```
SELECT dblink_build_sql_insert('foo', '1 2', 2, '{"1", "a"}', '{"1", "b"a"}');
```

```
-----------
INSERT INTO foo(f1,f2,f3) VALUES('1','b"a'","1")
(1 row)
```
dblink_build_sql_delete

Name
dblink_build_sql_delete — builds a DELETE statement using supplied values for primary key field values

Synopsis
dblink_build_sql_delete(text relname,
    int2vector primary_key_attnums,
    integer num_primary_key_atts,
    text[] tgt_pk_att_vals_array) returns text

Description
dblink_build_sql_delete can be useful in doing selective replication of a local table to a remote database. It builds a SQL DELETE command that will delete the row with the given primary key values.

Arguments
relname
    Name of a local relation, for example foo or myschema.mytab. Include double quotes if the name is mixed-case or contains special characters, for example "FooBar"; without quotes, the string will be folded to lower case.
primary_key_attnums
    Attribute numbers (1-based) of the primary key fields, for example 1 2.
num_primary_key_atts
    The number of primary key fields.
tgt_pk_att_vals_array
    Values of the primary key fields to be used in the resulting DELETE command. Each field is represented in text form.

Return Value
Returns the requested SQL statement as text.
Notes

As of PostgreSQL 9.0, the attribute numbers in `primary_key_attnums` are interpreted as logical column numbers, corresponding to the column’s position in `SELECT * FROM relname`. Previous versions interpreted the numbers as physical column positions. There is a difference if any column(s) to the left of the indicated column have been dropped during the lifetime of the table.

Examples

```sql
SELECT dblink_build_sql_delete('"MyFoo"', 'l 2', 2, '{"1", "b"}');
```

```
DELETE FROM "MyFoo" WHERE f1='1' AND f2='b'
(1 row)
```
dblink_build_sql_update

Name

dblink_build_sql_update — builds an UPDATE statement using a local tuple, replacing the primary key field values with alternative supplied values

Synopsis

dblink_build_sql_update(text relname,
                        int2vector primary_key_attnums,
                        integer num_primary_key_atts,
                        text[] src_pk_att_vals_array,
                        text[] tgt_pk_att_vals_array) returns text

Description

dblink_build_sql_update can be useful in doing selective replication of a local table to a remote database. It selects a row from the local table based on primary key, and then builds a SQL UPDATE command that will duplicate that row, but with the primary key values replaced by the values in the last argument. (To make an exact copy of the row, just specify the same values for the last two arguments.) The UPDATE command always assigns all fields of the row — the main difference between this and dblink_build_sql_insert is that it’s assumed that the target row already exists in the remote table.

Arguments

rename

Name of a local relation, for example foo or myschema.mytab. Include double quotes if the name is mixed-case or contains special characters, for example "FooBar"; without quotes, the string will be folded to lower case.

primary_key_attnums

Attribute numbers (1-based) of the primary key fields, for example 1 2.

num_primary_key_atts

The number of primary key fields.

src_pk_att_vals_array

Values of the primary key fields to be used to look up the local tuple. Each field is represented in text form. An error is thrown if there is no local row with these primary key values.

tgt_pk_att_vals_array

Values of the primary key fields to be placed in the resulting UPDATE command. Each field is represented in text form.
Return Value

Returns the requested SQL statement as text.

Notes

As of PostgreSQL 9.0, the attribute numbers in primary_key_attnums are interpreted as logical column numbers, corresponding to the column’s position in SELECT * FROM relname. Previous versions interpreted the numbers as physical column positions. There is a difference if any column(s) to the left of the indicated column have been dropped during the lifetime of the table.

Examples

SELECT dblink_build_sql_update('foo', '1 2', 2, '{"1", "a"}', '{"1", "b"}');

UPDATE foo SET f1='1', f2='b', f3='1' WHERE f1='1' AND f2='b'
(1 row)
F.11. dict_int

dict_int is an example of an add-on dictionary template for full-text search. The motivation for this example dictionary is to control the indexing of integers (signed and unsigned), allowing such numbers to be indexed while preventing excessive growth in the number of unique words, which greatly affects the performance of searching.

F.11.1. Configuration

The dictionary accepts two options:

- The `maxlen` parameter specifies the maximum number of digits allowed in an integer word. The default value is 6.
- The `rejectlong` parameter specifies whether an overlength integer should be truncated or ignored. If `rejectlong` is `false` (the default), the dictionary returns the first `maxlen` digits of the integer. If `rejectlong` is `true`, the dictionary treats an overlength integer as a stop word, so that it will not be indexed. Note that this also means that such an integer cannot be searched for.

F.11.2. Usage

Installing the `dict_int` extension creates a text search template `intdict_template` and a dictionary `intdict` based on it, with the default parameters. You can alter the parameters, for example

```
mydb# ALTER TEXT SEARCH DICTIONARY intdict (MAXLEN = 4, REJECTLONG = true);
```

or create new dictionaries based on the template.

To test the dictionary, you can try

```
mydb# select ts_lexize('intdict', '12345678');
```

```
ts_lexize
-----------
\{123456\}
```

but real-world usage will involve including it in a text search configuration as described in Chapter 12. That might look like this:

```
ALTER TEXT SEARCH CONFIGURATION english
    ALTER MAPPING FOR int, uint WITH intdict;
```
F.12. dict_xsyn

dict_xsyn (Extended Synonym Dictionary) is an example of an add-on dictionary template for full-text search. This dictionary type replaces words with groups of their synonyms, and so makes it possible to search for a word using any of its synonyms.

F.12.1. Configuration

A dict_xsyn dictionary accepts the following options:

- matchorig controls whether the original word is accepted by the dictionary. Default is true.
- matchsynonyms controls whether the synonyms are accepted by the dictionary. Default is false.
- keeporig controls whether the original word is included in the dictionary’s output. Default is true.
- keepsynonyms controls whether the synonyms are included in the dictionary’s output. Default is true.
- rules is the base name of the file containing the list of synonyms. This file must be stored in $SHAREDIR/tsearch_data/ (where $SHAREDIR means the PostgreSQL installation’s shared-data directory). Its name must end in .rules (which is not to be included in the rules parameter).

The rules file has the following format:

- Each line represents a group of synonyms for a single word, which is given first on the line. Synonyms are separated by whitespace, thus:
  word syn1 syn2 syn3
- The sharp (#) sign is a comment delimiter. It may appear at any position in a line. The rest of the line will be skipped.

Look at xsyn_sample.rules, which is installed in $SHAREDIR/tsearch_data/, for an example.

F.12.2. Usage

Installing the dict_xsyn extension creates a text search template xsyn_template and a dictionary xsyn based on it, with default parameters. You can alter the parameters, for example

```sql
mydb# ALTER TEXT SEARCH DICTIONARY xsyn (RULES='my_rules', KEEPORIG=false);
```

or create new dictionaries based on the template.

To test the dictionary, you can try

```sql
mydb=# SELECT ts_lexize('xsyn', 'word');
    ts_lexize
--------------------
    {syn1,syn2,syn3}
```

```sql
mydb# ALTER TEXT SEARCH DICTIONARY xsyn (RULES='my_rules', KEEPORIG=true);
```

ALTER TEXT SEARCH DICTIONARY
F.13. earthdistance

The earthdistance module provides two different approaches to calculating great circle distances on the surface of the Earth. The one described first depends on the cube module (which must be installed before earthdistance can be installed). The second one is based on the built-in point data type, using longitude and latitude for the coordinates.

In this module, the Earth is assumed to be perfectly spherical. (If that’s too inaccurate for you, you might want to look at the PostGIS\(^2\) project.)

F.13.1. Cube-based Earth Distances

Data is stored in cubes that are points (both corners are the same) using 3 coordinates representing the x, y, and z distance from the center of the Earth. A domain earth over cube is provided, which includes constraint checks that the value meets these restrictions and is reasonably close to the actual surface of the Earth.

\(^2\) http://postgis.net/
The radius of the Earth is obtained from the `earth()` function. It is given in meters. But by changing this one function you can change the module to use some other units, or to use a different value of the radius that you feel is more appropriate.

This package has applications to astronomical databases as well. Astronomers will probably want to change `earth()` to return a radius of $180/\pi$ so that distances are in degrees.

Functions are provided to support input in latitude and longitude (in degrees), to support output of latitude and longitude, to calculate the great circle distance between two points and to easily specify a bounding box usable for index searches.

The provided functions are shown in Table F-6.

**Table F-6. Cube-based Earthdistance Functions**

<table>
<thead>
<tr>
<th>Function</th>
<th>Returns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>earth()</code></td>
<td><code>float8</code></td>
<td>Returns the assumed radius of the Earth.</td>
</tr>
<tr>
<td><code>sec_to_gc(float8)</code></td>
<td><code>float8</code></td>
<td>Converts the normal straight line (secant) distance between two points on the surface of the Earth to the great circle distance between them.</td>
</tr>
<tr>
<td><code>gc_to_sec(float8)</code></td>
<td><code>float8</code></td>
<td>Converts the great circle distance between two points on the surface of the Earth to the normal straight line (secant) distance between them.</td>
</tr>
<tr>
<td><code>ll_to_earth(float8, float8)</code></td>
<td><code>earth</code></td>
<td>Returns the location of a point on the surface of the Earth given its latitude (argument 1) and longitude (argument 2) in degrees.</td>
</tr>
<tr>
<td><code>latitude(earth)</code></td>
<td><code>float8</code></td>
<td>Returns the latitude in degrees of a point on the surface of the Earth.</td>
</tr>
<tr>
<td><code>longitude(earth)</code></td>
<td><code>float8</code></td>
<td>Returns the longitude in degrees of a point on the surface of the Earth.</td>
</tr>
<tr>
<td><code>earth_distance(earth, earth)</code></td>
<td><code>float8</code></td>
<td>Returns the great circle distance between two points on the surface of the Earth.</td>
</tr>
</tbody>
</table>
Appendix F. Additional Supplied Modules

### F.13.2. Point-based Earth Distances

The second part of the module relies on representing Earth locations as values of type `point`, in which the first component is taken to represent longitude in degrees, and the second component is taken to represent latitude in degrees. Points are taken as (longitude, latitude) and not vice versa because longitude is closer to the intuitive idea of x-axis and latitude to y-axis.

A single operator is provided, shown in Table F-7.

**Table F-7. Point-based Earth-distance Operators**

<table>
<thead>
<tr>
<th>Operator</th>
<th>Returns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>point &lt;@&gt; point</code></td>
<td><code>float8</code></td>
<td>Gives the distance in statute miles between two points on the Earth’s surface.</td>
</tr>
</tbody>
</table>

Note that unlike the `cube`-based part of the module, units are hardwired here: changing the `earth()` function will not affect the results of this operator.

One disadvantage of the longitude/latitude representation is that you need to be careful about the edge conditions near the poles and near +/- 180 degrees of longitude. The `cube`-based representation avoids these discontinuities.

### F.14. file_fdw

The `file_fdw` module provides the foreign-data wrapper `file_fdw`, which can be used to access data files in the server’s file system. Data files must be in a format that can be read by `COPY FROM`; see `COPY` for details. Access to such data files is currently read-only.

A foreign table created using this wrapper can have the following options:

- `filename`
  - Specifies the file to be read. Required. Must be an absolute path name.
format

Specifies the file’s format, the same as COPY’s FORMAT option.

header

Specifies whether the file has a header line, the same as COPY’s HEADER option.

delimiter

Specifies the file’s delimiter character, the same as COPY’s DELIMITER option.

quote

Specifies the file’s quote character, the same as COPY’s QUOTE option.

escape

Specifies the file’s escape character, the same as COPY’s ESCAPE option.

null

Specifies the file’s null string, the same as COPY’s NULL option.

encoding

Specifies the file’s encoding, the same as COPY’s ENCODING option.

Note that while COPY allows options such as OIDS and HEADER to be specified without a corresponding value, the foreign data wrapper syntax requires a value to be present in all cases. To activate COPY options normally supplied without a value, you can instead pass the value TRUE.

A column of a foreign table created using this wrapper can have the following options:

force_not_null

This is a Boolean option. If true, it specifies that values of the column should not be matched against the null string (that is, the file-level null option). This has the same effect as listing the column in COPY’s FORCE_NOT_NULL option.

force_null

This is a Boolean option. If true, it specifies that values of the column which match the null string are returned as NULL even if the value is quoted. Without this option, only unquoted values matching the null string are returned as NULL. This has the same effect as listing the column in COPY’s FORCE_NULL option.

COPY’s OIDS and FORCE_QUOTE options are currently not supported by file_fdw.

These options can only be specified for a foreign table or its columns, not in the options of the file_fdw foreign-data wrapper, nor in the options of a server or user mapping using the wrapper.

Changing table-level options requires superuser privileges, for security reasons: only a superuser should be able to determine which file is read. In principle non-superusers could be allowed to change the other options, but that’s not supported at present.

For a foreign table using file_fdw, EXPLAIN shows the name of the file to be read. Unless COSTS OFF is specified, the file size (in bytes) is shown as well.
Example F-1. Create a Foreign Table for PostgreSQL CSV Logs

One of the obvious uses for the file_fdw is to make the PostgreSQL activity log available as a table for querying. To do this, first you must be logging to a CSV file, which here we will call pglog.csv. First, install file_fdw as an extension:

```
CREATE EXTENSION file_fdw;
```

Then create a foreign server:

```
CREATE SERVER pglog FOREIGN DATA WRAPPER file_fdw;
```

Now you are ready to create the foreign data table. Using the CREATE FOREIGN TABLE command, you will need to define the columns for the table, the CSV file name, and its format:

```
CREATE FOREIGN TABLE pglog (
    log_time timestamp(3) with time zone,
    user_name text,
    database_name text,
    process_id integer,
    connection_from text,
    session_id text,
    session_line_num bigint,
    command_tag text,
    session_start_time timestamp with time zone,
    virtual_transaction_id text,
    transaction_id bigint,
    error_severity text,
    sql_state_code text,
    message text,
    detail text,
    hint text,
    internal_query text,
    internal_query_pos integer,
    context text,
    query text,
    query_pos integer,
    location text,
    application_name text
) SERVER pglog 
OPTIONS ( filename '/home/josh/9.1/data/pg_log/pglog.csv', format 'csv' );
```

That’s it — now you can query your log directly. In production, of course, you would need to define some way to deal with log rotation.

F.15. fuzzystrmatch

The fuzzystrmatch module provides several functions to determine similarities and distance between strings.
F.15.1. Soundex

The Soundex system is a method of matching similar-sounding names by converting them to the same code. It was initially used by the United States Census in 1880, 1900, and 1910. Note that Soundex is not very useful for non-English names.

The fuzzystrmatch module provides two functions for working with Soundex codes:

- `soundex(text)` returns text
- `difference(text, text)` returns int

The `soundex` function converts a string to its Soundex code. The `difference` function converts two strings to their Soundex codes and then reports the number of matching code positions. Since Soundex codes have four characters, the result ranges from zero to four, with zero being no match and four being an exact match. (Thus, the function is misnamed — similarity would have been a better name.)

Here are some usage examples:

```sql
SELECT soundex('hello world!');
SELECT soundex('Anne'), soundex('Ann'), difference('Anne', 'Ann');
SELECT soundex('Anne'), soundex('Andrew'), difference('Anne', 'Andrew');
SELECT soundex('Anne'), soundex('Margaret'), difference('Anne', 'Margaret');

CREATE TABLE s (nm text);
INSERT INTO s VALUES ('john');
INSERT INTO s VALUES ('joan');
INSERT INTO s VALUES ('wobbly');
INSERT INTO s VALUES ('jack');
SELECT * FROM s WHERE soundex(nm) = soundex('john');
SELECT * FROM s WHERE difference(s.nm, 'john') > 2;
```

F.15.2. Levenshtein

This function calculates the Levenshtein distance between two strings:

- `levenshtein(text source, text target, int ins_cost, int del_cost, int sub_cost)` returns int
- `levenshtein(text source, text target)` returns int
- `levenshtein_less_equal(text source, text target, int ins_cost, int del_cost, int sub_cost)` returns int
- `levenshtein_less_equal(text source, text target, int max_d)` returns int
Both `source` and `target` can be any non-null string, with a maximum of 255 characters. The cost parameters specify how much to charge for a character insertion, deletion, or substitution, respectively. You can omit the cost parameters, as in the second version of the function; in that case they all default to 1.

`levenshtein_less_equal` is an accelerated version of the Levenshtein function for use when only small distances are of interest. If the actual distance is less than or equal to `max_d`, then `levenshtein_less_equal` returns the correct distance; otherwise it returns some value greater than `max_d`. If `max_d` is negative then the behavior is the same as `levenshtein`.

Examples:

```
test=# SELECT levenshtein('GUMBO', 'GAMBOL');
levenshtein
-----------
    2
(1 row)

test=# SELECT levenshtein('GUMBO', 'GAMBOL', 2,1,1);
levenshtein
-----------
    3
(1 row)

test=# SELECT levenshtein_less_equal('extensive', 'exhaustive',2);
levenshtein_less_equal
-----------------------
    3
(1 row)

test=# SELECT levenshtein_less_equal('extensive', 'exhaustive',4);
levenshtein_less_equal
-----------------------
    4
(1 row)
```

F.15.3. Metaphone

Metaphone, like Soundex, is based on the idea of constructing a representative code for an input string. Two strings are then deemed similar if they have the same codes.

This function calculates the metaphone code of an input string:

```
metaphone(text source, int max_output_length) returns text

source has to be a non-null string with a maximum of 255 characters. max_output_length sets the maximum length of the output metaphone code; if longer, the output is truncated to this length.

Example:

test=# SELECT metaphone('GUMBO', 4);
metaphone
-----------
3384
```
### F.15.4. Double Metaphone

The Double Metaphone system computes two “sounds like” strings for a given input string — a “primary” and an “alternate”. In most cases they are the same, but for non-English names especially they can be a bit different, depending on pronunciation. These functions compute the primary and alternate codes:

- `dmetaphone(text source) returns text`
- `dmetaphone_alt(text source) returns text`

There is no length limit on the input strings.

Example:

```sql
SELECT dmetaphone('gumbo');
```

```
dmetaphone
------------
KMP
```

### F.16. hstore

This module implements the `hstore` data type for storing sets of key/value pairs within a single PostgreSQL value. This can be useful in various scenarios, such as rows with many attributes that are rarely examined, or semi-structured data. Keys and values are simply text strings.

#### F.16.1. hstore External Representation

The text representation of an `hstore`, used for input and output, includes zero or more `key => value` pairs separated by commas. Some examples:

```
k => v
foo => bar, baz => whatever
"1-a" => "anything at all"
```

The order of the pairs is not significant (and may not be reproduced on output). Whitespace between pairs or around the `=>` sign is ignored. Double-quote keys and values that include whitespace, commas, =s or >s. To include a double quote or a backslash in a key or value, escape it with a backslash.

Each key in an `hstore` is unique. If you declare an `hstore` with duplicate keys, only one will be stored in the `hstore` and there is no guarantee as to which will be kept:

```sql
SELECT 'a=>1,a=>2':::hstore;
```

```
hstore
-------
1 row
```
Appendix F. Additional Supplied Modules
---------"a"=>"1"

A value (but not a key) can be an SQL NULL. For example:
key => NULL

The NULL keyword is case-insensitive. Double-quote the NULL to treat it as the ordinary string “NULL”.
Note: Keep in mind that the hstore text format, when used for input, applies before any required
quoting or escaping. If you are passing an hstore literal via a parameter, then no additional processing is needed. But if you’re passing it as a quoted literal constant, then any single-quote characters
and (depending on the setting of the standard_conforming_strings configuration parameter) backslash characters need to be escaped correctly. See Section 4.1.2.1 for more on the handling of string
constants.

On output, double quotes always surround keys and values, even when it’s not strictly necessary.

F.16.2. hstore Operators and Functions
The operators provided by the hstore module are shown in Table F-8, the functions in Table F-9.
Table F-8. hstore Operators
Operator

Description

Example

Result

hstore -> text

get value for key (NULL
if not present)

’a=>x,
b=>y’::hstore ->
’a’

x

hstore -> text[]

get values for keys
(NULL if not present)

’a=>x, b=>y,
c=>z’::hstore ->
ARRAY[’c’,’a’]

{"z","x"}

hstore || hstore

concatenate hstores

’a=>b,
c=>d’::hstore ||
’c=>x,
d=>q’::hstore

"a"=>"b",
"c"=>"x",
"d"=>"q"

hstore ? text

does hstore contain
key?

’a=>1’::hstore ?
’a’

t

hstore ?& text[]

does hstore contain all ’a=>1,b=>2’::hstoret
specified keys?
?& ARRAY[’a’,’b’]

hstore ?| text[]

does hstore contain
any of the specified
keys?

’a=>1,b=>2’::hstoret
?| ARRAY[’b’,’c’]

</table>
### Function | Return Type | Description | Example | Result
---|---|---|---|---
`hstore_to_jsonb(hstore)` | `jsonb` | get hstore as a jsonb value, converting all non-null values to JSON strings | `hstore_to_jsonb(hstore)`
--- | --- | --- | --- | ---
`hstore_to_json_loose(hstore)` | `json` | get hstore as a json value, but attempt to distinguish numerical and Boolean values so they are unquoted in the JSON | `hstore_to_json_loose(hstore)`
--- | --- | --- | --- | ---
`hstore_to_jsonb_loose(hstore)` | `jsonb` | get hstore as a jsonb value, but attempt to distinguish numerical and Boolean values so they are unquoted in the JSON | `hstore_to_jsonb_loose(hstore)`
--- | --- | --- | --- | ---
`slic(hstore, text[])` | `hstore` | extract a subset of an hstore | `slice(hstore, text[])`
--- | --- | --- | --- | ---
`each(hstore)` | setof(key text, value text) | get hstore’s keys and values as a set | `select * from each('a=1,b=2')`
--- | --- | --- | --- | ---
`exist(hstore, text)` | boolean | does hstore contain key? | `exist(hstore, text)`
--- | --- | --- | --- | ---
`defined(hstore, text)` | boolean | does hstore contain non-NULL value for key? | `defined(hstore, text)`
--- | --- | --- | --- | ---
`delete(hstore, text)` | `hstore` | delete pair with matching key | `delete(hstore, text)`
--- | --- | --- | --- | ---
`delete(hstore, text[])` | `hstore` | delete pairs with matching keys | `delete(hstore, text[])`
--- | --- | --- | --- | ---
`delete(hstore, hstore)` | `hstore` | delete pairs matching those in the second argument | `delete(hstore, hstore)`
### Appendix F. Additional Supplied Modules

<table>
<thead>
<tr>
<th>Function</th>
<th>Return Type</th>
<th>Description</th>
<th>Example</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>populate_record(record, hstore)</td>
<td>record</td>
<td>replace fields in record with matching values from hstore</td>
<td>see Examples section</td>
<td></td>
</tr>
</tbody>
</table>

**Note:** The function `hstore_to_json` is used when an `hstore` value is cast to `json`. Likewise, `hstore_to_jsonb` is used when an `hstore` value is cast to `jsonb`.

**Note:** The function `populate_record` is actually declared with `anyelement`, not `record`, as its first argument, but it will reject non-record types with a run-time error.

### F.16.3. Indexes

`hstore` has GiST and GIN index support for the `@>`, `?`, `?&` and `?|` operators. For example:

```sql
CREATE INDEX hidx ON testhstore USING GIST (h);
CREATE INDEX hidx ON testhstore USING GIN (h);
```

`hstore` also supports `btree` or `hash` indexes for the `=` operator. This allows `hstore` columns to be declared `UNIQUE`, or to be used in `GROUP BY`, `ORDER BY` or `DISTINCT` expressions. The sort ordering for `hstore` values is not particularly useful, but these indexes may be useful for equivalence lookups. Create indexes for `=` comparisons as follows:

```sql
CREATE INDEX hidx ON testhstore USING BTREE (h);
CREATE INDEX hidx ON testhstore USING HASH (h);
```

### F.16.4. Examples

Add a key, or update an existing key with a new value:

```sql
UPDATE tab SET h = h || hstore('c', '3');
```

Delete a key:

```sql
UPDATE tab SET h = delete(h, 'k1');
```

Convert a record to an `hstore`:
CREATE TABLE test (col1 integer, col2 text, col3 text);
INSERT INTO test VALUES (123, 'foo', 'bar');

SELECT hstore(t) FROM test AS t;
  hstore
---------------------------------------------
  "col1"=>"123", "col2"=>"foo", "col3"=>"bar"
(1 row)

Convert an hstore to a predefined record type:

CREATE TABLE test (col1 integer, col2 text, col3 text);

SELECT * FROM populate_record(null::test,
    "col1"=>"456", "col2"=>"zzz");
col1 | col2 | col3
----+-----+------
456 | zzz |     
(1 row)

Modify an existing record using the values from an hstore:

CREATE TABLE test (col1 integer, col2 text, col3 text);
INSERT INTO test VALUES (123, 'foo', 'bar');

SELECT (r).* FROM (SELECT t #= "col3"=>"baz" AS r FROM test t) s;
col1 | col2 | col3
----+-----+------
123 | foo | baz
(1 row)

F.16.5. Statistics

The hstore type, because of its intrinsic liberality, could contain a lot of different keys. Checking for valid keys is the task of the application. The following examples demonstrate several techniques for checking keys and obtaining statistics.

Simple example:

SELECT * FROM each('aaa=>bq, b=>NULL, ""=>1');

Using a table:

SELECT (each(h)).key, (each(h)).value INTO stat FROM testhstore;
Online statistics:

```sql
SELECT key, count(*) FROM
    (SELECT (each(h)).key FROM testhstore) AS stat
GROUP BY key
ORDER BY count DESC, key;
```

<table>
<thead>
<tr>
<th>key</th>
<th>count</th>
</tr>
</thead>
<tbody>
<tr>
<td>line</td>
<td>883</td>
</tr>
<tr>
<td>query</td>
<td>207</td>
</tr>
<tr>
<td>pos</td>
<td>203</td>
</tr>
<tr>
<td>node</td>
<td>202</td>
</tr>
<tr>
<td>space</td>
<td>197</td>
</tr>
<tr>
<td>status</td>
<td>195</td>
</tr>
<tr>
<td>public</td>
<td>194</td>
</tr>
<tr>
<td>title</td>
<td>190</td>
</tr>
<tr>
<td>org</td>
<td>189</td>
</tr>
</tbody>
</table>

F.16.6. Compatibility

As of PostgreSQL 9.0, hstore uses a different internal representation than previous versions. This presents no obstacle for dump/restore upgrades since the text representation (used in the dump) is unchanged.

In the event of a binary upgrade, upward compatibility is maintained by having the new code recognize old-format data. This will entail a slight performance penalty when processing data that has not yet been modified by the new code. It is possible to force an upgrade of all values in a table column by doing an `UPDATE` statement as follows:

```sql
UPDATE tablename SET hstorecol = hstorecol || "";
```

Another way to do it is:

```sql
ALTER TABLE tablename ALTER hstorecol TYPE hstore USING hstorecol || "";
```

The `ALTER TABLE` method requires an exclusive lock on the table, but does not result in bloating the table with old row versions.

F.16.7. Transforms

Additional extensions are available that implement transforms for the hstore type for the languages PL/Perl and PL/Python. The extensions for PL/Perl are called `hstore_plperl` and `hstore_plperlu`, for trusted and untrusted PL/Perl. If you install these transforms and specify them when creating a function, hstore values are mapped to Perl hashes. The extensions for PL/Python are called

3392
Appendix F. Additional Supplied Modules

hstore_plpythonu, hstore_plpython2u, and hstore_plpython3u (see Section 44.1 for the PL/Python naming convention). If you use them, hstore values are mapped to Python dictionaries.

F.16.8. Authors

Oleg Bartunov <oleg@sai.msu.su>, Moscow, Moscow University, Russia
Teodor Sigaev <teodor@sigaev.ru>, Moscow, Delta-Soft Ltd., Russia
Additional enhancements by Andrew Gierth <andrew@taol1.riddles.org.uk>, United Kingdom

F.17. intagg

The intagg module provides an integer aggregator and an enumerator. intagg is now obsolete, because there are built-in functions that provide a superset of its capabilities. However, the module is still provided as a compatibility wrapper around the built-in functions.

F.17.1. Functions

The aggregator is an aggregate function int_array_aggregate(integer) that produces an integer array containing exactly the integers it is fed. This is a wrapper around array_agg, which does the same thing for any array type.

The enumerator is a function int_array_enum(integer[]) that returns setof integer. It is essentially the reverse operation of the aggregator: given an array of integers, expand it into a set of rows. This is a wrapper around unnest, which does the same thing for any array type.

F.17.2. Sample Uses

Many database systems have the notion of a one to many table. Such a table usually sits between two indexed tables, for example:

CREATE TABLE left (id INT PRIMARY KEY, ...);
CREATE TABLE right (id INT PRIMARY KEY, ...);
CREATE TABLE one_to_many(left INT REFERENCES left, right INT REFERENCES right);

It is typically used like this:

SELECT right.* from right JOIN one_to_many ON (right.id = one_to_many.right)
   WHERE one_to_many.left = item;

This will return all the items in the right hand table for an entry in the left hand table. This is a very common construct in SQL.

Now, this methodology can be cumbersome with a very large number of entries in the one_to_many table. Often, a join like this would result in an index scan and a fetch for each right hand entry in the table
for a particular left hand entry. If you have a very dynamic system, there is not much you can do. However, if you have some data which is fairly static, you can create a summary table with the aggregator.

CREATE TABLE summary AS
    SELECT left, int_array_aggregate(right) AS right
    FROM one_to_many
    GROUP BY left;

This will create a table with one row per left item, and an array of right items. Now this is pretty useless without some way of using the array; that’s why there is an array enumerator. You can do

SELECT left, int_array_enum(right) FROM summary WHERE left = item;

The above query using int_array_enum produces the same results as

SELECT left, right FROM one_to_many WHERE left = item;

The difference is that the query against the summary table has to get only one row from the table, whereas the direct query against one_to_many must index scan and fetch a row for each entry.

On one system, an EXPLAIN showed a query with a cost of 8488 was reduced to a cost of 329. The original query was a join involving the one_to_many table, which was replaced by:

SELECT right, count(right) FROM
    ( SELECT left, int_array_enum(right) AS right
    FROM summary JOIN (SELECT left FROM left_table WHERE left = item) AS lefts
    ON (summary.left = lefts.left)
    ) AS list
GROUP BY right
ORDER BY count DESC;

---

F.18. intarray

The intarray module provides a number of useful functions and operators for manipulating null-free arrays of integers. There is also support for indexed searches using some of the operators.

All of these operations will throw an error if a supplied array contains any NULL elements.

Many of these operations are only sensible for one-dimensional arrays. Although they will accept input arrays of more dimensions, the data is treated as though it were a linear array in storage order.

---

F.18.1. intarray Functions and Operators

The functions provided by the intarray module are shown in Table F-10, the operators in Table F-11.
### Appendix F. Additional Supplied Modules

#### Table F-10. intarray Functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Return Type</th>
<th>Description</th>
<th>Example</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>icount(int[])</td>

<td>int[]</td>
</tr>
<tr>
<td>int[]</td>
<td>int[]</td>
<td>int[]</td>
</tr>
<tr>
<td>int[] &amp; int[]</td>
<td>int[]</td>
<td>intersection of arrays</td>
</tr>
<tr>
<td>int[] @@ query_int</td>
<td>boolean</td>
<td>true if array satisfies query (see below)</td>
</tr>
<tr>
<td>query_int ~~ int[]</td>
<td>boolean</td>
<td>true if array satisfies query (commutator of @@)</td>
</tr>
</tbody>
</table>

(Before PostgreSQL 8.2, the containment operators @> and <@ were respectively called @ and ~. These names are still available, but are deprecated and will eventually be retired. Notice that the old names are reversed from the convention formerly followed by the core geometric data types!)

The operators &&, @> and <@ are equivalent to PostgreSQL’s built-in operators of the same names, except that they work only on integer arrays that do not contain nulls, while the built-in operators work for any array type. This restriction makes them faster than the built-in operators in many cases.

The @@ and ~~ operators test whether an array satisfies a query, which is expressed as a value of a specialized data type `query_int`. A query consists of integer values that are checked against the elements of the array, possibly combined using the operators & (AND), | (OR), and ! (NOT). Parentheses can be used as needed. For example, the query 1& (2|3) matches arrays that contain 1 and also contain either 2 or 3.

F.18.2. Index Support

`intarray` provides index support for the &&, @>, <@, and @@ operators, as well as regular array equality.

Two GiST index operator classes are provided: `gist__int_ops` (used by default) is suitable for small- to medium-size data sets, while `gist__intbig_ops` uses a larger signature and is more suitable for indexing large data sets (i.e., columns containing a large number of distinct array values). The implementation uses an RD-tree data structure with built-in lossy compression.

There is also a non-default GIN operator class `gin__int_ops` supporting the same operators.

The choice between GiST and GIN indexing depends on the relative performance characteristics of GiST and GIN, which are discussed elsewhere.

F.18.3. Example

-- a message can be in one or more “sections”
CREATE TABLE message (mid INT PRIMARY KEY, sections INT[], ...);

-- create specialized index
CREATE INDEX message_rdtree_idx ON message USING GIST (sections gist__int_ops);

-- select messages in section 1 OR 2 - OVERLAP operator
SELECT message.mid FROM message WHERE message.sections && '{1,2}';

-- select messages in sections 1 AND 2 - CONTAINS operator
SELECT message.mid FROM message WHERE message.sections @> '{1,2}';

-- the same, using QUERY operator
SELECT message.mid FROM message WHERE message.sections @@ '1&2'::query_int;

F.18.4. Benchmark

The source directory contrib/intarray/bench contains a benchmark test suite, which can be run against an installed PostgreSQL server. (It also requires DBD::Pg to be installed.) To run:

cd .../contrib/intarray/bench
createdb TEST
psql -c "CREATE EXTENSION intarray" TEST
./create_test.pl | psql TEST
./bench.pl

The bench.pl script has numerous options, which are displayed when it is run without any arguments.

F.18.5. Authors

All work was done by Teodor Sigaev (<teodor@sigaev.ru>) and Oleg Bartunov (<oleg@sai.msu.su>). See http://www.sai.msu.su/~megera/postgres/gist/ for additional information. Andrey Oktyabrski did a great work on adding new functions and operations.

F.19. isn

The isn module provides data types for the following international product numbering standards: EAN13, UPC, ISBN (books), ISMN (music), and ISSN (serials). Numbers are validated on input according to a hard-coded list of prefixes; this list of prefixes is also used to hyphenate numbers on output. Since new prefixes are assigned from time to time, the list of prefixes may be out of date. It is hoped that a future version of this module will obtained the prefix list from one or more tables that can be easily updated by users as needed; however, at present, the list can only be updated by modifying the source code and recompiling. Alternatively, prefix validation and hyphenation support may be dropped from a future version of this module.
### F.19.1. Data Types

Table F-12 shows the data types provided by the `isn` module.

<table>
<thead>
<tr>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EAN13</td>
<td>European Article Numbers, always displayed in the EAN13 display format</td>
</tr>
<tr>
<td>ISBN13</td>
<td>International Standard Book Numbers to be displayed in the new EAN13 display format</td>
</tr>
<tr>
<td>ISMN13</td>
<td>International Standard Music Numbers to be displayed in the new EAN13 display format</td>
</tr>
<tr>
<td>ISSN13</td>
<td>International Standard Serial Numbers to be displayed in the new EAN13 display format</td>
</tr>
<tr>
<td>ISBN</td>
<td>International Standard Book Numbers to be displayed in the old short display format</td>
</tr>
<tr>
<td>ISMN</td>
<td>International Standard Music Numbers to be displayed in the old short display format</td>
</tr>
<tr>
<td>ISSN</td>
<td>International Standard Serial Numbers to be displayed in the old short display format</td>
</tr>
<tr>
<td>UPC</td>
<td>Universal Product Codes</td>
</tr>
</tbody>
</table>

Some notes:

1. ISBN13, ISMN13, ISSN13 numbers are all EAN13 numbers.
2. EAN13 numbers aren’t always ISBN13, ISMN13 or ISSN13 (some are).
3. Some ISBN13 numbers can be displayed as ISBN.
4. Some ISMN13 numbers can be displayed as ISMN.
5. Some ISSN13 numbers can be displayed as ISSN.
6. UPC numbers are a subset of the EAN13 numbers (they are basically EAN13 without the first 0 digit).
7. All UPC, ISBN, ISMN and ISSN numbers can be represented as EAN13 numbers.

Internally, all these types use the same representation (a 64-bit integer), and all are interchangeable. Multiple types are provided to control display formatting and to permit tighter validity checking of input that is supposed to denote one particular type of number.

The `ISBN`, `ISMN`, and `ISSN` types will display the short version of the number (ISxN 10) whenever it’s possible, and will show ISxN 13 format for numbers that do not fit in the short version. The `EAN13`, `ISBN13`, `ISMN13`, and `ISSN13` types will always display the long version of the ISxN (EAN13).
F.19.2. Casts

The isn module provides the following pairs of type casts:

- ISBN13 ↔ EAN13
- ISMN13 ↔ EAN13
- ISSN13 ↔ EAN13
- ISBN ↔ EAN13
- ISMN ↔ EAN13
- ISSN ↔ EAN13
- UPC ↔ EAN13
- ISMN ↔ ISMN13
- ISSN ↔ ISSN13

When casting from EAN13 to another type, there is a run-time check that the value is within the domain of the other type, and an error is thrown if not. The other casts are simply relabelings that will always succeed.

F.19.3. Functions and Operators

The isn module provides the standard comparison operators, plus B-tree and hash indexing support for all these data types. In addition there are several specialized functions; shown in Table F-13. In this table, isn means any one of the module’s data types.

<table>
<thead>
<tr>
<th>Function</th>
<th>Returns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>isn_weak(boolean)</td>
<td>boolean</td>
<td>Sets the weak input mode (returns new setting)</td>
</tr>
<tr>
<td>isn_weak()</td>
<td>boolean</td>
<td>Gets the current status of the weak mode</td>
</tr>
<tr>
<td>make_valid(isn)</td>
<td>isn</td>
<td>Validates an invalid number (clears the invalid flag)</td>
</tr>
<tr>
<td>is_valid(isn)</td>
<td>boolean</td>
<td>Checks for the presence of the invalid flag</td>
</tr>
</tbody>
</table>

*Weak* mode is used to be able to insert invalid data into a table. Invalid means the check digit is wrong, not that there are missing numbers.

Why would you want to use the weak mode? Well, it could be that you have a huge collection of ISBN numbers, and that there are so many of them that for weird reasons some have the wrong check digit (perhaps the numbers were scanned from a printed list and the OCR got the numbers wrong, perhaps the numbers were manually captured... who knows). Anyway, the point is you might want to clean the mess...
up, but you still want to be able to have all the numbers in your database and maybe use an external tool
to locate the invalid numbers in the database so you can verify the information and validate it more easily;
so for example you’d want to select all the invalid numbers in the table.

When you insert invalid numbers in a table using the weak mode, the number will be inserted with the
corrected check digit, but it will be displayed with an exclamation mark (!) at the end, for example
0-11-000322-5!. This invalid marker can be checked with the is_valid function and cleared with the
make_valid function.

You can also force the insertion of invalid numbers even when not in the weak mode, by appending the !
character at the end of the number.

Another special feature is that during input, you can write ? in place of the check digit, and the correct
check digit will be inserted automatically.

F.19.4. Examples

--Using the types directly:
SELECT isbn('978-0-393-04002-9');
SELECT isbn13('0901690546');
SELECT issn('1436-4522');

--Casting types:
-- note that you can only cast from ean13 to another type when the
-- number would be valid in the realm of the target type;
-- thus, the following will NOT work: select isbn(ean13('0220356483481'));
-- but these will:
SELECT upc(ean13('0220356483481'));
SELECT ean13(upc('220356483481'));

--Create a table with a single column to hold ISBN numbers:
CREATE TABLE test (id isbn);
INSERT INTO test VALUES('9780393040029');

--Automatically calculate check digits (observe the ’?’):
INSERT INTO test VALUES('220500896?');
INSERT INTO test VALUES('978055215372?');

SELECT issn('3251231?');
SELECT ismn('979047213542?');

--Using the weak mode:
SELECT isn_weak(true);
INSERT INTO test VALUES('978-0-11-000533-4');
INSERT INTO test VALUES('9780141219307');
INSERT INTO test VALUES('2-205-00876-X');
SELECT isn weak(false);

SELECT id FROM test WHERE NOT is_valid(id);
UPDATE test SET id = make_valid(id) WHERE id = '2-205-00876-X!';

SELECT * FROM test;
Appendix F. Additional Supplied Modules

SELECT isbn13(id) FROM test;

F.19.5. Bibliography
The information to implement this module was collected from several sites, including:

- http://www.isbn-international.org/
- http://www.issn.org/
- http://www.ismn-international.org/
- http://www.wikipedia.org/

The prefixes used for hyphenation were also compiled from:

- http://www.gs1.org/productssolutions/idkeys/support/prefix_list.html
- https://www.isbn-international.org/content/isbn-users-manual
- http://www.ismn-international.org/ranges.html

Care was taken during the creation of the algorithms and they were meticulously verified against the suggested algorithms in the official ISBN, ISMN, ISSN User Manuals.

F.19.6. Author
Germán Méndez Bravo (Kronuz), 2004 - 2006
This module was inspired by Garrett A. Wollman’s isbn_issn code.

F.20. lo
The lo module provides support for managing Large Objects (also called LOs or BLOBs). This includes a data type lo and a trigger lo_manage.

F.20.1. Rationale
One of the problems with the JDBC driver (and this affects the ODBC driver also), is that the specification assumes that references to BLOBs (Binary Large OBjects) are stored within a table, and if that entry is changed, the associated BLOB is deleted from the database.

As PostgreSQL stands, this doesn’t occur. Large objects are treated as objects in their own right; a table entry can reference a large object by OID, but there can be multiple table entries referencing the same
large object OID, so the system doesn’t delete the large object just because you change or remove one such entry.

Now this is fine for PostgreSQL-specific applications, but standard code using JDBC or ODBC won’t delete the objects, resulting in orphan objects — objects that are not referenced by anything, and simply occupy disk space.

The \texttt{lo} module allows fixing this by attaching a trigger to tables that contain LO reference columns. The trigger essentially just does a \texttt{lo\_unlink} whenever you delete or modify a value referencing a large object. When you use this trigger, you are assuming that there is only one database reference to any large object that is referenced in a trigger-controlled column!

The module also provides a data type \texttt{lo}, which is really just a domain of the \texttt{oid} type. This is useful for differentiating database columns that hold large object references from those that are OIDs of other things. You don’t have to use the \texttt{lo} type to use the trigger, but it may be convenient to use it to keep track of which columns in your database represent large objects that you are managing with the trigger. It is also rumored that the ODBC driver gets confused if you don’t use \texttt{lo} for BLOB columns.

\section*{F.20.2. How to Use It}

Here’s a simple example of usage:

\begin{quote}
CREATE TABLE image (title TEXT, raster lo);
\end{quote}

\begin{quote}
CREATE TRIGGER t\_raster BEFORE UPDATE OR DELETE ON image
  FOR EACH ROW EXECUTE PROCEDURE lo\_manage(raster);
\end{quote}

For each column that will contain unique references to large objects, create a \texttt{BEFORE UPDATE OR DELETE} trigger, and give the column name as the sole trigger argument. You can also restrict the trigger to only execute on updates to the column by using \texttt{BEFORE UPDATE OF column\_name}. If you need multiple \texttt{lo} columns in the same table, create a separate trigger for each one, remembering to give a different name to each trigger on the same table.

\section*{F.20.3. Limitations}

- Dropping a table will still orphan any objects it contains, as the trigger is not executed. You can avoid this by preceding the \texttt{DROP TABLE} with \texttt{DELETE FROM table}.

  \texttt{TRUNCATE} has the same hazard.

  If you already have, or suspect you have, orphaned large objects, see the \texttt{vacuumlo} module to help you clean them up. It’s a good idea to run \texttt{vacuumlo} occasionally as a back-stop to the \texttt{lo\_manage} trigger.

- Some frontends may create their own tables, and will not create the associated trigger(s). Also, users may not remember (or know) to create the triggers.

Peter Mount <peter@retep.org.uk>

F.21. ltree

This module implements a data type ltree for representing labels of data stored in a hierarchical tree-like structure. Extensive facilities for searching through label trees are provided.

F.21.1. Definitions

A label is a sequence of alphanumeric characters and underscores (for example, in C locale the characters A-Za-z0-9_ are allowed). Labels must be less than 256 bytes long.

Examples: 42, Personal_Services

A label path is a sequence of zero or more labels separated by dots, for example L1.L2.L3, representing a path from the root of a hierarchical tree to a particular node. The length of a label path must be less than 65kB, but keeping it under 2kB is preferable.

Example: Top.Countries.Europe.Russia

The ltree module provides several data types:

- ltree stores a label path.
- lquery represents a regular-expression-like pattern for matching ltree values. A simple word matches that label within a path. A star symbol (*) matches zero or more labels. For example:

  - foo Match the exact label path foo
  - *.foo.* Match any label path containing the label foo
  - *.foo Match any label path whose last label is foo

Star symbols can also be quantified to restrict how many labels they can match:

  - *{n} Match exactly n labels
  - *{n,m} Match at least n but not more than m labels
  - *{0,m} Match at most m labels -- same as *{0,m}

There are several modifiers that can be put at the end of a non-star label in lquery to make it match more than just the exact match:

  - @ Match case-insensitively, for example a@ matches A
  - * Match any label with this prefix, for example foo* matches foobar
  - % Match initial underscore-separated words

The behavior of % is a bit complicated. It tries to match words rather than the entire label. For example foo_bar% matches foo_bar_baz but not foo_barbaz. If combined with *, prefix matching applies to each word separately, for example foo_bar%* matches fool_bar2_baz but not fool_br2_baz.

Also, you can write several possibly-modified labels separated with | (OR) to match any of those labels, and you can put ! (NOT) at the start to match any label that doesn’t match any of the alternatives.
Here’s an annotated example of lquery:
Top.*{0,2}.sport@.!football|tennis.Russ*|Spain
a. b. c. d. e.

This query will match any label path that:
  a. begins with the label Top
  b. and next has zero to two labels before
  c. a label beginning with the case-insensitive prefix sport
  d. then a label not matching football nor tennis
  e. and then ends with a label beginning with Russ or exactly matching Spain.

- ltxtquery represents a full-text-search-like pattern for matching ltree values. An ltxtquery value contains words, possibly with the modifiers @, *, % at the end; the modifiers have the same meanings as in lquery. Words can be combined with & (AND), | (OR), ! (NOT), and parentheses. The key difference from lquery is that ltxtquery matches words without regard to their position in the label path.

  Here’s an example ltxtquery:
  Europe & Russia* & !Transportation
  This will match paths that contain the label Europe and any label beginning with Russia (case-insensitive), but not paths containing the label Transportation. The location of these words within the path is not important. Also, when % is used, the word can be matched to any underscore-separated word within a label, regardless of position.

  Note: ltxtquery allows whitespace between symbols, but ltree and lquery do not.

**F.21.2. Operators and Functions**

Type ltree has the usual comparison operators =, !>, <, <=, >=. Comparison sorts in the order of a tree traversal, with the children of a node sorted by label text. In addition, the specialized operators shown in Table F-14 are available.

**Table F-14. ltree Operators**

<table>

<tr>
<td><code>lquery ~ ltree[]</code></td>
<td>boolean</td>
<td>does array contain any path matching <code>lquery</code>?</td>
</tr>
<tr>
<td><code>ltree[] ? lquery[]</code></td>
<td>boolean</td>
<td>does <code>ltree</code> array contain any path matching any <code>lquery</code>?</td>
</tr>
<tr>
<td><code>lquery[] ? ltree[]</code></td>
<td>boolean</td>
<td>does <code>ltree</code> array contain any path matching any <code>lquery</code>?</td>
</tr>
<tr>
<td><code>ltree[] @ ltxtquery</code></td>
<td>boolean</td>
<td>does array contain any path matching <code>ltxtquery</code>?</td>
</tr>
<tr>
<td><code>ltxtquery @ ltree[]</code></td>
<td>boolean</td>
<td>does array contain any path matching <code>ltxtquery</code>?</td>
</tr>
<tr>
<td><code>ltree[] ?@&gt; ltree</code></td>
<td><code>ltree</code></td>
<td>first array entry that is an ancestor of <code>ltree</code>; NULL if none</td>
</tr>
<tr>
<td><code>ltree[] ?&lt;@ ltree</code></td>
<td><code>ltree</code></td>
<td>first array entry that is a descendant of <code>ltree</code>; NULL if none</td>
</tr>
<tr>
<td><code>ltree[] ?~ lquery</code></td>
<td><code>ltree</code></td>
<td>first array entry that matches <code>lquery</code>; NULL if none</td>
</tr>
<tr>
<td><code>ltree[] ?@ ltxtquery</code></td>
<td><code>ltree</code></td>
<td>first array entry that matches <code>ltxtquery</code>; NULL if none</td>
</tr>
</tbody>
</table>

The operators `<@, @>, @` and `~` have analogues `^<@, ^@>, ^@, ^~`, which are the same except they do not use indexes. These are useful only for testing purposes.
The available functions are shown in Table F-15.

### Table F-15. ltree Functions

<td></td>
</tr>
<tr>
<td>lca(ltree[])</td>
<td>ltree</td>
<td>longest common ancestor of paths in array</td>
<td>lca(array['1.2.3.4.5.6'])</td>
<td></td>
</tr>
</tbody>
</table>

### F.21.3. Indexes

`ltree` supports several types of indexes that can speed up the indicated operators:

- **B-tree index over** `ltree`: `<, <=, =, =>, >`
- **GiST index over** `ltree`: `<, <=, =, =>, @>, <@, @, ~, ?`

Example of creating such an index:

```
CREATE INDEX path_gist_idx ON test USING GIST (path);
```

- **GiST index over** `ltree[]`: `ltree[]`: `<@ ltree, ltree @>` `ltree[]`, `@`, `~`, `?`

Example of creating such an index:

```
CREATE INDEX path_gist_idx ON test USING GIST (array_path);
```

Note: This index type is lossy.

### F.21.4. Example

This example uses the following data (also available in file `contrib/ltree/ltreetest.sql` in the source distribution):

```sql
CREATE TABLE test (path ltree);
INSERT INTO test VALUES ('Top');
INSERT INTO test VALUES ('Top.Science');
INSERT INTO test VALUES ('Top.Science.Astronomy');
INSERT INTO test VALUES ('Top.Science.Astronomy.Astrophysics');
INSERT INTO test VALUES ('Top.Science.Astronomy.Cosmology');
INSERT INTO test VALUES ('Top.Hobbies');
INSERT INTO test VALUES ('Top.Hobbies.Amateurs_Astronomy');
INSERT INTO test VALUES ('Top.Collections');
INSERT INTO test VALUES ('Top.Collections.Pictures');
INSERT INTO test VALUES ('Top.Collections.Pictures.Astronomy');
INSERT INTO test VALUES ('Top.Collections.Pictures.Astronomy.Astronauts');
CREATE INDEX path_gist_idx ON test USING GIST (path);
```
CREATE INDEX path_idx ON test USING BTREE (path);

Now, we have a table `test` populated with data describing the hierarchy shown below:

```
Top
  / | \  
Science Hobbies Collections
  / | \  
   Astronomy Amateurs_Astronomy Pictures
  / \    |
Astrophysics Cosmology Astronomy
   / | \
   Galaxies Stars Astronauts
```

We can do inheritance:

```
ltested=> SELECT path FROM test WHERE path <@ 'Top.Science';
path
------------------------------------
Top.Science
Top.Science.Astronomy
Top.Science.Astronomy.Astrophysics
(4 rows)
```

Here are some examples of path matching:

```
ltested=> SELECT path FROM test WHERE path ~ '*.Astronomy.*';
path
-----------------------------------------------
Top.Science.Astronomy
Top.Science.Astronomy.Astrophysics
Top.Collections.Pictures.Astronomy
(7 rows)
ltested=> SELECT path FROM test WHERE path ~ '*.!pictures@.*.Astronomy.*';
path
------------------------------------
Top.Science.Astronomy
Top.Science.Astronomy.Astrophysics
(3 rows)
```

Here are some examples of full text search:

```
ltested=> SELECT path FROM test WHERE path @ 'Astro* & !pictures@';
path
3408
```
Appendix F. Additional Supplied Modules

---
Top.Science.Astronomy
Top.Science.Astronomy.Astrophysics
Top.Hobbies.Amateurs_Astronomy
(4 rows)

ltreetest=> SELECT path FROM test WHERE path & 'Astro* & !pictures@';
   path
---
Top.Science.Astronomy
Top.Science.Astronomy.Astrophysics
(3 rows)

Path construction using functions:

ltreetest=> SELECT subpath(path,0,2)||'Space'||subpath(path,2) FROM test WHERE path <@ 'Top.Science.Astronomy';
   ?column?
---
Top.Science.Space.Astronomy
(3 rows)

We could simplify this by creating a SQL function that inserts a label at a specified position in a path:

CREATE FUNCTION ins_label(ltree, int, text) RETURNS ltree
   AS 'select subpath($1,0,$2) || $3 || subpath($1,$2);'
   LANGUAGE SQL IMMUTABLE;

ltreetest=> SELECT ins_label(path,2,'Space') FROM test WHERE path <@ 'Top.Science.Astronomy';
   ins_label
---
Top.Science.Space.Astronomy
(3 rows)

F.21.5. Transforms

Additional extensions are available that implement transforms for the ltree type for PL/Python. The extensions are called ltree_plpythonu, ltree_plpython2u, and ltree_plpython3u (see Section 44.1 for the PL/Python naming convention). If you install these transforms and specify them when creating a function, ltree values are mapped to Python lists. (The reverse is currently not supported, however.)
Appendix F. Additional Supplied Modules

F.21.6. Authors

All work was done by Teodor Sigaev (<teodor@stack.net>) and Oleg Bartunov (<oleg@sai.msu.su>). See http://www.sai.msu.su/~megera/postgres/gist/ for additional information. Authors would like to thank Eugeny Rodichev for helpful discussions. Comments and bug reports are welcome.

F.22. pageinspect

The pageinspect module provides functions that allow you to inspect the contents of database pages at a low level, which is useful for debugging purposes. All of these functions may be used only by superusers.

F.22.1. Functions

get_raw_page(relname text, fork text, blkno int) returns bytea

get_raw_page reads the specified block of the named relation and returns a copy as a bytea value. This allows a single time-consistent copy of the block to be obtained. fork should be 'main' for the main data fork, 'fsm' for the free space map, 'vm' for the visibility map, or 'init' for the initialization fork.

get_raw_page(relname text, blkno int) returns bytea

A shorthand version of get_raw_page, for reading from the main fork. Equivalent to get_raw_page(relname, 'main', blkno)

page_header(page bytea) returns record

page_header shows fields that are common to all PostgreSQL heap and index pages. A page image obtained with get_raw_page should be passed as argument. For example:

```
test=# SELECT * FROM page_header(get_raw_page('pg_class', 0));

<table>
<thead>
<tr>
<th>lsn</th>
<th>checksum</th>
<th>flags</th>
<th>lower</th>
<th>upper</th>
<th>special</th>
<th>pagesize</th>
<th>version</th>
<th>prune_xid</th>
</tr>
</thead>
<tbody>
<tr>
<td>0/24A1B50</td>
<td>1</td>
<td>1</td>
<td>232</td>
<td>368</td>
<td>8192</td>
<td>8192</td>
<td>4</td>
<td></td>
</tr>
</tbody>
</table>
```

The returned columns correspond to the fields in the PageHeaderData struct. See src/include/storage/bufpage.h for details.

heap_page_items(page bytea) returns setof record

heap_page_items shows all line pointers on a heap page. For those line pointers that are in use, tuple headers as well as tuple raw data are also shown. All tuples are shown, whether or not the tuples were visible to an MVCC snapshot at the time the raw page was copied.

A heap page image obtained with get_raw_page should be passed as argument. For example:

```
test=# SELECT * FROM heap_page_items(get_raw_page('pg_class', 0));
```

See src/include/storage/itemid.h and src/include/access/htup_details.h for explanations of the fields returned.
Appendix F. Additional Supplied Modules

tuple_data_split(rel_oid, t_data bytea, t_infomask integer, t_infomask2 integer, t_bits text [, do_detoast bool]) returns bytea[]

tuple_data_split splits tuple data into attributes in the same way as backend internals.

test=# SELECT tuple_data_split('pg_class'::regclass, t_data, t_infomask, t_infomask2, t_bits) FROM heap_page_items(get_raw_page('pg_class', 0));

This function should be called with the same arguments as the return attributes of heap_page_items.

If do_detoast is true, attribute that will be detoasted as needed. Default value is false.

heap_page_item_attrs(rel_oid, t_data bytea, [, do_detoast bool]) returns bytea[]

heap_page_item_attrs is equivalent to heap_page_items except that it returns tuple raw data as an array of attributes that can optionally be detoasted by do_detoast which is false by default.

A heap page image obtained with get_raw_page should be passed as argument. For example:

    test=# SELECT * FROM heap_page_item_attrs(get_raw_page('pg_class', 0), 'pg_class'::regclass);

bt_metap(relname text) returns record

bt_metap returns information about a B-tree index’s metapage. For example:

    test=# SELECT * FROM bt_metap('pg_cast_oid_index');

bt_page_stats(relname text, blkno int) returns record

bt_page_stats returns summary information about single pages of B-tree indexes. For example:

    test=# SELECT * FROM bt_page_stats('pg_cast_oid_index', 1);

bt_page_items(relname text, blkno int) returns setof record

bt_page_items returns detailed information about all of the items on a B-tree index page. For example:

    test=# SELECT * FROM bt_page_items('pg_cast_oid_index', 1);
In a B-tree leaf page, \texttt{ctid} points to a heap tuple. In an internal page, the block number part of \texttt{ctid} points to another page in the index itself, while the offset part (the second number) is ignored and is usually 1.

Note that the first item on any non-rightmost page (any page with a non-zero value in the \texttt{btpo_next} field) is the page’s “high key”, meaning its \texttt{data} serves as an upper bound on all items appearing on the page, while its \texttt{ctid} field is meaningless. Also, on non-leaf pages, the first real data item (the first item that is not a high key) is a “minus infinity” item, with no actual value in its \texttt{data} field. Such an item does have a valid downlink in its \texttt{ctid} field, however.

\begin{verbatim}
brin_page_type(page bytea) returns text

\texttt{brin_page_type} returns the page type of the given BRIN index page, or throws an error if the page is not a valid BRIN page. For example:

\texttt{test=# SELECT \texttt{brin_page_type}(get\_raw\_page(‘brinidx’, 0));}
\end{verbatim}

\begin{verbatim}
brin_metapage_info(page bytea) returns record

\texttt{brin_metapage_info} returns assorted information about a BRIN index metapage. For example:

\texttt{test=# SELECT * FROM \texttt{brin_metapage_info}(get\_raw\_page(‘brinidx’, 0));}
\end{verbatim}

\begin{verbatim}
brin_revmap_data(page bytea) returns setof tid

\texttt{brin_revmap_data} returns the list of tuple identifiers in a BRIN index range map page. For example:

\texttt{test=# SELECT * FROM \texttt{brin_revmap_data}(get\_raw\_page(‘brinidx’, 2)) limit 5;}
\end{verbatim}

\begin{verbatim}
brin_page_items(page bytea, index oid) returns setof record

\texttt{brin_page_items} returns the data stored in the BRIN data page. For example:

\texttt{test=# SELECT * FROM \texttt{brin_page_items}(get\_raw\_page(‘brinidx’, 5), ‘brinidx’)}
\end{verbatim}

\texttt{ORDER BY blknum, attnum LIMIT 6;}

3412
## Appendix F. Additional Supplied Modules

</tr>
</tbody>
</table>

The returned columns correspond to the fields in the `BrinMemTuple` and `BrinValues` structs. See `src/include/access/brin_tuple.h` for details.

gin_metapage_info(page bytea) returns record

gin_metapage_info returns information about a GIN index metapage. For example:

test=# SELECT * FROM gin_metapage_info(get_raw_page('gin_index', 0));
-| RECORD 1 |------------+-----------|
pending_head | 4294967295 |
pending_tail  | 4294967295 |
tail_free_size | 0         |
n_pending_pages | 0         |
n_pending_tuples | 0         |
n_total_pages | 7         |
n_entry_pages | 6         |
n_data_pages  | 0         |
n_entries    | 693        |
version      | 2         |

gin_page_opaque_info(page bytea) returns record

gin_page_opaque_info returns information about a GIN index opaque area, like the page type. For example:

test=# SELECT * FROM gin_page_opaque_info(get_raw_page('gin_index', 2));
-+-------------------------------+------------------------+
| rightlink | maxoff | flags                  |
|-----------+--------+------------------------|
| 5         | 0      | {data,leaf,compressed} |
(1 row)

gin_leafpage_items(page bytea) returns setof record

gin_leafpage_items returns information about the data stored in a GIN leaf page. For example:

test=# SELECT first_tid, nbytes, tids[0:5] as some_tids FROM gin_leafpage_items(get_raw_page('gin_test_idx', 2));
-+-----------------+-----------------+---------------------------------+
| first_tid | nbytes | some_tids             |
|-----------+--------+-----------------------|
| (8,41)   | 244    | {"(8,41)","(8,43)","(8,44)","(8,45)","(8,46)"} |
| (10,45)  | 248    | {"(10,45)","(10,46)","(10,47)","(10,48)","(10,49)"} |
| (12,52)  | 248    | {"(12,52)","(12,53)","(12,54)","(12,55)","(12,56)"} |
| (14,59)  | 320    | {"(14,59)","(14,60)","(14,61)","(14,62)","(14,63)"} |
| (167,16) | 376    | {"(167,16)","(167,17)","(167,18)","(167,19)","(167,20)"} |
| (170,30) | 376    | {"(170,30)","(170,31)","(170,32)","(170,33)","(170,34)"} |
| (173,44) | 197    | {"(173,44)","(173,45)","(173,46)","(173,47)","(173,48)"} |
(7 rows)
fsm_page_contents(page bytea) returns text

fsm_page_contents shows the internal node structure of a FSM page. The output is a multiline string, with one line per node in the binary tree within the page. Only those nodes that are not zero are printed. The so-called "next" pointer, which points to the next slot to be returned from the page, is also printed.

See src/backend/storage/freespace/README for more information on the structure of an FSM page.

F.23. passwordcheck

The passwordcheck module checks users’ passwords whenever they are set with CREATE ROLE or ALTER ROLE. If a password is considered too weak, it will be rejected and the command will terminate with an error.

To enable this module, add `$libdir/passwordcheck` to shared_preload_libraries in postgresql.conf, then restart the server.

You can adapt this module to your needs by changing the source code. For example, you can use CrackLib\(^3\) to check passwords — this only requires uncommenting two lines in the Makefile and rebuilding the module. (We cannot include CrackLib by default for license reasons.) Without CrackLib, the module enforces a few simple rules for password strength, which you can modify or extend as you see fit.

Caution

To prevent unencrypted passwords from being sent across the network, written to the server log or otherwise stolen by a database administrator, PostgreSQL allows the user to supply pre-encrypted passwords. Many client programs make use of this functionality and encrypt the password before sending it to the server.

This limits the usefulness of the passwordcheck module, because in that case it can only try to guess the password. For this reason, passwordcheck is not recommended if your security requirements are high. It is more secure to use an external authentication method such as GSSAPI (see Chapter 20) than to rely on passwords within the database.

Alternatively, you could modify passwordcheck to reject pre-encrypted passwords, but forcing users to set their passwords in clear text carries its own security risks.

F.24. pg_buffercache

The pg_buffercache module provides a means for examining what’s happening in the shared buffer cache in real time.

The module provides a C function pg_buffercache_pages that returns a set of records, plus a view pg_buffercache that wraps the function for convenient use.

---
\(^3\) [http://sourceforge.net/projects/cracklib/](http://sourceforge.net/projects/cracklib/)
By default public access is revoked from both of these, just in case there are security issues lurking.

F.24.1. The \texttt{pg\_buffercache} View

The definitions of the columns exposed by the view are shown in Table F-16.

Table F-16. \texttt{pg\_buffercache} Columns

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>References</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bufferid</td>
<td>integer</td>
<td></td>
<td>ID, in the range \texttt{1..shared_buffers}</td>
</tr>
<tr>
<td>relfilenode</td>
<td>oid</td>
<td>\texttt{pg_class.relfilenode}</td>
<td>Filenode number of the relation</td>
</tr>
<tr>
<td>reltablespace</td>
<td>oid</td>
<td>\texttt{pg_tablespace.oid}</td>
<td>Tablespace OID of the relation</td>
</tr>
<tr>
<td>reldatabase</td>
<td>oid</td>
<td>\texttt{pg_database.oid}</td>
<td>Database OID of the relation</td>
</tr>
<tr>
<td>relforknumber</td>
<td>smallint</td>
<td></td>
<td>Fork number within the relation; see \texttt{include/common/relpath.h}</td>
</tr>
<tr>
<td>relblocknumber</td>
<td>bigint</td>
<td></td>
<td>Page number within the relation</td>
</tr>
<tr>
<td>isdirty</td>
<td>boolean</td>
<td></td>
<td>Is the page dirty?</td>

<td>smallint</td>
<td></td>
<td>Clock-sweep access count</td>
</tr>
<tr>
<td>pinning_backends</td>
<td>integer</td>
<td></td>
<td>Number of backends pinning this buffer</td>
</tr>
</tbody>
</table>

There is one row for each buffer in the shared cache. Unused buffers are shown with all fields null except bufferid. Shared system catalogs are shown as belonging to database zero.

Because the cache is shared by all the databases, there will normally be pages from relations not belonging to the current database. This means that there may not be matching join rows in \texttt{pg\_class} for some rows, or that there could even be incorrect joins. If you are trying to join against \texttt{pg\_class}, it’s a good idea to restrict the join to rows having reldatabase equal to the current database’s OID or zero.

When the \texttt{pg\_buffercache} view is accessed, internal buffer manager locks are taken for long enough to copy all the buffer state data that the view will display. This ensures that the view produces a consistent set of results, while not blocking normal buffer activity longer than necessary. Nonetheless there could be some impact on database performance if this view is read often.

F.24.2. Sample Output

\[
\text{regression=# SELECT c.relname, count(\ast) AS buffers}
\text{ FROM pg\_buffercache b INNER JOIN pg\_class c}
\]
Appendix F. Additional Supplied Modules

ON b.relfilenode = pg_relation_filenode(c.oid) AND b.reldatabase IN (0, (SELECT oid FROM pg_database WHERE datname = current_database()))
GROUP BY c.relname
ORDER BY 2 DESC
LIMIT 10;

Design suggestions: Neil Conway <neilc@samurai.com>
Debugging advice: Tom Lane <tgl@sss.pgh.pa.us>

F.25. pgcrypto

The pgcrypto module provides cryptographic functions for PostgreSQL.

F.25.1. General Hashing Functions

F.25.1.1. digest()

digest(data text, type text) returns bytea
digest(data bytea, type text) returns bytea

Computes a binary hash of the given data. type is the algorithm to use. Standard algorithms are md5, sha1, sha224, sha256, sha384 and sha512. If pgcrypto was built with OpenSSL, more algorithms are available, as detailed in Table F-20.

If you want the digest as a hexadecimal string, use encode() on the result. For example:

CREATE OR REPLACE FUNCTION sha1(bytea) returns text AS $$
SELECT encode(digest($1, 'sha1'), 'hex')
$$ LANGUAGE SQL STRICT IMMUTABLE;

F.25.1.2. hmac()

hmac(data text, key text, type text) returns bytea
hmac(data bytea, key bytea, type text) returns bytea

Calculates hashed MAC for data with key key. type is the same as in digest().
This is similar to digest() but the hash can only be recalculated knowing the key. This prevents the scenario of someone altering data and also changing the hash to match. If the key is larger than the hash block size it will first be hashed and the result will be used as key.

F.25.2. Password Hashing Functions

The functions crypt() and gen_salt() are specifically designed for hashing passwords. crypt() does the hashing and gen_salt() prepares algorithm parameters for it.
The algorithms in crypt() differ from the usual MD5 or SHA1 hashing algorithms in the following respects:

1. They are slow. As the amount of data is so small, this is the only way to make brute-forcing passwords hard.
2. They use a random value, called the salt, so that users having the same password will have different encrypted passwords. This is also an additional defense against reversing the algorithm.
3. They include the algorithm type in the result, so passwords hashed with different algorithms can co-exist.
4. Some of them are adaptive — that means when computers get faster, you can tune the algorithm to be slower, without introducing incompatibility with existing passwords.
Table F-17 lists the algorithms supported by the crypt() function.

Table F-17. Supported Algorithms for crypt()

<table>
<thead>
<tr>
<th>Algorithm</th>

</tr>
</tbody>
</table>
of 4 hashes per second on the hardware of that time. Slower than 4 hashes per second would probably dampen usability. Faster than 100 hashes per second is probably too fast.

Table F-19 gives an overview of the relative slowness of different hashing algorithms. The table shows how much time it would take to try all combinations of characters in an 8-character password, assuming that the password contains either only lower case letters, or upper- and lower-case letters and numbers. In the crypt-bf entries, the number after a slash is the iter_count parameter of gen_salt.

</tbody>
</table>

Notes:

- The machine used is an Intel Mobile Core i3.
- crypt-des and crypt-md5 algorithm numbers are taken from John the Ripper v1.6.38 -test output.
- md5 hash numbers are from mdcrack 1.2.
- sha1 numbers are from lcrack-20031130-beta.
- crypt-bf numbers are taken using a simple program that loops over 1000 8-character passwords. That way I can show the speed with different numbers of iterations. For reference: john -test shows 13506 loops/sec for crypt-bf/5. (The very small difference in results is in accordance with the fact that the crypt-bf implementation in pgcrypto is the same one used in John the Ripper.)

Note that “try all combinations” is not a realistic exercise. Usually password cracking is done with the help of dictionaries, which contain both regular words and various mutations of them. So, even somewhat word-like passwords could be cracked much faster than the above numbers suggest, while a 6-character non-word-like password may escape cracking. Or not.

F.25.3. PGP Encryption Functions

The functions here implement the encryption part of the OpenPGP (RFC 4880) standard. Supported are both symmetric-key and public-key encryption.

An encrypted PGP message consists of 2 parts, or packets:
Appendix F. Additional Supplied Modules

- Packet containing a session key — either symmetric-key or public-key encrypted.
- Packet containing data encrypted with the session key.

When encrypting with a symmetric key (i.e., a password):

1. The given password is hashed using a String2Key (S2K) algorithm. This is rather similar to crypt() algorithms — purposefully slow and with random salt — but it produces a full-length binary key.
2. If a separate session key is requested, a new random key will be generated. Otherwise the S2K key will be used directly as the session key.
3. If the S2K key is to be used directly, then only S2K settings will be put into the session key packet. Otherwise the session key will be encrypted with the S2K key and put into the session key packet.

When encrypting with a public key:

1. A new random session key is generated.
2. It is encrypted using the public key and put into the session key packet.

In either case the data to be encrypted is processed as follows:

1. Optional data-manipulation: compression, conversion to UTF-8, and/or conversion of line-endings.
2. The data is prefixed with a block of random bytes. This is equivalent to using a random IV.
3. An SHA1 hash of the random prefix and data is appended.
4. All this is encrypted with the session key and placed in the data packet.

F.25.3.1. pgp_sym_encrypt ()

pgp_sym_encrypt(data text, psw text [, options text ]) returns bytea
pgp_sym_encrypt_bytea(data bytea, psw text [, options text ]) returns bytea

Encrypt data with a symmetric PGP key psw. The options parameter can contain option settings, as described below.

F.25.3.2. pgp_sym_decrypt ()

pgp_sym_decrypt(msg bytea, psw text [, options text ]) returns text
pgp_sym_decrypt_bytea(msg bytea, psw text [, options text ]) returns bytea

Decrypt a symmetric-key-encrypted PGP message.

Decrypting bytea data with pgp_symDecrypt is disallowed. This is to avoid outputting invalid character data. Decrypting originally textual data with pgp_sym_decrypt_bytea is fine.

The options parameter can contain option settings, as described below.
F.25.3.3. pgp_pub_encrypt()

pgp_pub_encrypt(data text, key bytea [, options text ]) returns bytea
pgp_pub_encrypt_bytea(data bytea, key bytea [, options text ]) returns bytea

Encrypt data with a public PGP key key. Giving this function a secret key will produce an error. The options parameter can contain option settings, as described below.

F.25.3.4. pgp_pub_decrypt()

pgp_pub_decrypt(msg bytea, key bytea [, psw text [, options text ]]) returns text
pgp_pub_decrypt_bytea(msg bytea, key bytea [, psw text [, options text ]]) returns bytea

Decrypt a public-key-encrypted message. key must be the secret key corresponding to the public key that was used to encrypt. If the secret key is password-protected, you must give the password in psw. If there is no password, but you want to specify options, you need to give an empty password.

Decrypting bytea data with pgp_pub_decrypt is disallowed. This is to avoid outputting invalid character data. Decrypting originally textual data with pgp_pub_decrypt_bytea is fine.

The options parameter can contain option settings, as described below.

F.25.3.5. pgp_key_id()

pgp_key_id(bytea) returns text

pgp_key_id extracts the key ID of a PGP public or secret key. Or it gives the key ID that was used for encrypting the data, if given an encrypted message.

It can return 2 special key IDs:

• SYMKEY
  The message is encrypted with a symmetric key.

• ANYKEY
  The message is public-key encrypted, but the key ID has been removed. That means you will need to try all your secret keys on it to see which one decrypts it. pgcrypto itself does not produce such messages.

Note that different keys may have the same ID. This is rare but a normal event. The client application should then try to decrypt with each one, to see which fits — like handling ANYKEY.

F.25.3.6. armor(), dearmor()

armor(data bytea [, , keys text[], values text[] ]) returns text
dearmor(data text) returns bytea

These functions wrap/unwrap binary data into PGP ASCII-armor format, which is basically Base64 with CRC and additional formatting.
If the keys and values arrays are specified, an armor header is added to the armored format for each key/value pair. Both arrays must be single-dimensional, and they must be of the same length. The keys and values cannot contain any non-ASCII characters.

**F.25.3.7. pgp_armor_headers**

pgp_armor_headers(data text, key out text, value out text) returns setof record

pgp_armor_headers() extracts the armor headers from data. The return value is a set of rows with two columns, key and value. If the keys or values contain any non-ASCII characters, they are treated as UTF-8.

**F.25.3.8. Options for PGP Functions**

Options are named to be similar to GnuPG. An option’s value should be given after an equal sign; separate options from each other with commas. For example:

    pgp_sym_encrypt(data, psw, 'compress-algo=1, cipher-algo=aes256')

All of the options except convert-crlf apply only to encrypt functions. Decrypt functions get the parameters from the PGP data.

The most interesting options are probably compress-algo and unicode-mode. The rest should have reasonable defaults.

**F.25.3.8.1. cipher-algo**

Which cipher algorithm to use.

Values: bf, aes128, aes192, aes256 (OpenSSL-only: 3des, cast5)
Default: aes128
Applies to: pgp_sym_encrypt, pgp_pub_encrypt

**F.25.3.8.2. compress-algo**

Which compression algorithm to use. Only available if PostgreSQL was built with zlib.

Values:
- 0 - no compression
- 1 - ZIP compression
- 2 - ZLIB compression (= ZIP plus meta-data and block CRCs)
Default: 0
Applies to: pgp_sym_encrypt, pgp_pub_encrypt
Appendix F. Additional Supplied Modules

F.25.3.8.3. compress-level
How much to compress. Higher levels compress smaller but are slower. 0 disables compression.

Values: 0, 1-9
Default: 6
 Applies to: pgp_sym_encrypt, pgp_pub_encrypt

F.25.3.8.4. convert-crlf
Whether to convert \n into \n when encrypting and \n to \n when decrypting. RFC 4880 specifies that text data should be stored using \n line-feeds. Use this to get fully RFC-compliant behavior.

Values: 0, 1
Default: 0
 Applies to: pgp_sym_encrypt, pgp_pub_encrypt, pgp_sym_decrypt, pgp_pub_decrypt

F.25.3.8.5. disable-mdc
Do not protect data with SHA-1. The only good reason to use this option is to achieve compatibility with ancient PGP products, predating the addition of SHA-1 protected packets to RFC 4880. Recent gnupg.org and pgp.com software supports it fine.

Values: 0, 1
Default: 0
 Applies to: pgp_sym_encrypt, pgp_pub_encrypt

F.25.3.8.6. sess-key
Use separate session key. Public-key encryption always uses a separate session key; this option is for symmetric-key encryption, which by default uses the S2K key directly.

Values: 0, 1
Default: 0
 Applies to: pgp_sym_encrypt

F.25.3.8.7. s2k-mode
Which S2K algorithm to use.

Values:
  0 - Without salt. Dangerous!
  1 - With salt but with fixed iteration count.
  3 - Variable iteration count.
Default: 3
 Applies to: pgp_sym_encrypt
F.25.3.8.8. s2k-count
The number of iterations of the S2K algorithm to use. It must be a value between 1024 and 65011712, inclusive.

Default: A random value between 65536 and 253952
Applies to: pgp_sym_encrypt, only with s2k-mode=3

F.25.3.8.9. s2k-digest-algo
Which digest algorithm to use in S2K calculation.
Values: md5, sha1
Default: sha1
Applies to: pgp_sym_encrypt

F.25.3.8.10. s2k-cipher-algo
Which cipher to use for encrypting separate session key.
Values: bf, aes, aes128, aes192, aes256
Default: use cipher-algo
Applies to: pgp_sym_encrypt

F.25.3.8.11. unicode-mode
Whether to convert textual data from database internal encoding to UTF-8 and back. If your database already is UTF-8, no conversion will be done, but the message will be tagged as UTF-8. Without this option it will not be.
Values: 0, 1
Default: 0
Applies to: pgp_sym_encrypt, pgp_pub_encrypt

F.25.3.9. Generating PGP Keys with GnuPG
To generate a new key:

```
gpg --gen-key
```

The preferred key type is “DSA and Elgamal”.
For RSA encryption you must create either DSA or RSA sign-only key as master and then add an RSA encryption subkey with `gpg --edit-key`.

To list keys:
gpg --list-secret-keys

To export a public key in ASCII-armor format:

gpg -a --export KEYID > public.key

To export a secret key in ASCII-armor format:

gpg -a --export-secret-keys KEYID > secret.key

You need to use dearmor() on these keys before giving them to the PGP functions. Or if you can handle binary data, you can drop -a from the command.

F.25.3.10. Limitations of PGP Code

• No support for signing. That also means that it is not checked whether the encryption subkey belongs to the master key.
• No support for encryption key as master key. As such practice is generally discouraged, this should not be a problem.
• No support for several subkeys. This may seem like a problem, as this is common practice. On the other hand, you should not use your regular GPG/PGP keys with pgcrypto, but create new ones, as the usage scenario is rather different.

F.25.4. Raw Encryption Functions

These functions only run a cipher over data; they don’t have any advanced features of PGP encryption. Therefore they have some major problems:

1. They use user key directly as cipher key.
2. They don’t provide any integrity checking, to see if the encrypted data was modified.
3. They expect that users manage all encryption parameters themselves, even IV.
4. They don’t handle text.

So, with the introduction of PGP encryption, usage of raw encryption functions is discouraged.

encrypt(data bytea, key bytea, type text) returns bytea
decrypt(data bytea, key bytea, type text) returns bytea

Encrypt/decrypt data using the cipher method specified by type. The syntax of the type string is:

`algorithm [ - mode ] [ /pad: padding ]`

where `algorithm` is one of:

- `bf` — Blowfish
- `aes` — AES (Rijndael-128, -192 or -256)

and `mode` is one of:

- `cbc` — next block depends on previous (default)
- `ecb` — each block is encrypted separately (for testing only)

and `padding` is one of:

- `pkcs` — data may be any length (default)
- `none` — data must be multiple of cipher block size

So, for example, these are equivalent:

- `encrypt(data, 'fooz', 'bf')`
- `encrypt(data, 'fooz', 'bf-cbc/pad:pkcs')`

In `encrypt_iv` and `decrypt_iv`, the `iv` parameter is the initial value for the CBC mode; it is ignored for ECB. It is clipped or padded with zeroes if not exactly block size. It defaults to all zeroes in the functions without this parameter.

### F.25.5. Random-Data Functions

`gen_random_bytes(count integer) returns bytea`

Returns `count` cryptographically strong random bytes. At most 1024 bytes can be extracted at a time. This is to avoid draining the randomness generator pool.

`gen_random_uuid() returns uuid`

Returns a version 4 (random) UUID.
F.25.6. Notes

F.25.6.1. Configuration

`pgcrypto` configures itself according to the findings of the main PostgreSQL `configure` script. The options that affect it are `--with-zlib` and `--with-openssl`.

When compiled with zlib, PGP encryption functions are able to compress data before encrypting.

When compiled with OpenSSL, there will be more algorithms available. Also public-key encryption functions will be faster as OpenSSL has more optimized BIGNUM functions.

Table F-20. Summary of Functionality with and without OpenSSL

<table>
<thead>
<tr>
<th>Functionality</th>
<th>Built-in</th>
<th>With OpenSSL</th>
</tr>
</thead>
<tbody>
<tr>
<td>MD5</td>
<td>yes</td>
<td>yes</td>

<td>yes</td>
</tr>
</tbody>
</table>

Notes:

1. SHA2 algorithms were added to OpenSSL in version 0.9.8. For older versions, `pgcrypto` will use built-in code.
2. Any digest algorithm OpenSSL supports is automatically picked up. This is not possible with ciphers, which need to be supported explicitly.
3. AES is included in OpenSSL since version 0.9.7. For older versions, `pgcrypto` will use built-in code.

F.25.6.2. NULL Handling

As is standard in SQL, all functions return NULL, if any of the arguments are NULL. This may create security risks on careless usage.

F.25.6.3. Security Limitations

All `pgcrypto` functions run inside the database server. That means that all the data and passwords move between `pgcrypto` and client applications in clear text. Thus you must:
1. Connect locally or use SSL connections.
2. Trust both system and database administrator.
If you cannot, then better do crypto inside client application.
The implementation does not resist side-channel attacks\(^5\). For example, the time required for a \texttt{pgcrypto}
decryption function to complete varies among ciphertexts of a given size.

### F.25.6.4. Useful Reading

  The GNU Privacy Handbook.
  Describes the crypt-blowfish algorithm.
  How to choose a good password.
  Interesting idea for picking passwords.

F.26. pg_freespacemap

The pg_freespacemap module provides a means for examining the free space map (FSM). It provides a function called pg_freespace, or two overloaded functions, to be precise. The functions show the value recorded in the free space map for a given page, or for all pages in the relation.

By default public access is revoked from the functions, just in case there are security issues lurking.

F.26.1. Functions

pg_freespace(rel regclass IN, blkno bigint IN) returns int2

Returns the amount of free space on the page of the relation, specified by blkno, according to the FSM.

pg_freespace(rel regclass IN, blkno OUT bigint, avail OUT int2)

Displays the amount of free space on each page of the relation, according to the FSM. A set of (blkno bigint, avail int2) tuples is returned, one tuple for each page in the relation.

The values stored in the free space map are not exact. They’re rounded to precision of 1/256th of BLCKSZ (32 bytes with default BLCKSZ), and they’re not kept fully up-to-date as tuples are inserted and updated.

For indexes, what is tracked is entirely-unused pages, rather than free space within pages. Therefore, the values are not meaningful, just whether a page is full or empty.

Note: The interface was changed in version 8.4, to reflect the new FSM implementation introduced in the same version.
### F.26.2. Sample Output

```sql
postgres=# SELECT * FROM pg_freespace('foo');
blkno | avail
-------+-------
0     | 0

```

### F.26.3. Author

Original version by Mark Kirkwood &lt;markir@paradise.net.nz&gt;. Rewritten in version 8.4 to suit new FSM implementation by Heikki Linnakangas &lt;heikki@enterprisedb.com&gt;

### F.27. pg_prewarm

The **pg_prewarm** module provides a convenient way to load relation data into either the operating system buffer cache or the PostgreSQL buffer cache.
**F.27.1. Functions**

```sql
pg_prewarm(regclass, mode text default 'buffer', fork text default 'main',
  first_block int8 default null,
  last_block int8 default null) RETURNS int8
```

The first argument is the relation to be prewarmed. The second argument is the prewarming method to be used, as further discussed below; the third is the relation fork to be prewarmed, usually `main`. The fourth argument is the first block number to prewarm (`NULL` is accepted as a synonym for zero). The fifth argument is the last block number to prewarm (`NULL` means prewarm through the last block in the relation). The return value is the number of blocks prewarmed.

There are three available prewarming methods. `prefetch` issues asynchronous prefetch requests to the operating system, if this is supported, or throws an error otherwise. `read` reads the requested range of blocks; unlike `prefetch`, this is synchronous and supported on all platforms and builds, but may be slower. `buffer` reads the requested range of blocks into the database buffer cache.

Note that with any of these methods, attempting to prewarm more blocks than can be cached — by the OS when using `prefetch` or `read`, or by PostgreSQL when using `buffer` — will likely result in lower-numbered blocks being evicted as higher numbered blocks are read in. Prewarmed data also enjoys no special protection from cache evictions, so it is possible that other system activity may evict the newly prewarmed blocks shortly after they are read; conversely, prewarming may also evict other data from cache. For these reasons, prewarming is typically most useful at startup, when caches are largely empty.

**F.27.2. Author**

Robert Haas <rhaas@postgresql.org>

**F.28. pgrowlocks**

The `pgrowlocks` module provides a function to show row locking information for a specified table.

**F.28.1. Overview**

```sql
pgrowlocks(text) returns setof record
```

The parameter is the name of a table. The result is a set of records, with one row for each locked row within the table. The output columns are shown in Table F-21.

**Table F-21. pgrowlocks Output Columns**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>locked_row</td>
<td>tid</td>
<td>Tuple ID (TID) of locked row</td>
</tr>
<tr>
<td>locker</td>
<td>xid</td>
<td>Transaction ID of locker, or multixact ID if multitransaction</td>
</tr>
</tbody>
</table>
Appendix F. Additional Supplied Modules

<td>Process IDs of locking backends (more than one if multitransaction)</td>
</tr>
</tbody>
</table>
F.29. \texttt{pg\_stat\_statements}

The \texttt{pg\_stat\_statements} module provides a means for tracking execution statistics of all SQL statements executed by a server.

The module must be loaded by adding \texttt{pg\_stat\_statements} to \texttt{shared\_preload\_libraries} in \texttt{postgresql.conf}, because it requires additional shared memory. This means that a server restart is needed to add or remove the module.

When \texttt{pg\_stat\_statements} is loaded, it tracks statistics across all databases of the server. To access and manipulate these statistics, the module provides a view, \texttt{pg\_stat\_statements}, and the utility functions \texttt{pg\_stat\_statements\_reset} and \texttt{pg\_stat\_statements}. These are not available globally but can be enabled for a specific database with \texttt{CREATE EXTENSION pg\_stat\_statements}.

F.29.1. The \texttt{pg\_stat\_statements} View

The statistics gathered by the module are made available via a view named \texttt{pg\_stat\_statements}. This view contains one row for each distinct database ID, user ID and query ID (up to the maximum number of distinct statements that the module can track). The columns of the view are shown in Table F-22.

Table F-22. \texttt{pg\_stat\_statements} Columns

</table>

For security reasons, non-superusers are not allowed to see the SQL text or queryid of queries executed by other users. They can see the statistics, however, if the view has been installed in their database.

Plannable queries (that is, SELECT, INSERT, UPDATE, and DELETE) are combined into a single pg_stat_statements entry whenever they have identical query structures according to an internal hash calculation. Typically, two queries will be considered the same for this purpose if they are semantically equivalent except for the values of literal constants appearing in the query. Utility commands (that is, all other commands) are compared strictly on the basis of their textual query strings, however.

When a constant’s value has been ignored for purposes of matching the query to other queries, the constant is replaced by ? in the pg_stat_statements display. The rest of the query text is that of the first query that had the particular queryid hash value associated with the pg_stat_statements entry.

In some cases, queries with visibly different texts might get merged into a single pg_stat_statements entry. Normally this will happen only for semantically equivalent queries, but there is a small chance of hash collisions causing unrelated queries to be merged into one entry. (This cannot happen for queries belonging to different users or databases, however.)

Since the queryid hash value is computed on the post-parse-analysis representation of the queries, the opposite is also possible: queries with identical texts might appear as separate entries, if they have different meanings as a result of factors such as different search_path settings.

Consumers of pg_stat_statements may wish to use queryid (perhaps in combination with dbid and userid) as a more stable and reliable identifier for each entry than its query text. However, it is important to understand that there are only limited guarantees around the stability of the queryid hash value. Since the identifier is derived from the post-parse-analysis tree, its value is a function of, among other things, the internal object identifiers appearing in this representation. This has some counterintuitive implications. For example, pg_stat_statements will consider two apparently-identical queries to be distinct, if they reference a table that was dropped and recreated between the executions of the two queries. The hashing process is also sensitive to differences in machine architecture and other facets of the platform. Furthermore, it is not safe to assume that queryid will be stable across major versions of PostgreSQL.

As a rule of thumb, queryid values can be assumed to be stable and comparable only so long as the underlying server version and catalog metadata details stay exactly the same. Two servers participating in replication based on physical WAL replay can be expected to have identical queryid values for the same query. However, logical replication schemes do not promise to keep replicas identical in all relevant
Appendix F. Additional Supplied Modules

details, so queryid will not be a useful identifier for accumulating costs across a set of logical replicas. If in doubt, direct testing is recommended.

The representative query texts are kept in an external disk file, and do not consume shared memory. Therefore, even very lengthy query texts can be stored successfully. However, if many long query texts are accumulated, the external file might grow unmanageably large. As a recovery method if that happens, pg_stat_statements may choose to discard the query texts, whereupon all existing entries in the pg_stat_statements view will show null query fields, though the statistics associated with each queryid are preserved. If this happens, consider reducing pg_stat_statements.max to prevent recurrences.

F.29.2. Functions

pg_stat_statements_reset() returns void

pg_stat_statements_reset discards all statistics gathered so far by pg_stat_statements. By default, this function can only be executed by superusers.

pg_stat_statements(showtext boolean) returns setof record

The pg_stat_statements view is defined in terms of a function also named pg_stat_statements. It is possible for clients to call the pg_stat_statements function directly, and by specifying showtext := false have query text be omitted (that is, the OUT argument that corresponds to the view's query column will return nulls). This feature is intended to support external tools that might wish to avoid the overhead of repeatedly retrieving query texts of indeterminate length. Such tools can instead cache the first query text observed for each entry themselves, since that is all pg_stat_statements itself does, and then retrieve query texts only as needed. Since the server stores query texts in a file, this approach may reduce physical I/O for repeated examination of the pg_stat_statements data.

F.29.3. Configuration Parameters

pg_stat_statements.max(integer)

pg_stat_statements.max is the maximum number of statements tracked by the module (i.e., the maximum number of rows in the pg_stat_statements view). If more distinct statements than that are observed, information about the least-executed statements is discarded. The default value is 5000. This parameter can only be set at server start.

pg_stat_statements.track (enum)

pg_stat_statements.track controls which statements are counted by the module. Specify top to track top-level statements (those issued directly by clients), all to also track nested statements (such as statements invoked within functions), or none to disable statement statistics collection. The default value is top. Only superusers can change this setting.

pg_stat_statements.track_utility (boolean)

pg_stat_statements.track_utility controls whether utility commands are tracked by the module. Utility commands are all those other than SELECT, INSERT, UPDATE and DELETE. The
pg_stat_statements.save (boolean)

pg_stat_statements.save specifies whether to save statement statistics across server shutdowns. If it is off then statistics are not saved at shutdown nor reloaded at server start. The default value is on. This parameter can only be set in the postgresql.conf file or on the server command line.

The module requires additional shared memory proportional to pg_stat_statements.max. Note that this memory is consumed whenever the module is loaded, even if pg_stat_statements.track is set to none.

These parameters must be set in postgresql.conf. Typical usage might be:

```
# postgresql.conf
shared_preload_libraries = 'pg_stat_statements'
pg_stat_statements.max = 10000
pg_stat_statements.track = all
```

**F.29.4. Sample Output**

```
bench=# SELECT pg_stat_statements_reset();

$ pgbench -i bench
$ pgbench -c10 -t300 bench

bench=# \x
bench=# SELECT query, calls, total_time, rows, 100.0 * shared_blks_hit / nullif(shared_blks_hit + shared_blks_read, 0) AS hit_percent
FROM pg_stat_statements ORDER BY total_time DESC LIMIT 5;

- [ RECORD 1 ]---------------------------------------------------------------------
query | UPDATE pgbench_branches SET bbalance = bbalance + ? WHERE bid = ?;  
calls | 3000
total_time | 9609.00100000002
rows | 2836
hit_percent | 99.9778970000200936
- [ RECORD 2 ]---------------------------------------------------------------------
query | UPDATE pgbench_tellers SET tbalance = tbalance + ? WHERE tid = ?;  
calls | 3000
total_time | 8015.156
rows | 2990
hit_percent | 99.9731126579631345
- [ RECORD 3 ]---------------------------------------------------------------------
query | copy pgbench_accounts from stdin  
calls | 1
total_time | 310.624
rows | 100000
hit_percent | 0.30395136778115501520
- [ RECORD 4 ]---------------------------------------------------------------------
```

3437
F.29.5. Authors

Takahiro Itagaki <itagaki.takahiro@oss.ntt.co.jp>. Query normalization added by Peter Geoghegan <peter@2ndquadrant.com>.

F.30. pgstattuple

The `pgstattuple` module provides various functions to obtain tuple-level statistics.

F.30.1. Functions

`pgstattuple(regclass) returns record`

`pgstattuple` returns a relation’s physical length, percentage of “dead” tuples, and other info. This may help users to determine whether vacuum is necessary or not. The argument is the target relation’s name (optionally schema-qualified) or OID. For example:

```
test=> SELECT * FROM pgstattuple('pg_catalog.pg_proc');
-\[ RECORD 1 \]-------
table_len    | 458752
tuple_count | 1470
tuple_len    | 438896
tuple_percent | 95.67
dead_tuple_count | 11
dead_tuple_len    | 3157
dead_tuple_percent | 0.69
free_space    | 8932
free_percent  | 1.95
```

The output columns are described in Table F-23.
Appendix F. Additional Supplied Modules

### Table F-23. pgstattuple Output Columns

<table>
<thead>
<tr>
<th>Column</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_len</td>
<td>bigint</td>
<td>Physical relation length in bytes</td>
</tr>
<tr>
<td>tuple_count</td>
<td>bigint</td>
<td>Number of live tuples</td>
</tr>
<tr>
<td>tuple_len</td>
<td>bigint</td>
<td>Total length of live tuples in bytes</td>
</tr>
<tr>
<td>tuple_percent</td>
<td>float8</td>
<td>Percentage of live tuples</td>
</tr>
<tr>
<td>dead_tuple_count</td>
<td>bigint</td>
<td>Number of dead tuples</td>
</tr>
<tr>
<td>dead_tuple_len</td>
<td>bigint</td>
<td>Total length of dead tuples in bytes</td>
</tr>
<tr>
<td>dead_tuple_percent</td>
<td>float8</td>
<td>Percentage of dead tuples</td>
</tr>
<tr>
<td>free_space</td>
<td>bigint</td>
<td>Total free space in bytes</td>
</tr>
<tr>
<td>free_percent</td>
<td>float8</td>
<td>Percentage of free space</td>
</tr>
</tbody>
</table>

**Note:** The `table_len` will always be greater than the sum of the `tuple_len`, `dead_tuple_len` and `free_space`. The difference is accounted for by fixed page overhead, the per-page table of pointers to tuples, and padding to ensure that tuples are correctly aligned.

`pgstattuple` acquires only a read lock on the relation. So the results do not reflect an instantaneous snapshot; concurrent updates will affect them.

`pgstattuple` judges a tuple is “dead” if `HeapTupleSatisfiesDirty` returns false.

`pgstattuple(text)` returns record

This is the same as `pgstattuple(regclass)`, except that the target relation is specified as TEXT. This function is kept because of backward-compatibility so far, and will be deprecated in some future release.

`pgstatindex(regclass)` returns record

`pgstatindex` returns a record showing information about a B-tree index. For example:

```sql
test=> SELECT * FROM pgstatindex('pg_cast_oid_index');
- [ RECORD 1 ]----------
  version | 2
  tree_level | 0
  index_size | 16384
  root_block_no | 1
  internal_pages | 0
  leaf_pages | 1
  empty_pages | 0
  deleted_pages | 0
  avg_leaf_density | 54.27
  leaf_fragmentation | 0
```

The output columns are:
### Appendix F. Additional Supplied Modules

<table>
<thead>
<tr>
<th>Column</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>version</td>
<td>integer</td>
<td>B-tree version number</td>
</tr>
<tr>
<td>tree_level</td>
<td>integer</td>
<td>Tree level of the root page</td>
</tr>
<tr>
<td>index_size</td>
<td>bigint</td>
<td>Total index size in bytes</td>
</tr>
<tr>
<td>root_block_no</td>
<td>bigint</td>
<td>Location of root page (zero if none)</td>
</tr>
<tr>
<td>internal_pages</td>
<td>bigint</td>
<td>Number of “internal” (upper-level) pages</td>
</tr>
<tr>
<td>leaf_pages</td>
<td>bigint</td>
<td>Number of leaf pages</td>
</tr>
<tr>
<td>empty_pages</td>
<td>bigint</td>
<td>Number of empty pages</td>
</tr>
<tr>
<td>deleted_pages</td>
<td>bigint</td>
<td>Number of deleted pages</td>
</tr>
<tr>
<td>avg_leaf_density</td>
<td>float8</td>
<td>Average density of leaf pages</td>
</tr>
<tr>
<td>leaf_fragmentation</td>
<td>float8</td>
<td>Leaf page fragmentation</td>
</tr>
</tbody>
</table>

The reported `index_size` will normally correspond to one more page than is accounted for by `internal_pages + leaf_pages + empty_pages + deleted_pages`, because it also includes the index’s metapage.

As with `pgstattuple`, the results are accumulated page-by-page, and should not be expected to represent an instantaneous snapshot of the whole index.

**pgstatindex(text)** returns record

This is the same as `pgstatindex(regclass)`, except that the target index is specified as TEXT. This function is kept because of backward-compatibility so far, and will be deprecated in some future release.

**pgstatginindex(regclass)** returns record

`pgstatginindex` returns a record showing information about a GIN index. For example:

```sql
test=> SELECT * FROM pgstatginindex('test_gin_index');
-[ RECORD 1 ]-----------------------------------------------
 version | 1
 pending_pages | 0
 pending_tuples | 0
```

The output columns are:

<table>
<thead>
<tr>
<th>Column</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>version</td>
<td>integer</td>
<td>GIN version number</td>
</tr>
<tr>
<td>pending_pages</td>
<td>integer</td>
<td>Number of pages in the pending list</td>
</tr>
<tr>
<td>pending_tuples</td>
<td>bigint</td>
<td>Number of tuples in the pending list</td>
</tr>
</tbody>
</table>
Appendix F. Additional Supplied Modules

pg_relpages(regclass) returns bigint

pg_relpages returns the number of pages in the relation.

pg_relpages(text) returns bigint

This is the same as pg_relpages(regclass), except that the target relation is specified as TEXT. This function is kept because of backward-compatibility so far, and will be deprecated in some future release.

pgstattuple_approx(regclass) returns record

pgstattuple_approx is a faster alternative to pgstattuple that returns approximate results. The argument is the target relation’s name or OID. For example:

test=> SELECT * FROM pgstattuple_approx('pg_catalog.pg_proc'::regclass);

- [ RECORD 1 ]----------
  | table_len | 573440 |
  | scanned_percent | 2 |
  | approx_tuple_count | 2740 |
  | approx_tuple_len | 561210 |
  | approx_tuple_percent | 97.87 |
  | dead_tuple_count | 0 |
  | dead_tuple_len | 0 |
  | dead_tuple_percent | 0 |
  | approx_free_space | 11996 |
  | approx_free_percent | 2.09 |

The output columns are described in Table F-24.

Whereas pgstattuple always performs a full-table scan and returns an exact count of live and dead tuples (and their sizes) and free space, pgstattuple_approx tries to avoid the full-table scan and returns exact dead tuple statistics along with an approximation of the number and size of live tuples and free space.

It does this by skipping pages that have only visible tuples according to the visibility map (if a page has the corresponding VM bit set, then it is assumed to contain no dead tuples). For such pages, it derives the free space value from the free space map, and assumes that the rest of the space on the page is taken up by live tuples.

For pages that cannot be skipped, it scans each tuple, recording its presence and size in the appropriate counters, and adding up the free space on the page. At the end, it estimates the total number of live tuples based on the number of pages and tuples scanned (in the same way that VACUUM estimates pg_class.reltuples).

Table F-24. pgstattuple_approx Output Columns

<table>
<thead>
<tr>
<th>Column</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_len</td>
<td>bigint</td>
<td>Physical relation length in bytes (exact)</td>
</tr>
<tr>
<td>scanned_percent</td>
<td>float8</td>
<td>Percentage of table scanned</td>
</tr>
<tr>
<td>approx_tuple_count</td>
<td>bigint</td>
<td>Number of live tuples (estimated)</td>
</tr>
<tr>
<td>approx_tuple_len</td>
<td>bigint</td>
<td>Total length of live tuples in bytes (estimated)</td>
</tr>
</tbody>
</table>
### Appendix F. Additional Supplied Modules

<table>
<thead>
<tr>
<th>Column</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>approx_tuple_percent</td>
<td>float8</td>
<td>Percentage of live tuples</td>
</tr>
<tr>
<td>dead_tuple_count</td>
<td>bigint</td>
<td>Number of dead tuples (exact)</td>
</tr>
<tr>
<td>dead_tuple_len</td>
<td>bigint</td>
<td>Total length of dead tuples in bytes (exact)</td>
</tr>
<tr>
<td>dead_tuple_percent</td>
<td>float8</td>
<td>Percentage of dead tuples</td>
</tr>
<tr>
<td>approx_free_space</td>
<td>bigint</td>
<td>Total free space in bytes (estimated)</td>
</tr>
<tr>
<td>approx_free_percent</td>
<td>float8</td>
<td>Percentage of free space</td>
</tr>
</tbody>
</table>

In the above output, the free space figures may not match the pgstattrun output exactly, because the free space map gives us an exact figure, but is not guaranteed to be accurate to the byte.

### F.30.2. Authors

Tatsuo Ishii, Satoshi Nagayasu and Abhijit Menon-Sen

### F.31. pg_trgm

The pg_trgm module provides functions and operators for determining the similarity of alphanumeric text based on trigram matching, as well as index operator classes that support fast searching for similar strings.

#### F.31.1. Trigram (or Trigraph) Concepts

A trigram is a group of three consecutive characters taken from a string. We can measure the similarity of two strings by counting the number of trigrams they share. This simple idea turns out to be very effective for measuring the similarity of words in many natural languages.

**Note:** pg_trgm ignores non-word characters (non-alphanumerics) when extracting trigrams from a string. Each word is considered to have two spaces prefixed and one space suffixed when determining the set of trigrams contained in the string. For example, the set of trigrams in the string "cat" is "c", "ca", "cat", and "at". The set of trigrams in the string "foo|bar" is "f", "fo", "foo", "oo ", " b", " ba", "bar", and "ar ".

#### F.31.2. Functions and Operators

The functions provided by the pg_trgm module are shown in Table F-25, the operators in Table F-26.
### Table F-25. pg_trgm Functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Returns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>similarity(text, text)</td>
<td>real</td>
<td>Returns a number that indicates how similar the two arguments are. The range of the result is zero (indicating that the two strings are completely dissimilar) to one (indicating that the two strings are identical).</td>
</tr>
<tr>
<td>show_trgm(text)</td>
<td>text[]</td>
<td>Returns an array of all the trigrams in the given string. (In practice this is seldom useful except for debugging.)</td>
</tr>
<tr>
<td>word_similarity(text, text)</td>
<td>real</td>
<td>Returns a number that indicates the greatest similarity between the set of trigrams in the first string and any continuous extent of an ordered set of trigrams in the second string. For details, see the explanation below.</td>
</tr>
<tr>
<td>show_limit()</td>
<td>real</td>
<td>Returns the current similarity threshold used by the %. This sets the minimum similarity between two words for them to be considered similar enough to be misspellings of each other, for example (deprecated).</td>
</tr>
<tr>
<td>set_limit(real)</td>
<td>real</td>
<td>Sets the current similarity threshold that is used by the % operator. The threshold must be between 0 and 1 (default is 0.3). Returns the same value passed in (deprecated).</td>
</tr>
</tbody>
</table>

Consider the following example:

```sql
# SELECT word_similarity('word', 'two words');
word_similarity
-------------
     0.8
(1 row)
```

In the first string, the set of trigrams is (" w", " wo", " ord", " wor", " rd "). In the second string, the ordered set of trigrams is (" t", " tw", " two", " wo ", " w", " wo", " wor", " ord", " rds", " ds "). The most similar extent of an ordered set of trigrams in the second string is (" w", " wo", " wor", " ord"), and the similarity is 0.8.
This function returns a value that can be approximately understood as the greatest similarity between the first string and any substring of the second string. However, this function does not add padding to the boundaries of the extent. Thus, the number of additional characters present in the second string is not considered, except for the mismatched word boundaries.

Table F-26. pg_trgm Operators

<table>
<thead>
<tr>
<th>Operator</th>
<th>Returns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>text % text</td>
<td>boolean</td>
<td>Returns true if its arguments have a similarity that is greater than the current similarity threshold set by pg_trgm.similarity_threshold.</td>
</tr>
<tr>
<td>text &lt;% text</td>
<td>boolean</td>
<td>Returns true if the similarity between the trigram set in the first argument and a continuous extent of an ordered trigram set in the second argument is greater than the current word similarity threshold set by pg_trgm.word_similarity_threshold parameter.</td>
</tr>
<tr>
<td>text %&gt; text</td>
<td>boolean</td>
<td>Commutator of the &lt;% operator.</td>
</tr>
<tr>
<td>text &lt;-&gt; text</td>
<td>real</td>
<td>Returns the “distance” between the arguments, that is one minus the similarity() value.</td>
</tr>
<tr>
<td>text &lt;&lt;-&gt; text</td>
<td>real</td>
<td>Returns the “distance” between the arguments, that is one minus the word_similarity() value.</td>
</tr>
<tr>
<td>text &lt;-&gt;&gt; text</td>
<td>real</td>
<td>Commutator of the &lt;&lt;-&gt; operator.</td>
</tr>
</tbody>
</table>

F.31.3. GUC Parameters

pg_trgm.similarity_threshold(real)

Sets the current similarity threshold that is used by the % operator. The threshold must be between 0 and 1 (default is 0.3).

pg_trgm.word_similarity_threshold(real)

Sets the current word similarity threshold that is used by <\% and %> operators. The threshold must be between 0 and 1 (default is 0.6).
F.31.4. Index Support

The `pg_trgm` module provides GiST and GIN index operator classes that allow you to create an index over a text column for the purpose of very fast similarity searches. These index types support the above-described similarity operators, and additionally support trigram-based index searches for `LIKE`, `ILIKE`, `~` and `~*` queries. (These indexes do not support equality nor simple comparison operators, so you may need a regular B-tree index too.)

Example:

```sql
CREATE TABLE test_trgm (t text);
CREATE INDEX trgm_idx ON test_trgm USING GIST (t gist_trgm_ops);
```

or

```sql
CREATE INDEX trgm_idx ON test_trgm USING GIN (t gin_trgm_ops);
```

At this point, you will have an index on the `t` column that you can use for similarity searching. A typical query is

```sql
SELECT t, similarity(t, 'word') AS sml
FROM test_trgm
WHERE t % 'word'
ORDER BY sml DESC, t;
```

This will return all values in the text column that are sufficiently similar to `word`, sorted from best match to worst. The index will be used to make this a fast operation even over very large data sets.

A variant of the above query is

```sql
SELECT t, t <-> 'word' AS dist
FROM test_trgm
ORDER BY dist LIMIT 10;
```

This can be implemented quite efficiently by GiST indexes, but not by GIN indexes. It will usually beat the first formulation when only a small number of the closest matches is wanted.

Also you can use an index on the `t` column for word similarity. For example:

```sql
SELECT t, word_similarity('word', t) AS sml
FROM test_trgm
WHERE 'word' % t
ORDER BY sml DESC, t;
```

This will return all values in the text column for which there is a continuous extent in the corresponding ordered trigram set that is sufficiently similar to the trigram set of `word`, sorted from best match to worst. The index will be used to make this a fast operation even over very large data sets.

A variant of the above query is

```sql
SELECT t, 'word' <<<-> t AS dist
FROM test_trgm
ORDER BY dist LIMIT 10;
```
Appendix F. Additional Supplied Modules

This can be implemented quite efficiently by GiST indexes, but not by GIN indexes.

Beginning in PostgreSQL 9.1, these index types also support index searches for \texttt{LIKE} and \texttt{ILIKE}, for example

\begin{verbatim}
SELECT * FROM test_trgm WHERE t LIKE '%foo%bar';
\end{verbatim}

The index search works by extracting trigrams from the search string and then looking these up in the index. The more trigrams in the search string, the more effective the index search is. Unlike B-tree based searches, the search string need not be left-anchored.

Beginning in PostgreSQL 9.3, these index types also support index searches for regular-expression matches (\texttt{-} and \texttt{-} operators), for example

\begin{verbatim}
SELECT * FROM test_trgm WHERE t ~ '(foo|bar)';
\end{verbatim}

The index search works by extracting trigrams from the regular expression and then looking these up in the index. The more trigrams that can be extracted from the regular expression, the more effective the index search is. Unlike B-tree based searches, the search string need not be left-anchored.

For both \texttt{LIKE} and regular-expression searches, keep in mind that a pattern with no extractable trigrams will degenerate to a full-index scan.

The choice between GiST and GIN indexing depends on the relative performance characteristics of GiST and GIN, which are discussed elsewhere.

\textbf{F.31.5. Text Search Integration}

Trigram matching is a very useful tool when used in conjunction with a full text index. In particular it can help to recognize misspelled input words that will not be matched directly by the full text search mechanism.

The first step is to generate an auxiliary table containing all the unique words in the documents:

\begin{verbatim}
CREATE TABLE words AS SELECT word FROM
ts_stat('SELECT to_tsvector("simple", bodytext) FROM documents');
\end{verbatim}

where \texttt{documents} is a table that has a text field \texttt{bodytext} that we wish to search. The reason for using the \texttt{simple} configuration with the \texttt{to_tsvector} function, instead of using a language-specific configuration, is that we want a list of the original (unstemmed) words.

Next, create a trigram index on the word column:

\begin{verbatim}
CREATE INDEX words_idx ON words USING GIN (word gin_trgm_ops);
\end{verbatim}

Now, a \texttt{SELECT} query similar to the previous example can be used to suggest spellings for misspelled words in user search terms. A useful extra test is to require that the selected words are also of similar length to the misspelled word.

\begin{verbatim}
Note: Since the \texttt{words} table has been generated as a separate, static table, it will need to be periodically regenerated so that it remains reasonably up-to-date with the document collection. Keeping it exactly current is usually unnecessary.
\end{verbatim}

F.32. pg_visibility

The pg_visibility module provides a means for examining the visibility map (VM) and page-level visibility information of a table. It also provides functions to check the integrity of a visibility map and to force it to be rebuilt.

Three different bits are used to store information about page-level visibility. The all-visible bit in the visibility map indicates that every tuple in the corresponding page of the relation is visible to every current and future transaction. The all-frozen bit in the visibility map indicates that every tuple in the page is frozen; that is, no future vacuum will need to modify the page until such time as a tuple is inserted, updated, deleted, or locked on that page. The page header's PD_ALL_VISIBLE bit has the same meaning as the all-visible bit in the visibility map, but is stored within the data page itself rather than in a separate data structure. These two bits will normally agree, but the page’s all-visible bit can sometimes be set while the visibility map bit is clear after a crash recovery. The reported values can also disagree because of a change that occurs after pg_visibility examines the visibility map and before it examines the data page. Any event that causes data corruption can also cause these bits to disagree.

Functions that display information about PD_ALL_VISIBLE bits are much more costly than those that only consult the visibility map, because they must read the relation’s data blocks rather than only the (much smaller) visibility map. Functions that check the relation’s data blocks are similarly expensive.

F.32.1. Functions

pg_visibility_map(relation regclass, blkno bigint, all_visible OUT boolean, all_frozen OUT boolean) returns record

Returns the all-visible and all-frozen bits in the visibility map for the given block of the given relation.
Appendix F. Additional Supplied Modules

pg_visibility(relation regclass, blkno bigint, all_visible OUT boolean, all_frozen OUT boolean, pd_all_visible OUT boolean) returns record

Returns the all-visible and all-frozen bits in the visibility map for the given block of the given relation, plus the PD_ALL_VISIBLE bit of that block.

pg_visibility_map(relation regclass, blkno OUT bigint, all_visible OUT boolean, all_frozen OUT boolean) returns setof record

Returns the all-visible and all-frozen bits in the visibility map for each block of the given relation.

pg_visibility(relation regclass, blkno OUT bigint, all_visible OUT boolean, all_frozen OUT boolean, pd_all_visible OUT boolean) returns setof record

Returns the all-visible and all-frozen bits in the visibility map for each block of the given relation, plus the PD_ALL_VISIBLE bit of each block.

pg_visibility_map_summary(relation regclass, all_visible OUT bigint, all_frozen OUT bigint) returns record

Returns the number of all-visible pages and the number of all-frozen pages in the relation according to the visibility map.

pg_check_frozen(relation regclass, t_ctid OUT tid) returns setof tid

Returns the TIDs of non-frozen tuples stored in pages marked all-frozen in the visibility map. If this function returns a non-empty set of TIDs, the visibility map is corrupt.

pg_check_visible(relation regclass, t_ctid OUT tid) returns setof tid

Returns the TIDs of non-all-visible tuples stored in pages marked all-visible in the visibility map. If this function returns a non-empty set of TIDs, the visibility map is corrupt.

pg_truncate_visibility_map(relation regclass) returns void

Truncates the visibility map for the given relation. This function is useful if you believe that the visibility map for the relation is corrupt and wish to force rebuilding it. The first VACUUM executed on the given relation after this function is executed will scan every page in the relation and rebuild the visibility map. (Until that is done, queries will treat the visibility map as containing all zeroes.)

By default, these functions are executable only by superusers.

Robert Haas <rhaas@postgresql.org>

F.33. postgres_fdw

The postgres_fdw module provides the foreign-data wrapper postgres_fdw, which can be used to access data stored in external PostgreSQL servers.

The functionality provided by this module overlaps substantially with the functionality of the older dblink module. But postgres_fdw provides more transparent and standards-compliant syntax for accessing remote tables, and can give better performance in many cases.
Appendix F. Additional Supplied Modules

To prepare for remote access using _postgres_fdw_

1. Install the _postgres_fdw_ extension using CREATE EXTENSION.
2. Create a foreign server object, using CREATE SERVER, to represent each remote database you want to connect to. Specify connection information, except _user_ and _password_, as options of the server object.
3. Create a user mapping, using CREATE USER MAPPING, for each database user you want to allow to access each foreign server. Specify the remote user name and password to use as _user_ and _password_ options of the user mapping.
4. Create a foreign table, using CREATE FOREIGN TABLE or IMPORT FOREIGN SCHEMA, for each remote table you want to access. The columns of the foreign table must match the referenced remote table. You can, however, use table and/or column names different from the remote table’s, if you specify the correct remote names as options of the foreign table object.

Now you need only _SELECT_ from a foreign table to access the data stored in its underlying remote table. You can also modify the remote table using _INSERT_, _UPDATE_, or _DELETE_. (Of course, the remote user you have specified in your user mapping must have privileges to do these things.)

Note that _postgres_fdw_ currently lacks support for _INSERT_ statements with an _ON CONFLICT DO UPDATE_ clause. However, the _ON CONFLICT DO NOTHING_ clause is supported, provided a unique index inference specification is omitted.

It is generally recommended that the columns of a foreign table be declared with exactly the same data types, and collations if applicable, as the referenced columns of the remote table. Although _postgres_fdw_ is currently rather forgiving about performing data type conversions at need, surprising semantic anomalies may arise when types or collations do not match, due to the remote server interpreting _WHERE_ clauses slightly differently from the local server.

Note that a foreign table can be declared with fewer columns, or with a different column order, than its underlying remote table has. Matching of columns to the remote table is by name, not position.

**F.33.1. FDW Options of _postgres_fdw_**

**F.33.1.1. Connection Options**

A foreign server using the _postgres_fdw_ foreign data wrapper can have the same options that _libpq_ accepts in connection strings, as described in Section 32.1.2, except that these options are not allowed:

- _user_ and _password_ (specify these in a user mapping, instead)
- _client_encoding_ (this is automatically set from the local server encoding)
- _fallback_application_name_ (always set to _postgres_fdw_)

Only superusers may connect to foreign servers without password authentication, so always specify the _password_ option for user mappings belonging to non-superusers.
F.33.1.2. Object Name Options

These options can be used to control the names used in SQL statements sent to the remote PostgreSQL server. These options are needed when a foreign table is created with names different from the underlying remote table’s names.

schema_name

This option, which can be specified for a foreign table, gives the schema name to use for the foreign table on the remote server. If this option is omitted, the name of the foreign table’s schema is used.

table_name

This option, which can be specified for a foreign table, gives the table name to use for the foreign table on the remote server. If this option is omitted, the foreign table’s name is used.

column_name

This option, which can be specified for a column of a foreign table, gives the column name to use for the column on the remote server. If this option is omitted, the column’s name is used.

F.33.1.3. Cost Estimation Options

postgres_fdw retrieves remote data by executing queries against remote servers, so ideally the estimated cost of scanning a foreign table should be whatever it costs to be done on the remote server, plus some overhead for communication. The most reliable way to get such an estimate is to ask the remote server and then add something for overhead — but for simple queries, it may not be worth the cost of an additional remote query to get a cost estimate. So postgres_fdw provides the following options to control how cost estimation is done:

use_remote_estimate

This option, which can be specified for a foreign table or a foreign server, controls whether postgres_fdw issues remote EXPLAIN commands to obtain cost estimates. A setting for a foreign table overrides any setting for its server, but only for that table. The default is false.

fdw_startup_cost

This option, which can be specified for a foreign server, is a numeric value that is added to the estimated startup cost of any foreign-table scan on that server. This represents the additional overhead of establishing a connection, parsing and planning the query on the remote side, etc. The default value is 100.

fdw_tuple_cost

This option, which can be specified for a foreign server, is a numeric value that is used as extra cost per-tuple for foreign-table scans on that server. This represents the additional overhead of data transfer between servers. You might increase or decrease this number to reflect higher or lower network delay to the remote server. The default value is 0.01.

When use_remote_estimate is true, postgres_fdw obtains row count and cost estimates from the remote server and then adds fdw_startup_cost and fdw_tuple_cost to the cost estimates. When use_remote_estimate is false, postgres_fdw performs local row count and cost estimation and then adds fdw_startup_cost and fdw_tuple_cost to the cost estimates. This local estimation is unlikely to be very accurate unless local copies of the remote table’s statistics are available. Running ANALYZE
on the foreign table is the way to update the local statistics; this will perform a scan of the remote table and then calculate and store statistics just as though the table were local. Keeping local statistics can be a useful way to reduce per-query planning overhead for a remote table — but if the remote table is frequently updated, the local statistics will soon be obsolete.

F.33.1.4. Remote Execution Options

By default, only WHERE clauses using built-in operators and functions will be considered for execution on the remote server. Clauses involving non-built-in functions are checked locally after rows are fetched. If such functions are available on the remote server and can be relied on to produce the same results as they do locally, performance can be improved by sending such WHERE clauses for remote execution. This behavior can be controlled using the following option:

extensions

This option is a comma-separated list of names of PostgreSQL extensions that are installed, in compatible versions, on both the local and remote servers. Functions and operators that are immutable and belong to a listed extension will be considered shippable to the remote server. This option can only be specified for foreign servers, not per-table.

When using the extensions option, it is the user's responsibility that the listed extensions exist and behave identically on both the local and remote servers. Otherwise, remote queries may fail or behave unexpectedly.

fetch_size

This option specifies the number of rows postgres_fdw should get in each fetch operation. It can be specified for a foreign table or a foreign server. The option specified on a table overrides an option specified for the server. The default is 100.

F.33.1.5. Updatability Options

By default all foreign tables using postgres_fdw are assumed to be updatable. This may be overridden using the following option:

updatable

This option controls whether postgres_fdw allows foreign tables to be modified using INSERT, UPDATE and DELETE commands. It can be specified for a foreign table or a foreign server. A table-level option overrides a server-level option. The default is true.

Of course, if the remote table is not in fact updatable, an error would occur anyway. Use of this option primarily allows the error to be thrown locally without querying the remote server. Note however that the information_schema views will report a postgres_fdw foreign table to be updatable (or not) according to the setting of this option, without any check of the remote server.

F.33.1.6. Importing Options

postgres_fdw is able to import foreign table definitions using IMPORT FOREIGN SCHEMA. This command creates foreign table definitions on the local server that match tables or views present on the
remote server. If the remote tables to be imported have columns of user-defined data types, the local server must have compatible types of the same names.

Importing behavior can be customized with the following options (given in the IMPORT FOREIGN SCHEMA command):

**import_collate**

This option controls whether column COLLATE options are included in the definitions of foreign tables imported from a foreign server. The default is true. You might need to turn this off if the remote server has a different set of collation names than the local server does, which is likely to be the case if it’s running on a different operating system.

**import_default**

This option controls whether column DEFAULT expressions are included in the definitions of foreign tables imported from a foreign server. The default is false. If you enable this option, be wary of defaults that might get computed differently on the local server than they would be on the remote server; nextval() is a common source of problems. The IMPORT will fail altogether if an imported default expression uses a function or operator that does not exist locally.

**import_not_null**

This option controls whether column NOT NULL constraints are included in the definitions of foreign tables imported from a foreign server. The default is true.

Note that constraints other than NOT NULL will never be imported from the remote tables. Although PostgreSQL does support CHECK constraints on foreign tables, there is no provision for importing them automatically, because of the risk that a constraint expression could evaluate differently on the local and remote servers. Any such inconsistency in the behavior of a CHECK constraint could lead to hard-to-detect errors in query optimization. So if you wish to import CHECK constraints, you must do so manually, and you should verify the semantics of each one carefully. For more detail about the treatment of CHECK constraints on foreign tables, see CREATE FOREIGN TABLE.

**F.33.2. Connection Management**

`postgres_fdw` establishes a connection to a foreign server during the first query that uses a foreign table associated with the foreign server. This connection is kept and re-used for subsequent queries in the same session. However, if multiple user identities (user mappings) are used to access the foreign server, a connection is established for each user mapping.

**F.33.3. Transaction Management**

During a query that references any remote tables on a foreign server, `postgres_fdw` opens a transaction on the remote server if one is not already open corresponding to the current local transaction. The remote transaction is committed or aborted when the local transaction commits or aborts. Savepoints are similarly managed by creating corresponding remote savepoints.

The remote transaction uses SERIALIZABLE isolation level when the local transaction has SERIALIZABLE isolation level; otherwise it uses REPEATABLE READ isolation level. This choice ensures
Appendix F. Additional Supplied Modules

that if a query performs multiple table scans on the remote server, it will get snapshot-consistent results for all the scans. A consequence is that successive queries within a single transaction will see the same data from the remote server, even if concurrent updates are occurring on the remote server due to other activities. That behavior would be expected anyway if the local transaction uses SERIALIZABLE or REPEATABLE READ isolation level, but it might be surprising for a READ COMMITTED local transaction. A future PostgreSQL release might modify these rules.

F.33.4. Remote Query Optimization

postgres_fdw attempts to optimize remote queries to reduce the amount of data transferred from foreign servers. This is done by sending query WHERE clauses to the remote server for execution, and by not retrieving table columns that are not needed for the current query. To reduce the risk of misexecution of queries, WHERE clauses are not sent to the remote server unless they use only data types, operators, and functions that are built-in or belong to an extension that’s listed in the foreign server’s extensions option. Operators and functions in such clauses must be IMMUTABLE as well. For an UPDATE or DELETE query, postgres_fdw attempts to optimize the query execution by sending the whole query to the remote server if there are no query WHERE clauses that cannot be sent to the remote server, no local joins for the query, no row-level local BEFORE or AFTER triggers on the target table, and no CHECK OPTION constraints from parent views. In UPDATE, expressions to assign to target columns must use only built-in data types, IMMUTABLE operators, or IMMUTABLE functions, to reduce the risk of misexecution of the query.

When postgres_fdw encounters a join between foreign tables on the same foreign server, it sends the entire join to the foreign server, unless for some reason it believes that it will be more efficient to fetch rows from each table individually, or unless the table references involved are subject to different user mappings. While sending the JOIN clauses, it takes the same precautions as mentioned above for the WHERE clauses.

The query that is actually sent to the remote server for execution can be examined using EXPLAIN VERBOSE.

F.33.5. Remote Query Execution Environment

In the remote sessions opened by postgres_fdw, the search_path parameter is set to just pg_catalog, so that only built-in objects are visible without schema qualification. This is not an issue for queries generated by postgres_fdw itself, because it always supplies such qualification. However, this can pose a hazard for functions that are executed on the remote server via triggers or rules on remote tables. For example, if a remote table is actually a view, any functions used in that view will be executed with the restricted search path. It is recommended to schema-qualify all names in such functions, or else attach SET search_path options (see CREATE FUNCTION) to such functions to establish their expected search path environment.

postgres_fdw likewise establishes remote session settings for the parameters TimeZone, DateStyle, IntervalStyle, and extra_float_digits. These are less likely to be problematic than search_path, but can be handled with function SET options if the need arises.

It is not recommended that you override this behavior by changing the session-level settings of these parameters; that is likely to cause postgres_fdw to malfunction.
F.33.6. Cross-Version Compatibility

`postgres_fdw` can be used with remote servers dating back to PostgreSQL 8.3. Read-only capability is available back to 8.1. A limitation however is that `postgres_fdw` generally assumes that immutable built-in functions and operators are safe to send to the remote server for execution, if they appear in a `WHERE` clause for a foreign table. Thus, a built-in function that was added since the remote server’s release might be sent to it for execution, resulting in “function does not exist” or a similar error. This type of failure can be worked around by rewriting the query, for example by embedding the foreign table reference in a `sub-SELECT with OFFSET 0` as an optimization fence, and placing the problematic function or operator outside the `sub-SELECT`.

F.33.7. Examples

Here is an example of creating a foreign table with `postgres_fdw`. First install the extension:

```sql
CREATE EXTENSION postgres_fdw;
```

Then create a foreign server using `CREATE SERVER`. In this example we wish to connect to a PostgreSQL server on host 192.83.123.89 listening on port 5432. The database to which the connection is made is named `foreign_db` on the remote server:

```sql
CREATE SERVER foreign_server
  FOREIGN DATA WRAPPER postgres_fdw
  OPTIONS (host '192.83.123.89', port '5432', dbname 'foreign_db');
```

A user mapping, defined with `CREATE USER MAPPING`, is needed as well to identify the role that will be used on the remote server:

```sql
CREATE USER MAPPING FOR local_user
  SERVER foreign_server
  OPTIONS (user 'foreign_user', password 'password');
```

Now it is possible to create a foreign table with `CREATE FOREIGN TABLE`. In this example we wish to access the table named `some_schema.some_table` on the remote server. The local name for it will be `foreign_table`:

```sql
CREATE FOREIGN TABLE foreign_table
  (id integer NOT NULL,
   data text
  )
  SERVER foreign_server
  OPTIONS (schema_name 'some_schema', table_name 'some_table');
```

It’s essential that the data types and other properties of the columns declared in `CREATE FOREIGN TABLE` match the actual remote table. Column names must match as well, unless you attach `column_name` options to the individual columns to show how they are named in the remote table. In many cases, use of `IMPORT FOREIGN SCHEMA` is preferable to constructing foreign table definitions manually.
Appendix F. Additional Supplied Modules

F.33.8. Author

Shigeru Hanada <shigeru.hanada@gmail.com>

F.34. seg

This module implements a data type `seg` for representing line segments, or floating point intervals. `seg` can represent uncertainty in the interval endpoints, making it especially useful for representing laboratory measurements.

F.34.1. Rationale

The geometry of measurements is usually more complex than that of a point in a numeric continuum. A measurement is usually a segment of that continuum with somewhat fuzzy limits. The measurements come out as intervals because of uncertainty and randomness, as well as because the value being measured may naturally be an interval indicating some condition, such as the temperature range of stability of a protein.

Using just common sense, it appears more convenient to store such data as intervals, rather than pairs of numbers. In practice, it even turns out more efficient in most applications.

Further along the line of common sense, the fuzziness of the limits suggests that the use of traditional numeric data types leads to a certain loss of information. Consider this: your instrument reads 6.50, and you input this reading into the database. What do you get when you fetch it? Watch:

```sql
test=> select 6.50 :: float8 as "pH";
pH
---
6.5
(1 row)
```

In the world of measurements, 6.50 is not the same as 6.5. It may sometimes be critically different. The experimenters usually write down (and publish) the digits they trust. 6.50 is actually a fuzzy interval contained within a bigger and even fuzzier interval, 6.5, with their center points being (probably) the only common feature they share. We definitely do not want such different data items to appear the same.

Conclusion? It is nice to have a special data type that can record the limits of an interval with arbitrarily variable precision. Variable in the sense that each data element records its own precision.

Check this out:

```sql
test=> select '6.25 .. 6.50'::seg as "pH";
pH
------------
6.25 .. 6.50
(1 row)
```
F.34.2. Syntax

The external representation of an interval is formed using one or two floating-point numbers joined by the range operator (.. or ...). Alternatively, it can be specified as a center point plus or minus a deviation. Optional certainty indicators (<, > or ~) can be stored as well. (Certainty indicators are ignored by all the built-in operators, however.) Table F-27 gives an overview of allowed representations; Table F-28 shows some examples.

In Table F-27, x, y, and delta denote floating-point numbers. x and y, but not delta, can be preceded by a certainty indicator.

### Table F-27. seg External Representations

<table>
<thead>
<tr>
<th>Representation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x</td>
<td>Single value (zero-length interval)</td>
</tr>
<tr>
<td>x .. y</td>
<td>Interval from x to y</td>
</tr>
<tr>
<td>x (±) delta</td>
<td>Interval from x - delta to x + delta</td>
</tr>
<tr>
<td>x .</td>
<td>Open interval with lower bound x</td>
</tr>
<tr>
<td>.. x</td>
<td>Open interval with upper bound x</td>
</tr>
</tbody>
</table>

### Table F-28. Examples of Valid seg Input

<table>
<thead>
<tr>
<th>Example</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.0</td>
<td>Creates a zero-length segment (a point, if you will)</td>
</tr>
<tr>
<td>~5.0</td>
<td>Creates a zero-length segment and records ~ in the data. ~ is ignored by seg operations, but is preserved as a comment.</td>
</tr>
<tr>
<td>&lt;5.0</td>
<td>Creates a point at 5.0. &lt; is ignored but is preserved as a comment.</td>
</tr>
<tr>
<td>&gt;5.0</td>
<td>Creates a point at 5.0. &gt; is ignored but is preserved as a comment.</td>
</tr>
<tr>
<td>5(±)0.3</td>
<td>Creates an interval 4.7 .. 5.3. Note that the (±) notation isn’t preserved.</td>
</tr>
<tr>
<td>50 ..</td>
<td>Everything that is greater than or equal to 50</td>
</tr>
<tr>
<td>.. 0</td>
<td>Everything that is less than or equal to 0</td>
</tr>
<tr>
<td>1.5e-2 .. 2E-2</td>
<td>Creates an interval 0.015 .. 0.02</td>
</tr>
<tr>
<td>1 ... 2</td>
<td>The same as 1.2, or 1 .. 2, or 1..2 (spaces around the range operator are ignored)</td>
</tr>
</tbody>
</table>

Because .. is widely used in data sources, it is allowed as an alternative spelling of ... Unfortunately, this creates a parsing ambiguity: it is not clear whether the upper bound in 0 .. 23 is meant to be 23 or 0.23. This is resolved by requiring at least one digit before the decimal point in all numbers in seg input.

As a sanity check, seg rejects intervals with the lower bound greater than the upper, for example 5 .. 2.
F.34.3. Precision

`seg` values are stored internally as pairs of 32-bit floating point numbers. This means that numbers with more than 7 significant digits will be truncated.

Numbers with 7 or fewer significant digits retain their original precision. That is, if your query returns 0.00, you will be sure that the trailing zeroes are not the artifacts of formatting: they reflect the precision of the original data. The number of leading zeroes does not affect precision: the value 0.0067 is considered to have just 2 significant digits.

F.34.4. Usage

The `seg` module includes a GiST index operator class for `seg` values. The operators supported by the GiST operator class are shown in Table F-29.

### Table F-29. Seg GiST Operators

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>[a, b] &lt;&lt; [c, d]</code></td>
<td><code>[a, b]</code> is entirely to the left of <code>[c, d]</code>. That is, <code>[a, b] &lt;&lt; [c, d]</code> is true if <code>b &lt; c</code> and false otherwise.</td>
</tr>
<tr>
<td><code>[a, b] &gt;&gt; [c, d]</code></td>
<td><code>[a, b]</code> is entirely to the right of <code>[c, d]</code>. That is, <code>[a, b] &gt;&gt; [c, d]</code> is true if <code>a &gt; d</code> and false otherwise.</td>
</tr>
<tr>
<td><code>[a, b] &amp;&lt; [c, d]</code></td>
<td>Overlaps or is left of — This might be better read as “does not extend to right of”. It is true when <code>b &lt;= d</code>.</td>
</tr>
<tr>
<td><code>[a, b] &amp;&gt; [c, d]</code></td>
<td>Overlaps or is right of — This might be better read as “does not extend to left of”. It is true when <code>a &gt;= c</code>.</td>
</tr>
<tr>
<td><code>[a, b] = [c, d]</code></td>
<td>Same as — The segments <code>[a, b]</code> and <code>[c, d]</code> are identical, that is, <code>a = c</code> and <code>b = d</code>.</td>
</tr>
<tr>
<td><code>[a, b] &amp; &amp; [c, d]</code></td>
<td>The segments <code>[a, b]</code> and <code>[c, d]</code> overlap.</td>
</tr>
<tr>
<td><code>[a, b] @&gt; [c, d]</code></td>
<td>The segment <code>[a, b]</code> contains the segment <code>[c, d]</code>, that is, <code>a &lt;= c</code> and <code>b &gt;= d</code>.</td>
</tr>
<tr>
<td><code>[a, b] &lt;@ [c, d]</code></td>
<td>The segment <code>[a, b]</code> is contained in <code>[c, d]</code>, that is, <code>a &gt;= c</code> and <code>b &lt;= d</code>.</td>
</tr>
</tbody>
</table>

(Before PostgreSQL 8.2, the containment operators `@>` and `<@` were respectively called `@` and `~`. These names are still available, but are deprecated and will eventually be retired. Notice that the old names are reversed from the convention formerly followed by the core geometric data types!)

The standard B-tree operators are also provided, for example

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>[a, b] &lt; [c, d]</code></td>
<td>Less than</td>
</tr>
<tr>
<td><code>[a, b] &gt; [c, d]</code></td>
<td>Greater than</td>
</tr>
</tbody>
</table>
These operators do not make a lot of sense for any practical purpose but sorting. These operators first compare (a) to (c), and if these are equal, compare (b) to (d). That results in reasonably good sorting in most cases, which is useful if you want to use ORDER BY with this type.

**F.34.5. Notes**

For examples of usage, see the regression test `sql/seg.sql`.

The mechanism that converts `(+-)` to regular ranges isn’t completely accurate in determining the number of significant digits for the boundaries. For example, it adds an extra digit to the lower boundary if the resulting interval includes a power of ten:

```
postgres=> select '10(+-)1':seg as seg;
seg
---------
9.0 .. 11  -- should be: 9 .. 11
```

The performance of an R-tree index can largely depend on the initial order of input values. It may be very helpful to sort the input table on the `seg` column; see the script `sort-segments.pl` for an example.

**F.34.6. Credits**

Original author: Gene Selkov, Jr. `<selkovjr@mcs.anl.gov>`, Mathematics and Computer Science Division, Argonne National Laboratory.

My thanks are primarily to Prof. Joe Hellerstein (http://db.cs.berkeley.edu/jmh/) for elucidating the gist of the GiST (http://gist.cs.berkeley.edu/). I am also grateful to all Postgres developers, present and past, for enabling myself to create my own world and live undisturbed in it. And I would like to acknowledge my gratitude to Argonne Lab and to the U.S. Department of Energy for the years of faithful support of my database research.

**F.35. sepgsql**

`sepgsql` is a loadable module that supports label-based mandatory access control (MAC) based on SELinux security policy.

**Warning**

The current implementation has significant limitations, and does not enforce mandatory access control for all actions. See Section F.35.7.
Appendix F. Additional Supplied Modules

F.35.1. Overview

This module integrates with SELinux to provide an additional layer of security checking above and beyond what is normally provided by PostgreSQL. From the perspective of SELinux, this module allows PostgreSQL to function as a user-space object manager. Each table or function access initiated by a DML query will be checked against the system security policy. This check is in addition to the usual SQL permissions checking performed by PostgreSQL.

SELinux access control decisions are made using security labels, which are represented by strings such as `system_u:object_r:sepgsql_table_t:s0`. Each access control decision involves two labels: the label of the subject attempting to perform the action, and the label of the object on which the operation is to be performed. Since these labels can be applied to any sort of object, access control decisions for objects stored within the database can be (and, with this module, are) subjected to the same general criteria used for objects of any other type, such as files. This design is intended to allow a centralized security policy to protect information assets independent of the particulars of how those assets are stored.

The SECURITY LABEL statement allows assignment of a security label to a database object.

F.35.2. Installation

`sepgsql` can only be used on Linux 2.6.28 or higher with SELinux enabled. It is not available on any other platform. You will also need libselinux 2.1.10 or higher and selinux-policy 3.9.13 or higher (although some distributions may backport the necessary rules into older policy versions).

The `sestatus` command allows you to check the status of SELinux. A typical display is:

```
$ sestatus
SELinux status: enabled
SELinuxfs mount: /selinux
Current mode: enforcing
Mode from config file: enforcing
Policy version: 24
Policy from config file: targeted
```

If SELinux is disabled or not installed, you must set that product up first before installing this module.

To build this module, include the option `--with-selinux` in your PostgreSQL configure command. Be sure that the `libselinux-devel` RPM is installed at build time.

To use this module, you must include `sepgsql` in the `shared_preload_libraries` parameter in `postgresql.conf`. The module will not function correctly if loaded in any other manner. Once the module is loaded, you should execute `sepgsql.sql` in each database. This will install functions needed for security label management, and assign initial security labels.

Here is an example showing how to initialize a fresh database cluster with `sepgsql` functions and security labels installed. Adjust the paths shown as appropriate for your installation:

```
$ export PGDATA=/path/to/data/directory
$ initdb
$ vi $PGDATA/postgresql.conf
    change
    #shared_preload_libraries = " # (change requires restart)
    to
```
Please note that you may see some or all of the following notifications depending on the particular versions you have of libselinux and selinux-policy:

```
/etc/selinux/targeted/contexts/sepgsql_contexts: line 33 has invalid object type db_blobs
/etc/selinux/targeted/contexts/sepgsql_contexts: line 36 has invalid object type db_language
```

These messages are harmless and should be ignored.

If the installation process completes without error, you can now start the server normally.

### F.35.3. Regression Tests

Due to the nature of SELinux, running the regression tests for sepgsql requires several extra configuration steps, some of which must be done as root. The regression tests will not be run by an ordinary make check or make installcheck command; you must set up the configuration and then invoke the test script manually. The tests must be run in the contrib/sepgsql directory of a configured PostgreSQL build tree. Although they require a build tree, the tests are designed to be executed against an installed server, that is they are comparable to make installcheck not make check.

First, set up sepgsql in a working database according to the instructions in Section F.35.2. Note that the current operating system user must be able to connect to the database as superuser without password authentication.

Second, build and install the policy package for the regression test. The sepgsql-regtest policy is a special purpose policy package which provides a set of rules to be allowed during the regression tests. It should be built from the policy source file sepgsql-regtest.te, which is done using make with a Makefile supplied by SELinux. You will need to locate the appropriate Makefile on your system; the path shown below is only an example. Once built, install this policy package using the semodule command, which loads supplied policy packages into the kernel. If the package is correctly installed, semodule -l should list sepgsql-regtest as an available policy package:

```
$ cd .../contrib/sepgsql
$ make -f /usr/share/selinux/devel/Makefile
$ sudo semodule -u sepgsql-regtest.pp
$ sudo semodule -l | grep sepgsql
sepgsql-regtest 1.07
```

Third, turn on sepgsql_regression_test_mode. For security reasons, the rules in sepgsql-regtest are not enabled by default; the sepgsql_regression_test_mode parameter enables the rules needed to launch the regression tests. It can be turned on using the setsebool command:

```
$ setsebool -a sepgsql_regression_test_mode=on
```

3460
$ sudo setsebool sepgsql_regression_test_mode on
$ getsebool sepgsql_regression_test_mode
sepgsql_regression_test_mode --> on

Fourth, verify your shell is operating in the unconfined_t domain:

$ id -Z
unconfined_u:unconfined_r:unconfined_t:s0-s0:c0.c1023

See Section F.35.8 for details on adjusting your working domain, if necessary.
Finally, run the regression test script:

$ ./test_sepgsql

This script will attempt to verify that you have done all the configuration steps correctly, and then it will run the regression tests for the sepgsql module.

After completing the tests, it’s recommended you disable the sepgsql_regression_test_mode parameter:

$ sudo setsebool sepgsql_regression_test_mode off

You might prefer to remove the sepgsql-regtest policy entirely:

$ sudo semodule -r sepgsql-regtest

### F.35.4. GUC Parameters

**sepgsql.permissive (boolean)**

This parameter enables sepgsql to function in permissive mode, regardless of the system setting. The default is off. This parameter can only be set in the postgresql.conf file or on the server command line.

When this parameter is on, sepgsql functions in permissive mode, even if SELinux in general is working in enforcing mode. This parameter is primarily useful for testing purposes.

**sepgsql.debug_audit (boolean)**

This parameter enables the printing of audit messages regardless of the system policy settings. The default is off, which means that messages will be printed according to the system settings.

The security policy of SELinux also has rules to control whether or not particular accesses are logged. By default, access violations are logged, but allowed accesses are not.

This parameter forces all possible logging to be turned on, regardless of the system policy.
F.35.5. Features

F.35.5.1. Controlled Object Classes

The security model of SELinux describes all the access control rules as relationships between a subject entity (typically, a client of the database) and an object entity (such as a database object), each of which is identified by a security label. If access to an unlabeled object is attempted, the object is treated as if it were assigned the label `unlabeled_t`.

Currently, sepgsql allows security labels to be assigned to schemas, tables, columns, sequences, views, and functions. When sepgsql is in use, security labels are automatically assigned to supported database objects at creation time. This label is called a default security label, and is decided according to the system security policy, which takes as input the creator’s label, the label assigned to the new object’s parent object and optionally name of the constructed object.

A new database object basically inherits the security label of the parent object, except when the security policy has special rules known as type-transition rules, in which case a different label may be applied. For schemas, the parent object is the current database; for tables, sequences, views, and functions, it is the containing schema; for columns, it is the containing table.

F.35.5.2. DML Permissions

For tables, `db_table:select`, `db_table:insert`, `db_table:update` or `db_table:delete` are checked for all the referenced target tables depending on the kind of statement; in addition, `db_table:select` is also checked for all the tables that contain columns referenced in the `WHERE` or `RETURNING` clause, as a data source for `UPDATE`, and so on.

Column-level permissions will also be checked for each referenced column. `db_column:select` is checked on not only the columns being read using `SELECT`, but those being referenced in other DML statements; `db_column:update` or `db_column:insert` will also be checked for columns being modified by `UPDATE` or `INSERT`.

For example, consider:

```
UPDATE t1 SET x = 2, y = md5sum(y) WHERE z = 100;
```

Here, `db_column:update` will be checked for `t1.x`, since it is being updated, `db_column:{select update}` will be checked for `t1.y`, since it is both updated and referenced, and `db_column:select` will be checked for `t1.z`, since it is only referenced. `db_table:{select update}` will also be checked at the table level.

For sequences, `db_sequence:get_value` is checked when we reference a sequence object using `SELECT`; however, note that we do not currently check permissions on execution of corresponding functions such as `lastval()`.

For views, `db_view:expand` will be checked, then any other required permissions will be checked on the objects being expanded from the view, individually.

For functions, `db_procedure:{execute}` will be checked when user tries to execute a function as a part of query, or using fast-path invocation. If this function is a trusted procedure, it also checks `db_procedure:{entrypoint}` permission to check whether it can perform as entry point of trusted procedure.
In order to access any schema object, \texttt{db\_schema:search} permission is required on the containing schema. When an object is referenced without schema qualification, schemas on which this permission is not present will not be searched (just as if the user did not have \texttt{USAGE} privilege on the schema). If an explicit schema qualification is present, an error will occur if the user does not have the requisite permission on the named schema.

The client must be allowed to access all referenced tables and columns, even if they originated from views which were then expanded, so that we apply consistent access control rules independent of the manner in which the table contents are referenced.

The default database privilege system allows database superusers to modify system catalogs using DML commands, and reference or modify toast tables. These operations are prohibited when \texttt{sepgsql} is enabled.

**F.35.5.3. DDL Permissions**

SELinux defines several permissions to control common operations for each object type; such as creation, alter, drop and relabel of security label. In addition, several object types have special permissions to control their characteristic operations; such as addition or deletion of name entries within a particular schema.

Creating a new database object requires \texttt{create} permission. SELinux will grant or deny this permission based on the client’s security label and the proposed security label for the new object. In some cases, additional privileges are required:

- CREATE DATABASE additionally requires \texttt{getattr} permission for the source or template database.
- Creating a schema object additionally requires \texttt{add\_name} permission on the parent schema.
- Creating a table additionally requires permission to create each individual table column, just as if each table column were a separate top-level object.
- Creating a function marked as \texttt{LEAKPROOF} additionally requires \texttt{install} permission. (This permission is also checked when \texttt{LEAKPROOF} is set for an existing function.)

When \texttt{DROP} command is executed, \texttt{drop} will be checked on the object being removed. Permissions will be also checked for objects dropped indirectly via \texttt{CASCADE}. Deletion of objects contained within a particular schema (tables, views, sequences and procedures) additionally requires \texttt{remove\_name} on the schema.

When \texttt{ALTER} command is executed, \texttt{setattr} will be checked on the object being modified for each object types, except for subsidiary objects such as the indexes or triggers of a table, where permissions are instead checked on the parent object. In some cases, additional permissions are required:

- Moving an object to a new schema additionally requires \texttt{remove\_name} permission on the old schema and \texttt{add\_name} permission on the new one.
- Setting the \texttt{LEAKPROOF} attribute on a function requires \texttt{install} permission.
- Using \texttt{SECURITY LABEL} on an object additionally requires \texttt{relabel\_from} permission for the object in conjunction with its old security label and \texttt{relabel\_to} permission for the object in conjunction with its new security label. (In cases where multiple label providers are installed and the user tries to set a security label, but it is not managed by SELinux, only \texttt{setattr} should be checked here. This is currently not done due to implementation restrictions.)
F.35.5.4. Trusted Procedures

Trusted procedures are similar to security definer functions or setuid commands. SELinux provides a feature to allow trusted code to run using a security label different from that of the client, generally for the purpose of providing highly controlled access to sensitive data (e.g. rows might be omitted, or the precision of stored values might be reduced). Whether or not a function acts as a trusted procedure is controlled by its security label and the operating system security policy. For example:

```sql
postgres=# CREATE TABLE customer (cid int primary key, cname text, credit text);
CREATE TABLE
postgres=# SECURITY LABEL ON COLUMN customer.credit IS 'system_u:object_r:sepgsql_secret_table_t:s0';
SECURITY LABEL
postgres=# CREATE FUNCTION show_credit(int) RETURNS text AS 'SELECT regexp_replace(credit, "-[0-9]+\$", "-xxxx", "g") FROM customer WHERE cid = $1' LANGUAGE sql;
CREATE FUNCTION
postgres=# SECURITY LABEL ON FUNCTION show_credit(int) IS 'system_u:object_r:sepgsql_trusted_proc_exec_t:s0';
SECURITY LABEL
```

The above operations should be performed by an administrative user.

```sql
postgres=# SELECT * FROM customer;
ERROR: SELinux: security policy violation
postgres=# SELECT cid, cname, show_credit(cid) FROM customer;
   cid |   cname |       show_credit
-------+--------+---------------------
      1 |   taro | 1111-2222-3333-xxxx
      2 | hanako | 5555-6666-7777-xxxx
(2 rows)
```

In this case, a regular user cannot reference `customer.credit` directly, but a trusted procedure `show_credit` allows the user to print the credit card numbers of customers with some of the digits masked out.

F.35.5.5. Dynamic Domain Transitions

It is possible to use SELinux’s dynamic domain transition feature to switch the security label of the client process, the client domain, to a new context, if that is allowed by the security policy. The client domain needs the `setcurrent` permission and also `dyntransition` from the old to the new domain.

Dynamic domain transitions should be considered carefully, because they allow users to switch their label, and therefore their privileges, at their option, rather than (as in the case of a trusted procedure) as mandated by the system. Thus, the `dyntransition` permission is only considered safe when used to switch to a domain with a smaller set of privileges than the original one. For example:
In this example above we were allowed to switch from the larger MCS range \texttt{c1.c1.023} to the smaller range \texttt{c1.c4}, but switching back was denied.

A combination of dynamic domain transition and trusted procedure enables an interesting use case that fits the typical process life-cycle of connection pooling software. Even if your connection pooling software is not allowed to run most of SQL commands, you can allow it to switch the security label of the client using the \texttt{sepgsql\_setcon()} function from within a trusted procedure; that should take some credential to authorize the request to switch the client label. After that, this session will have the privileges of the target user, rather than the connection pooler. The connection pooler can later revert the security label change by again using \texttt{sepgsql\_setcon()} with NULL argument, again invoked from within a trusted procedure with appropriate permissions checks. The point here is that only the trusted procedure actually has permission to change the effective security label, and only does so when given proper credentials. Of course, for secure operation, the credential store (table, procedure definition, or whatever) must be protected from unauthorized access.

\textbf{F.35.5.6. Miscellaneous}

We reject the LOAD command across the board, because any module loaded could easily circumvent security policy enforcement.

\textbf{F.35.6. Sepgsql Functions}

Table F-30 shows the available functions.

\textbf{Table F-30. Sepgsql Functions}

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{sepgsql_getcon()}</td>
<td>Returns text that represents the client domain, the current security label of the client.</td>
</tr>
<tr>
<td>\texttt{sepgsql_setcon()}</td>
<td>Switches the client domain of the current session to the new domain, if allowed by the security policy. It also accepts NULL input as a request to transition to the client’s original domain.</td>
</tr>
</tbody>
</table>
### Appendix F. Additional Supplied Modules

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>sepgsql_mcstrans_in(text)</code> returns <code>text</code></td>
<td>Translates the given qualified MLS/MCS range into raw format if the mcstrans daemon is running.</td>
</tr>
<tr>
<td><code>sepgsql_mcstrans_out(text)</code> returns <code>text</code></td>
<td>Translates the given raw MLS/MCS range into qualified format if the mcstrans daemon is running.</td>
</tr>
<tr>
<td><code>sepgsql_restorecon(text)</code> returns <code>bool</code></td>
<td>Sets up initial security labels for all objects within the current database. The argument may be NULL, or the name of a specfile to be used as alternative of the system default.</td>
</tr>
</tbody>
</table>

### F.35.7. Limitations

Data Definition Language (DDL) Permissions

Due to implementation restrictions, some DDL operations do not check permissions.

Data Control Language (DCL) Permissions

Due to implementation restrictions, DCL operations do not check permissions.

Row-level access control

PostgreSQL supports row-level access, but `sepgsql` does not.

Covert channels

`sepgsql` does not try to hide the existence of a certain object, even if the user is not allowed to reference it. For example, we can infer the existence of an invisible object as a result of primary key conflicts, foreign key violations, and so on, even if we cannot obtain the contents of the object. The existence of a top secret table cannot be hidden; we only hope to conceal its contents.

### F.35.8. External Resources

**SE-PostgreSQL Introduction**

This wiki page provides a brief overview, security design, architecture, administration and upcoming features.

**Fedora SELinux User Guide**

This document provides a wide spectrum of knowledge to administer SELinux on your systems. It focuses primarily on Fedora, but is not limited to Fedora.

---

Fedora SELinux FAQ\(^8\)

This document answers frequently asked questions about SELinux. It focuses primarily on Fedora, but is not limited to Fedora.

**F.35.9. Author**

KaiGai Kohei <kaigai@ak.jp.nec.com>

**F.36. spi**

The spi module provides several workable examples of using the Server Programming Interface (SPI) and triggers. While these functions are of some value in their own right, they are even more useful as examples to modify for your own purposes. The functions are general enough to be used with any table, but you have to specify table and field names (as described below) while creating a trigger.

Each of the groups of functions described below is provided as a separately-installable extension.

**F.36.1. refint — Functions for Implementing Referential Integrity**

`check_primary_key()` and `check_foreign_key()` are used to check foreign key constraints. (This functionality is long since superseded by the built-in foreign key mechanism, of course, but the module is still useful as an example.)

`check_primary_key()` checks the referencing table. To use, create a `BEFORE INSERT OR UPDATE` trigger using this function on a table referencing another table. Specify as the trigger arguments: the referencing table’s column name(s) which form the foreign key, the referenced table name, and the column names in the referenced table which form the primary/unique key. To handle multiple foreign keys, create a trigger for each reference.

`check_foreign_key()` checks the referenced table. To use, create a `BEFORE DELETE OR UPDATE` trigger using this function on a table referenced by other table(s). Specify as the trigger arguments: the number of referencing tables for which the function has to perform checking, the action if a referencing key is found (`cascade` — to delete the referencing row, `restrict` — to abort transaction if referencing keys exist, `setnull` — to set referencing key fields to null), the triggered table’s column names which form the primary/unique key, then the referencing table name and column names (repeated for as many referencing tables as were specified by first argument). Note that the primary/unique key columns should be marked `NOT NULL` and should have a unique index.

There are examples in `refint.example`.

\(^8\) [http://docs.fedoraproject.org/selinux-faq](http://docs.fedoraproject.org/selinux-faq)
F.36.2. timetravel — Functions for Implementing Time Travel

Long ago, PostgreSQL had a built-in time travel feature that kept the insert and delete times for each tuple. This can be emulated using these functions. To use these functions, you must add to a table two columns of \texttt{abstime} type to store the date when a tuple was inserted (\texttt{start_date}) and changed/deleted (\texttt{stop_date}):

\begin{verbatim}
CREATE TABLE mytab ( ...
    start_date abstime,
    stop_date abstime
    ...
);
\end{verbatim}

The columns can be named whatever you like, but in this discussion we’ll call them \texttt{start_date} and \texttt{stop_date}.

When a new row is inserted, \texttt{start_date} should normally be set to current time, and \texttt{stop_date} to \texttt{infinity}. The trigger will automatically substitute these values if the inserted data contains nulls in these columns. Generally, inserting explicit non-null data in these columns should only be done when re-loading dumped data.

Tuples with \texttt{stop_date} equal to \texttt{infinity} are “valid now”, and can be modified. Tuples with a finite \texttt{stop_date} cannot be modified anymore — the trigger will prevent it. (If you need to do that, you can turn off time travel as shown below.)

For a modifiable row, on update only the \texttt{stop_date} in the tuple being updated will be changed (to current time) and a new tuple with the modified data will be inserted. \texttt{Start_date} in this new tuple will be set to current time and \texttt{stop_date} to \texttt{infinity}.

A delete does not actually remove the tuple but only sets its \texttt{stop_date} to current time.

To query for tuples “valid now”, include \texttt{stop_date = ‘infinity’} in the query’s \texttt{WHERE} condition. (You might wish to incorporate that in a view.) Similarly, you can query for tuples valid at any past time with suitable conditions on \texttt{start_date} and \texttt{stop_date}.

\texttt{timetravel()} is the general trigger function that supports this behavior. Create a \texttt{BEFORE INSERT OR UPDATE OR DELETE} trigger using this function on each time-traveled table. Specify two trigger arguments: the actual names of the \texttt{start_date} and \texttt{stop_date} columns. Optionally, you can specify one to three more arguments, which must refer to columns of type \texttt{text}. The trigger will store the name of the current user into the first of these columns during \texttt{INSERT}, the second column during \texttt{UPDATE}, and the third during \texttt{DELETE}.

\texttt{set_timetravel()} allows you to turn time-travel on or off for a table. \texttt{set_timetravel(‘mytab’, 1)} will turn TT ON for table \texttt{mytab}. \texttt{set_timetravel(‘mytab’, 0)} will turn TT OFF for table \texttt{mytab}. In both cases the old status is reported. While TT is off, you can modify the \texttt{start_date} and \texttt{stop_date} columns freely. Note that the on/off status is local to the current database session — fresh sessions will always start out with TT ON for all tables.

\texttt{get_timetravel()} returns the TT state for a table without changing it.

There is an example in \texttt{timetravel.example}. 

3468
F.36.3. autoinc — Functions for Autoincrementing Fields

`autoinc()` is a trigger that stores the next value of a sequence into an integer field. This has some overlap with the built-in “serial column” feature, but it is not the same: `autoinc()` will override attempts to substitute a different field value during inserts, and optionally it can be used to increment the field during updates, too.

To use, create a `BEFORE INSERT` (or optionally `BEFORE INSERT OR UPDATE`) trigger using this function. Specify two trigger arguments: the name of the integer column to be modified, and the name of the sequence object that will supply values. (Actually, you can specify any number of pairs of such names, if you’d like to update more than one autoincrementing column.)

There is an example in `autoinc.example`.

F.36.4. insert_username — Functions for Tracking Who Changed a Table

`insert_username()` is a trigger that stores the current user’s name into a text field. This can be useful for tracking who last modified a particular row within a table.

To use, create a `BEFORE INSERT` and/or `UPDATE` trigger using this function. Specify a single trigger argument: the name of the text column to be modified.

There is an example in `insert_username.example`.

F.36.5. moddatetime — Functions for Tracking Last Modification Time

`moddatetime()` is a trigger that stores the current time into a `timestamp` field. This can be useful for tracking the last modification time of a particular row within a table.

To use, create a `BEFORE UPDATE` trigger using this function. Specify a single trigger argument: the name of the column to be modified. The column must be of type `timestamp` or `timestamp with time zone`.

There is an example in `moddatetime.example`.

F.37. sslinfo

The `sslinfo` module provides information about the SSL certificate that the current client provided when connecting to PostgreSQL. The module is useless (most functions will return NULL) if the current connection does not use SSL.

This extension won’t build at all unless the installation was configured with `--with-openssl`.
F.37.1. Functions Provided

ssl_is_used() returns boolean

   Returns TRUE if current connection to server uses SSL, and FALSE otherwise.

ssl_version() returns text

   Returns the name of the protocol used for the SSL connection (e.g. SSLv2, SSLv3, or TLSv1).

ssl_cipher() returns text

   Returns the name of the cipher used for the SSL connection (e.g. DHE-RSA-AES256-SHA).

ssl_client_cert_present() returns boolean

   Returns TRUE if current client has presented a valid SSL client certificate to the server, and FALSE otherwise. (The server might or might not be configured to require a client certificate.)

ssl_client_serial() returns numeric

   Returns serial number of current client certificate. The combination of certificate serial number and certificate issuer is guaranteed to uniquely identify a certificate (but not its owner — the owner ought to regularly change their keys, and get new certificates from the issuer).

So, if you run your own CA and allow only certificates from this CA to be accepted by the server, the serial number is the most reliable (albeit not very mnemonic) means to identify a user.

ssl_client_dn() returns text

   Returns the full subject of the current client certificate, converting character data into the current database encoding. It is assumed that if you use non-ASCII characters in the certificate names, your database is able to represent these characters, too. If your database uses the SQL_ASCII encoding, non-ASCII characters in the name will be represented as UTF-8 sequences.

   The result looks like /CN=Somebody /C=Some country/O=Some organization.

ssl_issuer_dn() returns text

   Returns the full issuer name of the current client certificate, converting character data into the current database encoding. Encoding conversions are handled the same as for ssl_client_dn.

   The combination of the return value of this function with the certificate serial number uniquely identifies the certificate.

   This function is really useful only if you have more than one trusted CA certificate in your server’s root.crt file, or if this CA has issued some intermediate certificate authority certificates.

ssl_client_dn_field(fieldname text) returns text

   This function returns the value of the specified field in the certificate subject, or NULL if the field is not present. Field names are string constants that are converted into ASN1 object identifiers using the OpenSSL object database. The following values are acceptable:

   commonName (alias CN)
   surname (alias SN)
   name
   givenName (alias GN)
   countryName (alias C)
   localityName (alias L)
   stateOrProvinceName (alias ST)
organizationName (alias O)
organizationUnitName (alias OU)
title
description
initials
postalCode
streetAddress
generationQualifier
description
dnQualifier
x500UniqueIdentifier
pseudonym
role
e-mailAddress

All of these fields are optional, except commonName. It depends entirely on your CA’s policy which of them would be included and which wouldn’t. The meaning of these fields, however, is strictly defined by the X.500 and X.509 standards, so you cannot just assign arbitrary meaning to them.

ssl_issuer_field(fieldname text) returns text

Same as ssl_client_dn_field, but for the certificate issuer rather than the certificate subject.

ssl_extension_info() returns setof record

Provide information about extensions of client certificate: extension name, extension value, and if it is a critical extension.

F.38. tablefunc

The tablefunc module includes various functions that return tables (that is, multiple rows). These functions are useful both in their own right and as examples of how to write C functions that return multiple rows.

F.38.1. Functions Provided

Table F-31 shows the functions provided by the tablefunc module.
<table>
<thead>
<tr>
<th>Function</th>
<th>Returns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>normal_rand(int numvals,</td>
<td>setof float8</td>
<td>Produces a set of normally distributed random values</td>
</tr>
<tr>
<td>float8 mean, float8 stddev)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>crosstab(text sql)</td>
<td>setof record</td>
<td>Produces a “pivot table” containing row names plus $N$ value columns, where $N$ is determined by the row type specified in the calling query.</td>
</tr>
<tr>
<td>crosstabN(text sql)</td>
<td>setof table_crosstab_N</td>
<td>Produces a “pivot table” containing row names plus $N$ value columns. crosstab2, crosstab3, and crosstab4 are predefined, but you can create additional crosstabN functions as described below.</td>
</tr>
<tr>
<td>crosstab(text source_sql, text</td>
<td>setof record</td>
<td>Produces a “pivot table” with the value columns specified by a second query.</td>
</tr>
<tr>
<td>category_sql)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>crosstab(text sql, int N)</td>
<td>setof record</td>
<td>Obsolete version of crosstab(text). The parameter $N$ is now ignored, since the number of value columns is always determined by the calling query.</td>
</tr>
<tr>
<td>connectby(text relname, text</td>
<td>setof record</td>
<td>Produces a representation of a hierarchical tree structure.</td>
</tr>
<tr>
<td>keyid_fld, text parent_keyid_fld [, text orderby_fld ], text start_with, int max_depth [, text branch_delim ])</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

F.38.1.1. normal_rand

normal_rand(int numvals, float8 mean, float8 stddev) returns setof float8

normal_rand produces a set of normally distributed random values (Gaussian distribution).

numvals is the number of values to be returned from the function. mean is the mean of the normal distribution of values and stddev is the standard deviation of the normal distribution of values.

For example, this call requests 1000 values with a mean of 5 and a standard deviation of 3:

normal_rand(1000, 5, 3)
F.38.1.2. \texttt{crosstab} (text)

crosstab(text sql)
crosstab(text sql, int N)

The \texttt{crosstab} function is used to produce “pivot” displays, wherein data is listed across the page rather than down. For example, we might have data like

\begin{verbatim}
row1 val11
row1 val12
row1 val13
...
row2 val21
row2 val22
row2 val23
...
\end{verbatim}

which we wish to display like

\begin{verbatim}
row1 val11 val12 val13 ...
row2 val21 val22 val23 ...
...
\end{verbatim}

The \texttt{crosstab} function takes a text parameter that is a SQL query producing raw data formatted in the first way, and produces a table formatted in the second way.

The \texttt{sql} parameter is a SQL statement that produces the source set of data. This statement must return one \texttt{row_name} column, one \texttt{category} column, and one \texttt{value} column. \texttt{N} is an obsolete parameter, ignored if supplied (formerly this had to match the number of output value columns, but now that is determined by the calling query).

For example, the provided query might produce a set something like:

\begin{verbatim}
row1 cat1 val1
----------+-------+-------
row1 cat1 val1
row1 cat2 val2
row2 cat1 val3
row2 cat2 val4
...
\end{verbatim}
The `crosstab` function is declared to return `setof record`, so the actual names and types of the output columns must be defined in the `FROM` clause of the calling `SELECT` statement, for example:

```
SELECT * FROM crosstab('...') AS ct(row_name text, category_1 text, category_2 text);
```

This example produces a set something like:

```
<== value columns ==>
row_name  category_1  category_2
----------+------------+------------
row1      val1       val2
row2      val5       val6
```

The `FROM` clause must define the output as one `row_name` column (of the same data type as the first result column of the SQL query) followed by `N` `value` columns (all of the same data type as the third result column of the SQL query). You can set up as many output value columns as you wish. The names of the output columns are up to you.

The `crosstab` function produces one output row for each consecutive group of input rows with the same `row_name` value. It fills the output value columns, left to right, with the value fields from these rows. If there are fewer rows in a group than there are output value columns, the extra output columns are filled with nulls; if there are more rows, the extra input rows are skipped.

In practice the SQL query should always specify `ORDER BY 1,2` to ensure that the input rows are properly ordered, that is, values with the same `row_name` are brought together and correctly ordered within the row. Notice that `crosstab` itself does not pay any attention to the second column of the query result; it’s just there to be ordered by, to control the order in which the third-column values appear across the page.

Here is a complete example:

```
CREATE TABLE ct(id SERIAL, rowid TEXT, attribute TEXT, value TEXT);
INSERT INTO ct(rowid, attribute, value) VALUES('test1','att1','val1');
INSERT INTO ct(rowid, attribute, value) VALUES('test1','att2','val2');
INSERT INTO ct(rowid, attribute, value) VALUES('test1','att3','val3');
INSERT INTO ct(rowid, attribute, value) VALUES('test1','att4','val4');
INSERT INTO ct(rowid, attribute, value) VALUES('test2','att1','val5');
INSERT INTO ct(rowid, attribute, value) VALUES('test2','att2','val6');
INSERT INTO ct(rowid, attribute, value) VALUES('test2','att3','val7');
INSERT INTO ct(rowid, attribute, value) VALUES('test2','att4','val8');

SELECT *
FROM crosstab(
  'select rowid, attribute, value
```
from ct
where attribute = "att2" or attribute = "att3"
order by 1,2'
AS ct(row_name text, category_1 text, category_2 text, category_3 text);

row_name | category_1 | category_2 | category_3
----------+------------+------------+------------
test1     | val2       | val3       |            |
test2     | val6       | val7       |            |
(2 rows)

You can avoid always having to write out a FROM clause to define the output columns, by setting up a custom crosstab function that has the desired output row type wired into its definition. This is described in the next section. Another possibility is to embed the required FROM clause in a view definition.

**Note:** See also the \crosstabview command in psql, which provides functionality similar to crosstab().

### F.38.1.3. crosstabN (text)

crosstabN(text sql)

The crosstabN functions are examples of how to set up custom wrappers for the general crosstab function, so that you need not write out column names and types in the calling SELECT query. The tablefunc module includes crosstab2, crosstab3, and crosstab4, whose output row types are defined as

```
CREATE TYPE tablefunc_crosstab_N AS {
  row_name TEXT,
  category_1 TEXT,
  category_2 TEXT,
  .
  .
  .
  category_N TEXT
};
```

Thus, these functions can be used directly when the input query produces row_name and value columns of type text, and you want 2, 3, or 4 output values columns. In all other ways they behave exactly as described above for the general crosstab function.

For instance, the example given in the previous section would also work as

```
SELECT *
FROM crosstab3(
  'select rowid, attribute, value
  from ct
  where attribute = "att2" or attribute = "att3"
  order by 1,2');
```
These functions are provided mostly for illustration purposes. You can create your own return types and functions based on the underlying \texttt{crosstab()} function. There are two ways to do it:

- Create a composite type describing the desired output columns, similar to the examples in \texttt{contrib/tablefunc/tablefunc--1.0.sql}. Then define a unique function name accepting one \texttt{text} parameter and returning \texttt{setof your_type_name}, but linking to the same underlying \texttt{crosstab} C function. For example, if your source data produces row names that are \texttt{text}, and values that are \texttt{float8}, and you want 5 value columns:

\begin{verbatim}
CREATE TYPE my_crosstab_float8_5_cols AS {
  my_row_name text,
  my_category_1 float8,
  my_category_2 float8,
  my_category_3 float8,
  my_category_4 float8,
  my_category_5 float8
};

CREATE OR REPLACE FUNCTION crosstab_float8_5_cols(text)
  RETURNS setof my_crosstab_float8_5_cols
AS '$libdir/tablefunc','crosstab' LANGUAGE C STABLE STRICT;
\end{verbatim}

- Use \texttt{OUT} parameters to define the return type implicitly. The same example could also be done this way:

\begin{verbatim}
CREATE OR REPLACE FUNCTION crosstab_float8_5_cols(
  IN text,
  OUT my_row_name text,
  OUT my_category_1 float8,
  OUT my_category_2 float8,
  OUT my_category_3 float8,
  OUT my_category_4 float8,
  OUT my_category_5 float8)
  RETURNS setof record
AS '$libdir/tablefunc','crosstab' LANGUAGE C STABLE STRICT;
\end{verbatim}

\textbf{F.38.1.4. \texttt{crosstab(text, text)}}
\texttt{crosstab(text source_sql, text category_sql)}

The main limitation of the single-parameter form of \texttt{crosstab} is that it treats all values in a group alike, inserting each value into the first available column. If you want the value columns to correspond to specific categories of data, and some groups might not have data for some of the categories, that doesn't work well. The two-parameter form of \texttt{crosstab} handles this case by providing an explicit list of the categories corresponding to the output columns.

\texttt{source_sql} is a SQL statement that produces the source set of data. This statement must return one \texttt{row_name} column, one \texttt{category} column, and one \texttt{value} column. It may also have one or more "extra" columns. The \texttt{row_name} column must be first. The \texttt{category} and \texttt{value} columns must be the last two
columns, in that order. Any columns between row_name and category are treated as “extra”. The “extra” columns are expected to be the same for all rows with the same row_name value.

For example, source_sql might produce a set something like:

```
SELECT row_name, extra_col, cat, value FROM foo ORDER BY 1;
```

<table>
<thead>
<tr>
<th>row_name</th>
<th>extra_col</th>
<th>cat</th>
<th>value</th>
</tr>
</thead>
<tbody>
<tr>
<td>row1</td>
<td>extra1</td>
<td>cat1</td>
<td>val1</td>
</tr>
<tr>
<td>row1</td>
<td>extra1</td>
<td>cat2</td>
<td>val2</td>
</tr>
<tr>
<td>row1</td>
<td>extra1</td>
<td>cat4</td>
<td>val4</td>
</tr>
<tr>
<td>row2</td>
<td>extra2</td>
<td>cat1</td>
<td>val5</td>
</tr>
<tr>
<td>row2</td>
<td>extra2</td>
<td>cat2</td>
<td>val6</td>
</tr>
<tr>
<td>row2</td>
<td>extra2</td>
<td>cat3</td>
<td>val7</td>
</tr>
<tr>
<td>row2</td>
<td>extra2</td>
<td>cat4</td>
<td>val8</td>
</tr>
</tbody>
</table>

category_sql is a SQL statement that produces the set of categories. This statement must return only one column. It must produce at least one row, or an error will be generated. Also, it must not produce duplicate values, or an error will be generated. category_sql might be something like:

```
SELECT DISTINCT cat FROM foo ORDER BY 1;
```

<table>
<thead>
<tr>
<th>cat</th>
</tr>
</thead>
<tbody>
<tr>
<td>cat1</td>
</tr>
<tr>
<td>cat2</td>
</tr>
<tr>
<td>cat3</td>
</tr>
<tr>
<td>cat4</td>
</tr>
</tbody>
</table>

The crosstab function is declared to return setof record, so the actual names and types of the output columns must be defined in the FROM clause of the calling SELECT statement, for example:

```
SELECT * FROM crosstab('...', '...')
    AS ct(row_name text, extra text, cat1 text, cat2 text, cat3 text, cat4 text);
```

This will produce a result something like:

```
<== value columns ==>
row_name extra cat1 cat2 cat3 cat4
---------+-------+------+------+------+------
row1     extra1 val1  val2  val4
row2     extra2 val5  val6  val7  val8
```

The FROM clause must define the proper number of output columns of the proper data types. If there are \( N \) columns in the source_sql query’s result, the first \( N-2 \) of them must match up with the first \( N-2 \) output columns. The remaining output columns must have the type of the last column of the source_sql query’s result, and there must be exactly as many of them as there are rows in the category_sql query’s result.
Appendix F. Additional Supplied Modules

The `crosstab` function produces one output row for each consecutive group of input rows with the same `row_name` value. The output `row_name` column, plus any “extra” columns, are copied from the first row of the group. The output `value` columns are filled with the `value` fields from rows having matching `category` values. If a row’s `category` does not match any output of the `category_sql` query, its `value` is ignored. Output columns whose matching `category` is not present in any input row of the group are filled with nulls.

In practice the `source_sql` query should always specify `ORDER BY 1` to ensure that values with the same `row_name` are brought together. However, ordering of the categories within a group is not important. Also, it is essential to be sure that the order of the `category_sql` query’s output matches the specified output column order.

Here are two complete examples:

```sql
create table sales(year int, month int, qty int);
insert into sales values(2007, 1, 1000);
insert into sales values(2007, 2, 1500);
insert into sales values(2007, 7, 500);
insert into sales values(2007, 11, 1500);
insert into sales values(2007, 12, 2000);
insert into sales values(2008, 1, 1000);

select * from crosstab(
    'select year, month, qty from sales order by 1',
    'select m from generate_series(1,12) m'
) as (year int, "Jan" int, "Feb" int, "Mar" int, "Apr" int, "May" int, "Jun" int, "Jul" int, "Aug" int, "Sep" int, "Oct" int, "Nov" int, "Dec" int);
```

```
<table>
<thead>
<tr>
<th>year</th>
<th>Jan</th>
<th>Feb</th>
<th>Mar</th>
<th>Apr</th>
<th>May</th>
<th>Jun</th>
<th>Jul</th>
<th>Aug</th>
<th>Sep</th>
<th>Oct</th>
<th>Nov</th>
<th>Dec</th>
</tr>
</thead>
<tbody>
<tr>
<td>2007</td>
<td>1000</td>
<td>1500</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>500</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>1500</td>
</tr>
<tr>
<td>2008</td>
<td>1000</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```

CREATE TABLE cth(rowid text, rowdt timestamp, attribute text, val text);
INSERT INTO cth VALUES('test1','01 March 2003','temperature','42');
INSERT INTO cth VALUES('test1','01 March 2003','test_result','PASS');
INSERT INTO cth VALUES('test1','01 March 2003','volts','2.6987');
INSERT INTO cth VALUES('test2','02 March 2003','temperature','53');
INSERT INTO cth VALUES('test2','02 March 2003','test_result','FAIL');
INSERT INTO cth VALUES('test2','02 March 2003','test_startdate','01 March 2003');
Appendix F. Additional Supplied Modules

INSERT INTO cth VALUES('test2','02 March 2003','volts','3.1234');

SELECT * FROM crosstab
{
  'SELECT rowid, rowdt, attribute, val FROM cth ORDER BY 1',
  'SELECT DISTINCT attribute FROM cth ORDER BY 1'
} AS
{
  rowid text,
  rowdt timestamp,
  temperature int4,
  test_result text,
  test_startdate timestamp,
  volts float8
};

<table>
<thead>
<tr>
<th>rowid</th>
<th>rowdt</th>
<th>temperature</th>
<th>test_result</th>
<th>test_startdate</th>
<th>volts</th>
</tr>
</thead>
<tbody>
<tr>
<td>test1</td>
<td>Sat Mar 01 00:00:00 2003</td>
<td>42</td>
<td>PASS</td>
<td></td>
<td>2.6987</td>
</tr>
<tr>
<td>test2</td>
<td>Sun Mar 02 00:00:00 2003</td>
<td>53</td>
<td>FAIL</td>
<td>Sat Mar 01 00:00:00 2003</td>
<td>3.1234</td>
</tr>
</tbody>
</table>

You can create predefined functions to avoid having to write out the result column names and types in each query. See the examples in the previous section. The underlying C function for this form of crosstab is named crosstab_hash.

**F.38.1.5. connectby**

connectby(text relname, text keyid_fld, text parent_keyid_fld
  [, text orderby_fld ], text start_with, int max_depth
  [, text branch_delim ])

The connectby function produces a display of hierarchical data that is stored in a table. The table must have a key field that uniquely identifies rows, and a parent-key field that references the parent (if any) of each row. connectby can display the sub-tree descending from any row.

Table F-32 explains the parameters.

**Table F-32. connectby Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>relname</td>
<td>Name of the source relation</td>
</tr>
<tr>
<td>keyid_fld</td>
<td>Name of the key field</td>
</tr>
<tr>
<td>parent_keyid_fld</td>
<td>Name of the parent-key field</td>
</tr>
<tr>
<td>orderby_fld</td>
<td>Name of the field to order siblings by (optional)</td>
</tr>
<tr>
<td>start_with</td>
<td>Key value of the row to start at</td>
</tr>
</tbody>
</table>
# Appendix F. Additional Supplied Modules

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>max_depth</td>
<td>Maximum depth to descend to, or zero for unlimited depth</td>
</tr>
<tr>
<td>branch_delim</td>
<td>String to separate keys with in branch output (optional)</td>
</tr>
</tbody>
</table>

The key and parent-key fields can be any data type, but they must be the same type. Note that the `start_with` value must be entered as a text string, regardless of the type of the key field.

The `connectby` function is declared to return `setof record`, so the actual names and types of the output columns must be defined in the `FROM` clause of the calling `SELECT` statement, for example:

```sql
SELECT * FROM connectby('connectby_tree', 'keyid', 'parent_keyid', 'pos', 'row2', 0, '~')
AS t(keyid text, parent_keyid text, level int, branch text, pos int);
```

The first two output columns are used for the current row’s key and its parent row’s key; they must match the type of the table’s key field. The third output column is the depth in the tree and must be of type `integer`. If a `branch_delim` parameter was given, the next output column is the branch display and must be of type `text`. Finally, if an `orderby_fld` parameter was given, the last output column is a serial number, and must be of type `integer`.

The “branch” output column shows the path of keys taken to reach the current row. The keys are separated by the specified `branch_delim` string. If no branch display is wanted, omit both the `branch_delim` parameter and the branch column in the output column list.

If the ordering of siblings of the same parent is important, include the `orderby_fld` parameter to specify which field to order siblings by. This field can be of any sortable data type. The output column list must include a final integer serial-number column, if and only if `orderby_fld` is specified.

The parameters representing table and field names are copied as-is into the SQL queries that `connectby` generates internally. Therefore, include double quotes if the names are mixed-case or contain special characters. You may also need to schema-qualify the table name.

In large tables, performance will be poor unless there is an index on the parent-key field.

It is important that the `branch_delim` string not appear in any key values, else `connectby` may incorrectly report an infinite-recursion error. Note that if `branch_delim` is not provided, a default value of `~` is used for recursion detection purposes.

Here is an example:

```sql
CREATE TABLE connectby_tree(keyid text, parent_keyid text, pos int);

INSERT INTO connectby_tree VALUES('row1',NULL, 0);
INSERT INTO connectby_tree VALUES('row2','row1', 0);
INSERT INTO connectby_tree VALUES('row3','row1', 0);
INSERT INTO connectby_tree VALUES('row4','row2', 1);
INSERT INTO connectby_tree VALUES('row5','row2', 0);
INSERT INTO connectby_tree VALUES('row6','row4', 0);
INSERT INTO connectby_tree VALUES('row7','row3', 0);
INSERT INTO connectby_tree VALUES('row8','row6', 0);
INSERT INTO connectby_tree VALUES('row9','row5', 0);

-- with branch, without orderby_fld (order of results is not guaranteed)
```
### Appendix F. Additional Supplied Modules

```sql
SELECT * FROM connectby('connectby_tree', 'keyid', 'parent_keyid', 'row2', 0, ' ~')
AS t(keyid text, parent_keyid text, level int, branch text);
```

<table>
<thead>
<tr>
<th>keyid</th>
<th>parent_keyid</th>
<th>level</th>
<th>branch</th>
</tr>
</thead>
<tbody>
<tr>
<td>row2</td>
<td></td>
<td>0</td>
<td>row2</td>
</tr>
<tr>
<td>row4</td>
<td>row2</td>
<td>1</td>
<td>row2-row4</td>
</tr>
<tr>
<td>row6</td>
<td>row4</td>
<td>2</td>
<td>row2-row4-row6</td>
</tr>
<tr>
<td>row8</td>
<td>row6</td>
<td>3</td>
<td>row2-row4-row6-row8</td>
</tr>
<tr>
<td>row5</td>
<td>row2</td>
<td>1</td>
<td>row2-row5</td>
</tr>
<tr>
<td>row9</td>
<td>row5</td>
<td>2</td>
<td>row2-row5-row9</td>
</tr>
</tbody>
</table>

(6 rows)

**-- without branch, without orderby_fld (order of results is not guaranteed)**

```sql
SELECT * FROM connectby('connectby_tree', 'keyid', 'parent_keyid', 'row2', 0)
AS t(keyid text, parent_keyid text, level int);
```

<table>
<thead>
<tr>
<th>keyid</th>
<th>parent_keyid</th>
<th>level</th>
</tr>
</thead>
<tbody>
<tr>
<td>row2</td>
<td></td>
<td>0</td>
</tr>
<tr>
<td>row4</td>
<td>row2</td>
<td>1</td>
</tr>
<tr>
<td>row6</td>
<td>row4</td>
<td>2</td>
</tr>
<tr>
<td>row8</td>
<td>row6</td>
<td>3</td>
</tr>
<tr>
<td>row5</td>
<td>row2</td>
<td>1</td>
</tr>
<tr>
<td>row9</td>
<td>row5</td>
<td>2</td>
</tr>
</tbody>
</table>

(6 rows)

**-- with branch, with orderby_fld (notice that row5 comes before row4)**

```sql
SELECT * FROM connectby('connectby_tree', 'keyid', 'parent_keyid', 'pos', 'row2', 0, ' ~')
AS t(keyid text, parent_keyid text, level int, branch text, pos int);
```

**F.39. tcn**

The `tcn` module provides a trigger function that notifies listeners of changes to any table on which it is attached. It must be used as an `AFTER` trigger for each row.

Only one parameter may be supplied to the function in a `CREATE TRIGGER` statement, and that is optional. If supplied it will be used for the channel name for the notifications. If omitted `tcn` will be used for the channel name.

The payload of the notifications consists of the table name, a letter to indicate which type of operation was performed, and column name/value pairs for primary key columns. Each part is separated from the next by a comma. For ease of parsing using regular expressions, table and column names are always wrapped in double quotes, and data values are always wrapped in single quotes. Embedded quotes are doubled.

A brief example of using the extension follows.

```sql
CREATE TABLE tcndata (
a int not null,
b date not null,
c text,
primary key (a, b)
);

CREATE TRIGGER tcndata_tcn_trigger
after insert or update or delete on tcndata
for each row execute procedure triggered_change_notification();

LISTEN tcn;

INSERT 0 3
Asynchronous notification "tcn" with payload ""tcndata",I,"a"='1','b'='2012-12-22'" received from server process with PID 22770.
Asynchronous notification "tcn" with payload ""tcndata",I,"a"='1','b'='2012-12-23'" received from server process with PID 22770.
Asynchronous notification "tcn" with payload ""tcndata",U,"a"='1','b'='2012-12-22'" received from server process with PID 22770.
Asynchronous notification "tcn" with payload ""tcndata",U,"a"='1','b'='2012-12-23'" received from server process with PID 22770.
UPDATE 2
Asynchronous notification "tcn" with payload ""tcndata",U,"a"='1','b'='2012-12-22'" received from server process with PID 22770.
Asynchronous notification "tcn" with payload ""tcndata",D,"a"='1','b'='2012-12-22'" received from server process with PID 22770.
DELETE 1
Asynchronous notification "tcn" with payload ""tcndata",D,"a"='1','b'='2012-12-22'" received from server process with PID 22770.
```

Appendix F. Additional Supplied Modules

F.40. test_decoding

test_decoding is an example of a logical decoding output plugin. It doesn’t do anything especially useful, but can serve as a starting point for developing your own output plugin.

test_decoding receives WAL through the logical decoding mechanism and decodes it into text representations of the operations performed.

Typical output from this plugin, used over the SQL logical decoding interface, might be:

```
postgres=# SELECT * FROM pg_logical_slot_get_changes('test_slot', NULL, NULL, 'include-xids', '0');

location | xid     | data
------------------------
0/16D30F8 | 691 | BEGIN
0/16D32A0 | 691 | table public.data: INSERT: id[int4]:2 data[text]:'arg'
0/16D32A0 | 691 | table public.data: INSERT: id[int4]:3 data[text]:'demo'
0/16D32A0 | 691 | COMMIT
0/16D32B8 | 692 | BEGIN
0/16D3398 | 692 | table public.data: DELETE: id[int4]:2
0/16D3398 | 692 | table public.data: DELETE: id[int4]:3
0/16D3398 | 692 | COMMIT
```

F.41. tsearch2

The tsearch2 module provides backwards-compatible text search functionality for applications that used tsearch2 before text searching was integrated into core PostgreSQL in release 8.3.

F.41.1. Portability Issues

Although the built-in text search features were based on tsearch2 and are largely similar to it, there are numerous small differences that will create portability issues for existing applications:

- Some functions’ names were changed, for example rank to ts_rank. The replacement tsearch2 module provides aliases having the old names.

- The built-in text search data types and functions all exist within the system schema pg_catalog. In an installation using tsearch2, these objects would usually have been in the public schema, though some users chose to place them in a separate schema of their own. Explicitly schema-qualified references to the objects will therefore fail in either case. The replacement tsearch2 module provides alias objects that are stored in public (or another schema if necessary) so that such references will still work.

- There is no concept of a “current parser” or “current dictionary” in the built-in text search features, only of a current search configuration (set by the default_text_search_config parameter). While the current parser and current dictionary were used only by functions intended for debugging, this might still pose a porting obstacle in some cases. The replacement tsearch2 module emulates these additional state variables and provides backwards-compatible functions for setting and retrieving them.
Appendix F. Additional Supplied Modules

There are some issues that are not addressed by the replacement tsearch2 module, and will therefore require application code changes in any case:

- The old tsearch2 trigger function allowed items in its argument list to be names of functions to be invoked on the text data before it was converted to tsvector format. This was removed as being a security hole, since it was not possible to guarantee that the function invoked was the one intended. The recommended approach if the data must be massaged before being indexed is to write a custom trigger that does the work for itself.

- Text search configuration information has been moved into core system catalogs that are noticeably different from the tables used by tsearch2. Any applications that examined or modified those tables will need adjustment.

- If an application used any custom text search configurations, those will need to be set up in the core catalogs using the new text search configuration SQL commands. The replacement tsearch2 module offers a little bit of support for this by making it possible to load an old set of tsearch2 configuration tables into PostgreSQL 8.3. (Without the module, it is not possible to load the configuration data because values in the regprocedure columns cannot be resolved to functions.) While those configuration tables won’t actually do anything, at least their contents will be available to be consulted while setting up an equivalent custom configuration in 8.3.

- The old reset_tsearch() and get_covers() functions are not supported.

- The replacement tsearch2 module does not define any alias operators, relying entirely on the built-in ones. This would only pose an issue if an application used explicitly schema-qualified operator names, which is very uncommon.

F.41.2. Converting a pre-8.3 Installation

The recommended way to update a pre-8.3 installation that uses tsearch2 is:

1. Make a dump from the old installation in the usual way, but be sure not to use -c (--clean) option of pg_dump or pg_dumpall.

2. In the new installation, create empty database(s) and install the replacement tsearch2 module into each database that will use text search. This must be done before loading the dump data! If your old installation had the tsearch2 objects in a schema other than public, be sure to adjust the CREATE EXTENSION command so that the replacement objects are created in that same schema.

3. Load the dump data. There will be quite a few errors reported due to failure to recreate the original tsearch2 objects. These errors can be ignored, but this means you cannot restore the dump in a single transaction (eg, you cannot use pg_restore’s -1 switch).

4. Examine the contents of the restored tsearch2 configuration tables (pg_ts_cfg and so on), and create equivalent built-in text search configurations as needed. You may drop the old configuration tables once you’ve extracted all the useful information from them.

5. Test your application.

At a later time you may wish to rename application references to the alias text search objects, so that you can eventually uninstall the replacement tsearch2 module.

Tsearch2 Development Site http://www.sai.msu.su/~megera/postgres/gist/tsearch/V2/

F.42. tsm_system_rows

The tsm_system_rows module provides the table sampling method SYSTEM_ROWS, which can be used in the TABLESAMPLE clause of a SELECT command.

This table sampling method accepts a single integer argument that is the maximum number of rows to read. The resulting sample will always contain exactly that many rows, unless the table does not contain enough rows, in which case the whole table is selected.

Like the built-in SYSTEM sampling method, SYSTEM_ROWS performs block-level sampling, so that the sample is not completely random but may be subject to clustering effects, especially if only a small number of rows are requested.

SYSTEM_ROWS does not support the REPEATABLE clause.

F.42.1. Examples

Here is an example of selecting a sample of a table with SYSTEM_ROWS. First install the extension:

CREATE EXTENSION tsm_system_rows;

Then you can use it in a SELECT command, for instance:

SELECT * FROM my_table TABLESAMPLE SYSTEM_ROWS(100);

This command will return a sample of 100 rows from the table my_table (unless the table does not have 100 visible rows, in which case all its rows are returned).

F.43. tsm_system_time

The tsm_system_time module provides the table sampling method SYSTEM_TIME, which can be used in the TABLESAMPLE clause of a SELECT command.

This table sampling method accepts a single floating-point argument that is the maximum number of milliseconds to spend reading the table. This gives you direct control over how long the query takes, at the price that the size of the sample becomes hard to predict. The resulting sample will contain as many rows as could be read in the specified time, unless the whole table has been read first.

Like the built-in SYSTEM sampling method, SYSTEM_TIME performs block-level sampling, so that the sample is not completely random but may be subject to clustering effects, especially if only a small number of rows are selected.
Appendix F. Additional Supplied Modules

SYSTEM_TIME does not support the REPEATABLE clause.

F.43.1. Examples

Here is an example of selecting a sample of a table with SYSTEM_TIME. First install the extension:

CREATE EXTENSION tsm_system_time;

Then you can use it in a SELECT command, for instance:

SELECT * FROM my_table TABLESAMPLE SYSTEM_TIME(1000);

This command will return as large a sample of my_table as it can read in 1 second (1000 milliseconds). Of course, if the whole table can be read in under 1 second, all its rows will be returned.

F.44. unaccent

unaccent is a text search dictionary that removes accents (diacritic signs) from lexemes. It’s a filtering dictionary, which means its output is always passed to the next dictionary (if any), unlike the normal behavior of dictionaries. This allows accent-insensitive processing for full text search.

The current implementation of unaccent cannot be used as a normalizing dictionary for the thesaurus dictionary.

F.44.1. Configuration

An unaccent dictionary accepts the following options:

- RULES is the base name of the file containing the list of translation rules. This file must be stored in $SHAREDIR/tsearch_data/ (where $SHAREDIR means the PostgreSQL installation’s shared-data directory). Its name must end in .rules (which is not to be included in the RULES parameter).

The rules file has the following format:

- Each line represents one translation rule, consisting of a character with accent followed by a character without accent. The first is translated into the second. For example,

  Å Å
  Å Å
  Å Å
  Å Å
  Å Å
  Å Å
  Å Å
  Å Å

  The two characters must be separated by whitespace, and any leading or trailing whitespace on a line is ignored.
Appendix F. Additional Supplied Modules

• Alternatively, if only one character is given on a line, instances of that character are deleted; this is useful in languages where accents are represented by separate characters.

• Actually, each “character” can be any string not containing whitespace, so unaccent dictionaries could be used for other sorts of substring substitutions besides diacritic removal.

• As with other PostgreSQL text search configuration files, the rules file must be stored in UTF-8 encoding. The data is automatically translated into the current database’s encoding when loaded. Any lines containing untranslatable characters are silently ignored, so that rules files can contain rules that are not applicable in the current encoding.

A more complete example, which is directly useful for most European languages, can be found in unaccent.rules, which is installed in $SHAREDIR/tsearch_data/ when the unaccent module is installed. This rules file translates characters with accents to the same characters without accents, and it also expands ligatures into the equivalent series of simple characters (for example, Æ to AE).

F.44.2. Usage

Installing the unaccent extension creates a text search template unaccent and a dictionary unaccent based on it. The unaccent dictionary has the default parameter setting RULES='unaccent', which makes it immediately usable with the standard unaccent.rules file. If you wish, you can alter the parameter, for example

mydb=# ALTER TEXT SEARCH DICTIONARY unaccent (RULES='my_rules');

or create new dictionaries based on the template.

To test the dictionary, you can try:

mydb=# select ts_lexize('unaccent','Hôtel');
    ts_lexize
    -----------
    {Hotel}
    (1 row)

Here is an example showing how to insert the unaccent dictionary into a text search configuration:

mydb=# CREATE TEXT SEARCH CONFIGURATION fr ( COPY = french );
mydb=# ALTER TEXT SEARCH CONFIGURATION fr
    ALTER MAPPING FOR hword, hword_part, word
    WITH unaccent, french_stem;
mydb=# select to_tsvector('fr','Hôtels de la Mer');
    to_tsvector
    -------------------
    'hotel':1 'mer':4
    (1 row)

mydb=# select to_tsvector('fr','Hôtel de la Mer') @@ to_tsquery('fr','Hotels');
?column?
    ---------
    t
F.44.3. Functions

The `unaccent()` function removes accents (diacritic signs) from a given string. Basically, it’s a wrapper around `unaccent`-type dictionaries, but it can be used outside normal text search contexts.

```
unaccent([dictionary regdictionary, ] string text) returns text
```

If the `dictionary` argument is omitted, the text search dictionary named `unaccent` and appearing in the same schema as the `unaccent()` function itself is used.

For example:

```
SELECT unaccent('unaccent', 'Hôtel');
SELECT unaccent('Hôtel');
```

F.45. uuid-ossp

The `uuid-ossp` module provides functions to generate universally unique identifiers (UUIDs) using one of several standard algorithms. There are also functions to produce certain special UUID constants.

F.45.1. uuid-ossp Functions

Table F-33 shows the functions available to generate UUIDs. The relevant standards ITU-T Rec. X.667, ISO/IEC 9834-8:2005, and RFC 4122 specify four algorithms for generating UUIDs, identified by the version numbers 1, 3, 4, and 5. (There is no version 2 algorithm.) Each of these algorithms could be suitable for a different set of applications.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
</table>

Table F-33. Functions for UUID Generation

3488
### Appendix F. Additional Supplied Modules

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>uuid_generate_v1()</code></td>
<td>This function generates a version 1 UUID. This involves the MAC address of the computer and a time stamp. Note that UUIDs of this kind reveal the identity of the computer that created the identifier and the time at which it did so, which might make it unsuitable for certain security-sensitive applications.</td>
</tr>
<tr>
<td><code>uuid_generate_v1mc()</code></td>
<td>This function generates a version 1 UUID but uses a random multicast MAC address instead of the real MAC address of the computer.</td>
</tr>
<tr>
<td><code>uuid_generate_v3(namespace uuid, name text)</code></td>
<td>This function generates a version 3 UUID in the given namespace using the specified input name. The namespace should be one of the special constants produced by the <code>uuid_ns_*()</code> functions shown in Table F-34. (It could be any UUID in theory.) The name is an identifier in the selected namespace. For example: <code>SELECT uuid_generate_v3(uuid_ns_url(), 'http://www.postgresql.org');</code> The name parameter will be MD5-hashed, so the cleartext cannot be derived from the generated UUID. The generation of UUIDs by this method has no random or environment-dependent element and is therefore reproducible.</td>
</tr>
<tr>
<td><code>uuid_generate_v4()</code></td>
<td>This function generates a version 4 UUID, which is derived entirely from random numbers.</td>
</tr>
<tr>
<td><code>uuid_generate_v5(namespace uuid, name text)</code></td>
<td>This function generates a version 5 UUID, which works like a version 3 UUID except that SHA-1 is used as a hashing method. Version 5 should be preferred over version 3 because SHA-1 is thought to be more secure than MD5.</td>
</tr>
</tbody>
</table>

#### Table F-34. Functions Returning UUID Constants

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>uuid_nil()</code></td>
<td>A “nil” UUID constant, which does not occur as a real UUID.</td>
</tr>
<tr>
<td><code>uuid_ns_dns()</code></td>
<td>Constant designating the DNS namespace for UUIDs.</td>
</tr>
<tr>
<td><code>uuid_ns_url()</code></td>
<td>Constant designating the URL namespace for UUIDs.</td>
</tr>
</tbody>
</table>
### Appendix F. Additional Supplied Modules

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>uuid_ns_oid()</code></td>
<td>Constant designating the ISO object identifier (OID) namespace for UUIDs. (This pertains to ASN.1 OIDs, which are unrelated to the OIDs used in PostgreSQL.)</td>
</tr>
<tr>
<td><code>uuid_ns_x500()</code></td>
<td>Constant designating the X.500 distinguished name (DN) namespace for UUIDs.</td>
</tr>
</tbody>
</table>

### F.45.2. Building `uuid-ossp`

Historically this module depended on the OSSP UUID library, which accounts for the module’s name. While the OSSP UUID library can still be found at [http://www.ossp.org/pkg/lib/uuid/](http://www.ossp.org/pkg/lib/uuid/), it is not well maintained, and is becoming increasingly difficult to port to newer platforms. `uuid-ossp` can now be built without the OSSP library on some platforms. On FreeBSD, NetBSD, and some other BSD-derived platforms, suitable UUID creation functions are included in the core `libc` library. On Linux, OS X, and some other platforms, suitable functions are provided in the `libuuid` library, which originally came from the e2fsprogs project (though on modern Linux it is considered part of `util-linux-ng`). When invoking `configure`, specify `--with-uuid=bsd` to use the BSD functions, or `--with-uuid=e2fs` to use e2fsprogs’ `libuuid`, or `--with-uuid=ossp` to use the OSSP UUID library. More than one of these libraries might be available on a particular machine, so `configure` does not automatically choose one.

**Note:** If you only need randomly-generated (version 4) UUIDs, consider using the `gen_random_uuid()` function from the `pgcrypto` module instead.

### F.45.3. Author

Peter Eisentraut <peter_e@gmx.net>

### F.46. xml2

The `xml2` module provides XPath querying and XSLT functionality.

#### F.46.1. Deprecation Notice

From PostgreSQL 8.3 on, there is XML-related functionality based on the SQL/XML standard in the core server. That functionality covers XML syntax checking and XPath queries, which is what this module does, and more, but the API is not at all compatible. It is planned that this module will be removed in a future version of PostgreSQL in favor of the newer standard API, so you are encouraged to try converting your applications. If you find that some of the functionality of this module is not available in an adequate
form with the newer API, please explain your issue to <pgsql-hackers@postgresql.org> so that the
deficiency can be addressed.

F.46.2. Description of Functions

Table F-35 shows the functions provided by this module. These functions provide straightforward XML
parsing and XPath queries. All arguments are of type text, so for brevity that is not shown.

Table F-35. Functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Returns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xml_is_well_formed(document)</td>
<td>bool</td>
<td>This parses the document text in its parameter and returns true if the document is well-formed XML. (Note: before PostgreSQL 8.2, this function was called xml_valid(). That is the wrong name since validity and well-formedness have different meanings in XML. The old name is still available, but is deprecated.)</td>
</tr>
<tr>
<td>xpath_string(document, query)</td>
<td>text</td>
<td>These functions evaluate the XPath query on the supplied document, and cast the result to the specified type.</td>
</tr>
<tr>
<td>xpath_number(document, query)</td>
<td>float4</td>
<td></td>
</tr>
<tr>
<td>xpath_bool(document, query)</td>
<td>bool</td>
<td></td>
</tr>
</tbody>
</table>
| xpath_nodeset(document, query, toptag, itemtag) | text    | This evaluates query on document and wraps the result in XML tags. If the result is multivalued, the output will look like: <toptag><itemtag>Value 1 which could be an XML fragment</itemtag><itemtag>Value 2....</itemtag></toptag>  
If either toptag or itemtag is an empty string, the relevant tag is omitted. |
| xpath_nodeset(document, query)           | text    | Like xpath_nodeset(document, query, toptag, itemtag) but result omits both tags.                                                                                                                        |
Appendix F. Additional Supplied Modules

<table>
<thead>
<tr>
<th>Function</th>
<th>Returns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xpath_nodeset(document, query, itemtag)</td>
<td>text</td>
<td>Like xpath_nodeset(document, query, toptag, itemtag) but result omits toptag.</td>
</tr>
<tr>
<td>xpath_list(document, query, separator)</td>
<td>text</td>
<td>This function returns multiple values separated by the specified separator, for example Value 1, Value 2, Value 3 if separator is , .</td>
</tr>
<tr>
<td>xpath_list(document, query)</td>
<td>text</td>
<td>This is a wrapper for the above function that uses , as the separator.</td>
</tr>
</tbody>
</table>

F.46.3. xpath_table

xpath_table(text key, text document, text relation, text xpaths, text criteria) returns setof record

xpath_table is a table function that evaluates a set of XPath queries on each of a set of documents and returns the results as a table. The primary key field from the original document table is returned as the first column of the result so that the result set can readily be used in joins. The parameters are described in Table F-36.

Table F-36. xpath_table Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>key</td>
<td>the name of the “key” field — this is just a field to be used as the first column of the output table, i.e., it identifies the record from which each output row came (see note below about multiple values)</td>
</tr>
<tr>
<td>document</td>
<td>the name of the field containing the XML document</td>
</tr>
<tr>
<td>relation</td>
<td>the name of the table or view containing the documents</td>
</tr>
<tr>
<td>xpaths</td>
<td>one or more XPath expressions, separated by</td>
</tr>
<tr>
<td>criteria</td>
<td>the contents of the WHERE clause. This cannot be omitted, so use true or 1=1 if you want to process all the rows in the relation</td>
</tr>
</tbody>
</table>

These parameters (except the XPath strings) are just substituted into a plain SQL SELECT statement, so you have some flexibility — the statement is

SELECT <key>, <document> FROM <relation> WHERE <criteria>

so those parameters can be anything valid in those particular locations. The result from this SELECT needs to return exactly two columns (which it will unless you try to list multiple fields for key or document).
Appendix F. Additional Supplied Modules

Beware that this simplistic approach requires that you validate any user-supplied values to avoid SQL injection attacks.

The function has to be used in a FROM expression, with an AS clause to specify the output columns; for example

```sql
SELECT * FROM xpath_table('article_id',
  'article_xml',
  'articles',
  '/article/author|/article/pages|/article/title',
  'date_entered > "2003-01-01" ')
AS t(article_id integer, author text, page_count integer, title text);
```

The AS clause defines the names and types of the columns in the output table. The first is the “key” field and the rest correspond to the XPath queries. If there are more XPath queries than result columns, the extra queries will be ignored. If there are more result columns than XPath queries, the extra columns will be NULL.

Notice that this example defines the page_count result column as an integer. The function deals internally with string representations, so when you say you want an integer in the output, it will take the string representation of the XPath result and use PostgreSQL input functions to transform it into an integer (or whatever type the AS clause requests). An error will result if it can’t do this — for example if the result is empty — so you may wish to just stick to text as the column type if you think your data has any problems.

The calling SELECT statement doesn’t necessarily have to be just SELECT * — it can reference the output columns by name or join them to other tables. The function produces a virtual table with which you can perform any operation you wish (e.g. aggregation, joining, sorting etc). So we could also have:

```sql
SELECT t.title, p.fullname, p.email
FROM xpath_table('article_id', 'article_xml', 'articles',
  '/article/title|/article/author/@id',
  'xpath_string(article_xml,"/article/@date") > "2003-03-20" ')
AS t(article_id integer, title text, author_id integer),
  tblPeopleinfo AS p
WHERE t.author_id = p.person_id;
```

as a more complicated example. Of course, you could wrap all of this in a view for convenience.

F.46.3.1. Multivalued Results

The xpath_table function assumes that the results of each XPath query might be multivalued, so the number of rows returned by the function may not be the same as the number of input documents. The first row returned contains the first result from each query, the second row the second result from each query. If one of the queries has fewer values than the others, null values will be returned instead.

In some cases, a user will know that a given XPath query will return only a single result (perhaps a unique document identifier) — if used alongside an XPath query returning multiple results, the single-valued result will appear only on the first row of the result. The solution to this is to use the key field as part of a join against a simpler XPath query. As an example:

```sql
CREATE TABLE test (}
id int PRIMARY KEY,
xml text
);

INSERT INTO test VALUES (1, '<doc num="C1">
<line num="L1"><a>1</a><b>2</b><c>3</c></line>
<line num="L2"><a>11</a><b>22</b><c>33</c></line>
</doc>');

INSERT INTO test VALUES (2, '<doc num="C2">
<line num="L1"><a>111</a><b>222</b><c>333</c></line>
<line num="L2"><a>111</a><b>222</b><c>333</c></line>
</doc>');

SELECT * FROM
  xpath_table('id','xml','test',
   '/doc/@num/doc/line/@num/doc/line/a/doc/line/b/doc/line/c',
   'true')
AS t(id int, doc_num varchar(10), line_num varchar(10), val1 int, val2 int, val3 int)
WHERE id = 1 ORDER BY doc_num, line_num

id | doc_num | line_num | val1 | val2 | val3
----+---------+----------+------+------+------
1 | C1 | L1 | 1 | 2 | 3

To get doc_num on every line, the solution is to use two invocations of xpath_table and join the results:

SELECT t.*,i.doc_num FROM
  xpath_table('id','xml','test',
   '/doc/line/@num/doc/line/a/doc/line/b/doc/line/c',
   'true')
AS t(id int, line_num varchar(10), val1 int, val2 int, val3 int),
xpath_table('id','xml','test', '/doc/@num', 'true')
AS i(id int, doc_num varchar(10))
WHERE i.id=t.id AND i.id=1
ORDER BY doc_num, line_num;

id | line_num | val1 | val2 | val3 | doc_num

F.46.4. XSLT Functions

The following functions are available if libxslt is installed:

F.46.4.1. xslt_process

xslt_process(text document, text stylesheet, text paramlist) returns text

This function applies the XSL stylesheet to the document and returns the transformed result. The paramlist is a list of parameter assignments to be used in the transformation, specified in the form \( a=1, b=2 \). Note that the parameter parsing is very simple-minded: parameter values cannot contain commas!

There is also a two-parameter version of xslt_process which does not pass any parameters to the transformation.

F.46.5. Author

John Gray <jgray@azuli.co.uk>

Development of this module was sponsored by Torchbox Ltd. (www.torchbox.com). It has the same BSD license as PostgreSQL.
Appendix G. Additional Supplied Programs

This appendix and the previous one contain information regarding the modules that can be found in the contrib directory of the PostgreSQL distribution. See Appendix F for more information about the contrib section in general and server extensions and plug-ins found in contrib specifically.

This appendix covers utility programs found in contrib. Once installed, either from source or a packaging system, they are found in the bin directory of the PostgreSQL installation and can be used like any other program.

G.1. Client Applications

This section covers PostgreSQL client applications in contrib. They can be run from anywhere, independent of where the database server resides. See also Reference II, PostgreSQL Client Applications for information about client applications that part of the core PostgreSQL distribution.

oid2name

Name

oid2name — resolve OIDs and file nodes in a PostgreSQL data directory

Synopsis

oid2name[option...]

Description

oid2name is a utility program that helps administrators to examine the file structure used by PostgreSQL. To make use of it, you need to be familiar with the database file structure, which is described in Chapter 65.

Note: The name "oid2name" is historical, and is actually rather misleading, since most of the time when you use it, you will really be concerned with tables’ filenode numbers (which are the file names visible in the database directories). Be sure you understand the difference between table OIDs and table filenodes!
oid2name connects to a target database and extracts OID, filenode, and/or table name information. You can also have it show database OIDs or tablespace OIDs.

Options

oid2name accepts the following command-line arguments:

- `-f filenode`
  show info for table with filenode `filenode`

- `-i`
  include indexes and sequences in the listing

- `-o oid`
  show info for table with OID `oid`

- `-q`
  omit headers (useful for scripting)

- `-s`
  show tablespace OIDs

- `-S`
  include system objects (those in information_schema, pg_toast and pg_catalog schemas)

- `-t tablename_pattern`
  show info for table(s) matching `tablename_pattern`

- `-V`
  --version
  Print the oid2name version and exit.

- `-x`
  display more information about each object shown: tablespace name, schema name, and OID

- `-?`
  --help
  Show help about oid2name command line arguments, and exit.

oid2name also accepts the following command-line arguments for connection parameters:

- `-d database`
  database to connect to

- `-H host`
  database server’s host
-p port
  database server’s port
-U username
  user name to connect as
-P password
  password (deprecated — putting this on the command line is a security hazard)

To display specific tables, select which tables to show by using -o, -f and/or -t. -o takes an OID, -f takes a filenode, and -t takes a table name (actually, it’s a LIKE pattern, so you can use things like foo%). You can use as many of these options as you like, and the listing will include all objects matched by any of the options. But note that these options can only show objects in the database given by -d.

If you don’t give any of -o, -f or -t, but do give -d, it will list all tables in the database named by -d. In this mode, the -S and -i options control what gets listed.

If you don’t give -d either, it will show a listing of database OIDs. Alternatively you can give -s to get a tablespace listing.

Notes

oid2name requires a running database server with non-corrupt system catalogs. It is therefore of only limited use for recovering from catastrophic database corruption situations.

Examples

$ # what’s in this database server, anyway?
$ oid2name
All databases:
  Oid  Database Name  Tablespace
  -------------------------------
  17228  alvherre  pg_default
  17255  regression  pg_default
  17227  template0  pg_default
  1  template1  pg_default

$ oid2name -s
All tablespaces:
  Oid  Tablespace Name
  -------------------------
  1663  pg_default
  1664  pg_global
  155151  fastdisk
  155152  bigdisk

$ # OK, let’s look into database alvherre
$ cd $PGDATA/base/17228
$ # get top 10 db objects in the default tablespace, ordered by size
$ ls -1S * | head -10

B. Palmer <bpalmer@crimelabs.net>
vacuumlo

Name
vacuumlo — remove orphaned large objects from a PostgreSQL database

Synopsis
vacuumlo [option...] dbname...

Description
vacuumlo is a simple utility program that will remove any “orphaned” large objects from a PostgreSQL database. An orphaned large object (LO) is considered to be any LO whose OID does not appear in any oid or lo data column of the database.

If you use this, you may also be interested in the lo_manage trigger in the lo module. lo_manage is useful to try to avoid creating orphaned LOs in the first place.

All databases named on the command line are processed.

Options
vacuumlo accepts the following command-line arguments:

-l limit
   Remove no more than limit large objects per transaction (default 1000). Since the server acquires a lock per LO removed, removing too many LOs in one transaction risks exceeding max_locks_per_transaction. Set the limit to zero if you want all removals done in a single transaction.

-n
   Don’t remove anything, just show what would be done.

-v
   Write a lot of progress messages.

-V
   --version
   Print the vacuumlo version and exit.

-?
   --help
   Show help about vacuumlo command line arguments, and exit.
vacuumlo also accepts the following command-line arguments for connection parameters:

- **h hostname**
  Database server’s host.

- **p port**
  Database server’s port.

- **U username**
  User name to connect as.

- **w**
  --no-password
  Never issue a password prompt. If the server requires password authentication and a password is not available by other means such as a `.pgpass` file, the connection attempt will fail. This option can be useful in batch jobs and scripts where no user is present to enter a password.

- **W**
  Force vacuumlo to prompt for a password before connecting to a database.
  This option is never essential, since vacuumlo will automatically prompt for a password if the server demands password authentication. However, vacuumlo will waste a connection attempt finding out that the server wants a password. In some cases it is worth typing `-W` to avoid the extra connection attempt.

### Notes

vacuumlo works by the following method: First, vacuumlo builds a temporary table which contains all of the OIDs of the large objects in the selected database. It then scans through all columns in the database that are of type `oid` or `lo`, and removes matching entries from the temporary table. (Note: Only types with these names are considered; in particular, domains over them are not considered.) The remaining entries in the temporary table identify orphaned LOs. These are removed.

G.2. Server Applications

This section covers PostgreSQL server-related applications in contrib. They are typically run on the host where the database server resides. See also Reference III, PostgreSQL Server Applications for information about server applications that part of the core PostgreSQL distribution.

pg_standby

Name

pg_standby — supports the creation of a PostgreSQL warm standby server

Synopsis

pg_standby [option...] archivelocation nextwalfile xlogfilepath [restartwalfile]

Description

pg_standby supports creation of a “warm standby” database server. It is designed to be a production-ready program, as well as a customizable template should you require specific modifications.

pg_standby is designed to be a waiting restore_command, which is needed to turn a standard archive recovery into a warm standby operation. Other configuration is required as well, all of which is described in the main server manual (see Section 26.2).

To configure a standby server to use pg_standby, put this into its recovery.conf configuration file:

```
restore_command = 'pg_standby archiveDir %f %p %r'
```

where `archiveDir` is the directory from which WAL segment files should be restored.

If `restartwalfile` is specified, normally by using the `%r` macro, then all WAL files logically preceding this file will be removed from `archivelocation`. This minimizes the number of files that need to be retained, while preserving crash-restart capability. Use of this parameter is appropriate if the `archivelocation` is a transient staging area for this particular standby server, but not when the `archivelocation` is intended as a long-term WAL archive area.

pg_standby assumes that `archivelocation` is a directory readable by the server-owning user. If `restartwalfile` (or `-k`) is specified, the `archivelocation` directory must be writable too.

There are two ways to fail over to a “warm standby” database server when the master server fails:

Smart Failover

In smart failover, the server is brought up after applying all WAL files available in the archive. This results in zero data loss, even if the standby server has fallen behind, but if there is a lot of unapplied WAL it can be a long time before the standby server becomes ready. To trigger a smart failover, create a trigger file containing the word `smart`, or just create it and leave it empty.
Fast Failover

In fast failover, the server is brought up immediately. Any WAL files in the archive that have not yet been applied will be ignored, and all transactions in those files are lost. To trigger a fast failover, create a trigger file and write the word **fast** into it. pg_standby can also be configured to execute a fast failover automatically if no new WAL file appears within a defined interval.

**Options**

pg_standby accepts the following command-line arguments:

- `-c`
  Use `cp` or `copy` command to restore WAL files from archive. This is the only supported behavior so this option is useless.

- `-d`
  Print lots of debug logging output on `stderr`.

- `-k`
  Remove files from `archivelocation` so that no more than this many WAL files before the current one are kept in the archive. Zero (the default) means not to remove any files from `archivelocation`. This parameter will be silently ignored if `restartwalfile` is specified, since that specification method is more accurate in determining the correct archive cut-off point. Use of this parameter is **deprecated** as of PostgreSQL 8.3; it is safer and more efficient to specify a `restartwalfile` parameter. A too small setting could result in removal of files that are still needed for a restart of the standby server, while a too large setting wastes archive space.

- `-r maxretries`
  Set the maximum number of times to retry the copy command if it fails (default 3). After each failure, we wait for `sleeptime * num_retries` so that the wait time increases progressively. So by default, we will wait 5 secs, 10 secs, then 15 secs before reporting the failure back to the standby server. This will be interpreted as end of recovery and the standby will come up fully as a result.

- `-s sleeptime`
  Set the number of seconds (up to 60, default 5) to sleep between tests to see if the WAL file to be restored is available in the archive yet. The default setting is not necessarily recommended; consult Section 26.2 for discussion.

- `-t triggerfile`
  Specify a trigger file whose presence should cause failover. It is recommended that you use a structured file name to avoid confusion as to which server is being triggered when multiple servers exist on the same system; for example `/tmp/pgsql.trigger.5432`.

- `-V`  
  `--version`
  Print the pg_standby version and exit.
pg_standby

-w maxwaittime

Set the maximum number of seconds to wait for the next WAL file, after which a fast failover will be performed. A setting of zero (the default) means wait forever. The default setting is not necessarily recommended; consult Section 26.2 for discussion.

-?
--help

Show help about pg_standby command line arguments, and exit.

Notes

pg_standby is designed to work with PostgreSQL 8.2 and later.

PostgreSQL 8.3 provides the %r macro, which is designed to let pg_standby know the last file it needs to keep. With PostgreSQL 8.2, the -k option must be used if archive cleanup is required. This option remains available in 8.3, but its use is deprecated.

PostgreSQL 8.4 provides the recovery_end_command option. Without this option a leftover trigger file can be hazardous.

pg_standby is written in C and has an easy-to-modify source code, with specifically designated sections to modify for your own needs

Examples

On Linux or Unix systems, you might use:

archive_command = 'cp %p .../archive/%f'

restore_command = 'pg_standby -d -s 2 -t /tmp/pgsql.trigger.5442 .../archive %f %p %r 2>>standby.log'

recovery_end_command = 'rm -f /tmp/pgsql.trigger.5442'

where the archive directory is physically located on the standby server, so that the archive_command is accessing it across NFS, but the files are local to the standby (enabling use of ln). This will:

- produce debugging output in standby.log
- sleep for 2 seconds between checks for next WAL file availability
- stop waiting only when a trigger file called /tmp/pgsql.trigger.5442 appears, and perform failover according to its content
- remove the trigger file when recovery ends
- remove no-longer-needed files from the archive directory
pg_standby
On Windows, you might use:
archive_command = ’copy %p ...\\archive\\%f’

restore_command = ’pg_standby -d -s 5 -t C:\pgsql.trigger.5442 ...\archive %f %p %r 2>>stand
recovery_end_command = ’del C:\pgsql.trigger.5442’

Note that backslashes need to be doubled in the archive_command, but not in the restore_command
or recovery_end_command. This will:

•

use the copy command to restore WAL files from archive

•

produce debugging output in standby.log

•

sleep for 5 seconds between checks for next WAL file availability

•

stop waiting only when a trigger file called C:\pgsql.trigger.5442 appears, and perform failover
according to its content

•

remove the trigger file when recovery ends

•

remove no-longer-needed files from the archive directory

The copy command on Windows sets the final file size before the file is completely copied, which would
ordinarily confuse pg_standby. Therefore pg_standby waits sleeptime seconds once it sees the proper
file size. GNUWin32’s cp sets the file size only after the file copy is complete.
Since the Windows example uses copy at both ends, either or both servers might be accessing the archive
directory across the network.

Appendix H. External Projects

PostgreSQL is a complex software project, and managing the project is difficult. We have found that many enhancements to PostgreSQL can be more efficiently developed separately from the core project.

H.1. Client Interfaces

There are only two client interfaces included in the base PostgreSQL distribution:

- libpq is included because it is the primary C language interface, and because many other client interfaces are built on top of it.
- ECPG is included because it depends on the server-side SQL grammar, and is therefore sensitive to changes in PostgreSQL itself.

All other language interfaces are external projects and are distributed separately. Table H-1 includes a list of some of these projects. Note that some of these packages might not be released under the same license as PostgreSQL. For more information on each language interface, including licensing terms, refer to its website and documentation.

H.2. Administration Tools

There are several administration tools available for PostgreSQL. The most popular is pgAdmin\(^1\), and there are several commercially available ones as well.

H.3. Procedural Languages

PostgreSQL includes several procedural languages with the base distribution: PL/pgSQL, PL/Tcl, PL/Perl, and PL/Python.

In addition, there are a number of procedural languages that are developed and maintained outside the core PostgreSQL distribution. Table H-2 lists some of these packages. Note that some of these projects might not be released under the same license as PostgreSQL. For more information on each procedural language, including licensing information, refer to its website and documentation.

H.4. Extensions

PostgreSQL is designed to be easily extensible. For this reason, extensions loaded into the database can function just like features that are built in. The contrib/ directory shipped with the source code contains several extensions, which are described in Appendix F. Other extensions are developed independently, like PostGIS\(^2\). Even PostgreSQL replication solutions can be developed externally. For example, Slony-I\(^3\) is a popular master/standby replication solution that is developed independently from the core project.

2. http://postgis.net/
Appendix I. The Source Code Repository

The PostgreSQL source code is stored and managed using the Git version control system. A public mirror of the master repository is available; it is updated within a minute of any change to the master repository. Our wiki, https://wiki.postgresql.org/wiki/Working_with_Git, has some discussion on working with Git. Note that building PostgreSQL from the source repository requires reasonably up-to-date versions of bison, flex, and Perl. These tools are not needed to build from a distribution tarball, because the files that these tools are used to build are included in the tarball. Other tool requirements are the same as shown in Section 16.2.

I.1. Getting The Source via Git

With Git you will make a copy of the entire code repository on your local machine, so you will have access to all history and branches offline. This is the fastest and most flexible way to develop or test patches.

Git

1. You will need an installed version of Git, which you can get from https://git-scm.com. Many systems already have a recent version of Git installed by default, or available in their package distribution system.

2. To begin using the Git repository, make a clone of the official mirror:

   ```
   git clone https://git.postgresql.org/git/postgresql.git
   ```

   This will copy the full repository to your local machine, so it may take a while to complete, especially if you have a slow Internet connection. The files will be placed in a new subdirectory `postgresql` of your current directory.

   The Git mirror can also be reached via the Git protocol. Just change the URL prefix to git, as in:

   ```
   git clone git://git.postgresql.org/git/postgresql.git
   ```

3. Whenever you want to get the latest updates in the system, `cd` into the repository, and run:

   ```
   git fetch
   ```

   Git can do a lot more things than just fetch the source. For more information, consult the Git man pages, or see the website at https://git-scm.com.
Appendix J. Documentation

PostgreSQL has four primary documentation formats:

- Plain text, for pre-installation information
- HTML, for on-line browsing and reference
- PDF or PostScript, for printing
- man pages, for quick reference.

Additionally, a number of plain-text README files can be found throughout the PostgreSQL source tree, documenting various implementation issues.

HTML documentation and man pages are part of a standard distribution and are installed by default. PDF and PostScript format documentation is available separately for download.

J.1. DocBook

The documentation sources are written in DocBook, which is a markup language superficially similar to HTML. Both of these languages are applications of the Standard Generalized Markup Language, SGML, which is essentially a language for describing other languages. In what follows, the terms DocBook and SGML are both used, but technically they are not interchangeable.

DocBook allows an author to specify the structure and content of a technical document without worrying about presentation details. A document style defines how that content is rendered into one of several final forms. DocBook is maintained by the OASIS group.¹ The official DocBook site² has good introductory and reference documentation and a complete O’Reilly book for your online reading pleasure. The NewbieDoc Docbook Guide³ is very helpful for beginners. The FreeBSD Documentation Project⁴ also uses DocBook and has some good information, including a number of style guidelines that might be worth considering.

J.2. Tool Sets

The following tools are used to process the documentation. Some might be optional, as noted.

DocBook DTD⁵

This is the definition of DocBook itself. We currently use version 4.2; you cannot use later or earlier.

¹. http://www.oasis-open.org
versions. You need the SGML variant of the DocBook DTD, but to build man pages you also need the XML variant of the same version.

ISO 8879 character entities\(^6\)

These are required by DocBook but are distributed separately because they are maintained by ISO.

DocBook DSSSL Stylesheets\(^7\)

These contain the processing instructions for converting the DocBook sources to other formats, such as HTML.

DocBook XSL Stylesheets\(^8\)

This is another stylesheet for converting DocBook to other formats. We currently use this to produce man pages and optionally HTMLHelp. You can also use this toolchain to produce HTML or PDF output, but official PostgreSQL releases use the DSSSL stylesheets for that.

The minimum required version is currently 1.74.0.

OpenJade\(^9\)

This is the base package of SGML processing. It contains an SGML parser, a DSSSL processor (that is, a program to convert SGML to other formats using DSSSL stylesheets), as well as a number of related tools. Jade is now being maintained by the OpenJade group, no longer by James Clark.

Libxml2\(^10\) for `xmlint`

This library and the `xmlint` tool it contains are used for processing XML. Many developers will already have Libxml2 installed, because it is also used when building the PostgreSQL code. Note, however, that `xmlint` might need to be installed from a separate subpackage.

Libxslt\(^11\) for `xsltproc`

This is the processing tool to use with the XSLT stylesheets (like jade is the processing tool for DSSSL stylesheets).

JadeTeX\(^12\)

If you want to, you can also install JadeTeX to use TeX as a formatting backend for Jade. JadeTeX can create PostScript or PDF files (the latter with bookmarks).

However, the output from JadeTeX is inferior to what you get from the RTF backend. Particular problem areas are tables and various artifacts of vertical and horizontal spacing. Also, there is no opportunity to manually polish the results.

We have documented experience with several installation methods for the various tools that are needed to process the documentation. These will be described below. There might be some other packaged distributions for these tools. Please report package status to the documentation mailing list, and we will include that information here.

\(^7\) http://wiki.docbook.org/DocBookDssslStylesheetDocs
\(^8\) http://wiki.docbook.org/DocBookXslStylesheets
\(^9\) http://openjade.sourceforge.net
\(^10\) http://xmlsoft.org/
\(^11\) http://xmlsoft.org/XSLT/
\(^12\) http://jadetex.sourceforge.net
J.2.1. Installation on Fedora, RHEL, and Derivatives

To install the required packages, use:

```
yum install docbook-dtds docbook-style-dsssl docbook-style-xsl libxslt openjade
```

J.2.2. Installation on FreeBSD

The FreeBSD Documentation Project is itself a heavy user of DocBook, so it comes as no surprise that there is a full set of “ports” of the documentation tools available on FreeBSD. The following ports need to be installed to build the documentation on FreeBSD.

- textproc/docbook-sgml
- textproc/docbook-xml
- textproc/docbook-xsl
- textproc/dsssl-docbook-modular
- textproc/libxslt
- textproc/openjade

A number of things from `/usr/ports/print (tex, jadetex)` might also be of interest.

More information about the FreeBSD documentation tools can be found in the FreeBSD Documentation Project’s instructions\(^\text{13}\).

J.2.3. Debian Packages

There is a full set of packages of the documentation tools available for Debian GNU/Linux. To install, simply use:

```
apt-get install docbook docbook-dsssl docbook-xsl libxml2-utils openjade1.3 opensp xsltproc
```

J.2.4. OS X

If you use MacPorts, the following will get you set up:

```
sudo port install docbook-dsssl docbook-sgml-4.2 docbook-xml-4.2 docbook-xsl libxslt openjade
```

J.2.5. Manual Installation from Source

The manual installation process of the DocBook tools is somewhat complex, so if you have pre-built packages available, use them. We describe here only a standard setup, with reasonably standard installation paths, and no “fancy” features. For details, you should study the documentation of the respective package, and read SGML introductory material.

J.2.5.1. Installing OpenJade

1. The installation of OpenJade offers a GNU-style ./configure; make; make install build process. Details can be found in the OpenJade source distribution. In a nutshell:

   ./configure --enable-default-catalog=/usr/local/share/sgml/catalog
   make
   make install

   Be sure to remember where you put the “default catalog”; you will need it below. You can also leave it off, but then you will have to set the environment variable SGML_CATALOG_FILES to point to the file whenever you use jade later on. (This method is also an option if OpenJade is already installed and you want to install the rest of the toolchain locally.)

   **Note:** Some users have reported encountering a segmentation fault using OpenJade 1.4devel to build the PDFs, with a message like:

   openjade:./stylesheet.dsl:664:2:E: flow object not accepted by port; only display flow objects
   Downgrading to OpenJade 1.3 should get rid of this error.

2. Additionally, you should install the files dsssl.dtd, fot.dtd, style-sheet.dtd, and catalog from the dsssl directory somewhere, perhaps into /usr/local/share/sgml/dsssl. It’s probably easiest to copy the entire directory:

   cp -R dsssl /usr/local/share/sgml

3. Finally, create the file /usr/local/share/sgml/catalog and add this line to it:

   CATALOG "dsssl/catalog"

   (This is a relative path reference to the file installed in step 2. Be sure to adjust it if you chose your installation layout differently.)

J.2.5.2. Installing the DocBook DTD Kit

1. Obtain the DocBook V4.2 distribution\(^{14}\).

2. Create the directory /usr/local/share/sgml/docbook-4.2 and change to it. (The exact location is irrelevant, but this one is reasonable within the layout we are following here.)

   $ mkdir /usr/local/share/sgml/docbook-4.2
   $ cd /usr/local/share/sgml/docbook-4.2

\(^{14}\) [http://www.docbook.org/sgml/4.2/docbook-4.2.zip](http://www.docbook.org/sgml/4.2/docbook-4.2.zip)
3. Unpack the archive:

```bash
$ unzip -a ...../docbook-4.2.zip
```
(The archive will unpack its files into the current directory.)

4. Edit the file `/usr/local/share/sgml/catalog` (or whatever you told jade during installation) and put a line like this into it:

```bash
CATALOG "docbook-4.2/docbook.cat"
```

5. Download the ISO 8879 character entities archive\(^{15}\), unpack it, and put the files in the same directory you put the DocBook files in:

```bash
$ cd /usr/local/share/sgml/docbook-4.2
$ unzip ...../ISOEnts.zip
```

6. Run the following command in the directory with the DocBook and ISO files:

```bash
perl -pi -e 's/iso-(.*).gml/ISO\1/g' docbook.cat
```
(This fixes a mixup between the names used in the DocBook catalog file and the actual names of the ISO character entity files.)

### J.2.5.3. Installing the DocBook DSSSL Style Sheets

To install the style sheets, unzip and untar the distribution and move it to a suitable place, for example `/usr/local/share/sgml`. (The archive will automatically create a subdirectory.)

```bash
$ gunzip docbook-dsssl-1.xx.tar.gz
$ tar -C /usr/local/share/sgml -xf docbook-dsssl-1.xx.tar
```

The usual catalog entry in `/usr/local/share/sgml/catalog` can also be made:

```bash
CATALOG "docbook-dsssl-1.xx/catalog"
```

Because stylesheets change rather often, and it’s sometimes beneficial to try out alternative versions, PostgreSQL doesn’t use this catalog entry. See Section J.2.6 for information about how to select the stylesheets instead.

### J.2.5.4. Installing JadeTeX

To install and use JadeTeX, you will need a working installation of TeX and LaTeX2e, including the supported tools and graphics packages, Babel, AMS fonts and AMS-LaTeX, the PSNFSS extension and companion kit of “the 35 fonts”, the dvips program for generating PostScript, the macro packages fancyhdr, hyperref, minitoc, url and ot2enc. All of these can be found on your friendly neighborhood CTAN site\(^{16}\). The installation of the TeX base system is far beyond the scope of this introduction. Binary packages should be available for any system that can run TeX.

Before you can use JadeTeX with the PostgreSQL documentation sources, you will need to increase the size of TeX’s internal data structures. Details on this can be found in the JadeTeX installation instructions.

\(^{15}\) [http://www.oasis-open.org/cover/ISOEnts.zip](http://www.oasis-open.org/cover/ISOEnts.zip)

\(^{16}\) [http://www.ctan.org](http://www.ctan.org)
Once that is finished you can install JadeTeX:

$$\texttt{gunzip jadetex-xxx.tar.gz}$$
$$\texttt{tar xf jadetex-xxx.tar}$$
$$\texttt{cd jadetex}$$
$$\texttt{make install}$$
$$\texttt{mktexlsr}$$

The last two need to be done as root.

### J.2.6. Detection by configure

Before you can build the documentation you need to run the configure script as you would when building the PostgreSQL programs themselves. Check the output near the end of the run, it should look something like this:

```
checking for onsgmls... onsgmls
checking for openjade... openjade
checking for DocBook V4.2... yes
checking for DocBook stylesheets... /usr/share/sgml/docbook/stylesheet/dsssl/modular
checking for collateindex.pl... /usr/bin/collateindex.pl
checking for xsltproc... xsltproc
checking for osx... osx
```

If neither `onsgmls` nor `nsgmls` were found then some of the following tests will be skipped. `nsgmls` is part of the Jade package. You can pass the environment variables `JADE` and `NSGMLS` to configure to point to the programs if they are not found automatically. If “DocBook V4.2” was not found then you did not install the DocBook DTD kit in a place where Jade can find it, or you have not set up the catalog files correctly. See the installation hints above. The DocBook stylesheets are looked for in a number of relatively standard places, but if you have them some other place then you should set the environment variable `DOCBOOKSTYLE` to the location and rerun `configure` afterwards.

### J.3. Building The Documentation

Once you have everything set up, change to the directory `doc/src/sgml` and run one of the commands described in the following subsections to build the documentation. (Remember to use GNU make.)

#### J.3.1. HTML

To build the HTML version of the documentation:

```
doc/src/sgml$ make html
```

This is also the default target. The output appears in the subdirectory `html`. 
To produce HTML documentation with the stylesheet used on postgresql.org\textsuperscript{17} instead of the default simple style use:

\begin{verbatim}
doc/src/sgml$ make STYLE=website html
\end{verbatim}

To create a proper index, the build might process several identical stages. If you do not care about the index, and just want to proof-read the output, use \texttt{draft}:

\begin{verbatim}
doc/src/sgml$ make draft
\end{verbatim}

To build the documentation as a single HTML page, use:

\begin{verbatim}
doc/src/sgml$ make postgres.html
\end{verbatim}

\section*{J.3.2. Manpages}

We use the DocBook XSL stylesheets to convert DocBook \texttt{refentry} pages to *roff output suitable for man pages. The man pages are also distributed as a tar archive, similar to the HTML version. To create the man pages, use the commands:

\begin{verbatim}
cd doc/src/sgml
make man
\end{verbatim}

\section*{J.3.3. Print Output via JadeTeX}

If you want to use JadeTex to produce a printable rendition of the documentation, you can use one of the following commands:

\begin{itemize}
  \item To generate PostScript via DVI in A4 format:
    \begin{verbatim}
doc/src/sgml$ make postgres-A4.ps
\end{verbatim}
    In U.S. letter format:
    \begin{verbatim}
doc/src/sgml$ make postgres-US.ps
\end{verbatim}
  \item To make a PDF:
    \begin{verbatim}
doc/src/sgml$ make postgres-A4.pdf
or:
doc/src/sgml$ make postgres-US.pdf
\end{verbatim}
(Of course you can also make a PDF version from the PostScript, but if you generate PDF directly, it will have hyperlinks and other enhanced features.)
\end{itemize}

\textsuperscript{17} https://www.postgresql.org/docs/current
When using JadeTeX to build the PostgreSQL documentation, you will probably need to increase some of TeX’s internal parameters. These can be set in the file `texmf.cnf`. The following settings worked at the time of this writing:

```plaintext
hash_extra.jadetex = 200000
hash_extra.pdfjadetex = 200000
pool_size.jadetex = 2000000
pool_size.pdfjadetex = 2000000
string_vacancies.jadetex = 150000
string_vacancies.pdfjadetex = 150000
max_strings.jadetex = 300000
max_strings.pdfjadetex = 300000
save_size.jadetex = 15000
save_size.pdfjadetex = 15000
```

### J.3.4. Overflow Text

Occasionally text is too wide for the printed margins, and in extreme cases, too wide for the printed page, e.g. non-wrapped text, wide tables. Overly wide text generates “Overfull hbox” messages in the TeX log output file, e.g. `postgres-US.log` or `postgres-A4.log`. There are 72 points in an inch so anything reported as over 72 points too wide will probably not fit on the printed page (assuming one inch margins). To find the SGML text causing the overflow, find the first page number mentioned above the overflow message, e.g. `[50 ###]` (page 50), and look at the page after that (e.g. page 51) in the PDF file to see the overflow text and adjust the SGML accordingly.

### J.3.5. Print Output via RTF

You can also create a printable version of the PostgreSQL documentation by converting it to RTF and applying minor formatting corrections using an office suite. Depending on the capabilities of the particular office suite, you can then convert the documentation to PostScript or PDF. The procedure below illustrates this process using Applixware.

**Note:** It appears that current versions of the PostgreSQL documentation trigger some bug in or exceed the size limit of OpenJade. If the build process of the RTF version hangs for a long time and the output file still has size 0, then you might have hit that problem. (But keep in mind that a normal build takes 5 to 10 minutes, so don’t abort too soon.)

**Applixware RTF Cleanup**

OpenJade omits specifying a default style for body text. In the past, this undiagnosed problem led to a long process of table of contents generation. However, with great help from the Applixware folks the symptom was diagnosed and a workaround is available.
1. Generate the RTF version by typing:

```bash
doc/src/sgml $ make postgres.rtf
```

2. Repair the RTF file to correctly specify all styles, in particular the default style. If the document contains `refentry` sections, one must also replace formatting hints which tie a preceding paragraph to the current paragraph, and instead tie the current paragraph to the following one. A utility, `fixrtf`, is available in `doc/src/sgml` to accomplish these repairs:

```bash
doc/src/sgml $./fixrtf --refentry postgres.rtf
```

The script adds `{\s0 Normal;}` as the zeroth style in the document. According to Applixware, the RTF standard would prohibit adding an implicit zeroth style, though Microsoft Word happens to handle this case. For repairing `refentry` sections, the script replaces `{\keepn` tags with `{\keep.

3. Open a new document in Applixware Words and then import the RTF file.

4. Generate a new table of contents (ToC) using Applixware.

   a. Select the existing ToC lines, from the beginning of the first character on the first line to the last character of the last line.

   b. Build a new ToC using `Tools -> Book Building -> Create Table of Contents`. Select the first three levels of headers for inclusion in the ToC. This will replace the existing lines imported in the RTF with a native Applixware ToC.

   c. Adjust the ToC formatting by using `Format -> Style`, selecting each of the three ToC styles, and adjusting the indents for `First` and `Left`. Use the following values:

<p>|</p>
<table>
<thead>
<tr>
<th>Style</th>
<th>First Indent (inches)</th>
<th>Left Indent (inches)</th>
</tr>
</thead>
<tbody>
<tr>
<td>TOC-Heading 1</td>
<td>0.4</td>
<td>0.4</td>
</tr>
<tr>
<td>TOC-Heading 2</td>
<td>0.8</td>
<td>0.8</td>
</tr>
<tr>
<td>TOC-Heading 3</td>
<td>1.2</td>
<td>1.2</td>
</tr>
</tbody>
</table>

5. Work through the document to:

   • Adjust page breaks.
   • Adjust table column widths.

6. Replace the right-justified page numbers in the Examples and Figures portions of the ToC with correct values. This only takes a few minutes.

7. Delete the index section from the document if it is empty.

8. Regenerate and adjust the table of contents.

   a. Select the ToC field.

   b. Select `Tools -> Book Building -> Create Table of Contents`.

   c. Unbind the ToC by selecting `Tools -> Field Editing -> Unprotect`.

   d. Delete the first line in the ToC, which is an entry for the ToC itself.
9. Save the document as native Applixware Words format to allow easier last minute editing later.
10. “Print” the document to a file in PostScript format.

### J.3.6. Plain Text Files

The installation instructions are also distributed as plain text, in case they are needed in a situation where better reading tools are not available. The INSTALL file corresponds to Chapter 16, with some minor changes to account for the different context. To recreate the file, change to the directory doc/src/sgml and enter `make INSTALL`.

In the past, the release notes and regression testing instructions were also distributed as plain text, but this practice has been discontinued.

### J.3.7. Syntax Check

Building the documentation can take very long. But there is a method to just check the correct syntax of the documentation files, which only takes a few seconds:

```
doc/src/sgml$ make check
```

### J.4. Documentation Authoring

SGML and DocBook do not suffer from an oversupply of open-source authoring tools. The most common tool set is the Emacs/XEmacs editor with appropriate editing mode. On some systems these tools are provided in a typical full installation.

#### J.4.1. Emacs/PSGML

PSGML is the most common and most powerful mode for editing SGML documents. When properly configured, it will allow you to use Emacs to insert tags and check markup consistency. You could use it for HTML as well. Check the PSGML web site\(^\text{18}\) for downloads, installation instructions, and detailed documentation.

There is one important thing to note with PSGML: its author assumed that your main SGML DTD directory would be `/usr/local/lib/sgml`. If, as in the examples in this chapter, you use `/usr/local/share/sgml`, you have to compensate for this, either by setting `SGML_CATALOG_FILES` environment variable, or you can customize your PSGML installation (its manual tells you how).

Put the following in your `~/.emacs` environment file (adjusting the path names to be appropriate for your system):

\(^{18}\) [http://www.lysator.liu.se/projects/about_psgml.html](http://www.lysator.liu.se/projects/about_psgml.html)
for SGML mode (psgml)

(setq sgml-omittag t)
(setq sgml-shorttag t)
(setq sgml-minimize-attributes nil)
(setq sgml-always-quote-attributes t)
(setq sgml-indent-step 1)
(setq sgml-indent-data t)
(setq sgml-parent-document nil)
(setq sgml-exposed-tags nil)
(setq sgml-catalog-files ’(’/usr/local/share/sgml/catalog’))

(autoload ’sgml-mode “psgml” “Major mode to edit SGML files.” t )

and in the same file add an entry for SGML into the (existing) definition for auto-mode-alist:

(setq auto-mode-alist ’(’(’\.sgml$’ . sgml-mode) ’))

You might find that when using PSGML, a comfortable way of working with these separate files of book parts is to insert a proper DOCTYPE declaration while you’re editing them. If you are working on this source, for instance, it is an appendix chapter, so you would specify the document as an “appendix” instance of a DocBook document by making the first line look like this:

<!DOCTYPE appendix PUBLIC "-//OASIS//DTD DocBook V4.2//EN”>

This means that anything and everything that reads SGML will get it right, and I can verify the document with nsgmls -s docguide.sgml (But you need to take out that line before building the entire documentation set.)

J.4.2. Other Emacs Modes

GNU Emacs ships with a different SGML mode, which is not quite as powerful as PSGML, but it’s less confusing and lighter weight. Also, it offers syntax highlighting (font-lock), which can be very helpful. src/tools/editors/emacs.samples contains sample settings for this mode.

Norm Walsh offers a major mode\(^\text{19}\) specifically for DocBook which also has font-lock and a number of features to reduce typing.

\(^\text{19}\) http://nwalsh.com/emacs/docbookide/index.html
J.5. Style Guide

J.5.1. Reference Pages

Reference pages should follow a standard layout. This allows users to find the desired information more quickly, and it also encourages writers to document all relevant aspects of a command. Consistency is not only desired among PostgreSQL reference pages, but also with reference pages provided by the operating system and other packages. Hence the following guidelines have been developed. They are for the most part consistent with similar guidelines established by various operating systems.

Reference pages that describe executable commands should contain the following sections, in this order. Sections that do not apply can be omitted. Additional top-level sections should only be used in special circumstances; often that information belongs in the “Usage” section.

Name

This section is generated automatically. It contains the command name and a half-sentence summary of its functionality.

Synopsis

This section contains the syntax diagram of the command. The synopsis should normally not list each command-line option; that is done below. Instead, list the major components of the command line, such as where input and output files go.

Description

Several paragraphs explaining what the command does.

Options

A list describing each command-line option. If there are a lot of options, subsections can be used.

Exit Status

If the program uses 0 for success and non-zero for failure, then you do not need to document it. If there is a meaning behind the different non-zero exit codes, list them here.

Usage

Describe any sublanguage or run-time interface of the program. If the program is not interactive, this section can usually be omitted. Otherwise, this section is a catch-all for describing run-time features. Use subsections if appropriate.

Environment

List all environment variables that the program might use. Try to be complete; even seemingly trivial variables like SHELL might be of interest to the user.

Files

List any files that the program might access implicitly. That is, do not list input and output files that were specified on the command line, but list configuration files, etc.
Appendix J. Documentation

Diagnostics

Explain any unusual output that the program might create. Refrain from listing every possible error message. This is a lot of work and has little use in practice. But if, say, the error messages have a standard format that the user can parse, this would be the place to explain it.

Notes

Anything that doesn’t fit elsewhere, but in particular bugs, implementation flaws, security considerations, compatibility issues.

Examples

Examples

History

If there were some major milestones in the history of the program, they might be listed here. Usually, this section can be omitted.

Author

Author (only used in the contrib section)

See Also

Cross-references, listed in the following order: other PostgreSQL command reference pages, PostgreSQL SQL command reference pages, citation of PostgreSQL manuals, other reference pages (e.g., operating system, other packages), other documentation. Items in the same group are listed alphabetically.

Reference pages describing SQL commands should contain the following sections: Name, Synopsis, Description, Parameters, Outputs, Notes, Examples, Compatibility, History, See Also. The Parameters section is like the Options section, but there is more freedom about which clauses of the command can be listed. The Outputs section is only needed if the command returns something other than a default command-completion tag. The Compatibility section should explain to what extent this command conforms to the SQL standard(s), or to which other database system it is compatible. The See Also section of SQL commands should list SQL commands before cross-references to programs.
Appendix K. Acronyms

This is a list of acronyms commonly used in the PostgreSQL documentation and in discussions about PostgreSQL.

Appendix K. Acronyms

RFC
Request For Comments\(^{39}\)

SGML
Standard Generalized Markup Language\(^{40}\)

SPI
Server Programming Interface

SP-GiST
Space-Partitioned Generalized Search Tree

SQL
Structured Query Language\(^{41}\)

SRF
Set-Returning Function

SSH
Secure Shell\(^{42}\)

SSL
Secure Sockets Layer\(^{43}\)

SSPI
Security Support Provider Interface\(^{44}\)

SYSV
Unix System V\(^{45}\)

TCP/IP
Transmission Control Protocol (TCP) / Internet Protocol (IP)\(^{46}\)

TID
Tuple Identifier

TOAST
The Oversized-Attribute Storage Technique

TPC
Transaction Processing Performance Council\(^{47}\)

\(^{47}\) [http://www.tpc.org/](http://www.tpc.org/)
Appendix K. Acronyms

URL
Uniform Resource Locator

UTC
Coordinated Universal Time

UTF
Unicode Transformation Format

UTF8
Eight-Bit Unicode Transformation Format

UUID
Universally Unique Identifier

WAL
Write-Ahead Log

XID
Transaction Identifier

XML
Extensible Markup Language

50. http://www.unicode.org/
Bibliography

Selected references and readings for SQL and PostgreSQL.

Some white papers and technical reports from the original POSTGRES development team are available at the University of California, Berkeley, Computer Science Department web site¹.

SQL Reference Books

PostgreSQL-specific Documentation

Discusses SQL history and syntax, and describes the addition of INTERSECT and EXCEPT constructs into PostgreSQL. Prepared as a Master’s Thesis with the support of O. Univ. Prof. Dr. Georg Gottlob and Univ. Ass. Mag. Katrin Seyr at Vienna University of Technology.
